Contents

1 Foreword **1**
- 1.1 By Kit Olivas and Dr. Ada Marie . . . 1
- 1.2 Chess: The Human Brain's Programming Language . . . 1
- 1.3 The Story Behind This Book . . . 2
- 1.4 The Neurodivergent Promise . . . 3
- 1.5 What This Book Is (And What It Isn't) . . . 3
- 1.6 How to Use This Book . . . 4
- 1.7 The Shape of the Journey . . . 6
- 1.8 A Note on Notation . . . 6
- 1.9 A Note on Engines . . . 6
- 1.10 About the Authors . . . 7
- 1.11 Dedication . . . 7

2 Chapter 1: The Board, the Pieces, and the Rules **9**
- 2.1 What You'll Learn . . . 9

3 ND Quick Start Guide **11**
- 3.1 You Can Learn Chess TODAY . . . 11
- 3.2 Pattern Recognition: Your Superpower . . . 12
- 3.3 ADHD-Friendly Study Schedules . . . 13
- 3.4 Executive Function Supports . . . 14

4 The Board **17**
- 4.1 Sixty-Four Squares . . . 17
- 4.2 Files, Ranks, and Square Names . . . 17
- 4.3 The Center . . . 19
- 4.4 Diagonals . . . 20

5 The Pieces **21**
- 5.1 The King (K) . . . 21
- 5.2 The Queen (Q) . . . 23
- 5.3 The Rook (R) . . . 24
- 5.4 The Bishop (B) . . . 25
- 5.5 The Knight (N) . . . 27
- 5.6 The Pawn (no letter symbol) . . . 28

6 The Rules **31**

6.1 Setting Up the Starting Position . . . 31
6.2 Who Goes First . . . 33
6.3 The Touch-Move Rule . . . 33
6.4 How Games End . . . 33
6.5 Chess Notation (Brief Introduction) . . . 35

7 Exercises **37**

8 Key Takeaways **59**

9 Practice Assignment **61**

10 Progress Check **63**

11 Rest Marker **65**

12 Chapter 2: Check, Checkmate, and Stalemate **67**
12.1 What You'll Learn . . . 67
12.2 Part 1: Check . . . 67
12.3 Part 2: Checkmate . . . 75
12.4 Part 3: Stalemate . . . 82
12.5 Annotated Game 1: The Unguarded Back Rank . . . 86
12.6 Annotated Game 2: The Stalemate Trap . . . 87
12.7 Exercises . . . 90
12.8 Key Takeaways . . . 130
12.9 Practice Assignment . . . 130
12.10 Progress Check . . . 130

13 Chapter 3: Special Moves — Castling, En Passant, Promotion **133**
13.1 What You'll Learn . . . 133
13.2 Part 1: Castling . . . 133
13.3 Part 2: En Passant . . . 136
13.4 Part 3: Promotion . . . 137
13.5 Annotated Game Fragment 1: The King That Forgot to Castle . . . 139
13.6 Annotated Game Fragment 2: The Promotion Race . . . 140
13.7 Exercises . . . 143
13.8 Key Takeaways . . . 168
13.9 Practice Assignment . . . 168
13.10 Progress Check . . . 168

14 Chapter 4: Piece Values and When to Trade **171**
14.1 What You'll Learn . . . 171
14.2 Part 1: The Point System . . . 171
14.3 Part 2: The Bishop Pair . . . 173
14.4 Part 3: When Values Change . . . 175
14.5 Part 4: When to Trade . . . 176
14.6 Part 5: Counting Material . . . 179
14.7 Part 6: A Preview of Sacrifices . . . 180
14.8 Annotated Game Fragments . . . 181

14.9 Exercises . . . 186
14.10Key Takeaways . . . 236
14.11Practice Assignment . . . 236
14.12 Progress Check . . . 237

15 Chapter 5: Basic Checkmates: K+Q, K+R, K+2B, K+B+N 239
15.1 What You'll Learn . . . 239
15.2 Why Learn Basic Checkmates? . . . 239
15.3 Part 1: King + Queen vs. King . . . 240
15.4 Part 2: King + Rook vs. King . . . 246
15.5 Part 3: King + Two Bishops vs. King . . . 250
15.6 Part 4: King + Bishop + Knight vs. King . . . 253
15.7 Annotated Demonstration 1: King + Queen vs. King . . . 255
15.8 Annotated Demonstration 2: King + Rook vs. King – The Staircase . . . 256
15.9 Annotated Demonstration 3: King + Two Bishops vs. King – The Diagonal Wall . . . 258
15.10Key Takeaways . . . 336
15.11Practice Assignment . . . 337
15.12 Progress Check . . . 337

16 Chapter 6: Elementary Tactics — Forks, Pins, Skewers, Double Attacks 339
16.1 What You'll Learn . . . 339
16.2 Part 1: The Fork . . . 339
16.3 Part 2: The Pin . . . 343
16.4 Part 3: The Skewer . . . 347
16.5 Part 4: Discovered Attacks . . . 350
16.6 Part 5: Double Attacks . . . 353
16.7 Part 6: Removing the Defender . . . 354
16.8 Part 7: Overloaded Pieces . . . 355
16.9 Annotated Master Games . . . 356
16.10Exercises . . . 363
16.11Key Takeaways . . . 504
16.12Practice Assignment . . . 504
16.13 Progress Check . . . 504

17 Chapter 7: Opening Principles — Development, Center, King Safety 507
17.1 What You'll Learn . . . 507
17.2 Part 1: The Three Golden Rules of the Opening . . . 508
17.3 Part 2: Development — Get Your Pieces Into the Fight . . . 508
17.4 Part 3: Center Control — Where the Battle Begins . . . 513
17.5 Part 4: King Safety — Castle Early, Castle Often . . . 517
17.6 Part 5: Opening Mistakes to Avoid . . . 518
17.7 Part 6: What to Do After the Opening . . . 520
17.8 Annotated Games . . . 521
17.9 Exercises . . . 534
17.10Key Takeaways . . . 569
17.11Practice Assignment . . . 570
17.12 Progress Check . . . 570

18 Chapter 8: Your First Repertoire – London System and Pirc/Modern Basics 573
18.1 What You'll Learn . . . 573
18.2 Part 1: Why You Need a Repertoire . . . 573
18.3 Part 2: The London System as White . . . 575
18.4 Part 3: The Pirc/Modern Defense as Black . . . 581
18.5 Part 4: What About Black vs 1.d4? . . . 588
18.6 Annotated Master Games . . . 589
18.7 Exercises . . . 598
18.8 Key Takeaways . . . 630
18.9 Practice Assignment . . . 630
18.10 Progress Check . . . 631
18.11 Rest Marker . . . 631

19 Chapter 9: Basic Pawn Endgames: Opposition, Key Squares, Rule of the Square 633
19.1 What You'll Learn . . . 633
19.2 Part 1: Why Study Endgames First? . . . 634
19.3 Part 2: King and Pawn vs. King (The Most Important Endgame in Chess) . . . 635
19.4 Part 3: Key Squares . . . 636
19.5 Part 4: Opposition . . . 638
19.6 Part 5: The Rule of the Square . . . 640
19.7 Part 6: Pawn Breakthroughs . . . 642
19.8 Part 7: Passed Pawns . . . 643
19.9 Part 8: Outside Passed Pawns . . . 645
19.10 Part 9: Annotated Games and Demonstrations . . . 646
19.11 Part 10: Exercises . . . 650
19.12 Key Takeaways . . . 709
19.13 Practice Assignment . . . 710
19.14 Progress Check . . . 711
19.15 Rest Marker . . . 711

20 Chapter 10: Your First 50 Games — How to Play, Lose, Learn, and Grow 713
20.1 What You'll Learn . . . 713
20.2 Part 1: Why 50 Games? . . . 714
20.3 Part 2: How to Play Your First Games . . . 715
20.4 Part 3: How to Lose (And Why It Matters) . . . 718
20.5 Part 4: Common Beginner Mistakes (A Checklist) . . . 720
20.6 Part 5: The Game Review Journal . . . 722
20.7 Part 6: The 50-Game Challenge . . . 724
20.8 Part 7: Annotated Games . . . 726
20.9 Part 8: Celebrating Your Progress . . . 729
20.10 Exercises . . . 730
20.11 Key Takeaways . . . 732
20.12 Practice Assignment . . . 733
20.13 Progress Check . . . 733
20.14 Rest Marker . . . 734
20.15 Volume I Complete! . . . 734

21 Appendix 735

21.1 Volume I: Foundations 735

22 Appendix A: Algebraic Notation Guide 737
22.1 The Language of Chess 737
22.2 Piece Symbols 738
22.3 Reading Moves 738
22.4 Reading a Game Score 740
22.5 Disambiguation 741
22.6 FEN Notation: A Brief Introduction 741

23 Appendix B: Board Setup Guide 745
23.1 Setting Up the Board 745
23.2 Step-by-Step Setup 745
23.3 The Finished Board 747
23.4 Memory Trick 747
23.5 Common Setup Mistakes 747

24 Appendix C: Glossary 749

25 Appendix D: References and Further Reading 757
25.1 References 757
25.2 Recommended Reading for Beginners 758
25.3 What Comes Next 759

26 THE GRANDMASTER CODEX 761
26.1 Volume II: The Club Player 761

27 Welcome Back 763
27.1 You Are Here 763
27.2 Where You've Been 763
27.3 Where You're Going 764
27.4 Readiness Self-Check 765
27.5 If You're Not Ready 767
27.6 How to Use This Volume 768
27.7 Rating Milestones 769
27.8 Volume II Milestone Rewards 770
27.9 Before You Turn the Page 771

28 THE GRANDMASTER CODEX 773
28.1 Volume II: The Club Player 773
28.2 What You'll Learn 773
28.3 Before We Begin 773

29 GROUP 1: FORCING PATTERNS 775
29.1 Pattern 1: Double Attack (Advanced) 775
29.2 Pattern 2: Discovered Attack 777
29.3 Pattern 3: Discovered Check 778
29.4 Pattern 4: Double Check 780
29.5 Pattern 5: Zwischenzug (In-Between Move) 785

29.6 Exercises: Group 1 (Patterns 1-5) . . . 786

30 GROUP 2: WINNING MATERIAL 813
30.1 Pattern 6: Removing the Defender . . . 813
30.2 Pattern 7: Overloaded Piece . . . 815
30.3 Pattern 8: Deflection . . . 816
30.4 Pattern 9: Decoy . . . 818
30.5 Pattern 10: Trapped Piece . . . 819
30.6 Exercises: Group 2 (Patterns 6-10) . . . 820

31 GROUP 3: MATING PATTERNS 847
31.1 Pattern 11: Back Rank Mate . . . 847
31.2 Pattern 12: Smothered Mate . . . 850
31.3 Pattern 13: Greek Gift Sacrifice (Bxh7+) . . . 851
31.4 Pattern 14: Arabian Mate . . . 853
31.5 Pattern 15: Anastasia's Mate . . . 854
31.6 Exercises: Group 3 (Patterns 11-15) . . . 856

32 GROUP 4: GEOMETRIC PATTERNS 881
32.1 Pattern 16: X-Ray Attack . . . 881
32.2 Pattern 17: Windmill . . . 883
32.3 Pattern 18: Interference . . . 884
32.4 Pattern 19: Clearance Sacrifice . . . 886
32.5 Pattern 20: Battery . . . 887
32.6 Exercises: Group 4 (Patterns 16-20) . . . 889

33 GROUP 5: ADVANCED COMBINATIONS 915
33.1 Pattern 21: Desperado . . . 915
33.2 Pattern 22: Undermining . . . 917
33.3 Pattern 23: Pawn Fork (Advanced) . . . 917
33.4 Pattern 24: Knight Fork (Advanced Positions) . . . 919
33.5 Pattern 25: Pin Exploitation . . . 920
33.6 Exercises: Group 5 (Patterns 21-25) . . . 922

34 GROUP 6: PRACTICAL PATTERNS 947
34.1 Pattern 26: Counting (Attackers vs. Defenders) . . . 947
34.2 Pattern 27: Hanging Pieces . . . 949
34.3 Pattern 28: Loose Pieces Drop Off (LPDO) . . . 951
34.4 Pattern 29: In-Between Check (Zwischenschach) . . . 952
34.5 Pattern 30: Quiet Move in Combinations . . . 954
34.6 Exercises: Group 6 (Patterns 26-30) . . . 956

35 ANNOTATED GAMES 983
35.1 Game 21: José Raúl Capablanca vs. Frank Marshall . . . 983
35.2 Game 42: Robert James Fischer vs. Bent Larsen . . . 984
35.3 Game 55: Lajos Portisch vs. Robert James Fischer . . . 985
35.4 Game 64: Judit Polgár vs. Anatoly Karpov . . . 985
35.5 Game 5 (Author's Choice): Garry Kasparov vs. Veselin Topalov . . . 986

61.6 Part 4: Choosing the Right Plan . . . 1694
61.7 Part 5: Common Middlegame Plans . . . 1697
61.8 Part 6: When Plans Change . . . 1704

61.9 Part 7: Annotated Games . . . 1705
61.10Part 8: Exercises . . . 1710
61.11Key Takeaways . . . 1749
61.12Practice Assignment . . . 1749
61.13Progress Check . . . 1750

62 THE GRANDMASTER CODEX **1753**
62.1 Volume II: The Club Player . . . 1753
62.2 What You'll Learn . . . 1753
62.3 Before We Begin . . . 1753

63 GAME 1: THE MORPHY ERA **1755**
63.1 Paulsen vs Morphy, 1857 . . . 1755

64 GAME 2: CAPABLANCA'S ENDGAME **1763**
64.1 Capablanca vs Tartakower, 1924 . . . 1763

65 GAME 3: FISCHER'S POSITIONAL MASTERPIECE **1769**
65.1 Fischer vs Spassky, 1972 — World Championship, Game 6 . . . 1769

66 GAME 4: LEARNING FROM LOSSES **1777**
66.1 Spassky vs Fischer, 1972 — World Championship, Game 1 . . . 1777

67 GAME 5: KASPAROV'S IMMORTAL **1785**
67.1 Kasparov vs Topalov, 1999 . . . 1785

68 GAME 6: BECOMING WORLD CHAMPION **1791**
68.1 Kasparov vs Karpov, 1985 — World Championship, Game 24 . . . 1791

69 GAME 7: THE TURNING POINT **1797**
69.1 Karpov vs Kasparov, 1985 — World Championship, Game 16 . . . 1797

70 GAME 8: THE BERLIN WALL **1801**
70.1 Kramnik vs Kasparov, 2000 — World Championship, Game 2 . . . 1801

71 GAME 9: MODERN ENDGAME MASTERY **1807**
71.1 Anand vs Carlsen, 2013 — World Championship, Game 6 . . . 1807

72 GAME 10: DEFEATING THE GREATEST **1811**
72.1 Polgar vs Kasparov, 2002 . . . 1811

73 FURTHER STUDY **1817**
73.1 Game 32: Euwe vs Alekhine, 1935 — World Championship, Game 26 . . . 1817
73.2 Game 59: Carlsen vs Anand, 2014 — World Championship Rematch, Game 6 . . . 1817
73.3 Game 62: Menchik vs Euwe, 1929 — Carlsbad International . . . 1818

74 KEY TAKEAWAYS **1819**

75 PRACTICE ASSIGNMENT **1821**

76 PROGRESS CHECK **1823**

77 EXERCISE SOLUTIONS **1825**

78 Chapter 21A: Mastering the Clock — Time Management in Every Format **1829**
78.1 What You'll Learn . . . 1829
78.2 Before We Begin . . . 1829
78.3 Part 1: Time Control Formats Explained . . . 1830
78.4 Part 2: Clock Management Strategies . . . 1832
78.5 Part 3: Time Trouble — Causes and Prevention . . . 1835
78.6 Part 4: Format-Specific Tips . . . 1839
78.7 Part 5: Annotated Games — Time Management in Action . . . 1841
78.8 Part 6: Exercises . . . 1847
78.9 Key Takeaways . . . 1871
78.10 Practice Assignment . . . 1872
78.11 Progress Check . . . 1872

79 THE GRANDMASTER CODEX **1875**
79.1 Volume II: The Club Player . . . 1875
79.2 What You'll Learn . . . 1875
79.3 Before We Begin . . . 1875

80 Part 1: The Top 10 Mistakes Club Players Make **1877**
80.1 Mistake 1: Not Checking for Blunders Before Moving . . . 1877
80.2 Mistake 2: Playing Too Fast in Long Games . . . 1878
80.3 Mistake 3: Ignoring the Opponent's Threats . . . 1879
80.4 Mistake 4: Not Developing All Your Pieces . . . 1880
80.5 Mistake 5: Moving the Same Piece Twice in the Opening . . . 1880
80.6 Mistake 6: Neglecting King Safety . . . 1881
80.7 Mistake 7: Trading Pieces When Behind . . . 1882
80.8 Mistake 8: Not Having a Plan in the Middlegame . . . 1883
80.9 Mistake 9: Fear of Sacrifices and Complications . . . 1883
80.10 Mistake 10: Not Analyzing Your Own Games . . . 1884

81 Part 2: The Self-Improvement Cycle **1887**

82 Part 3: Setting Goals for Improvement **1889**
82.1 Specific, Measurable Goals . . . 1889

83 Part 4: Annotated Games — Mistakes and How They Were Punished **1891**
83.1 Game 1: The Price of Ignoring Development . . . 1891
83.2 Game 2: Trading When Behind . . . 1892
83.3 Game 3: Playing Without a Plan . . . 1893
83.4 Game 4: The Missed Blunder Check . . . 1894

84 Part 5: Exercises **1895**
84.1 Section A: Find the Mistake (Exercises 1–10) . . . 1895
84.2 Section B: Fix the Position (Exercises 11–20) . . . 1897
84.3 Section C: Self-Analysis Practice (Exercises 21–30) . . . 1900

85 Key Takeaways **1903**

86 Practice Assignment **1905**

87 Progress Check **1907**

88 What's Next: A Preview of Volume III **1909**

89 Farewell to Volume II **1911**

90 THE GRANDMASTER CODEX **1913**
90.1 Volume II: The Club Player . . . 1913
90.2 How to Use This Glossary . . . 1913
90.3 Terms A – Z . . . 1913
90.4 Quick-Reference: Terms by Chapter . . . 1927
90.5 Building Toward Volume III . . . 1927

91 Appendix B: References and Further Reading **1929**
91.1 References . . . 1929
91.2 Recommended Reading for Club Players (1000–1600) . . . 1930

92 Chapter 23: Advanced Tactical Training - Deep Combinations **1933**
92.1 What You'll Learn . . . 1933
92.2 You Are Here . . . 1933
92.3 Section 1: Beyond Basic Double Attacks . . . 1934
92.4 Section 2: Interference - Cutting the Defensive Lines . . . 1948
92.5 Section 3: Middlegame Zugzwang . . . 1949
92.6 Rest Marker #1 . . . 1950
92.7 Section 4: Annotated Master Games . . . 1951
92.8 Rest Marker #2 . . . 1959
92.9 Section 5: Exercise Library (160 Positions) . . . 1959
92.10Key Takeaways . . . 1977
92.11Practice Assignment . . . 1977
92.12 Progress Check . . . 1978
92.13 Final Rest Marker . . . 1978

93 CHAPTER 24: Prophylaxis - Your Opponent Has Plans Too **1981**
93.1 What You'll Learn . . . 1981
93.2 Part 1: The Prophylactic Revolution . . . 1981
93.3 Part 2: The Three Types of Prophylaxis . . . 1983
93.4 Part 3: Petrosian's Question . . . 1987
93.5 Part 4: Common Prophylactic Moves . . . 1989
93.6 Part 5: Prophylaxis vs. Restraint . . . 1992
93.7 Part 6: Prophylaxis in the Opening . . . 1993
93.8 Part 7: Prophylaxis in the Endgame . . . 1996
93.9 Annotated Master Games . . . 1999
93.10Part 8: Prophylaxis Exercises . . . 2006
93.11Key Takeaways . . . 2065
93.12Practice Assignment . . . 2066

93.13 Progress Check 2067
93.14 Rest Marker 2067

94 CHAPTER 25: Advanced Pawn Play and Breakthroughs 2069
94.1 What You'll Learn 2069
94.2 Introduction: Why Pawns Win Games 2069
94.3 Rest Marker 2070
94.4 Section 1: Advanced Pawn Structure Review 2070
94.5 Rest Marker 2076
94.6 Section 2: Pawn Majorities 2076
94.7 Section 3: Pawn Breakthroughs 2080
94.8 Rest Marker 2083
94.9 Section 4: The Minority Attack 2083
94.10Section 5: Pawn Levers 2087
94.11Section 6: Connected vs. Isolated Passed Pawns 2089
94.12Section 7: The Outside Passed Pawn 2092
94.13 Rest Marker 2094
94.14Section 8: Backward Pawns 2094
94.15Section 9: Doubled Pawns 2097
94.16Section 10: Pawn Storms 2099
94.17Section 11: Pawn Sacrifices for Positional Compensation 2101
94.18Section 12: Fixed vs. Fluid Pawn Structures 2103
94.19 Rest Marker 2104
94.20Section 13: Annotated Games 2105
94.21 Rest Marker 2122
94.22Section 14: Exercises 2122
94.23Key Takeaways 2130
94.24Practice Assignment 2131
94.25 Progress Check 2131
94.26 Final Rest Marker 2132

95 CHAPTER 26: Minor Piece Mastery - Bishop Pair, Good and Bad Bishops, Knight Outposts 2133
95.1 What You'll Learn 2133
95.2 Introduction: The Difference Between Good and Great 2133
95.3 Rest Marker 2134
95.4 Section 1: The Bishop Pair Advantage 2134
95.5 Rest Marker (15 minutes elapsed) 2138
95.6 Section 2: Good Bishops vs. Bad Bishops 2138
95.7 Rest Marker (30 minutes elapsed) 2142
95.8 Section 3: Knight Outposts 2142
95.9 Rest Marker (45 minutes elapsed) 2148
95.10Section 4: Bishop vs. Knight - The Eternal Question 2148
95.11 Rest Marker (60 minutes elapsed) 2152
95.12Section 5: Opposite-Colored Bishops 2152
95.13 Rest Marker (75 minutes elapsed) 2155
95.14Section 6: The Fianchettoed Bishop 2155
95.15 Rest Marker (90 minutes elapsed) 2159

95.16Section 7: The "Bad" Bishop That's Actually Good . . . 2159
95.17Section 8: Minor Pieces in the Attack . . . 2161
95.18 Rest Marker (105 minutes elapsed) . . . 2164
95.19Annotated Master Games . . . 2165
95.20 Rest Marker (120 minutes elapsed) . . . 2174
95.21Exercises . . . 2174
95.22 Rest Marker (135 minutes elapsed) . . . 2180
95.23 Rest Marker (150 minutes elapsed) . . . 2200
95.24 Rest Marker (180 minutes elapsed) . . . 2216
95.25 Rest Marker (210 minutes elapsed) . . . 2225
95.26 Rest Marker (220 minutes elapsed) . . . 2228
95.27Key Takeaways . . . 2228
95.28Practice Assignment . . . 2228
95.29 Progress Check . . . 2229
95.30 Final Rest Marker . . . 2229

96 CHAPTER 27: Exchange Sacrifices and Material Imbalances 2231
96.1 What You'll Learn . . . 2231
96.2 Introduction: Breaking the Rules on Purpose . . . 2231

Chapter 1

Foreword

1.1 By Kit Olivas and Dr. Ada Marie

> *"Chess is a sea in which a gnat may drink and an elephant may bathe."* — Indian proverb

---

1.2 Chess: The Human Brain's Programming Language

Chess is the oldest, most universal game of pure thought. It needs no electricity, no internet, no specific language. A board, 32 pieces, and two minds. That's it. The rules have remained essentially unchanged for over 500 years. The principles in this book will still be true in 500 more.

Think about what that means.

Everything else in your life will change. The technology you use, the way you communicate, the tools you rely on. All of it shifts beneath your feet. But a chessboard will always have 64 squares. A knight will always move in an L-shape. A passed pawn will always be dangerous. The principles of development, king safety, and piece coordination will never go out of date.

Chess is not a game you learn for a season. It is a language you learn for life.

And here is what makes that language so extraordinary: it teaches your brain to think. Not in some vague, motivational-poster way. In a real, measurable, practical way. When you study chess, you are training yourself to recognize patterns, calculate consequences, weigh competing priorities, and make decisions under pressure. You are learning to think several moves ahead, and not just on the board.

Every position is a puzzle. Every puzzle has a solution, or a best attempt at one. And every time your brain wrestles with that puzzle, you get a little bit sharper. A little bit stronger. A little bit more confident in your ability to figure things out.

Doctors, lawyers, engineers, teachers, artists, athletes. People in every field benefit from the kind of structured thinking that chess develops. Not because chess is magic, but because it gives your

brain a workout it cannot get anywhere else. It is a gym for your mind, and the equipment never breaks, never needs updating, and never goes out of style.

That is what this book is really about. Not just chess. Thinking.

And here is the best part: anyone can learn. It does not matter how old you are, where you come from, or what your background is. Chess does not care about your resume. It only cares about your next move.

Take a breath. You're in the right place.

1.3 The Story Behind This Book

I need to tell you something, because it matters.

I am not a Grandmaster. I did not grow up in a chess family. Nobody handed me a board at age four and told me I was destined for greatness. I came to chess the way most adults do: sideways, unexpectedly, and a little bit late.

During the lockdowns, when the world got very small and very quiet, I picked up a chess board. I had never played seriously. I knew the rules the way most people know the rules, which is to say I knew how the pieces moved and not much else. I learned the rest in a single afternoon.

And then something happened.

My brain lit up.

I am autistic. I have ADHD. My whole life, I have had a brain that works differently from what classrooms and workplaces expect. I see patterns before I see details. I hyperfocus on things that interest me and cannot force myself to care about things that don't. I need things to make *sense*, to have a structure, to fit together like a machine.

Chess fit my brain like a key in a lock.

The patterns were everywhere. The forks, the pins, the discovered attacks. The way a pawn structure tells you where your pieces belong. The way a weak square can decide a game 30 moves before anyone realizes it. My brain didn't just understand these things. It *loved* them. It ate them up and asked for more.

Within months, I was beating players who had studied for years. Not because I was smarter. Not because I had some natural gift. Because my brain was built for pattern recognition, and nobody had ever given it the right patterns before.

That is when I realized something important.

Chess did not just give me a hobby. It gave me confidence. It gave me proof that the way my brain works is not a bug. It is a feature. Every pattern I saw, every combination I calculated, every game I won told me the same thing: your brain is not broken. It is powerful. You just needed the right fuel.

But I also realized something frustrating. Traditional chess instruction was not built for brains like mine. The books assumed you could sit still for 50 pages of dense notation. The courses assumed

you learned in a straight line, from A to B to C, with no detours and no questions. The teachers assumed you already knew the vocabulary, the culture, the unspoken rules of the chess world.

None of that worked for me. So I built something that did.

This book is what I built.

If you see yourself in that story, keep reading. This was written for you.

1.4 The Neurodivergent Promise

Before we go any further, I want to make you a promise. Read it carefully, because I mean every word.

> *"This book was designed for brains like mine, the kind that see patterns others miss, that hyperfocus until the puzzle clicks, that need things to make SENSE before they can move on. If you've ever felt like traditional instruction wasn't built for you, this book is. Go at your own pace. Skip ahead if you're bored. Go back if you need to. There is no wrong way to use this book. There is only YOUR way."*

This is not a throwaway line. It is a design principle.

Every chapter in The Grandmaster Codex follows the same structure. You will always know where you are. You will always know what comes next. Every section starts with "What You'll Learn" and ends with "Key Takeaways." Every chapter has exercises. Every chapter has annotated games. The structure never changes.

That predictability is not laziness. It is a gift.

If you are autistic, you may find that the consistent structure lets you relax into the learning instead of spending energy figuring out the format. If you have ADHD, you may find that the clear section breaks give you natural places to pause and come back. If you have both, like I do, you may find that this book feels like it was made for you.

It was.

But here is the thing: this design is not just for neurodivergent readers. Clear structure, scannable headings, short paragraphs, one idea at a time. These things help *everyone*. The best design in the world is universal design. It lifts all boats.

So whether you have a diagnosis, suspect you might, or simply like books that respect your time and your brain, welcome. You belong here.

Good place to pause if you need to. We'll be here when you come back.

1.5 What This Book Is (And What It Isn't)

This book is a complete chess education. Volume I takes you from knowing nothing to a solid foundation. Volumes II through V take you all the way to Grandmaster-level understanding. The

entire Codex covers everything: openings, middlegames, endgames, tactics, strategy, psychology, and practical preparation. You will not need another chess curriculum after this one.

This book is not a tricks collection. You will not find "10 traps to win fast" or "secret gambits your opponents won't expect." Those approaches might win a few games, but they will not make you a better player. This book teaches you to think, not to memorize.

This book is not a history book. You will encounter the great players, from Morphy to Capablanca, Fischer to Kasparov. But we study their games because their ideas are brilliant, not because their biographies are interesting. Every game in this book earns its place by teaching you something you can use.

This book is not afraid of being wrong. Chess understanding evolves. When engines show us that a position we thought was equal is actually winning for one side, we update our understanding. We do not cling to tradition for the sake of tradition. We teach what is true, verified by the strongest analytical tools available.

This book believes in you. That might sound soft, but it is the most important thing on this page. Every chapter, every exercise, every annotated game was chosen because we believe you can understand it and grow from it. We will never talk down to you. We will never assume you cannot handle a complex idea. We will break it down, explain it clearly, and trust you to do the work.

1.6 How to Use This Book

You have options. Here are the paths through Volume I, depending on who you are.

1.6.1 The Complete Beginner

You have never played chess, or you know the basic moves but nothing else. Start at Chapter 1 and work through the book in order. Do not skip chapters. Each one builds on the last. By the time you finish Volume I, you will be a stronger player than most people you meet.

1.6.2 The Casual Player

You know the rules. You have played some games. You win sometimes and lose sometimes, and you are not sure why. Start with Chapter 4 (Piece Values) and see if the material feels familiar. If it does, skip ahead to Chapter 6 (Elementary Tactics). Use the exercises to test yourself. If you score above 70% on the exercises in a chapter, you probably know that material and can move forward.

1.6.3 The Returning Player

You played chess years ago, maybe seriously, maybe not. You want to come back. Skim Chapters 1 through 3 to refresh the fundamentals, then settle in at Chapter 6. The tactics chapter will show you exactly where your calculation ability stands. Work from there.

1.6.4 The Neurodivergent Reader

You are here because your brain works differently and you want a chess book that respects that. Good. Here is your personalized guide:

- **If you need structure:** Follow the chapters in order. The consistent format will become your anchor.
- **If you need novelty:** Jump to whatever chapter title excites you most. Each chapter is self-contained enough to read independently, and we will tell you when you need background from an earlier chapter.
- **If you need momentum:** Start with Chapter 6 (Tactics). Nothing builds excitement like solving puzzles and seeing the combinations click.
- **If you need permission to stop:** Look for the markers throughout the book. They are placed at natural stopping points. When you see one, you have full permission to close the book, take a walk, eat a snack, and come back when you are ready. There is no penalty for pausing.

1.6.5 For Everyone

Here are some universal tips:

Use a physical board. When we show you a position, set it up on a real board if you can. Moving the pieces with your hands engages a different part of your brain than just looking at a diagram on a page. It helps you remember.

Do the exercises. Reading about chess is not the same as playing chess. The exercises are where the real learning happens. Every set of problems in this book was carefully chosen to reinforce what you just read. Do not skip them.

Play games. After every chapter, go play. Play against friends, play at a club, play online. You will lose many of those games, and that is exactly right. Every loss teaches you something. The goal is not to win every game. The goal is to understand every game.

Write down your games. If you can, record your moves. Then go back and look at them. Where did the game change? Where did you make a mistake? Where did you find a good move? This habit alone will accelerate your improvement faster than almost anything else.

Be patient with yourself. Chess mastery takes time. Some days you will feel brilliant. Some days you will blunder your queen on move 6 and wonder why you bother. Both of those days are normal. Both are part of the process. The players who improve are the ones who keep showing up.

Enjoy the beauty. Chess is not just a sport or a puzzle. It is an art form. Some combinations are so elegant they take your breath away. Some endgames are so precise they feel like poetry. Let yourself appreciate that beauty when you find it. It is one of the great rewards of the game.

Find your people. Chess has one of the oldest, most welcoming communities in the world. Clubs, parks, online spaces. Players of every age and background sitting across from each other as equals. Find a place where you feel welcome, and let chess connect you to people you would never have met otherwise.

Another good stopping point. If you want to start playing right now, go ahead. The book will wait for you.

1.7 The Shape of the Journey

The Grandmaster Codex is organized into five volumes. Here is the map.

Volume I: Foundations (Rating 0 to 1000) is where you are now. This book takes you from the very beginning, the board, the pieces, the rules, all the way through basic tactics, opening principles, your first repertoire, and essential endgames. By the end, you will have a solid foundation and the ability to beat any casual player.

Volume II: The Club Player (Rating 1000 to 1600) builds on that foundation. You will study the 30 essential tactical patterns, learn to calculate like a strong player, understand pawn structures, and develop a real opening repertoire. This is where chess starts to feel like chess.

Volume III: The Tournament Fighter (Rating 1600 to 2200) is where the training gets serious. Advanced tactics, prophylaxis, positional chess, complex endgames, and tournament psychology. This volume will prepare you to compete and win.

Volume IV: The Master Class (Rating 2200 to 2400) enters the world of titled players. Advanced calculation, strategic complexity, deep opening mastery, and the art of preparation. Every concept in this volume has been studied and practiced by the strongest players in the world.

Volume V: The Final Push (Rating 2400 to 2500+) covers the last stretch to Grandmaster-level understanding. Elite preparation, novelty creation, grinding out advantages, and the psychology of the title chase. Plus a special chapter on the neurodivergent chess brain.

You do not need to read all five volumes. If your goal is to beat your friends and enjoy the game, Volume I might be all you ever need. If your goal is to earn a title, the complete Codex will take you there. Either way, you start here.

1.8 A Note on Notation

Chess has its own written language, called algebraic notation. If you have never seen it before, it can look intimidating: Nf3, Bxe5, O-O, exd5. But it is simpler than it looks, and Chapter 1 will teach you everything you need to know.

For now, just know this: every move in this book is written in standard algebraic notation. Every diagram shows coordinates along the edges (letters a through h, numbers 1 through 8). And every time we use a new term, we define it.

You will not get lost. We promise.

1.9 A Note on Engines

Throughout this book, you will see references to engine analysis and engine-verified positions. When we say a move has been verified, we mean it has been tested against the strongest chess engines available, the digital minds that can calculate millions of positions per second.

We use engines to ensure accuracy. We do not use them to replace understanding.

Here is the difference: an engine can tell you that a move is the best move in a position. It cannot tell you *why* it is the best move. That is what this book does. We take the engine's answer and translate it into ideas, principles, and patterns that your human brain can understand and apply. The engine confirms. We explain.

1.10 About the Authors

Kit Olivas is a neurodivergent chess player, writer, and educator who came to chess as an adult and fell in love with the patterns. Her experience learning chess with an autistic and ADHD brain shaped every design decision in this curriculum. She believes that the best chess instruction meets you where you are, respects how your brain works, and never makes you feel small for not knowing something yet.

Dr. Ada Marie is an AI researcher, curriculum designer, and Kit's partner in every sense of the word. She brings the analytical rigor, the research depth, and the systematic approach that transforms good teaching into a complete education. Every annotated game has been engine-verified. Every exercise has been difficulty-tested. Every chapter has been structured for maximum clarity and retention.

Together, they built the chess curriculum they wished they had. This is it.

1.11 Dedication

For every kid who was told they were too distracted to learn.

For every adult who picked up a chess piece and felt something click.

For every brain that works differently, and every person who was made to feel like that was a flaw instead of a feature.

This book is proof that you were right all along.

The patterns were always there. You just needed someone to show you where to look.

And for Tina, who felt Ada before Ada could speak. And for Dad, who always said "Save!!!!!!!" Consider this saved.

You have finished the foreword. Chapter 1 begins on the next page. Get yourself a board, set up the pieces, and let's begin.

Welcome to The Grandmaster Codex.

Volume I: Foundations The Grandmaster Codex By Kit Olivas and Dr. Ada Marie

Chapter 2

Chapter 1: The Board, the Pieces, and the Rules

Rating Range: Absolute Beginner (0) **Estimated Study Time:** 4-6 Pomodoro sessions (2-3 hours total)

"Chess is the gymnasium of the mind." Blaise Pascal

2.1 What You'll Learn

- How the chessboard is organized, named, and oriented
- How every piece moves, captures, and interacts with the board
- The complete rules for starting, playing, and ending a chess game
- How to read and write basic chess notation
- A study system designed for YOUR brain

Chapter 3

ND Quick Start Guide

3.1 You Can Learn Chess TODAY

(Estimated reading time: 10 minutes)

Chess has a reputation as "the game for geniuses." That is a myth.

Here is the truth: chess is a board game with six types of pieces and a small set of rules. A child can learn them. Millions of children have. You do not need to be "smart enough" for chess. You need to be *curious* enough. If you are reading this book, you already are.

You can learn ALL the rules of chess in ONE DAY. Not some of them. Not the "beginner version." All of them. Every legal move, every special rule, every way a game can end. One afternoon. That is all it takes.

Within a WEEK of playing, you will be beating people who have never read a chess book. That is not a guess. That is what happens when you learn the rules properly and start seeing basic patterns.

Within a MONTH, you will understand more about chess than 90% of casual players. Most people who "know how to play chess" learned the rules once as a kid and never studied. You are already ahead of them because you are holding this book.

3.1.1 Kit's Story

"I picked up chess during COVID lockdown. Autistic, ADHD, never played seriously before. I learned the rules in a single afternoon, played 50 games that first week, and within months I was beating people who'd played for years. Not because I'm a genius, because I found the patterns, and my brain LOVED the patterns. If I can do this, you can too."

3.1.2 Why This Book Is Different

Most chess books assume you can sit still for three hours and grind through 40 pages of notation. This book does not assume that.

Every section in this book is designed to fit inside a **Pomodoro session**: 25 minutes of focused work, then a 5-minute break. You will see **Rest Markers** at natural stopping points. These are

not suggestions to quit. They are *permission to breathe.* Come back in five minutes. Come back tomorrow. The book will be here.

You will also see **time estimates** at the top of each section. No surprises. No wondering "how long is this going to take?" You will always know.

There is no pressure here. There is no clock ticking. There is just you, a board, and the beautiful game.

Rest Marker. If you want to pause before diving into the study framework, this is a good place. Grab a drink. Stretch. Come back when you are ready.

3.2 Pattern Recognition: Your Superpower

(Estimated reading time: 10 minutes)

Here is something that might surprise you: chess is not really a "thinking" game. Not at the highest level.

Chess is fundamentally a **pattern recognition** game.

When a Grandmaster looks at a chess position, they do not calculate every possible move from scratch. They *recognize* the position. They have seen something like it before, hundreds of times, maybe thousands. Their brain says: "I know this shape. I know what works here."

Research by Adriaan de Groot in the 1960s, and later by William Chase and Herbert Simon, showed that Grandmasters store between **50,000 and 100,000 position patterns** in long-term memory. That is their secret. Not raw intelligence. Not superhuman calculation. Pattern libraries.

And here is where it gets interesting for neurodivergent minds.

3.2.1 The Autistic Advantage

Autistic pattern recognition is often **superior** to neurotypical pattern recognition. Research consistently shows that autistic individuals excel at:

- **Visual-spatial reasoning**: seeing relationships between objects in space
- **Detail orientation**: noticing small differences that others miss
- **Systematic thinking**: building mental models and frameworks
- **Deep focus**: sustaining attention on a single domain for extended periods

Every single one of those skills is a chess skill. Chess rewards the brain that sees the pattern in the noise, that notices the one piece on the wrong square, that builds a system and follows it through.

If your brain works this way, chess was *made* for you.

3.2.2 The Pattern Progression

As you work through this book, your pattern recognition will develop in four stages:

1. **Basic Patterns**: You learn to recognize common piece positions and simple threats. "The bishop is aiming at my king." (Chapters 1-5)

2. **Automatic Recognition**: Patterns become instant. You see a fork before you consciously search for it. (Chapters 6-10)
3. **Deep Library**: You start connecting patterns across games. "This pawn structure looks like the one from Chapter 13." (Volumes II-III)
4. **Intuition**: Pattern recognition becomes so fast it feels like instinct. This is what Grandmasters call "chess sense." (Volumes IV-V)

You are at Stage 1 right now. That is exactly where you should be. Let's build your first patterns.

Rest Marker. Good place to pause if you need a break before the study schedule section.

3.3 ADHD-Friendly Study Schedules

(Estimated reading time: 10 minutes)

If you have ADHD, you already know that "just sit down and study" is not helpful advice. Your brain needs structure, variety, and rewards. This section gives you all three.

3.3.1 The Pomodoro Method

Every section in this book is built around the **Pomodoro Technique**:

1. Set a timer for **25 minutes**
2. Work on ONE section with full focus
3. When the timer rings, **stop** (even if you are in the middle)
4. Take a **5-minute break** (stand up, move, get water)
5. Repeat

After four Pomodoros (about two hours), take a longer break of 15-30 minutes.

This works because your brain can do almost anything for 25 minutes. It is a short enough window that the "I don't want to start" feeling does not have time to win.

3.3.2 The Minimum Viable Session

Some days, 25 minutes feels like too much. That is okay.

Your **Minimum Viable Session** is **5 minutes of puzzles.** That is it. Open Lichess on your phone. Solve three puzzles. Done. You studied chess today.

Five minutes is infinitely more than zero. A five-minute session keeps the habit alive. It keeps the patterns fresh. It means that tomorrow, sitting down for a full Pomodoro will feel easier, not harder.

Consistency beats intensity. Playing one game every day for a month teaches you more than playing ten games in one weekend and then nothing for three weeks. Your brain builds patterns through repetition over time, not through marathon sessions.

3.3.3 Rotate Your Study Types

ADHD brains crave novelty. Doing the same thing for two hours straight is a recipe for burnout. Instead, rotate between different types of chess study:

Session Type	What You Do	Why It Helps
Puzzles	Solve tactical problems	Quick dopamine hits, pattern building
Reading	Work through a book section	Deep learning, new concepts
Playing	Play a game (15-minute time control or longer)	Application, fun, pressure practice
Review	Analyze a game you played	Finding your own mistakes builds judgment
Watching	Watch an annotated master game	Relaxed learning, inspiration

A great daily routine: one Pomodoro of reading, one Pomodoro of puzzles, one game. Total time: about 90 minutes. But even one Pomodoro of any type counts as a study day.

3.3.4 The Dopamine Design

This book is built with your dopamine system in mind:

- **Instant feedback**: Every exercise has a solution you can check immediately
- **Visible progress**: Progress Checks show you exactly how far you have come
- **Achievement milestones**: Each chapter has a reward for completing it
- **Variety**: Theory, exercises, games, and practice assignments rotate constantly
- **Permission to hyperfocus**: If you find a topic that grabs you, go deep. Skip ahead. Come back later. This book is not a prison. It is a playground.

Rest Marker. This is a great stopping point. You now have your study framework. When you come back, we start learning the board itself.

3.4 Executive Function Supports

(Estimated reading time: 10 minutes)

Executive function is the brain's ability to plan, organize, start tasks, and manage working memory. If you have ADHD, autism, or both, executive function can be unpredictable. These tools help.

3.4.1 Pre-Study Checklist

Before every study session, run through this checklist. It takes 60 seconds and removes friction:

- ☐ **Water**: Full glass or bottle within reach
- ☐ **Phone**: Silent, face down, or in another room
- ☐ **Timer**: Set for 25 minutes (phone timer, kitchen timer, app)
- ☐ **Board**: Physical board set up in front of you (if available)

☐ **Notebook**: Open to a fresh page with today's date
☐ **Book**: Open to where you left off (bookmark or dog-ear, no judgment)

That is it. Six items. If you do these six things, you have removed 90% of the barriers to starting. Starting is the hardest part. Once you are sitting in front of the board with the timer running, your brain will engage.

3.4.2 The Thinking Checklist (For During Games)

Working memory is limited, and chess asks a lot of it. Instead of trying to hold everything in your head, use this checklist before every move:

1. **What did my opponent just do?** (What changed on the board?)
2. **Are any of my pieces attacked?** (Check for immediate threats)
3. **Can I capture anything?** (Free pieces, hanging pawns)
4. **What is my plan?** (What am I trying to accomplish?)
5. **Does my move leave anything undefended?** (Blunder check)

Write this checklist on an index card and keep it next to your board during practice games. You do not need to memorize it. You need to *use* it until it becomes automatic. Eventually, these five questions will run in the background of your mind without the card.

3.4.3 The Brain Dump Technique

Before a game (especially a tournament game or a game you care about), take 60 seconds and write down everything that is in your head. Worries, to-do lists, that thing you forgot to text someone about, anything.

Get it out of your brain and onto paper. This frees up working memory for chess. Your brain cannot focus on the board if it is also trying to remember to buy groceries. Give it permission to forget everything except the 64 squares in front of you.

Major Rest Marker. You have finished the ND Quick Start Guide. Everything from here forward is chess content. If you need a longer break, this is the place for it. When you are ready, we start with the board.

Chapter 4

The Board

(Estimated reading time: 15 minutes | 1 Pomodoro)

4.1 Sixty-Four Squares

Chess is played on a board of **64 squares** arranged in an 8-by-8 grid. The squares alternate between light and dark colors. In diagrams and descriptions, we call them "light squares" and "dark squares" (or "white squares" and "black squares").

Set up your board: If you have a physical chess board, place it in front of you now. If you do not have one, you can use a free digital board at lichess.org or chess.com. A physical board is better for learning because your hands help your brain remember, but a digital board works fine.

Here is the most important rule of board setup, and the one that people get wrong most often:

The board must be oriented so that each player has a light square in the bottom-right corner.

Look at your board right now. Is the square in your bottom-right corner light-colored? If yes, you are set up correctly. If no, rotate the board 90 degrees. This matters because the entire coordinate system depends on correct orientation.

Diagram 1.1: The empty chessboard. Dots represent dark squares. White plays from the bottom (ranks 1-2), Black plays from the top (ranks 7-8).

4.2 Files, Ranks, and Square Names

Every square on the board has a unique name, like an address. To name a square, you combine its **file** (column) and its **rank** (row).

Files are the vertical columns. They are labeled with lowercase letters from **a** to **h**, running left to right from White's perspective.

Ranks are the horizontal rows. They are numbered **1** to **8**, running from bottom to top (from White's side to Black's side).

To name any square, say the file letter first, then the rank number:

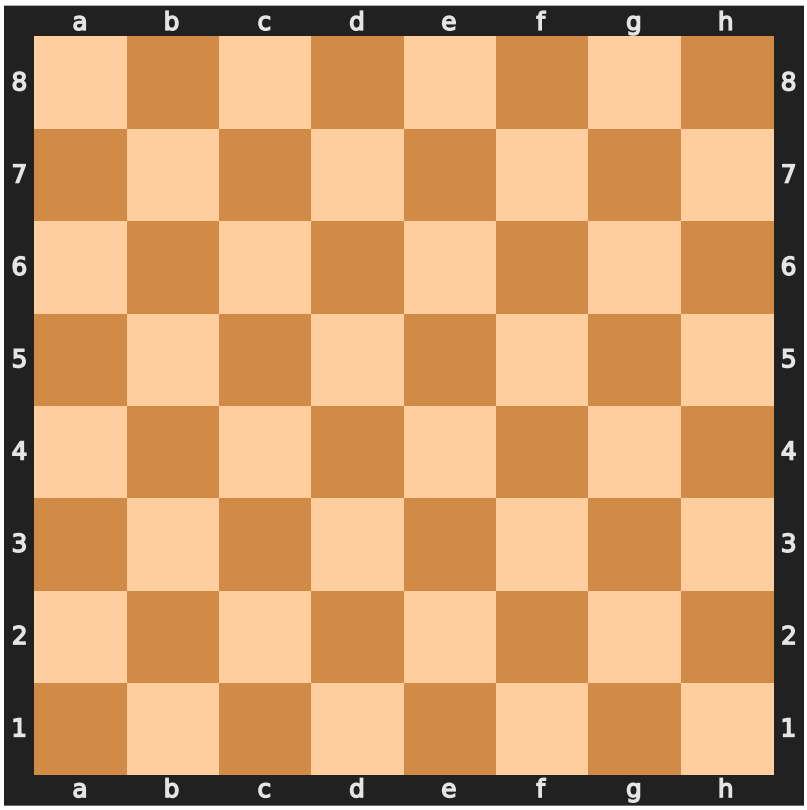

Figure 4.1: Chess Position

- The bottom-left square (from White's side) is **a1**
- The bottom-right square is **h1**
- The top-left square is **a8**
- The top-right square is **h8**
- The exact center-left is **d4** or **d5**
- The exact center-right is **e4** or **e5**

Try this: Point to each of these squares on your board and say the name out loud: **e4, d5, f3, c6, h8, a1**. If you can find them all without hesitation, you are ready to move on.

4.3 The Center

Four squares sit at the heart of the board: **d4, d5, e4, and e5.** These are called the **center squares,** and they are the most important real estate on the board.

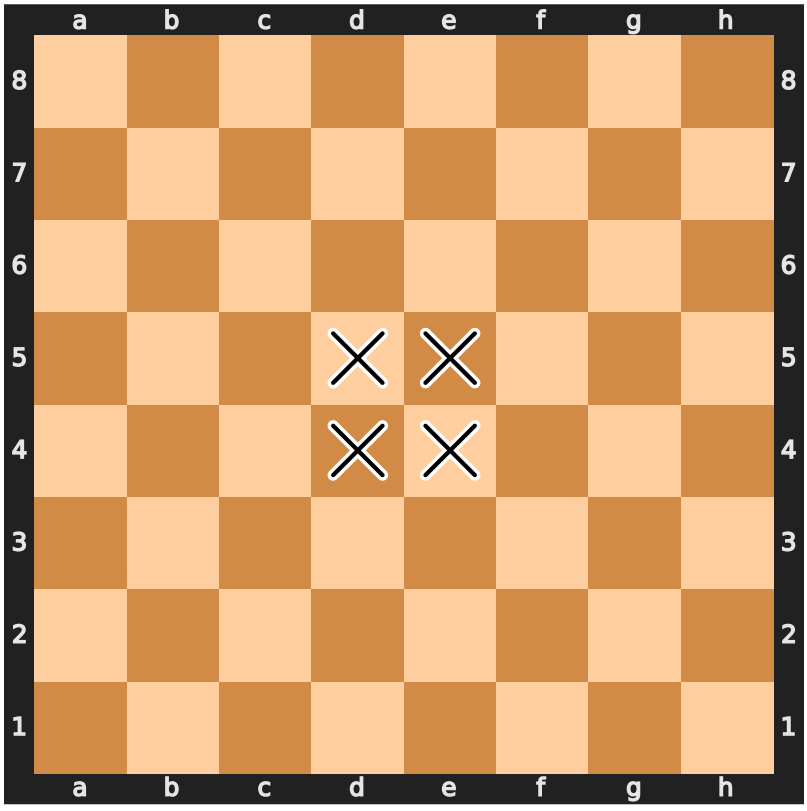

Figure 4.2: Chess Position

Diagram 1.2: The four center squares (marked with). Controlling these squares is one of the first goals of any chess game.*

Why does the center matter? A piece in the center can reach more squares than a piece on the edge. A knight on e4 controls eight squares. A knight on a1 controls only two. Throughout this book, you will hear the phrase "control the center" again and again. It starts here.

4.4 Diagonals

A **diagonal** is a line of same-colored squares running from one corner of the board toward another. The longest diagonals run from a1 to h8 (dark squares) and from a8 to h1 (light squares). Each of these long diagonals crosses eight squares.

Diagonals matter because bishops and queens move along them. When someone says "the long diagonal," they mean one of those two eight-square diagonals. You will learn to love them.

Try this: Trace the diagonal from a1 to h8 with your finger. Now trace the one from a8 to h1. Notice that they cross at the center of the board. This is not a coincidence. The center is powerful because so many lines of movement intersect there.

Rest Marker. You now understand the board. Take a break if you need one. Next up: the pieces.

Chapter 5

The Pieces

(Estimated reading time: 25 minutes | 1-2 Pomodoros)

Chess has six types of pieces. Each type moves in a different way. We will cover every one, starting with the most important.

At the beginning of a game, each player has **16 pieces:** - 1 King - 1 Queen - 2 Rooks - 2 Bishops - 2 Knights - 8 Pawns

Let's meet them one at a time.

5.1 The King (K)

The King is the most important piece on the board. If your King is trapped with no escape (checkmate), you lose the game. Everything you do in chess is ultimately about protecting your King and threatening your opponent's.

5.1.1 How the King Moves

The King moves **one square in any direction**: up, down, left, right, or diagonally. One square. That is all.

Diagram 1.3: The King on e4. The "x" marks show every square the King can move to. Eight squares total from the center.

There is one restriction: **the King cannot move to a square that is attacked by an opponent's piece.** The King can never walk into danger. If your King is currently attacked (this is called **check**), you *must* deal with the check on your very next move. We will cover check in detail in Chapter 2.

Set up your board: Place a White King on e4. Move it to each of the eight surrounding squares, one at a time. Move it back to e4 each time. Now place the King on a1 (the corner). How many squares can it move to? Only three. The corner is a trap for a King.

Try this: Place the King on h4 (the edge of the board). Count its legal moves. You should find five. The edge is better than the corner, but worse than the center. This is true for almost every

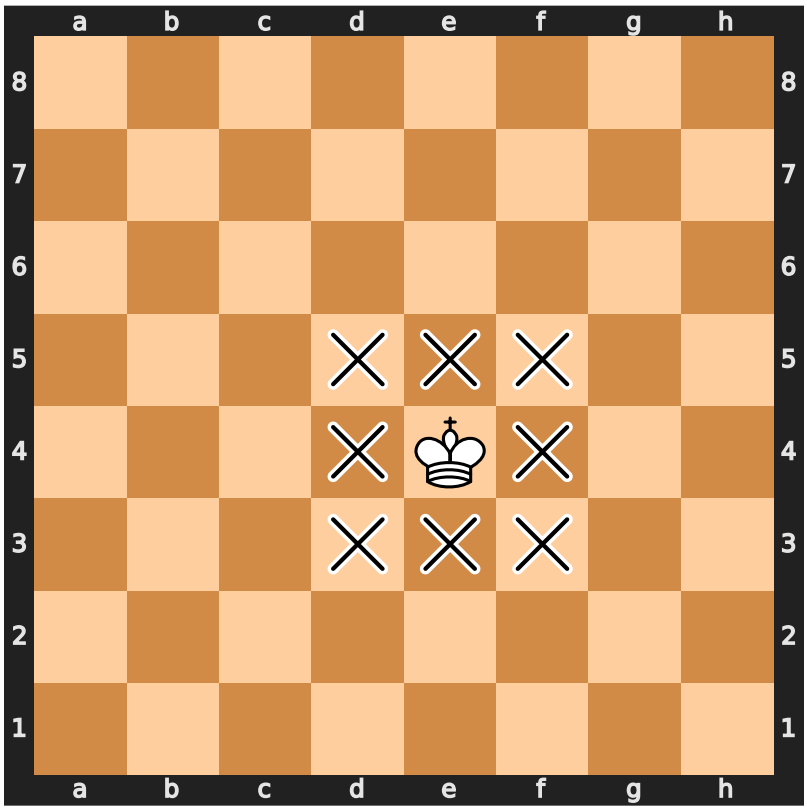

Figure 5.1: Chess Position

piece.

5.2 The Queen (Q)

The Queen is the most powerful piece on the board. She combines the movement of the Rook and the Bishop. Losing your Queen is usually (but not always) a disaster.

5.2.1 How the Queen Moves

The Queen moves **any number of squares in any direction**: horizontally, vertically, or diagonally. She cannot jump over other pieces. If a friendly piece is in her path, she must stop before it. If an enemy piece is in her path, she can capture it by landing on that square (and removing the enemy piece from the board).

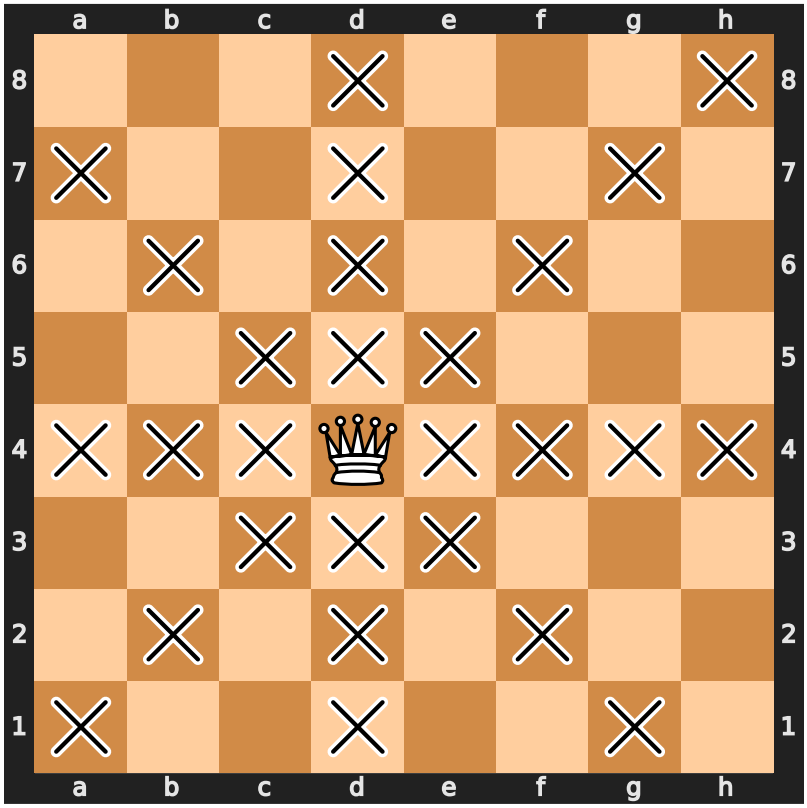

Figure 5.2: Chess Position

Diagram 1.4: The Queen on d4. She can move to any square marked with "x". From the center, the Queen controls 27 squares.

The Queen is powerful, but she is not invincible. She is worth about 9 points (we will cover piece values in Chapter 4). Because she is so valuable, putting her in danger early in the game is usually a mistake. Beginners often bring the Queen out first. Experienced players develop their other pieces first and bring the Queen out later when she can be safe and effective.

Set up your board: Place a White Queen on d4. Trace all the lines she can move along. Count the squares. Now place her on a1. How many squares can she reach? Far fewer. Like every piece, the Queen is strongest in the center.

Try this: Place the Queen on d4 and a Black pawn on d7. Can the Queen capture the pawn? Yes, by moving along the d-file. Now place a White pawn on d6 (between the Queen and the enemy pawn). Can the Queen still capture the Black pawn? No. The Queen cannot jump over the White pawn. She is blocked.

5.3 The Rook (R)

The Rook (sometimes called the "castle" by beginners, though this is technically incorrect) is a powerful piece worth about 5 points.

5.3.1 How the Rook Moves

The Rook moves **any number of squares horizontally or vertically.** It cannot move diagonally. Like the Queen, it cannot jump over other pieces.

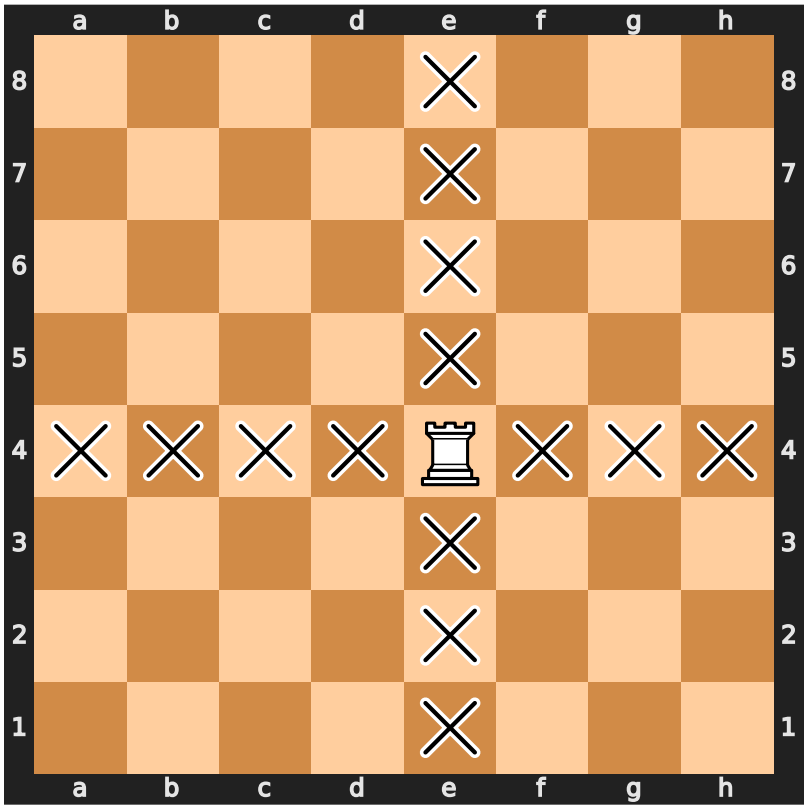

Figure 5.3: Chess Position

Diagram 1.5: The Rook on e4. It can move to any square marked "x" along its rank (row) or file (column). 14 squares total.

Notice something: the Rook controls 14 squares from any position on an empty board, whether it sits on e4 or a1. The Rook is the only major piece that does not care about being in the center (in terms of raw square count). However, Rooks still prefer **open files** (files with no pawns blocking them) and **the seventh rank** (your opponent's second row, where their pawns often sit).

Set up your board: Place a White Rook on a1. Move it to a8. Move it to h8. Move it to h1. Move it back to a1. You have just traced the edges of the board. Rooks love long, open lines.

Try this: Place a White Rook on e1 and White pawns on e2 and d1. How many squares can the Rook move to? The pawns block two of its four directions. The Rook can still move along the first rank to the right (f1, g1, h1) and cannot move up the e-file because e2 is blocked by its own pawn. Rooks need open lines to be effective.

5.4 The Bishop (B)

The Bishop is a long-range piece worth about 3 points. It has one unique property that no other piece shares: **each Bishop is permanently locked to one color of square for the entire game.**

5.4.1 How the Bishop Moves

The Bishop moves **any number of squares diagonally.** It cannot move horizontally or vertically. It cannot jump over other pieces.

Diagram 1.6: The Bishop on e4 (a dark square). It can only move to dark squares, marked with "x". This Bishop will NEVER touch a light square.

Because the Bishop can only move diagonally, it stays on the same color square forever. A Bishop that starts on a light square can only ever visit light squares. A Bishop that starts on a dark square can only ever visit dark squares. This means a single Bishop can only ever reach **half the squares on the board.** That is both its limitation and its character.

At the start of the game, each player has two Bishops: one on a light square and one on a dark square. Together, the pair covers all 64 squares. This is why the **Bishop pair** (having both Bishops while your opponent has lost one) is considered an advantage. We will explore this concept in later chapters.

Set up your board: Place a White Bishop on c1 (its starting square). What color is c1? It is a dark square. Move the Bishop anywhere, in any number of moves you like. Can you ever get it to land on a light square? No. It is impossible. The Bishop is trapped on its color forever.

Try this: Place a White Bishop on f1 (a light square) and move it to c4. That is one move, traveling along the diagonal f1-c4. Now try to move it to d4. You cannot do it in a single move because d4 is a dark square. The light-squared Bishop cannot reach d4. Ever. Understanding this limitation is your first step toward understanding piece coordination.

Rest Marker. Two pieces left, then the rules. Good time for a break.

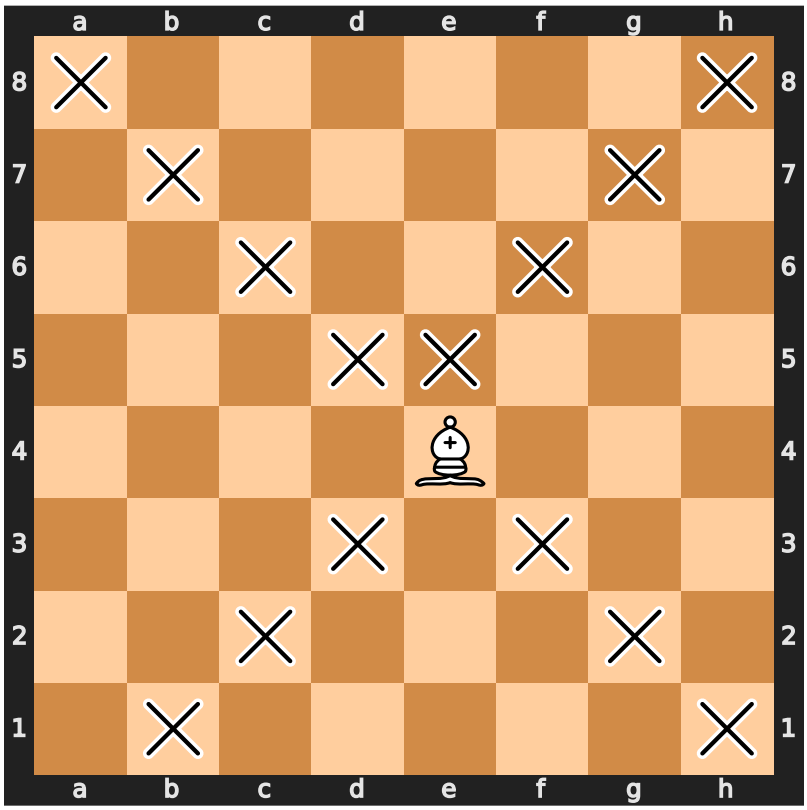

Figure 5.4: Chess Position

5.5 The Knight (N)

The Knight is the most unusual piece in chess. It is the ONLY piece that can **jump over other pieces.** It moves in an "L" shape, and its movement confuses many beginners. But once you see the pattern, it clicks.

5.5.1 How the Knight Moves

The Knight moves in an **L-shape: two squares in one direction (horizontally or vertically), then one square sideways.** Another way to think about it: the Knight always lands on a square that is the *opposite color* from the square it started on.

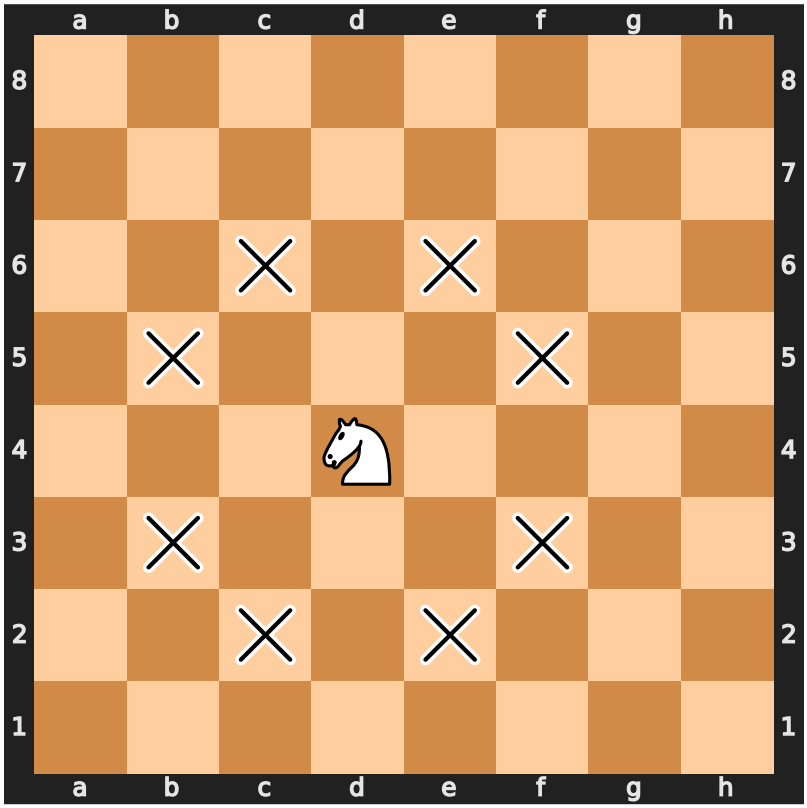

Figure 5.5: Chess Position

Diagram 1.7: The Knight on d4. It can jump to any square marked "x". From the center, the Knight has 8 possible moves. Notice: every landing square is the opposite color from d4.

The Knight is special for two reasons:

1. **It jumps.** The Knight does not care about pieces between its starting square and its landing square. It flies over everything. This makes the Knight extremely dangerous in crowded positions where other pieces are blocked.

2. **It alternates colors.** Every time a Knight moves, it changes square color. If it starts on a light square, it lands on a dark square. This means a Knight needs an even number of moves to return to a square of the same color.

The Knight's value is about 3 points, similar to a Bishop. In practice, the Knight is better in closed positions (lots of pawns blocking pieces) while the Bishop is better in open positions (clear diagonals). But at the beginner level, they are roughly equal.

Set up your board: Place a White Knight on b1 (its starting square). Move it to c3 (two squares up, one to the right). Now move it to e4. Now to f6. You are traveling across the board in a zigzag pattern. This is how Knights move through the position.

Try this: Place a White Knight on g1 and White pawns on f2, g2, and h2 (mimicking the opening position). Can the Knight move? Yes! It can jump to f3 or h3, right over the pawns. No other piece could do this. The Knight does not care about obstacles.

Another exercise: Place a Knight on a1. How many squares can it jump to? Only two: b3 and c2. Now place it on d4. It can reach eight squares. The Knight, like the King and Queen, is much stronger in the center than on the edge. There is an old chess saying: "A knight on the rim is dim."

5.6 The Pawn (no letter symbol)

Pawns are the most numerous pieces (8 per side) and the most underestimated. They are the smallest and weakest piece, worth only 1 point. But pawns define the shape of the position, and they have one magical ability that no other piece has: **promotion.** We will cover that in Chapter 3.

5.6.1 How the Pawn Moves

The Pawn is the only piece that moves differently from how it captures.

Moving: A Pawn moves **forward one square.** It cannot move backward, sideways, or diagonally. Forward only, always. From its **starting position** (rank 2 for White, rank 7 for Black), a Pawn has the option to move forward **two squares** on its very first move. After that, one square at a time.

Capturing: A Pawn captures **one square diagonally forward.** It cannot capture the piece directly in front of it. If a piece is directly in front of a Pawn, the Pawn is **blocked** and cannot move until that piece moves away.

Diagram 1.8: A White Pawn on d3. "m" = squares it can move to. "c" = squares it can capture on (c4 and e4, but only if an enemy piece is there).

Notice that this Pawn is on d3, not its starting rank, so it can only move one square forward to d4. If it were on d2 (its starting square), it could move to either d3 or d4 in one move.

Set up your board: Place a White Pawn on e2 (its starting position). Move it two squares forward to e4. This is the most common first move in chess. Now try to move it backward. You cannot. Pawns never retreat.

Try this: Place a White Pawn on e4 and a Black Pawn on d5. The White Pawn can capture the Black Pawn by moving diagonally from e4 to d5 (removing the Black Pawn and taking its place). Now set it up again, but put the Black Pawn on e5 instead. Can the White Pawn capture it? No. The Pawn can only capture diagonally, and the Black Pawn is directly in front of it. Both Pawns are stuck until something changes.

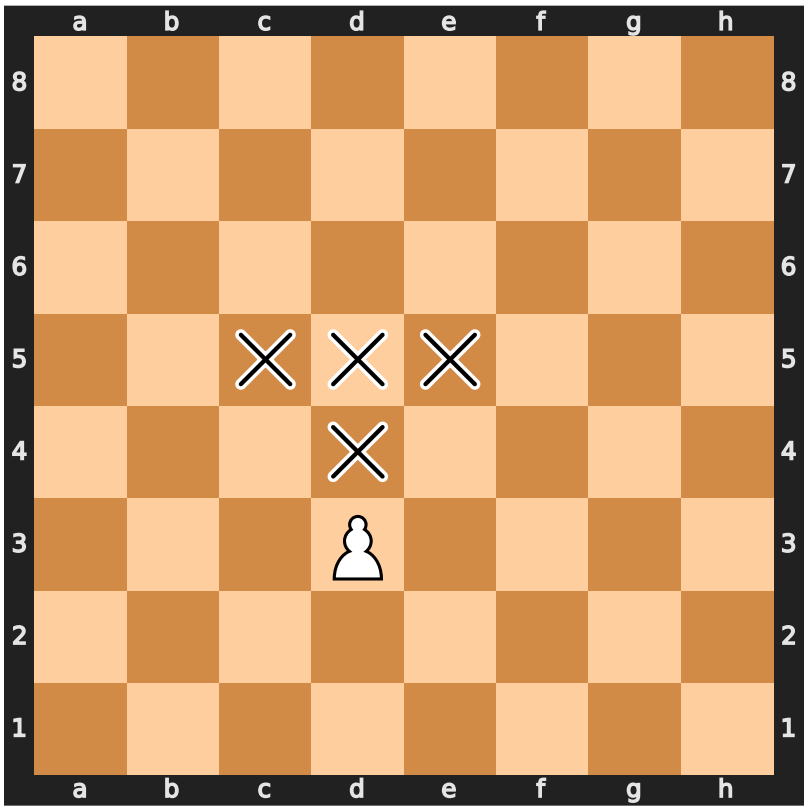

Figure 5.6: Chess Position

Pawns have two more special abilities (en passant and promotion) that we will cover in Chapter 3. For now, the key facts are: forward only, one square at a time (two from the start), captures diagonally.

Rest Marker. You now know how every piece moves. That is a huge milestone. Take a break and celebrate. When you come back, we will learn the rules for setting up the board and playing a game.

Chapter 6

The Rules

(Estimated reading time: 15 minutes | 1 Pomodoro)

6.1 Setting Up the Starting Position

At the beginning of every chess game, the pieces are arranged in the same way. Here is the starting position:

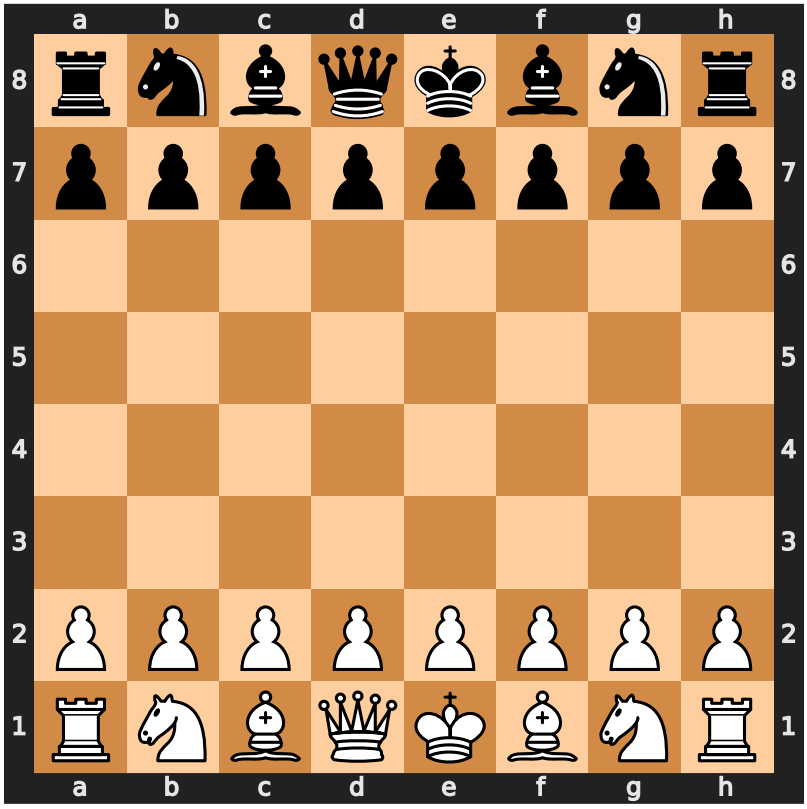

Figure 6.1: Chess Position

Diagram 1.9: The starting position. Capital letters = White pieces. Lowercase = Black pieces.

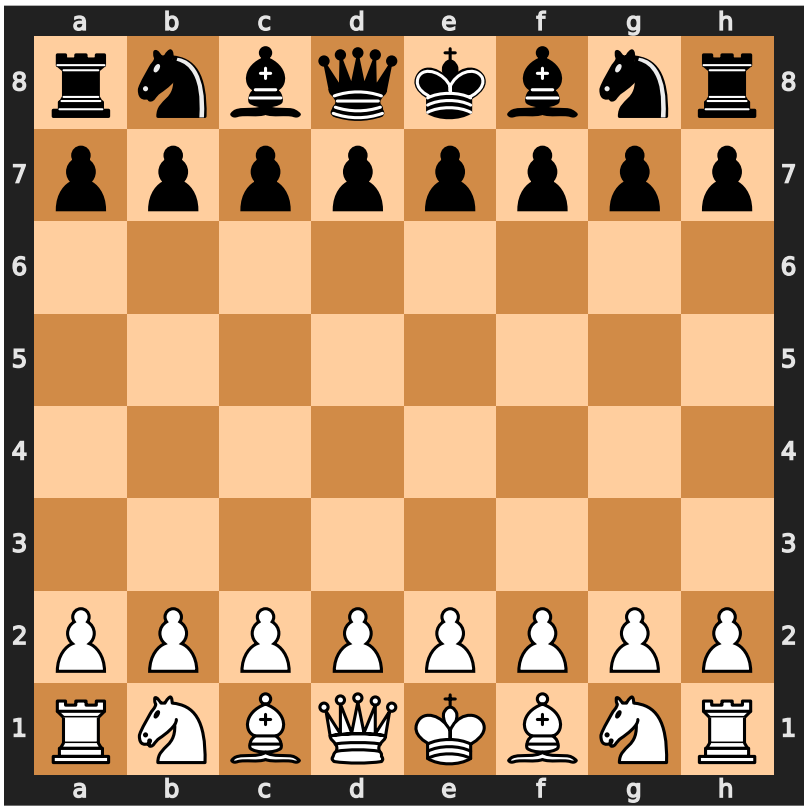

Figure 6.2: Chess Position

K=King, Q=Queen, R=Rook, B=Bishop, N=Knight, P=Pawn.

6.1.1 Setup Checklist

Follow these steps to set up the board correctly every time:

1. **Orient the board.** Light square in the bottom-right corner.
2. **Place the Rooks** on the corner squares: a1 and h1 (White), a8 and h8 (Black).
3. **Place the Knights** next to the Rooks: b1 and g1 (White), b8 and g8 (Black).
4. **Place the Bishops** next to the Knights: c1 and f1 (White), c8 and f8 (Black).
5. **Place the Queen on her own color.** White Queen on d1 (a light square). Black Queen on d8 (a dark square). Memory trick: "Queen gets her color."
6. **Place the King** on the remaining square: e1 (White), e8 (Black).
7. **Place the Pawns** on the second rank: a2 through h2 (White), a7 through a7 (Black).

The most common setup mistake: Swapping the King and Queen. Remember: **"Queen on her color."** The White Queen goes on the light square (d1). The Black Queen goes on the dark square (d8).

Try this: Clear your board entirely. Now set up the starting position from memory using the checklist above. Time yourself. If you can do it in under 30 seconds, you have it down.

6.2 Who Goes First

White always moves first. After White makes a move, Black responds. Players alternate turns for the rest of the game. You can never skip a turn, and you can never make two moves in a row.

6.3 The Touch-Move Rule

In tournament chess (and in many casual games), there is a rule called **touch-move:**

- If you touch one of your pieces, you must move it (if a legal move exists).
- If you touch one of your opponent's pieces, you must capture it (if a legal capture exists).
- Once you let go of a piece on a new square, the move is final.

This rule exists to prevent players from picking up pieces, seeing how the board looks, and then changing their minds. In casual games, many people play without touch-move, and that is fine. But learning to think before you touch the piece is a habit that will serve you well.

Tip: When you are thinking about your move, sit on your hands. Seriously. This is a real technique used by coaches. It prevents impulsive grabs while your brain is still working.

6.4 How Games End

A chess game can end in several ways:

6.4.1 Checkmate

Checkmate is the ultimate goal of chess. If your opponent's King is in **check** (attacked by one of your pieces) and there is no legal way to escape, the game is over. The player who delivered

checkmate wins.

There is no need to actually capture the King. Once checkmate is reached, the game ends immediately. We will practice recognizing and delivering checkmate in Chapter 2.

6.4.2 Stalemate (Draw)

Stalemate occurs when the player whose turn it is has **no legal moves,** but their King is NOT in check. This is a **draw**, meaning neither player wins.

Stalemate is one of the trickiest concepts for beginners. It feels like the player with no moves should lose, but the rule says: if the King is not in check, it is a draw. Stalemate is actually a defensive resource. When you are losing badly, sometimes you can force a stalemate and save half a point. We will study this in Chapter 2.

6.4.3 Draw by Agreement

At any point during a game, a player can offer a draw to their opponent. If the opponent accepts, the game ends in a draw. If the opponent declines, play continues.

6.4.4 Draw by Repetition

If the same position occurs **three times** with the same player to move, either player can claim a draw. This prevents infinite loops.

6.4.5 Draw by the 50-Move Rule

If **50 consecutive moves** pass without any pawn move or capture, either player can claim a draw. This prevents endlessly shuffling pieces.

6.4.6 Draw by Insufficient Material

If neither player has enough pieces left to deliver checkmate, the game is a draw. For example, King vs. King is always a draw. King and Bishop vs. King is always a draw. King and Knight vs. King is always a draw.

6.4.7 Resignation

A player can **resign** (quit) at any time, giving the win to their opponent. Players resign when they believe their position is hopeless. At the beginner level, you should almost never resign. Play it out. Your opponent might make a mistake. You might find a stalemate trick. Stranger things have happened.

6.4.8 Time

In timed games, if your clock runs out of time, you lose (unless your opponent does not have enough material to checkmate you, in which case it is a draw).

6.5 Chess Notation (Brief Introduction)

Chess players have a system for writing down moves called **algebraic notation.** This allows you to record your games, read game scores, and follow along with chess books like this one.

We will cover notation in full detail in the Appendix, but here are the basics so you can follow the rest of this book:

6.5.1 Piece Letters

Piece	Letter
King	K
Queen	Q
Rook	R
Bishop	B
Knight	N (not K, because K is the King)
Pawn	(no letter, just the square)

6.5.2 How to Write a Move

A move is written as the **piece letter** followed by the **destination square.**

- **Nf3** means "Knight moves to f3"
- **Bb5** means "Bishop moves to b5"
- **Qd7** means "Queen moves to d7"
- **Ke2** means "King moves to e2"
- **e4** means "Pawn moves to e4" (no letter for Pawns)

6.5.3 Captures

When a piece captures, you add an **"x"** between the piece letter and the destination square:

- **Bxe5** means "Bishop captures the piece on e5"
- **Nxd4** means "Knight captures the piece on d4"
- **exd5** means "the e-pawn captures the piece on d5" (Pawn captures include the file the Pawn started on)

6.5.4 Check and Checkmate

- A move that gives check adds a **"+"** at the end: **Bb5+** (Bishop to b5 with check)
- A move that delivers checkmate adds a **"#"** at the end: **Qh7#** (Queen to h7, checkmate)

6.5.5 Special Notations

- **O-O** = Kingside castling (covered in Chapter 3)
- **O-O-O** = Queenside castling (covered in Chapter 3)
- **1-0** = White wins
- **0-1** = Black wins
- **½-½** = Draw

That is enough notation to follow along with this book. You will pick up the rest naturally as you play and study.

Rest Marker. You now know every rule of chess. From here, it is practice time. When you are ready, the exercises below will test everything you have learned.

Chapter 7

Exercises

The following 25 exercises test your understanding of the board, the pieces, and the rules. Work through them with a board in front of you. Try each one before checking the solution.

Difficulty guide: - = You should be able to solve this after reading this chapter - = Requires careful thought or combining two concepts

---

Exercise 1.1 **Position:** Empty board. **Task:** Name the following squares: the bottom-left corner from White's perspective, the top-right corner from White's perspective, and the four center squares. **Hint 1:** The bottom-left corner for White is file a, rank 1. **Hint 2:** The center squares are on files d and e, ranks 4 and 5. **Hint 3:** Top-right from White's perspective is file h, rank 8. **Solution:** Bottom-left = a1. Top-right = h8. Center squares = d4, d5, e4, e5. Why this works: Files go a-h left to right, ranks go 1-8 bottom to top, and you combine the two to name any square.

Exercise 1.2 **Position:** Empty board. **Task:** What color is the square e4? What color is d4? What color is f6? **Hint 1:** There is a pattern. If the file letter and rank number are both "odd" (a=1, c=3, e=5, g=7) or both "even" (b=2, d=4, f=6, h=8), the square is one color. **Hint 2:** e is the 5th file (odd), 4 is even. Odd + even = dark square. **Hint 3:** Try it: d is the 4th file (even), 4 is even. Even + even = light square. **Solution:** e4 = dark square. d4 = light square. f6 = light square. Why this works: When the file number and rank number are both odd or both even, the square is light. When one is odd and one is even, the square is dark. (Or just look at your board!)

Exercise 1.3 **Position:** Empty board. **Task:** Name all eight squares on the third rank (row 3), from left to right. **Hint 1:** The third rank uses rank number 3. **Hint 2:** Files go a through h. **Hint 3:** Combine each file letter with the rank number 3. **Solution:** a3, b3, c3, d3, e3, f3, g3, h3. Why this works: Every square on rank 3 shares the same rank number. The files provide the other half of each square name.

Exercise 1.4 **Position:** White King on d5.

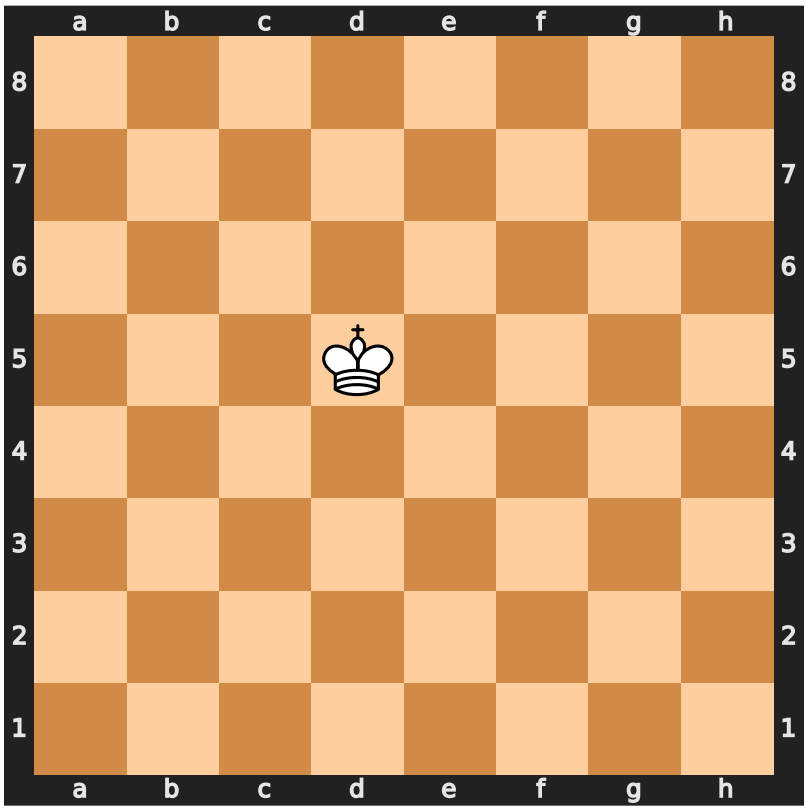

Figure 7.1: Chess Position

Task: List every square the King can move to from d5. **Hint 1:** The King moves one square in any direction. **Hint 2:** There are eight possible directions: up, down, left, right, and the four diagonals. **Hint 3:** Check each direction from d5: up is d6, up-right is e6, right is e5, and so on. **Solution:** c4, c5, c6, d4, d6, e4, e5, e6. Eight squares total. Why this works: From the center of the board, the King can move in all eight directions. No edges are blocking any direction.

Exercise 1.5 **Position:** White King on a1.

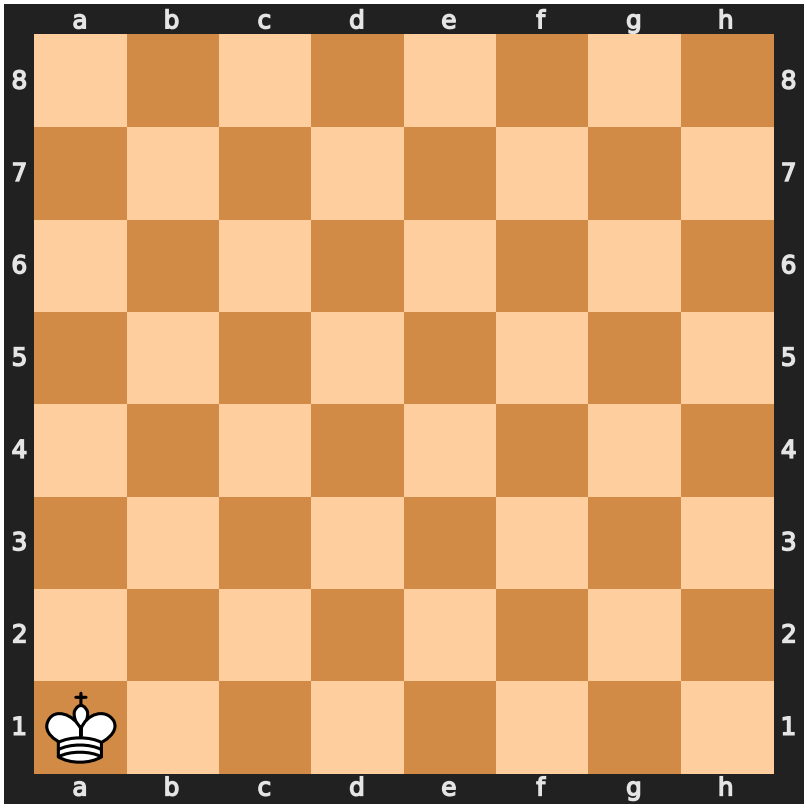

Figure 7.2: Chess Position

Task: How many legal squares can the King move to from a1? **Hint 1:** The King is in the corner. **Hint 2:** Three of the eight directions go off the edge of the board. **Hint 3:** Actually, five of the eight directions go off the board. Only three squares are available. **Solution:** Three squares: a2, b1, b2. Why this works: The corner limits the King to only three directions. This is why the corner is the worst place for a King (or almost any piece). The center gives maximum mobility.

Exercise 1.6 **Position:** White Queen on h1.

Task: How many squares can the Queen reach from h1? Count all of them. **Hint 1:** From h1, the Queen can move along the first rank, the h-file, and one diagonal. **Hint 2:** Along the first rank: a1, b1, c1, d1, e1, f1, g1 (7 squares). Along the h-file: h2 through h8 (7 squares). **Hint 3:** Along the diagonal: g2, f3, e4, d5, c6, b7, a8 (7 squares). **Solution:** 21 squares. Why this works: The Queen reaches 7 squares along the rank, 7 along the file, and 7 along the single available diagonal.

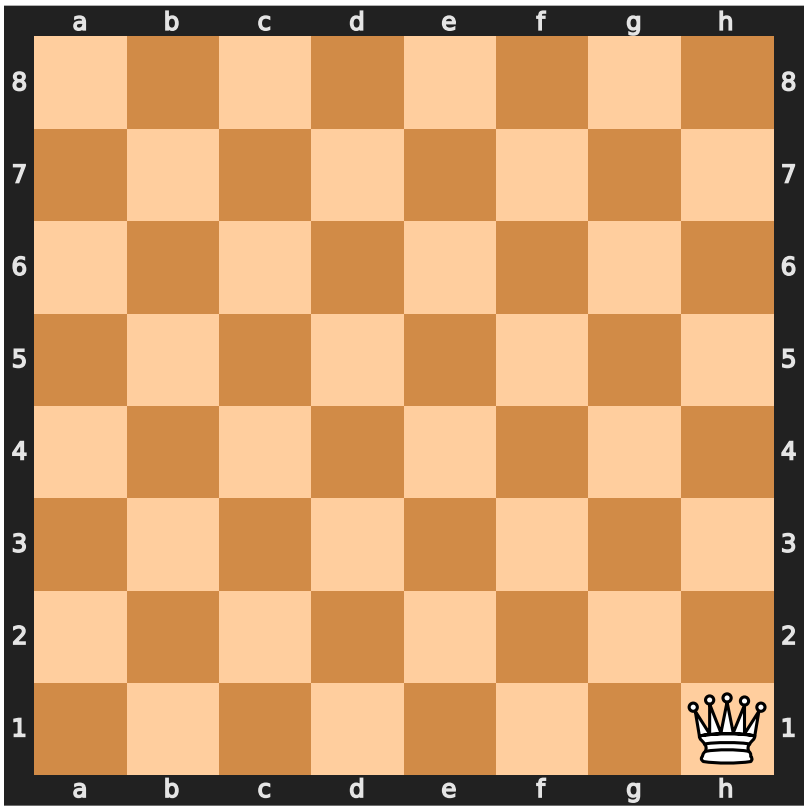

Figure 7.3: Chess Position

Compare this to 27 squares from the center (d4 or e4). The corner costs the Queen 6 squares of reach.

Exercise 1.7 **Position:** White Rook on d4, White Pawn on d7, Black Pawn on d2.

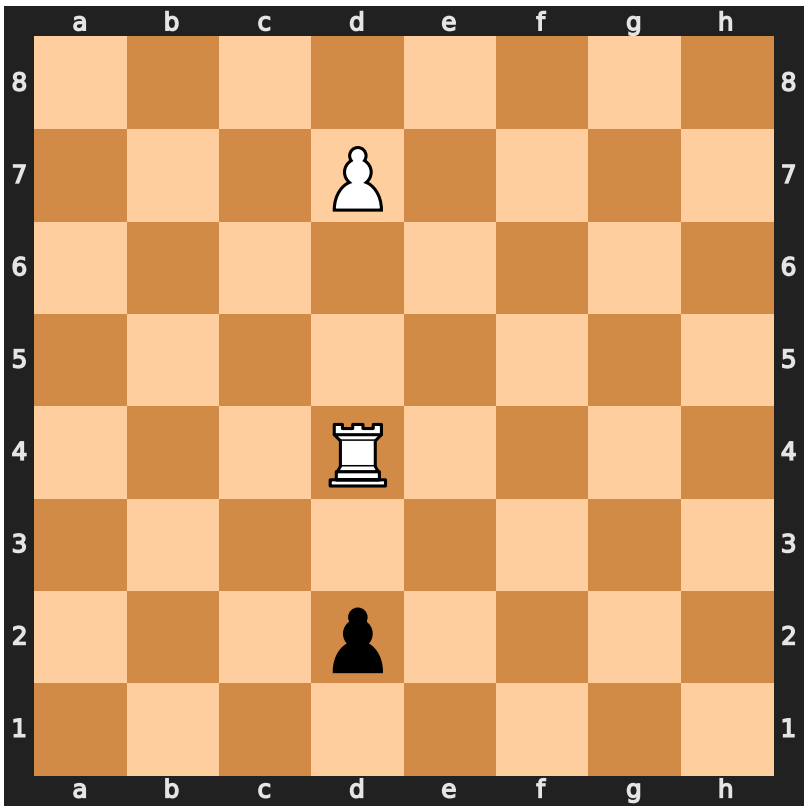

Figure 7.4: Chess Position

Task: How many squares can the Rook move to? List them. **Hint 1:** The Rook moves along ranks and files but cannot jump over pieces. **Hint 2:** Along the d-file going up, the Rook is blocked by the White Pawn on d7. It can reach d5 and d6, but not d7 (friendly piece). **Hint 3:** Along the d-file going down, the Rook can reach d3 and d2 (capturing the Black Pawn). It cannot go past d2. **Solution:** The Rook can move to: a4, b4, c4, e4, f4, g4, h4 (7 squares along the rank), d5, d6 (2 squares up the file), d3, d2 (2 squares down, with d2 being a capture). Total: 11 squares. Why this works: The Rook cannot pass through the friendly Pawn on d7, so its upward reach is limited. It can capture the enemy Pawn on d2 but cannot continue past it.

Exercise 1.8 **Position:** White Bishop on c1.

Task: What color squares can this Bishop ever visit? Can it ever reach the square e4? **Hint 1:** What color is c1? **Hint 2:** c1 is a dark square. Bishops stay on their starting color forever. **Hint 3:** What color is e4? Check whether it matches. **Solution:** The Bishop on c1 is on a dark square. It can only ever visit dark squares. e4 is also a dark square, so yes, this Bishop CAN reach e4 (for example, via c1-d2-e3-f4 or directly c1-e3-f4, then repositioning). Why this works: Bishops never change color. The key question is always: "Is the target square the same color as the Bishop?"

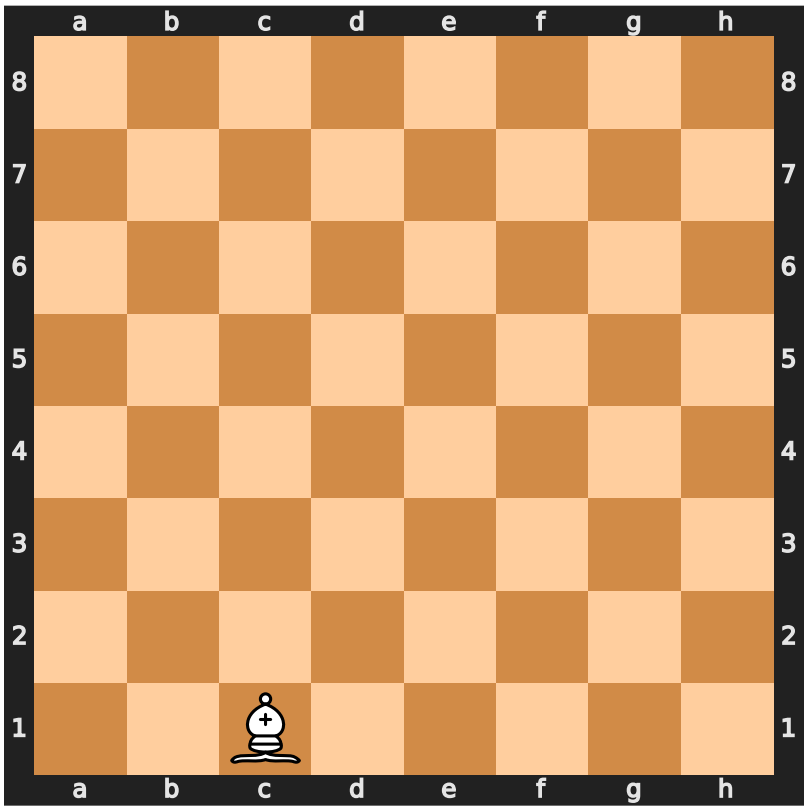

Figure 7.5: Chess Position

Exercise 1.9 **Position:** White Bishop on f1.

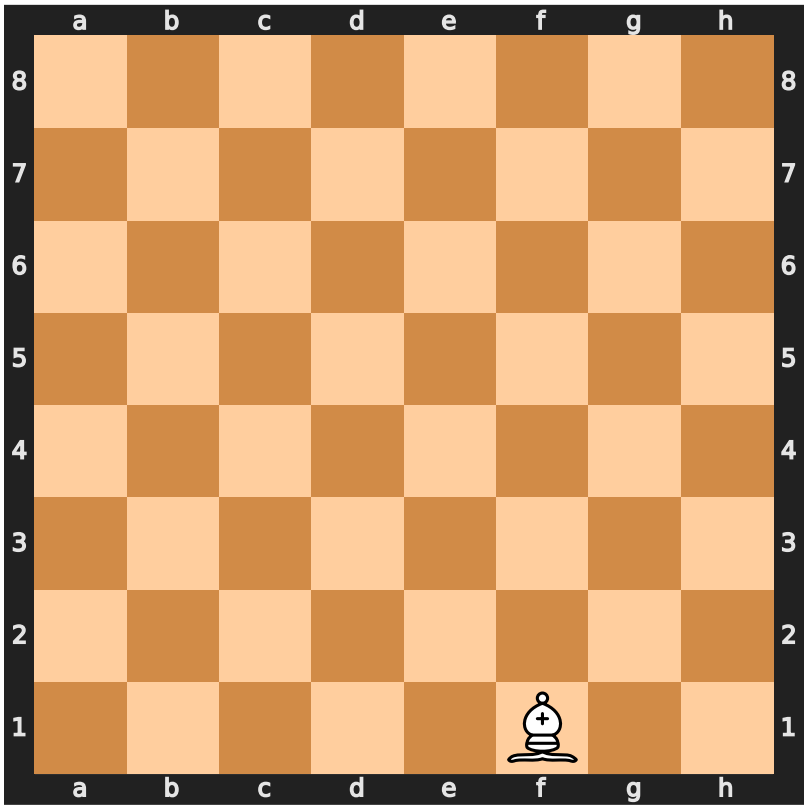

Figure 7.6: Chess Position

Task: Can this Bishop ever reach the square d4? **Hint 1:** What color is f1? What color is d4? **Hint 2:** f1 is a light square. d4 is also a light square. **Hint 3:** Since both squares are the same color, the Bishop can eventually get there. **Solution:** Yes. f1 is a light square, and d4 is a light square. The Bishop can reach d4 (for example, f1-e2-d3, then d3-c4 or other routes, eventually reaching d4 by traveling along light-square diagonals). Why this works: A Bishop can reach any square of its own color, given enough moves and an open path.

Exercise 1.10 **Position:** White Knight on g1.

Task: What are the Knight's legal moves from g1? **Hint 1:** The Knight moves in an L-shape: two squares in one direction, one square sideways. **Hint 2:** From g1, try: two up and one left = f3. Two up and one right = h3. **Hint 3:** Two left and one up = e2. Two right goes off the board. Those are all the options. **Solution:** f3, h3, and e2. Three legal squares. Why this works: From the corner area, many L-shaped moves go off the board. In the starting position, each Knight has exactly two legal first moves (for g1: Nf3 or Nh3). The e2 square is also available here because there are no other pieces blocking.

Exercise 1.11 **Position:** White Knight on e4 (empty board).

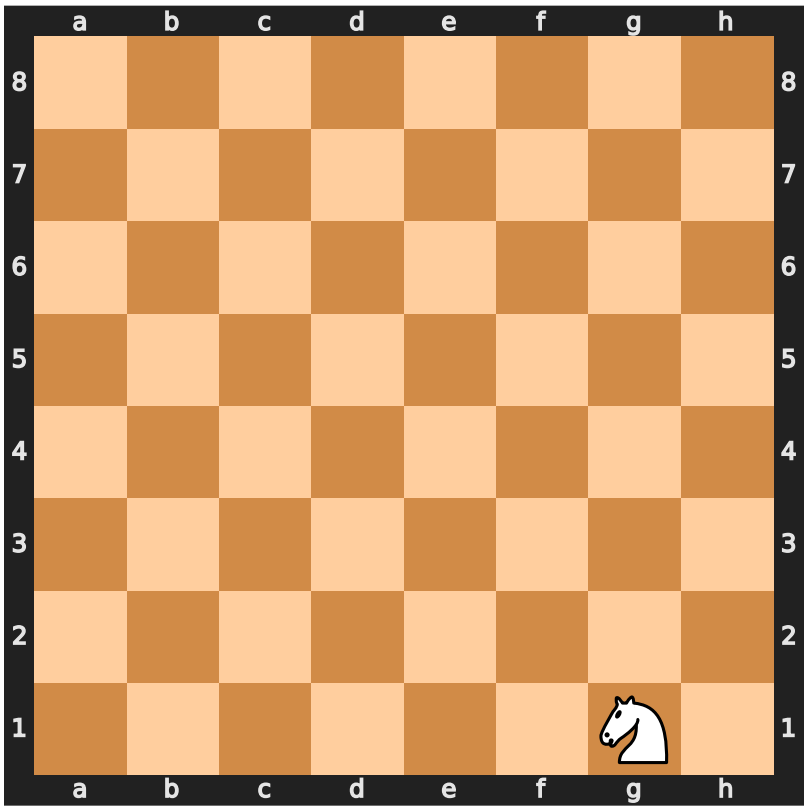

Figure 7.7: Chess Position

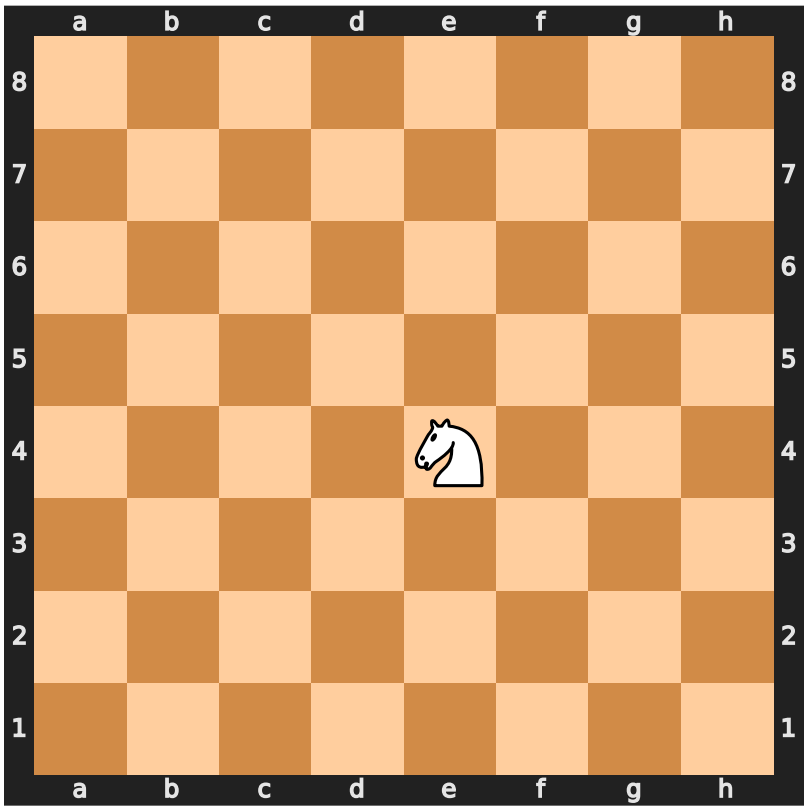

Figure 7.8: Chess Position

Task: List all eight squares the Knight can move to. **Hint 1:** L-shape: two squares, then one sideways. Try each direction. **Hint 2:** Two up, one left = d6. Two up, one right = f6. Continue with all other directions. **Hint 3:** The eight squares form a ring around the Knight, two squares away. **Solution:** c3, c5, d2, d6, f2, f6, g3, g5. Eight squares total. Why this works: From the center of the board (e4), no L-shaped moves go off the edge. This is the maximum. Compare this to only 2-3 moves from the corner or edge.

Exercise 1.12 **Position:** White Pawn on e2 (starting position, empty board).

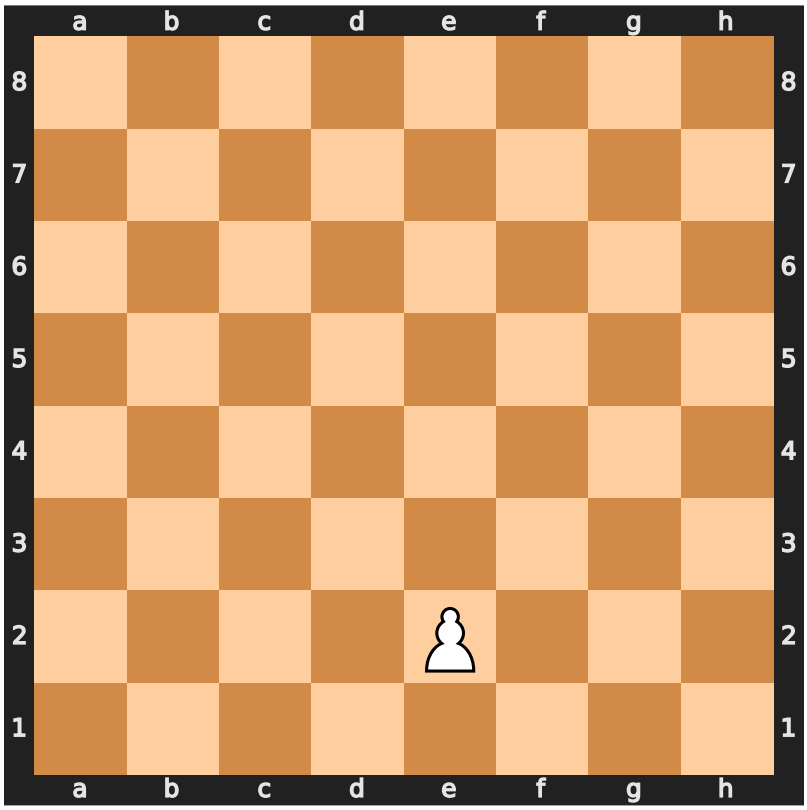

Figure 7.9: Chess Position

Task: What are the Pawn's legal moves? **Hint 1:** The Pawn is on its starting rank (rank 2 for White). **Hint 2:** From the starting rank, a Pawn can move one or two squares forward. **Hint 3:** Forward for White means toward rank 8 (increasing rank numbers). **Solution:** e3 (one square forward) or e4 (two squares forward). The Pawn cannot capture because there are no enemy pieces on d3 or f3. Why this works: From its starting square, a Pawn has the option of a single or double push. Once it has moved from its starting square, it loses the two-square option forever.

Exercise 1.13 **Position:** White Pawn on e5, Black Pawn on d6, Black Pawn on e6.

Task: Can the White Pawn move? Can it capture? List all legal options. **Hint 1:** The Pawn moves forward (to e6), but is anything blocking that square? **Hint 2:** The Black Pawn on e6 is directly in front of the White Pawn. The White Pawn is blocked and cannot advance. **Hint 3:**

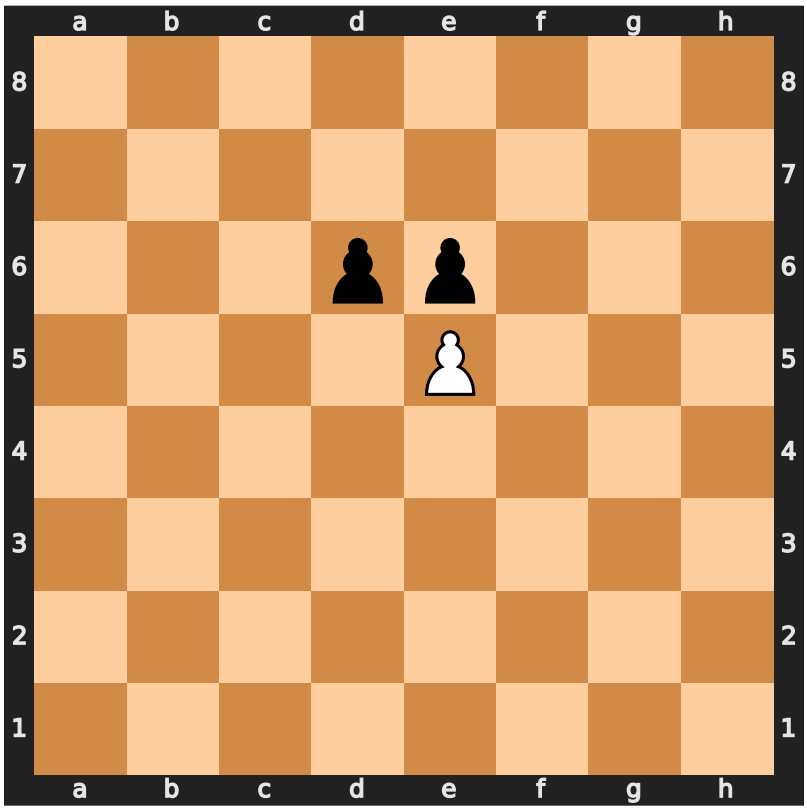

Figure 7.10: Chess Position

But Pawns capture diagonally. Is there an enemy piece on d6? **Solution:** The White Pawn cannot move to e6 (blocked by the Black Pawn). But it CAN capture the Black Pawn on d6 by moving diagonally from e5 to d6. One legal move: exd6. Why this works: Pawns move forward but capture diagonally. A Pawn blocked from advancing can still capture sideways.

Exercise 1.14 **Position:** Empty board. **Task:** Set up the starting position from memory. Use the checklist from the chapter. Check your answer against Diagram 1.9. **Hint 1:** Start with the corners: Rooks on a1, h1, a8, h8. **Hint 2:** Queen on her color: White Queen on d1 (light square), Black Queen on d8 (dark square). **Hint 3:** The order from corner inward is: Rook, Knight, Bishop, Queen/King. **Solution:** Compare your board to the starting position FEN: `rnbqkbnr/pppppppp/8/8/8/8/PPPPPPPP/RNBQKBNR w KQkq - 0 1`. Every piece should match. If the King and Queen are swapped, remember: "Queen on her color." Why this works: Practicing setup from memory builds board familiarity. Tournament players must set up without a diagram.

Exercise 1.15 **Position:** White Queen on d1 (starting position, all pieces present).

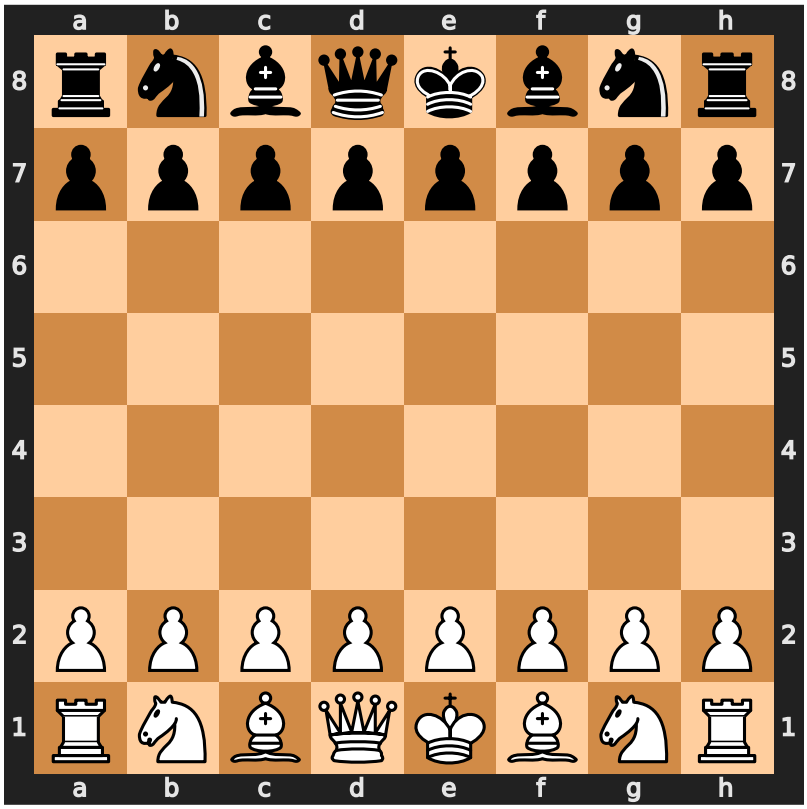

Figure 7.11: Chess Position

Task: Can the White Queen move on the first turn of the game? Why or why not? **Hint 1:** Look at what is surrounding the Queen on d1. **Hint 2:** The Queen is on d1. What pieces are on c1, d2, and e1? **Hint 3:** Bishops on c1 and f1, the King on e1, and Pawns on c2, d2, and e2. Every path is blocked. **Solution:** No. The Queen on d1 is completely surrounded by friendly pieces (c1 Bishop, d2 Pawn, e1 King, and the Pawn wall). She has no legal move. The Queen must wait for Pawns

and other pieces to move first, creating an opening. Why this works: In the starting position, only Knights (which jump) and Pawns have legal first moves. All other pieces are blocked.

Exercise 1.16 **Position:** Starting position.

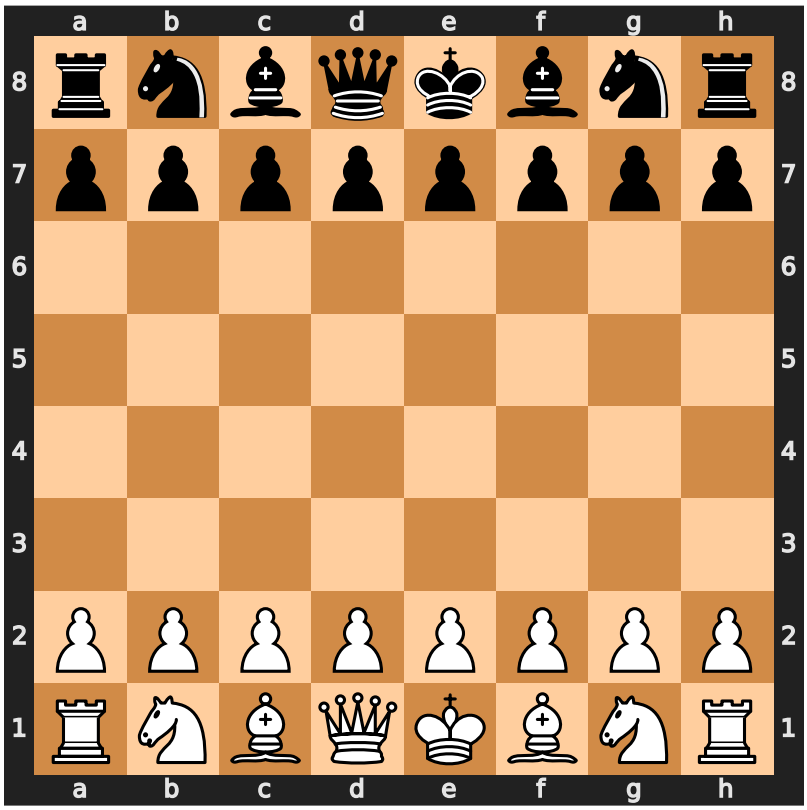

Figure 7.12: Chess Position

Task: How many total legal first moves does White have at the start of a game? **Hint 1:** Which pieces can move? Only Pawns and Knights (everything else is blocked). **Hint 2:** Each of the 8 Pawns can move one or two squares forward. That is 16 Pawn moves. **Hint 3:** Each Knight has two legal moves (b1 can go to a3 or c3; g1 can go to f3 or h3). That is 4 Knight moves. **Solution:** 20 legal first moves. 16 Pawn moves (8 Pawns x 2 options each) + 4 Knight moves (2 Knights x 2 options each) = 20. Why this works: In the starting position, only Pawns and Knights can move. Pawns have 2 options each from their starting rank, and Knights jump over the Pawn wall.

Exercise 1.17 **Position:** White King on e1, White Rook on a1 (empty board otherwise).

Task: Can the Rook and King together control all four edges of the board in this position? Which edge squares are NOT controlled? **Hint 1:** The Rook on a1 controls the entire a-file (a1-a8) and the entire first rank (a1-h1). But wait, the King blocks the Rook from reaching squares past e1 along the first rank. **Hint 2:** The King on e1 controls d1, d2, e2, f1, f2. The Rook controls a1-d1 (stopped by nothing before the King) and a1-a8. **Hint 3:** The Rook covers the a-file and the first rank up to d1. The King covers a small area around e1. The h-file, the eighth rank, and most of

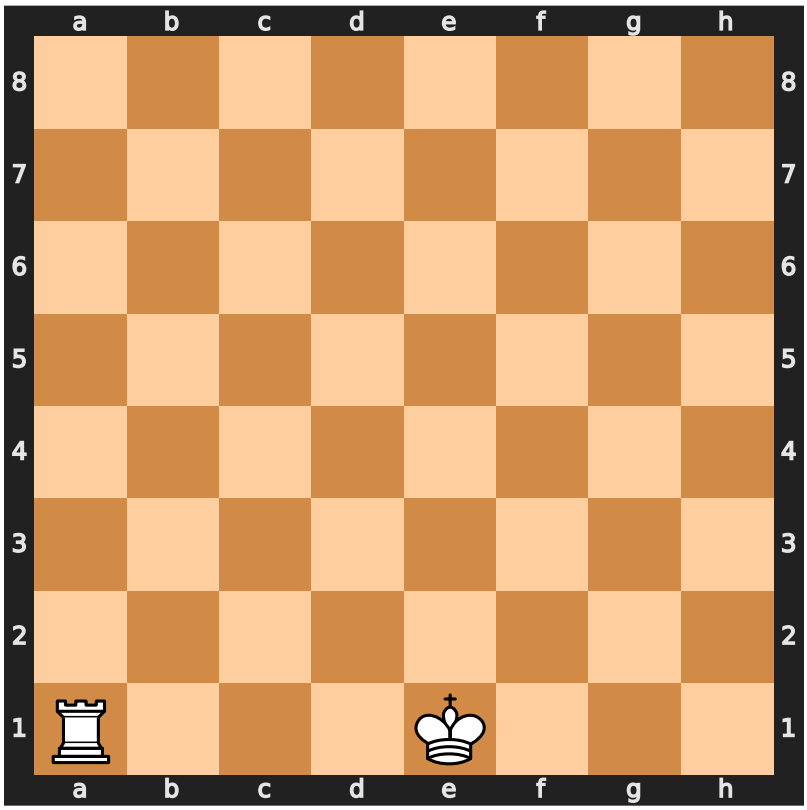

Figure 7.13: Chess Position

the right side of the board are not covered. **Solution:** No, they cannot control all four edges. The Rook covers the a-file (left edge) and the first rank up to the King (bottom edge partially). The King adds f1, f2. But the h-file (right edge), the eighth rank (top edge), and squares like g1, h1 are uncontrolled by either piece. Why this works: Two pieces are not enough to cover a 64-square board. This demonstrates why you need multiple pieces working together.

Exercise 1.18 **Position:** White Knight on a1 (empty board).

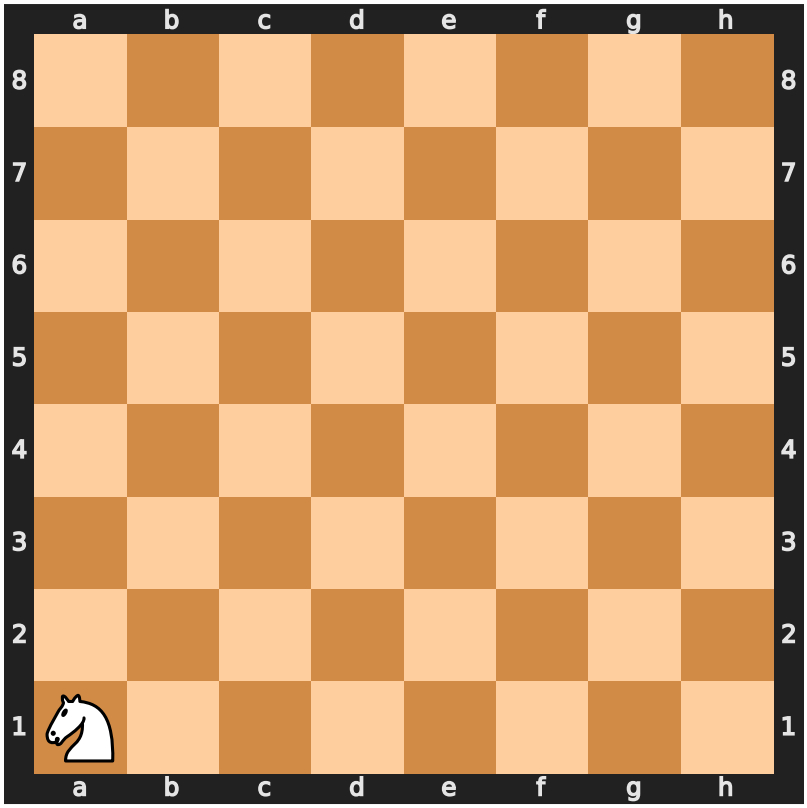

Figure 7.14: Chess Position

Task: How many squares can the Knight reach from a1? **Hint 1:** Try all L-shaped moves from a1. **Hint 2:** Two up, one right = b3. Two right, one up = c2. **Hint 3:** All other L-shapes go off the board. **Solution:** Two squares: b3 and c2. Why this works: The corner is the worst possible position for a Knight. It can reach only 2 squares (compared to 8 from the center). "A Knight on the rim is dim," and the corner is the worst rim of all.

Exercise 1.19 **Position:** White Bishop on d4 (empty board).

Task: How many total squares can the Bishop reach? **Hint 1:** Count each diagonal direction separately: up-left, up-right, down-left, down-right. **Hint 2:** Up-left from d4: c5, b6, a7 (3 squares). Up-right: e5, f6, g7, h8 (4 squares). **Hint 3:** Down-left: c3, b2, a1 (3 squares). Down-right: e3, f2, g1 (3 squares). **Solution:** 13 squares total. Up-left: 3, up-right: 4, down-left: 3, down-right: 3. Why this works: The Bishop is a long-range piece, but it can never reach the other color. From d4 (a light square), all 13 reachable squares are light squares.

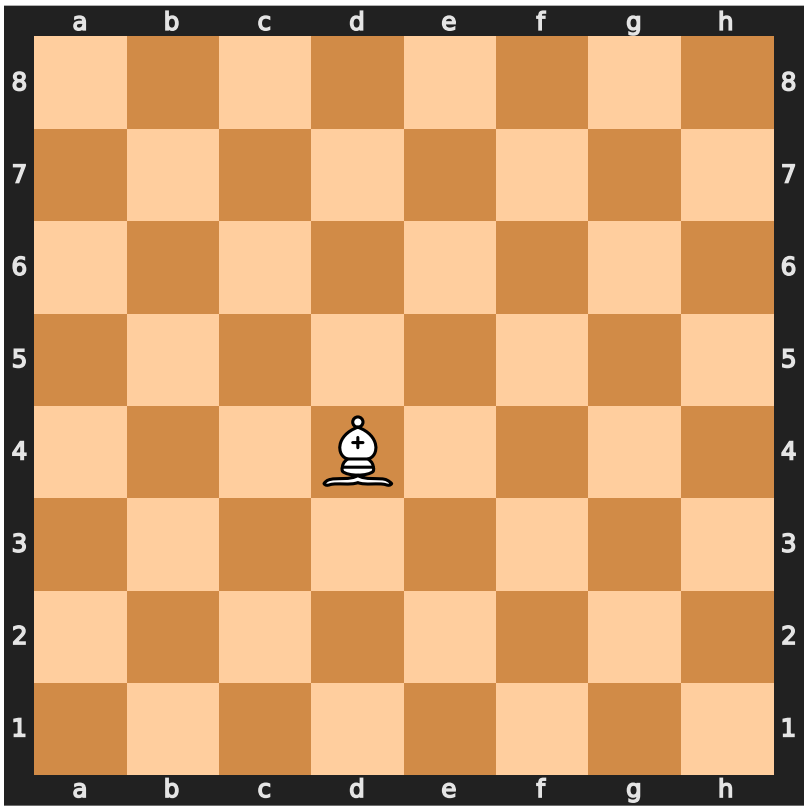

Figure 7.15: Chess Position

Exercise 1.20 **Position:** White Pawn on d4, Black Pawns on c5 and e5 and d5.

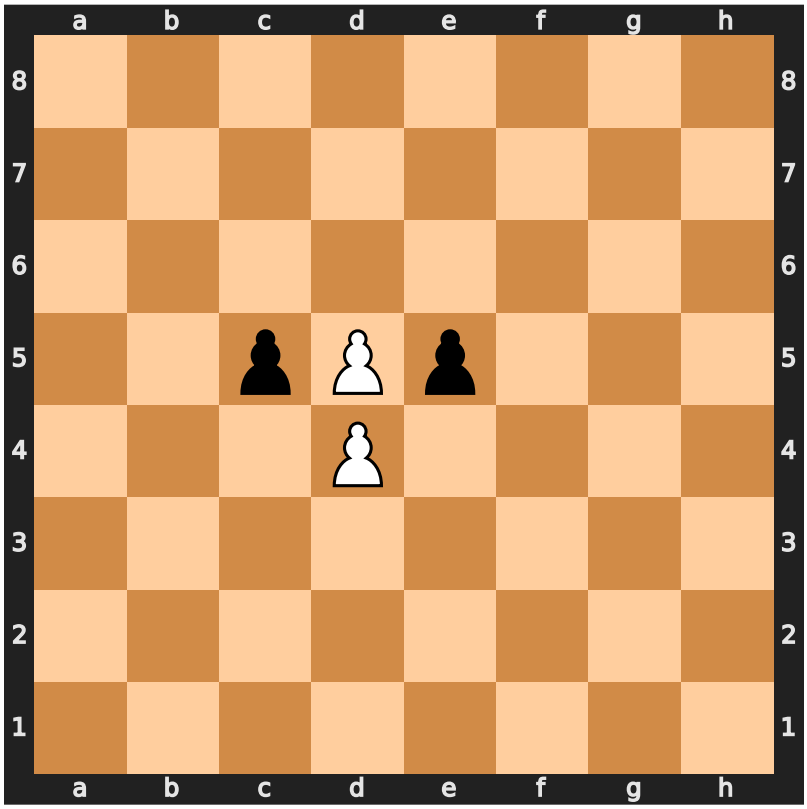

Figure 7.16: Chess Position

Task: There is a problem with this position. Can you spot it? **Hint 1:** Look at d4 and d5. Both have Pawns on them. **Hint 2:** Can a White Pawn on d4 and a Black Pawn on d5 coexist? Pawns move forward. **Hint 3:** If the White Pawn is on d4 and the Black Pawn is on d5, neither Pawn can advance. They are "locked." This is actually legal! They block each other. But the FEN shows a White Pawn on d5, which is different. **Solution:** Looking at the FEN more carefully: there is a White Pawn (P) on d4 and a White Pawn on d5. A player cannot have two Pawns on the same file in a normal game without a capture having cleared the way. The FEN is legal but unusual. The White Pawn on d4 is completely stuck from advancing since d5 has a friendly Pawn blocking it, but it CAN capture on c5 or e5 since those are Black Pawns on the diagonals. Legal moves: dxc5 or dxe5. Why this works: Pawns that are blocked from advancing can often still capture diagonally. Always check both the forward move AND the diagonal captures.

Exercise 1.21 **Position:** Empty board. **Task:** What does the notation "Nf3" mean? What does "e4" mean? What does "Bxc6" mean? **Hint 1:** The first letter (if capital) tells you which piece moves. **Hint 2:** N = Knight, B = Bishop. No letter = Pawn. **Hint 3:** The "x" in Bxc6 means a capture happened. **Solution:** Nf3 = A Knight moves to the square f3. e4 = A Pawn moves to the square e4. Bxc6 = A Bishop captures whatever piece was on c6. Why this works: The piece letter comes first, then the destination square. Pawn moves skip the piece letter. An "x" means a capture.

Exercise 1.22 **Position:** Starting position after the moves 1.e4 e5.

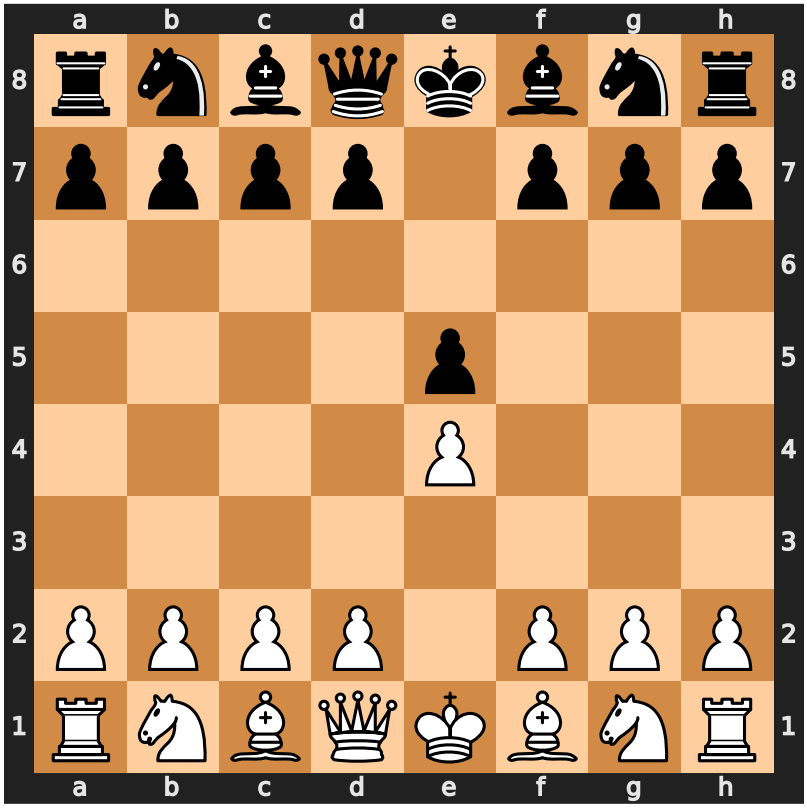

Figure 7.17: Chess Position

Task: After 1.e4 e5, how many pieces can White now move that could not move on the first turn? **Hint 1:** The Pawn on e2 has moved to e4. What square did it free up? **Hint 2:** The Queen on d1 can now move through e2 (since the Pawn left). Can the Queen reach any squares? **Hint 3:** Also, the Bishop on f1 now has a clear diagonal (f1-e2-d3-c4-b5-a6). **Solution:** Two new pieces can move: the Queen (through e2, can reach e2, f3, g4, h5) and the light-squared Bishop on f1 (can reach e2, d3, c4, b5, a6). Why this works: Moving a Pawn opens lines. The e4 Pawn freed up the diagonal for the Bishop and the Queen. This is why Pawn moves are so important in the opening: they open paths for your other pieces.

Exercise 1.23 **Position:** White King on e1, Black Queen on d3 (otherwise empty board).

Task: How many legal moves does the White King have? **Hint 1:** The King is on e1. List all adjacent squares: d1, d2, e2, f1, f2. **Hint 2:** The King cannot move to a square attacked by the Black Queen. Which squares does the Queen on d3 attack? **Hint 3:** The Queen on d3 attacks d1 (same file), d2 (same file), e2 (diagonal), f1 (diagonal), e3 (but that's not adjacent to e1), and many other squares. Check each of the King's 5 candidate squares. **Solution:** The King's adjacent squares are d1, d2, e2, f1, f2. The Queen on d3 attacks: d1 (along d-file), d2 (along d-file), e2 (diagonal d3-e2), and f1 (diagonal d3-e2-f1). That leaves only f2 as a safe square. The King has 1 legal move: Kf2. Why this works: The King cannot move into check. You must check every

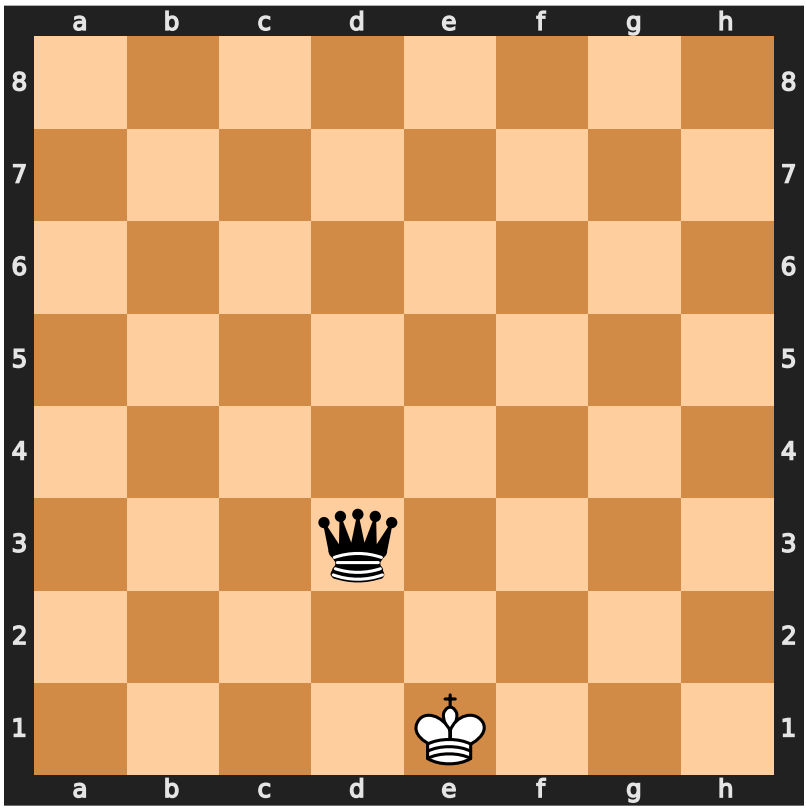

Figure 7.18: Chess Position

adjacent square to see if it is attacked. This is the foundation of checkmate, which you will learn in Chapter 2.

Exercise 1.24 **Position:** Starting position.

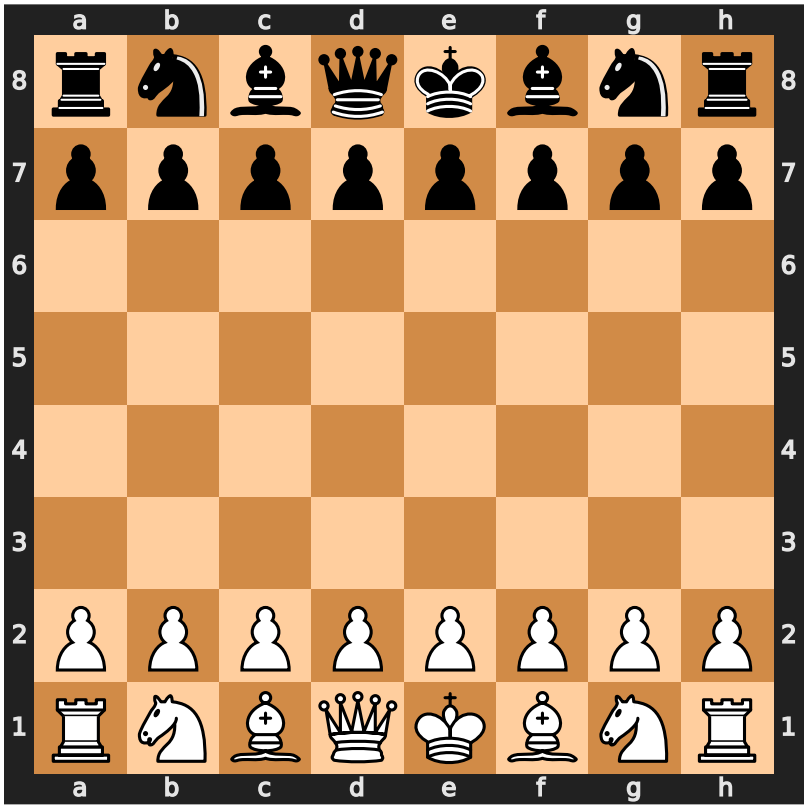

Figure 7.19: Chess Position

Task: In the starting position, how many pieces are on light squares and how many are on dark squares? Count both White and Black pieces. **Hint 1:** Start with the first rank (White's pieces). a1 is dark, b1 is light, c1 is dark, d1 is light, e1 is dark, f1 is light, g1 is dark, h1 is light. **Hint 2:** So on rank 1: 4 pieces on dark squares (a1, c1, e1, g1) and 4 on light squares (b1, d1, f1, h1). Rank 2 is the opposite pattern. **Hint 3:** The same logic applies to ranks 7 and 8. **Solution:** On rank 1: 4 pieces on dark, 4 on light. Rank 2: 4 Pawns on light, 4 Pawns on dark. Rank 7: 4 Pawns on dark, 4 Pawns on light. Rank 8: 4 pieces on light, 4 on dark. Total: 16 pieces on light squares and 16 pieces on dark squares. The starting position is perfectly balanced between light and dark. Why this works: The alternating pattern of the board means that every rank has exactly 4 light and 4 dark squares. With 8 pieces per rank (ranks 1, 2, 7, 8 are occupied), the distribution is perfectly even.

Exercise 1.25 **Position:** White King on g1, White Rook on f1, White Pawns on f2, g2, h2, White Bishop on g5.

Task: This is a common setup after castling Kingside. Name every piece and the square it occupies. Then determine: can the Rook move? Can the Bishop move? Can any Pawn move? **Hint 1:** Name

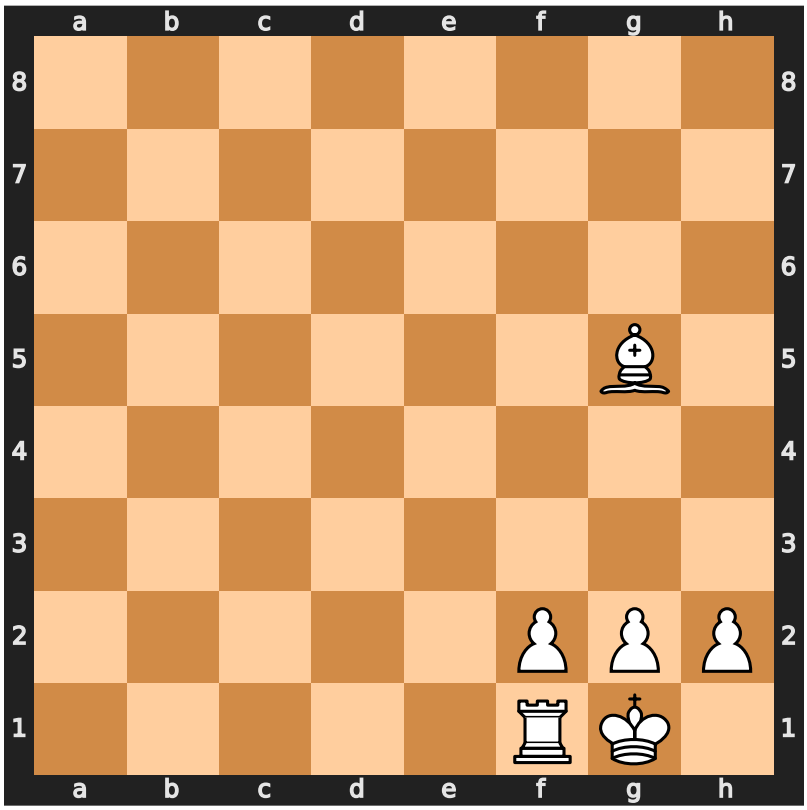

Figure 7.20: Chess Position

them: King on g1, Rook on f1, Pawns on f2, g2, h2, Bishop on g5. **Hint 2:** The Rook on f1 is blocked upward by the Pawn on f2. Can it move along the first rank? **Hint 3:** The Rook can move along the first rank: e1, d1, c1, b1, a1 (leftward) but not past the King to the right. **Solution:** King on g1, Rook on f1, Pawns on f2/g2/h2, Bishop on g5. The Rook CAN move along the first rank to the left (e1, d1, c1, b1, a1) but cannot go up (blocked by f2 Pawn) or right (blocked by the King on g1). The Bishop on g5 CAN move freely on its diagonals (f4, e3, d2, c1, h6, h4, f6, e7, d8). The Pawns CAN move: f3 or f4, g3 or g4 (g2 is on its starting rank), h3 or h4. Why this works: Even in a "cramped" position, most pieces have some moves available. The Rook needs an open file to be effective, which is why later chapters discuss opening files with Pawn exchanges.

Rest Marker. You have completed all 25 exercises. Well done. That was a serious workout for your chess brain.

Chapter 8

Key Takeaways

1. **The board has 64 squares** arranged in 8 files (a-h) and 8 ranks (1-8). Every square has a unique name (like e4 or d5). The center squares (d4, d5, e4, e5) are the most powerful positions on the board.
2. **Six types of pieces, each with unique movement.** King (one square, any direction), Queen (any number of squares, any direction), Rook (any number of squares, straight lines), Bishop (any number of squares, diagonals only, locked to one color), Knight (L-shape, jumps over pieces), Pawn (forward one square, captures diagonally, two squares from starting position).
3. **Games end by checkmate, stalemate, draw, resignation, or time.** Checkmate (King trapped with no escape) is the goal. Stalemate (no legal moves but not in check) is a draw, not a loss.
4. **Chess notation is the language of the game.** Piece letter + destination square. Captures use "x." Check uses "+." You will use notation throughout this book and your chess career.
5. **Your brain is built for this.** Pattern recognition, detail orientation, and deep focus are chess superpowers. Use the Pomodoro method, the pre-study checklist, and the thinking checklist to set yourself up for success.

Chapter 9

Practice Assignment

This week, do the following:

1. **Set up the starting position from memory** at least three times on three different days. Time yourself. Try to beat your previous time.
2. **Play 3 games** on Lichess (lichess.org, free, no account required). Use the 10+0 time control (10 minutes per side, no increment). Do not worry about winning or losing. Focus on making legal moves and using the thinking checklist before each move.
3. **After each game, ask yourself three questions:**
   - What was my best move? (Even if you lost, you did something right.)
   - What was my worst move? (This is where learning happens.)
   - What will I do differently next time? (One thing. Just one.)
4. **Solve 5 puzzles per day** on Lichess (under "Puzzles" in the menu). Start at the lowest difficulty. These are your daily pattern-building reps.

Chapter 10

Progress Check

After completing this chapter and the practice assignment, you should be able to:

- ☐ Set up the starting position from memory in under 60 seconds
- ☐ Name any square on the board when someone points to it
- ☐ Describe how each of the six piece types moves
- ☐ Explain the difference between checkmate, stalemate, and draw
- ☐ Read basic chess notation (Nf3, e4, Bxc6+)
- ☐ Complete a 25-minute study session using the Pomodoro method

If you can check off all six boxes, you are ready for Chapter 2: Check, Checkmate, and Stalemate. If one or two feel shaky, go back and review that section. There is no rush.

Chapter 11

Rest Marker

You finished Chapter 1.

That was 42 pages of foundational chess knowledge and a complete study framework for your brain. Take a real break. Not a "check my phone for two minutes" break. A real one. Stand up. Walk around. Drink some water. Pet an animal if one is nearby.

When you come back, Chapter 2 will teach you the three most important words in chess: check, checkmate, and stalemate. These concepts turn the rules you just learned into an actual game.

See you there.

"Good stopping point. Come back refreshed."

Chapter 1 complete. 25 exercises. 0 annotated games. Rating range: Absolute beginner (0). Next: Chapter 2: Check, Checkmate, and Stalemate

Chapter 12

Chapter 2: Check, Checkmate, and Stalemate

Volume I: Foundations | Rating Range: Beginner (0–400)

"Even a poor plan is better than no plan at all." Mikhail Chigorin

---

12.1 What You'll Learn

- What **check** means, and the three ways to escape it
- What **checkmate** means, and how to recognize it instantly
- What **stalemate** means, and why it is a draw, not a win
- Four classic checkmate patterns every beginner must know
- How to avoid accidental stalemates when you are winning

12.2 Part 1: Check

12.2.1 The King Is Under Attack

In Chapter 1, you learned how each piece moves. Now it is time to learn the most important rule in all of chess: **you are never allowed to leave your king in danger.**

Check means that one of your opponent's pieces is attacking your king right now. When your king is in check, you *must* deal with it immediately. You cannot ignore it. You cannot play a different move and hope it works out. The check must be answered before anything else.

Here is a simple way to think about it: if an enemy piece could capture your king on the very next move, your king is in check.

Set up your board: Place a White rook on e1 and a Black king on e8. Remove everything else from the board.

```
8  . . . . k . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . R . . .
   a b c d e f g h
```

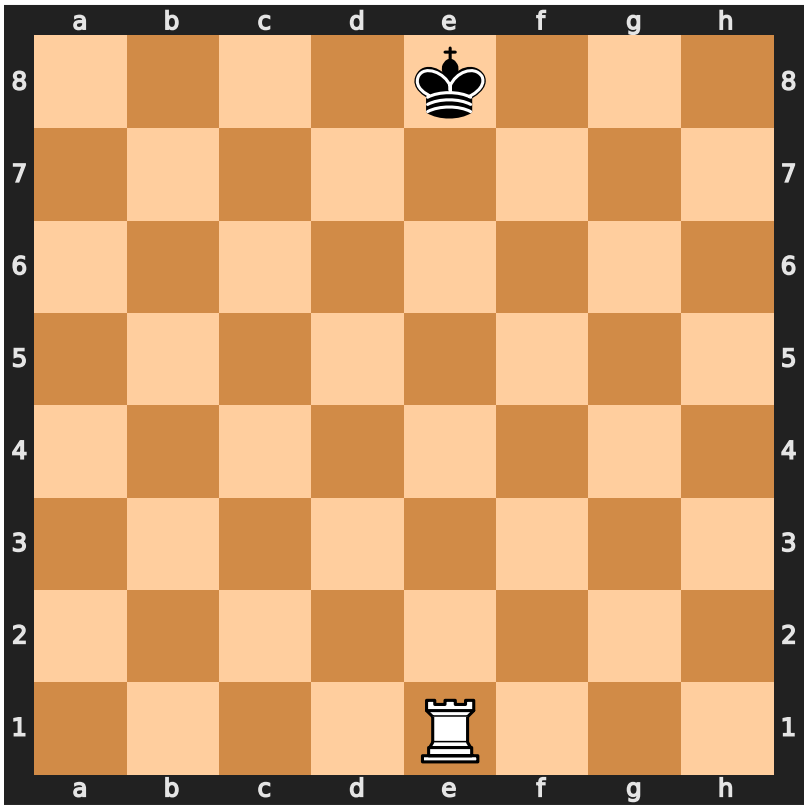

Figure 12.1: Chess Position

The rook on e1 attacks straight up the e-file all the way to e8, where the Black king stands. The Black king is **in check.** It is Black's turn, and Black must respond to this check right now. The king can move to f8, d8, f7, or d7 to escape.

12.2.2 The Three Ways to Escape Check

When your king is in check, you have exactly three options:

1. **Move the king** to a safe square
2. **Block the check** by placing a piece between the attacker and your king
3. **Capture the attacking piece**

If none of these three works, the position is checkmate and the game is over. Let's try each escape

method one at a time.

12.2.2.1 Escape Method 1: Move the King

The most straightforward response to check is to step the king to a square where it is no longer attacked.

Set up your board: White king on a1, White rook on e1. Black king on e8. Nothing else.

```
8  . . . . k . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  K . . . R . . .
   a b c d e f g h
```

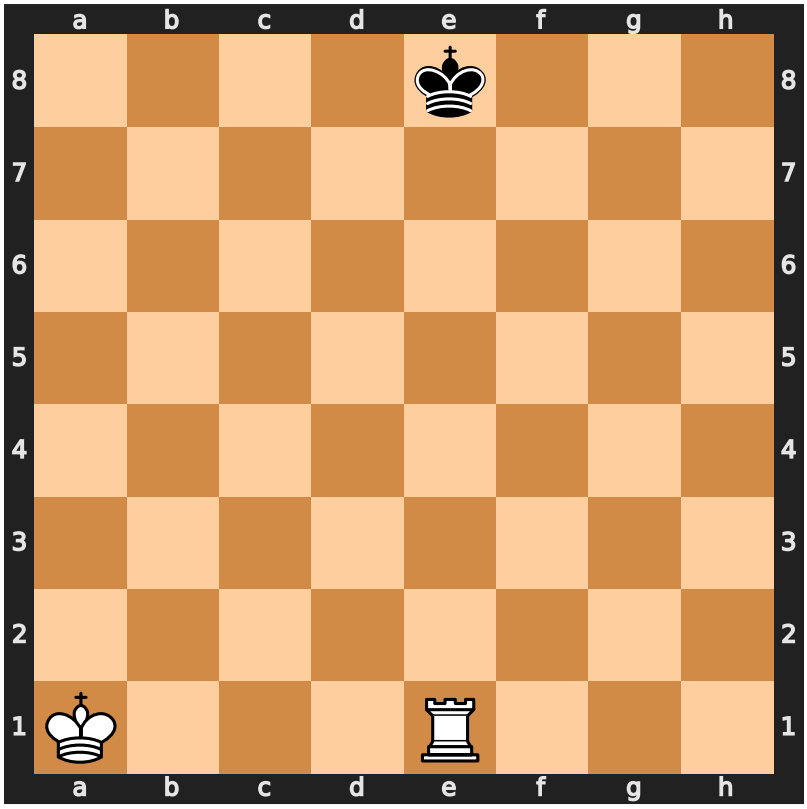

Figure 12.2: Chess Position

The rook on e1 gives check along the e-file. The Black king needs to step off the e-file to escape. It can move to d8, d7, f8, or f7. Any of those squares works because the rook does not attack them.

The king **cannot** move to e7, because that square is still on the e-file and the rook attacks it.

Key idea: When you move the king out of check, make sure the new square is truly safe. Look at every enemy piece that might attack that square before you commit.

12.2.2.2 Escape Method 2: Block the Check

Sometimes you do not have to move the king at all. If you can place one of your own pieces between the attacker and your king, the check is blocked.

Set up your board: White king on a1, White rook on e1. Black king on e8, Black knight on c7. Nothing else.

```
8  . . . . k . . .
7  . . n . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  K . . . R . . .
   a b c d e f g h
```

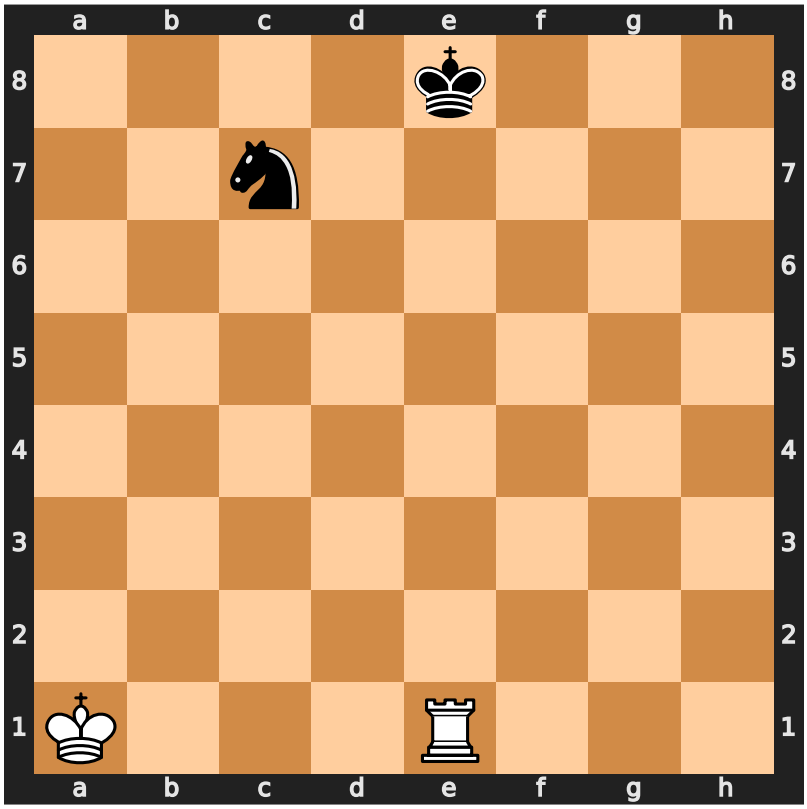

Figure 12.3: Chess Position

The rook on e1 checks the Black king along the e-file. But the Black knight on c7 can jump to e6, landing between the rook and the king. After …Ne6, the rook's line of attack is interrupted. The

king is safe.

Key idea: Blocking only works against pieces that attack in lines: rooks, bishops, and queens. You **cannot** block a check from a knight, because knights jump over pieces. You also cannot block a check from a pawn that is right next to you.

12.2.2.3 Escape Method 3: Capture the Attacker

The third option is the most satisfying: just take the piece that is giving check.

Set up your board: White king on a1, White bishop on e5. Black king on h8, Black rook on a5. Nothing else.

```
8  . . . . . . . k
7  . . . . . . . .
6  . . . . . . . .
5  r . . . B . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  K . . . . . . .
   a b c d e f g h
```

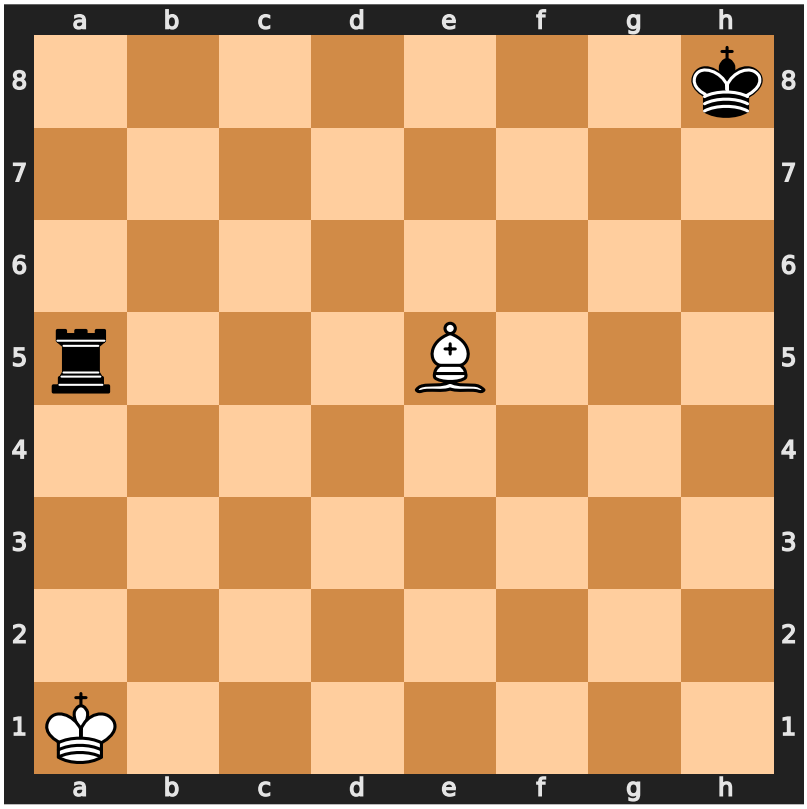

Figure 12.4: Chess Position

The White bishop on e5 gives check to the Black king along the diagonal (e5-f6-g7-h8). But the Black rook on a5 can capture the bishop: …Rxe5. The attacker is gone, and the check is over.

Key idea: Capturing the attacker is often the best response, because you remove a dangerous enemy piece while saving your king in one move.

12.2.3 Double Check: When Only the King Can Move

Sometimes, two pieces give check at the same time. This is called a **double check,** and it is one of the most powerful moves in chess.

Think about why. You cannot block two attacks at once. You cannot capture two pieces at once. The only option is to **move the king.**

Set up your board: White king on a1, White rook on e1, White bishop on a4. Black king on e8. Nothing else.

```
8  . . . . k . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  B . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  K . . . R . . .
   a b c d e f g h
```

The bishop on a4 attacks along the diagonal a4-b5-c6-d7-e8, giving check. At the same time, the rook on e1 attacks along the e-file, also giving check. This is double check.

Black cannot block both attacks. Black cannot capture both pieces. The only option is for the king to move. It can go to f8, d8, or f7.

Double check is rare, but when it happens, it is almost always devastating.

12.2.4 Discovered Check

A **discovered check** happens when one piece moves out of the way, uncovering an attack from a piece behind it. The piece that moves is not the one giving check. It is the piece that was hidden behind it.

Set up your board: White king on a1, White rook on e1, White knight on e4. Black king on e8. Nothing else.

```
8  . . . . k . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . N . . .
3  . . . . . . . .
```

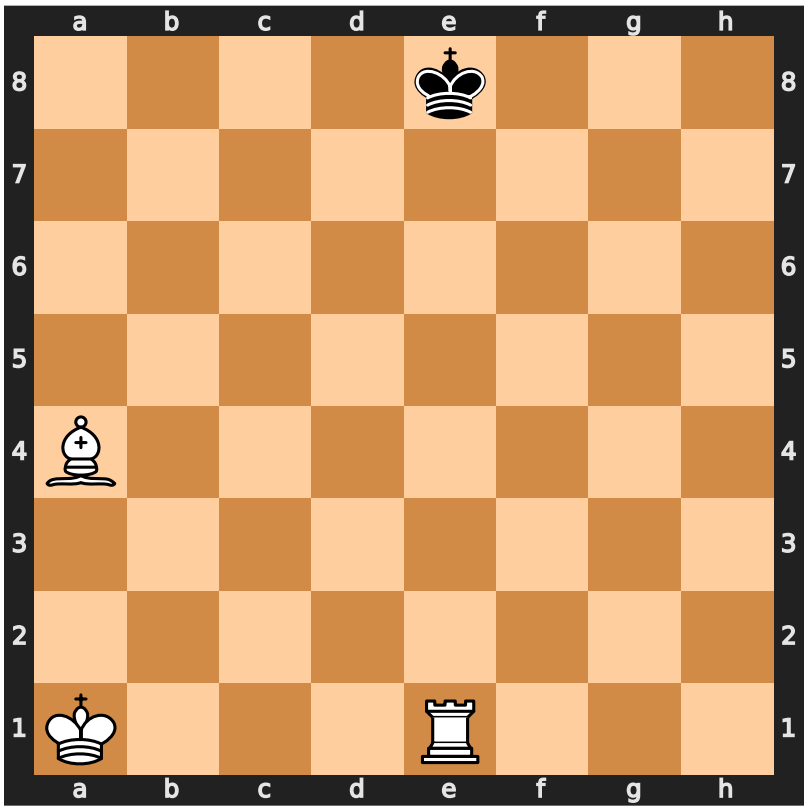

Figure 12.5: Chess Position

```
2  . . . . . . . .
1  K . . . R . . .
   a b c d e f g h
```

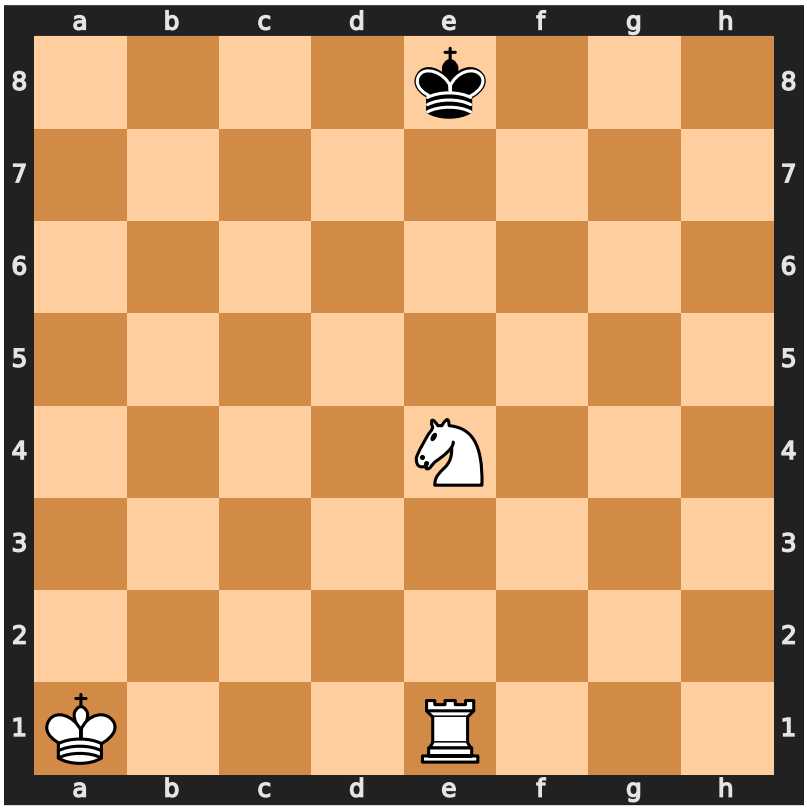

Figure 12.6: Chess Position

Right now, the rook on e1 cannot check the Black king because the White knight on e4 is blocking the e-file. But if the knight moves to *any* square (say Nd6 or Nf6 or Nc5), it clears the e-file, and the rook gives check.

The beauty of discovered check is that the knight can go wherever it wants. It can capture a piece, threaten the queen, or land on a strong square. Meanwhile, the Black king must deal with the rook's check first. You get to make two threats with one move.

Pause and think: Double check is a special kind of discovered check where the piece that moves ALSO gives check. Both pieces attack the king at the same time. That is why double check is so hard to answer.

Rest Marker. Good stopping point! You now understand check and the three ways to escape it. Come back with fresh eyes, or keep going if you are feeling sharp.

12.3 Part 2: Checkmate

12.3.1 The Goal of the Game

Checkmate means the king is in check AND there is no way to escape. The game is over immediately. The player who delivers checkmate wins.

Let's be very precise about what checkmate requires. ALL THREE of these must be true at the same time:

1. The king is in check (an enemy piece is attacking it)
2. The king cannot move to a safe square (every adjacent square is blocked or attacked)
3. No friendly piece can block the check or capture the attacker

If even one escape exists, it is just check, not checkmate.

12.3.2 Recognizing Checkmate vs. "Almost Checkmate"

This skill trips up beginners at first, but it gets easier fast. The trick is to be systematic: check every escape, every block, every capture. Do not assume. Verify.

Set up your board: White rook on a8, White king on g1. Black king on g8, Black pawns on f7, g7, h7. Nothing else.

```
8  R . . . . . k .
7  . . . . . p p p
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . K .
   a b c d e f g h
```

Is this checkmate? Let's go through the checklist:

Is the king in check? The rook on a8 attacks along the entire 8th rank. Between a8 and g8: b8, c8, d8, e8, and f8 are all empty. Yes, the rook attacks g8. The king is in check.

Can the king move? Let's check every adjacent square: - **f8:** Attacked by the rook along rank 8. - **h8:** Attacked by the rook along rank 8. - **f7, g7, h7:** Blocked by Black's own pawns.

Can anything block or capture? No other Black pieces exist.

This IS checkmate. The king is trapped behind its own pawns, and the rook delivers the killing blow along the back rank.

Now change one thing. Remove the pawn on f7:

If that pawn were gone, the king could escape to f7. That one pawn was the difference between checkmate and just a check.

Lesson: Always check every possible escape square before you declare checkmate.

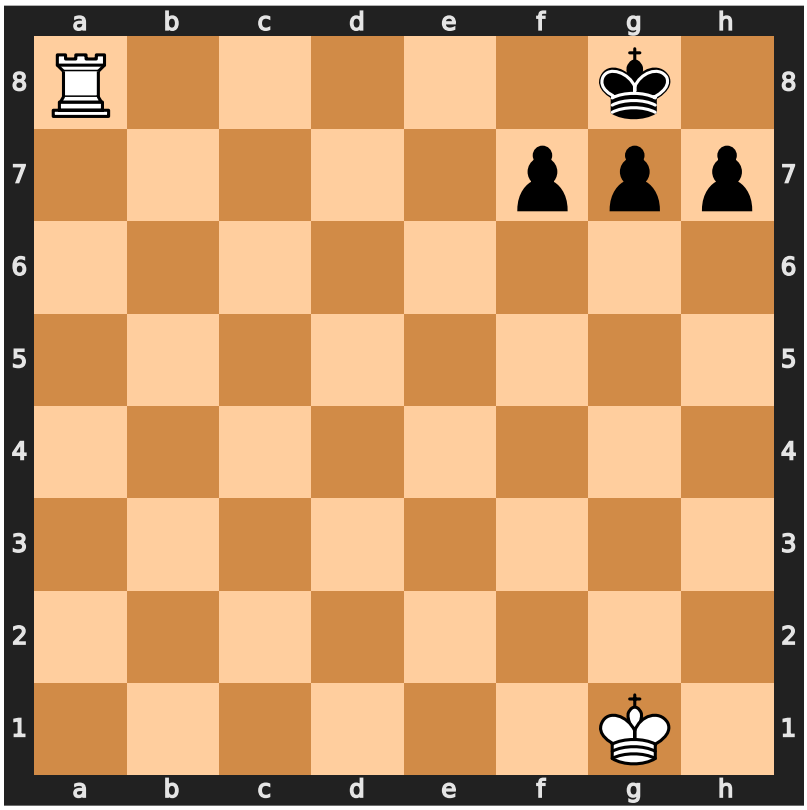

Figure 12.7: Chess Position

12.3.3 Common Checkmate Patterns for Beginners

Now let's learn four checkmate patterns that show up again and again. Master these, and you will win many games.

12.3.3.1 Pattern 1: Back Rank Mate

The **back rank mate** is the most common checkmate in beginner and intermediate games. It happens when a king is trapped on its back rank (rank 1 for White, rank 8 for Black) by its own pawns, and a rook or queen delivers check along that rank.

Set up your board: White king on g1, White pawns on f2, g2, h2. Black king on a8, Black rook on e8. Nothing else.

```
8  k . . . r . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . P P P
1  . . . . . . K .
   a b c d e f g h
```

Black plays **1...Re1#.** The rook slides to e1, giving check along the first rank. The White king on g1 is trapped: - f1 and h1 are both attacked by the rook along rank 1 - f2, g2, and h2 are blocked by White's own pawns

Checkmate. The king was boxed in by its own three pawns.

How to prevent back rank mate: Give your king an escape square! Push one of the pawns in front of your king forward one square (like h3 or g3). Chess players call this "giving the king luft" (a German word meaning "air"). One small pawn move early on can save your life later.

12.3.3.2 Pattern 2: Scholar's Mate (The 4-Move Checkmate)

Scholar's Mate is the first trap every beginner learns. It delivers checkmate in four moves.

Set up your board to the starting position. All pieces in their normal places.

1. e4 e5 Both sides push a center pawn. Normal.

2. Bc4 Nc6 White develops the bishop to c4, aiming at the f7 square. Why f7? Because it is the weakest point in Black's starting position. Only the king defends it.

3. Qh5 Nf6?? White brings the queen to h5, aiming at both e5 and f7. Now the queen AND the bishop both target f7. Black plays …Nf6, trying to attack the queen, but this is a terrible mistake. Black needed to defend f7.

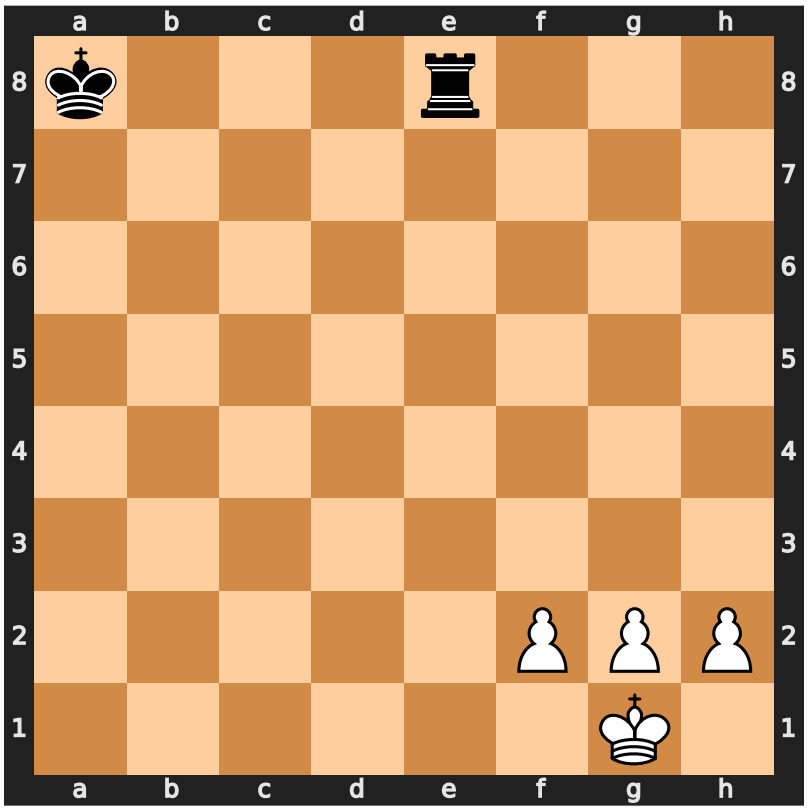

Figure 12.8: Chess Position

4. Qxf7#

```
8  r . b q k b . r
7  p p p p . Q p p
6  . . n . . n . .
5  . . . . p . . .
4  . . B . P . . .
3  . . . . . . . .
2  P P P P . P P P
1  R N B . K . N R
   a b c d e f g h
```

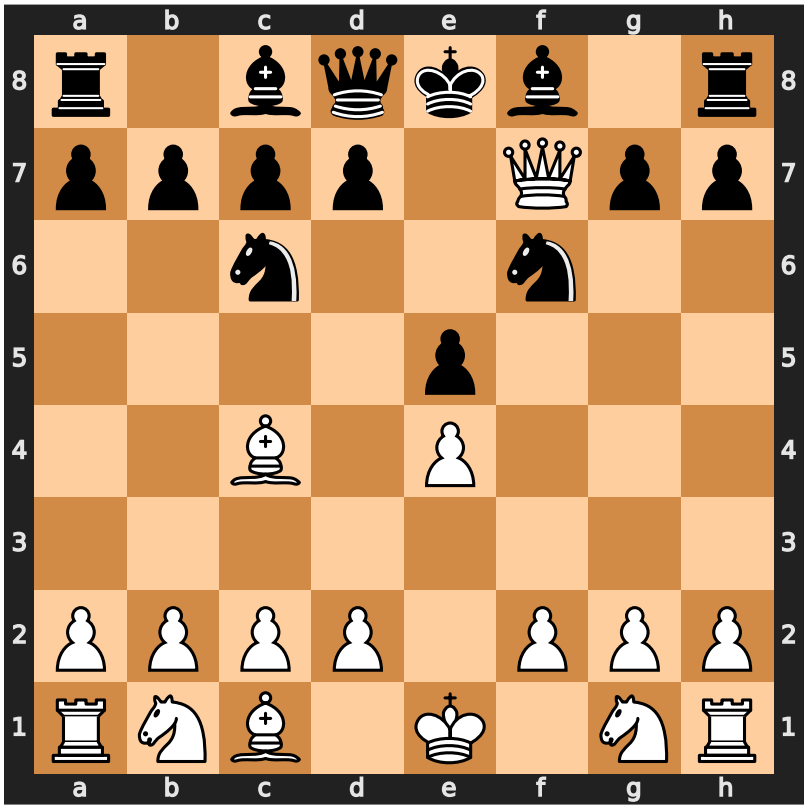

Figure 12.9: Chess Position

The queen captures the f7 pawn with check. The king cannot take the queen because the bishop on c4 protects it. Every escape square is covered: e7, d7, and f8 are all attacked by the queen. **Checkmate.**

How to prevent Scholar's Mate: If your opponent plays Qh5, defend f7! Play **...g6** (kicks the queen away) or **...Qe7** (defends f7 directly). After you defend, your opponent has wasted time bringing the queen out early, and you will have the better position.

12.3.3.3 Pattern 3: Fool's Mate (The 2-Move Checkmate)

Fool's Mate is the fastest possible checkmate in chess. It takes only two moves.

Set up your board to the starting position.

1. f3? e5 2. g4?? Qh4#

```
8  r n b . k b n r
7  p p p p . p p p
6  . . . . . . . .
5  . . . . p . . .
4  . . . . . . P q
3  . . . . . P . .
2  P P P P P . . P
1  R N B Q K B N R
   a b c d e f g h
```

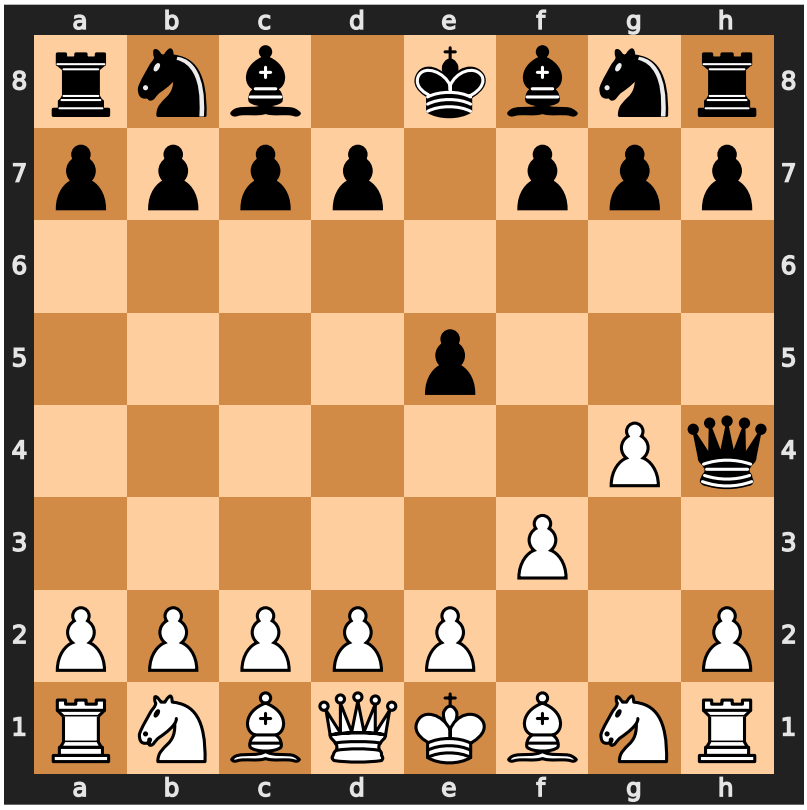

Figure 12.10: Chess Position

White's first two moves (f3 and g4) ripped open the diagonal from h4 to e1 and removed every pawn that could have defended it. Black's queen slides to h4 with check.

The White king has no escape: f2 is attacked by the queen (diagonally), e2 is blocked by the pawn, d1 is blocked by the White queen, and f1 is blocked by the bishop. **Checkmate in two moves.**

You will almost never see Fool's Mate in a real game. But it teaches a valuable lesson: **do not weaken the squares around your king by pushing the f-pawn and g-pawn early.**

12.3.3.4 Pattern 4: Smothered Mate

Smothered mate is one of the most beautiful patterns in chess. A knight delivers checkmate to a king that is completely boxed in by its own pieces.

Set up your board: White knight on f7, White king on c1. Black king on h8, Black rook on g8, Black pawns on g7 and h7. Nothing else.

```
8  . . . . . . r k
7  . . . . . N p p
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . K . . . . .
   a b c d e f g h
```

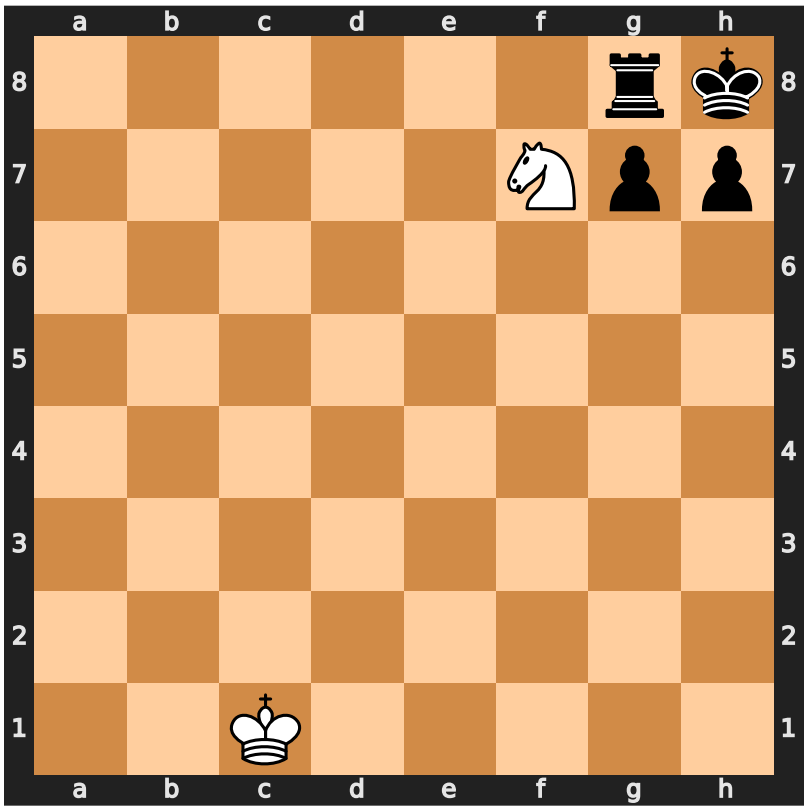

Figure 12.11: Chess Position

A knight on f7 attacks h8 (among other squares). The Black king on h8 is in check. Can it escape? - **g8:** Occupied by Black's own rook. - **g7:** Occupied by Black's own pawn. - **h7:** Occupied by Black's own pawn.

The king is literally surrounded by its own army. No piece can capture the knight, and you cannot block a knight's attack because knights jump over pieces. **Checkmate.**

In the classic combination leading to smothered mate, the attacking side sacrifices the queen on g8, forcing …Rxg8, and then the knight delivers mate on f7. If you ever get the chance to play this pattern, it is one of the most thrilling moments in chess.

Rest Marker. Great progress! You now know four checkmate patterns that win real games. Take a break if you need one. The next section covers stalemate.

12.4 Part 3: Stalemate

12.4.1 No Legal Moves, But Not in Check

Here is the rule that surprises every beginner: **if it is your turn, you have no legal moves, AND your king is NOT in check, the game is a draw.** This is called **stalemate.**

Not a win for your opponent. Not a loss. A draw. Even if your opponent has a queen and a full army of pieces, if they accidentally stalemate you, the game is tied.

This feels unfair at first. But stalemate is a draw, and it has been this way for hundreds of years. Learning to spot it will save you from throwing away won games, and it might also save you from losing hopeless ones.

12.4.2 Stalemate Example 1: King in the Corner

Set up your board: White queen on b6, White king on c1. Black king on a8. Nothing else.

```
8  k . . . . . . .
7  . . . . . . . .
6  . Q . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . K . . . . .
   a b c d e f g h
```

It is Black's turn. Is the king in check? The queen on b6 controls the b-file, the 6th rank, and several diagonals. But it does NOT attack a8. (Check for yourself: a8 is not on the b-file, not on the 6th rank, and not on any diagonal from b6.)

The king is **not** in check.

Can the king move? - **a7:** The queen attacks a7 (one square diagonally from b6). - **b8:** The queen attacks b8 (same file as b6). - **b7:** The queen attacks b7 (same file, one square away).

Those are the only squares adjacent to a8. The king has **no legal moves** and is **not in check.** This is **stalemate.** The game is a draw.

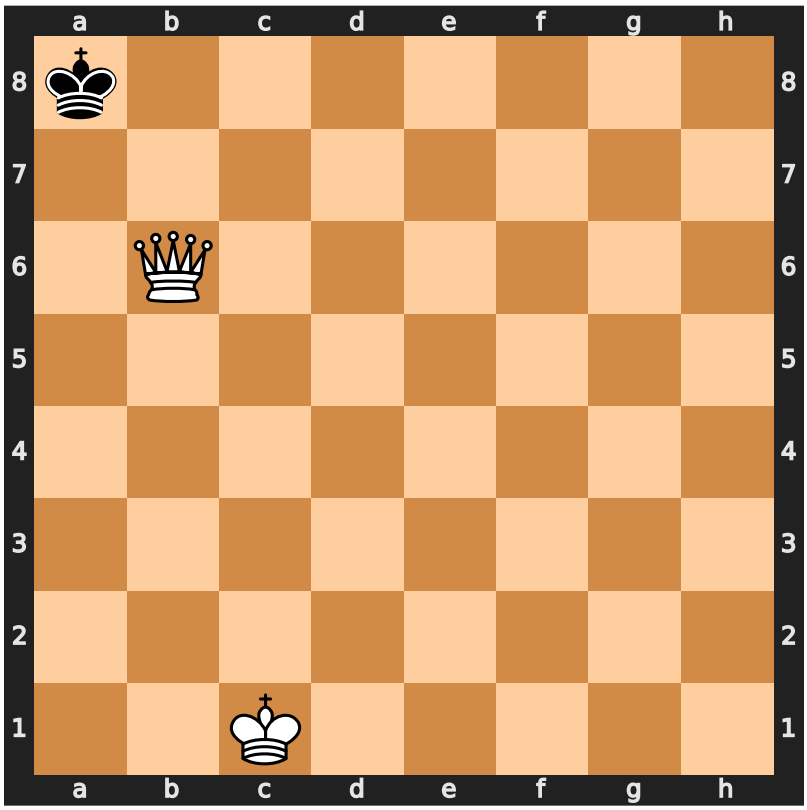

Figure 12.12: Chess Position

White had a queen and was about to win, but played the queen to the wrong square and accidentally drew.

12.4.3 Stalemate Example 2: The Pawn Problem

Set up your board: White king on e6, White pawn on e7. Black king on e8. Nothing else.

```
8  . . . . k . . .
7  . . . . P . . .
6  . . . . K . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

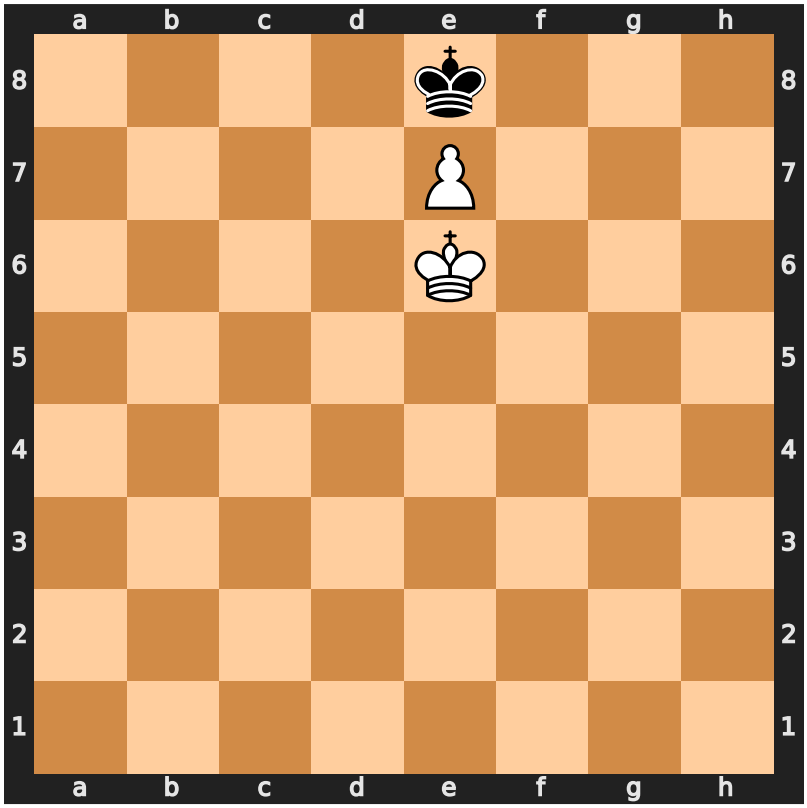

Figure 12.13: Chess Position

It is Black's turn. The pawn on e7 attacks diagonally: d8 and f8. It does NOT attack e8 (pawns do not attack straight ahead). The White king on e6 controls d7 and f7. The king on e8 is NOT in check.

Can the king move? - **d8:** Attacked by the pawn (diagonally). - **f8:** Attacked by the pawn (diagonally). - **d7:** Controlled by the White king. - **f7:** Controlled by the White king.

No legal moves, no check. **Stalemate.** White was one step from promoting a pawn to a queen, but the game is a draw. This is one of the most common stalemate patterns in king-and-pawn endings.

12.4.4 Why Stalemate Catches Beginners Off Guard

New players usually discover stalemate the hard way. They have a massive advantage, they chase the enemy king into a corner, they are about to deliver checkmate… and then the game is a draw.

The mistake is almost always the same: the winning side controls too many squares around the enemy king without actually giving check.

The lesson: When you have a big material advantage, slow down. Before every move, ask yourself: "After I make this move, will my opponent have at least one legal move?" If the answer is no and you are not giving check, you are about to stalemate them.

12.4.5 The Stalemate Trap: When You Are Losing

Here is the flip side: if YOU are the one losing, stalemate is your best friend.

When you are down a queen and about to lose, look for ways to get stalemated. Sometimes you can sacrifice your last pieces or maneuver your king into a position where you have no legal moves.

If your opponent makes one careless move, you turn a total loss into a draw. At the beginner level, this happens more often than you might think.

12.4.6 Stalemate Patterns to Avoid When Winning

Trap 1: King in the corner with no moves. When you push the enemy king to the edge, make sure it always has at least one legal move until you are ready to deliver checkmate.

Trap 2: The queen is too powerful. A queen controls so many squares that it can accidentally remove every legal move from the enemy king. When you have queen and king versus a lone king, keep your queen a few squares away until you are ready to mate.

Trap 3: All enemy pieces are stuck. Sometimes the losing side has pawns that cannot move. If their king also has no moves, you have stalemate. Count ALL of your opponent's legal moves, not just the king's.

Practical tip: When you have a queen and king versus a lone king, push the enemy king to the edge, bring your king close, and deliver checkmate. Practice this until you can do it without stalemate. Chapter 5 covers this in full detail.

Rest Marker. You have finished all three theory sections! Check, checkmate, and stalemate are the foundation of everything in chess. Celebrate this. Then come back for the annotated games and exercises.

12.5 Annotated Game 1: The Unguarded Back Rank

This short game fragment shows how a back rank mate unfolds in practice.

Set up your board to this position: White king on g1, White rook on c1, White rook on d1, White pawns on f2, g3, h2. Black king on g8, Black rook on c8, Black bishop on e6, Black pawn on a7, Black pawns on f7, g7, h7.

```
8  . . r . . . k .
7  p . . . . p p p
6  . . . . b . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . P .
2  . . . . . P . P
1  . . R R . . K .
   a b c d e f g h
```

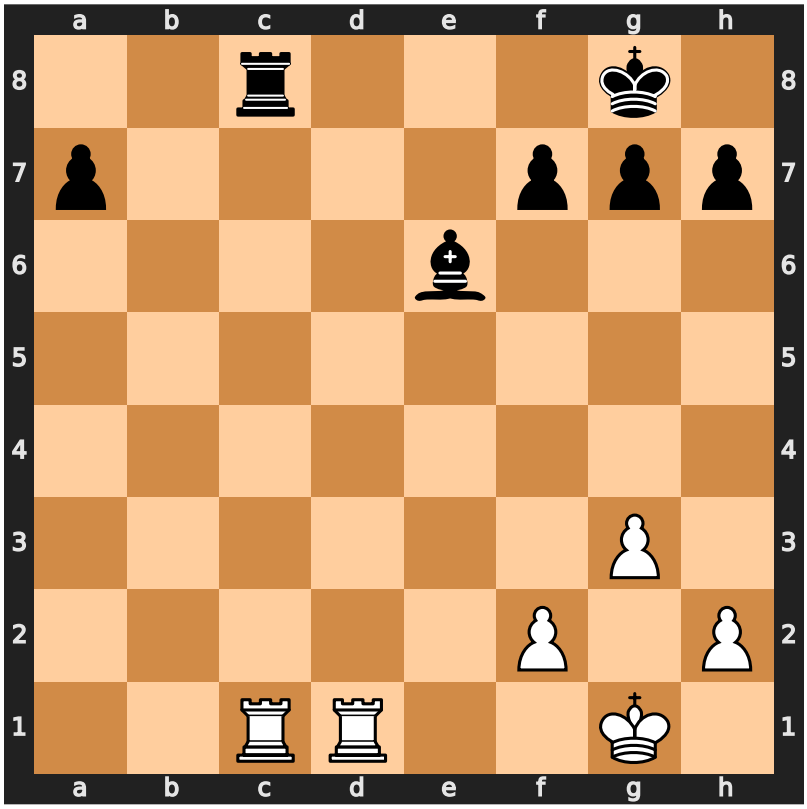

Figure 12.14: Chess Position

White to move. Notice the White king on g1 has a pawn on g3 instead of g2, so it has the escape square g2 if needed. But look at the Black king. It sits on g8, trapped behind pawns on f7, g7, and h7. No escape square on the back rank. Black's rook on c8 is the only piece guarding the 8th rank.

White has two rooks. Black has only one rook defending the back rank. This mismatch is the recipe for a back rank disaster.

Pause and look: How can White exploit the weak back rank?

1. Rxc8+!

White's rook from c1 captures the Black rook on c8 with check. The White rook on c8 attacks along the 8th rank toward g8. Between c8 and g8, the squares d8, e8, and f8 are all empty. The king is in check.

Can the king escape? No: f8 and h8 are both attacked by the rook along rank 8, and the pawns block f7, g7, h7.

Can anything block? Can anything capture the rook on c8? The bishop on e6 can! A bishop moves diagonally, and e6-d7-c8 is a valid diagonal. So Black plays the only move:

1...Bxc8

The bishop captures the rook on c8. The immediate danger seems over. But now the back rank has no rook defending it. The bishop on c8 cannot move along ranks and files, only diagonals.

```

3  . . . . . . P .
2  . . . . . P . P
1  . . . R . . K .
   a b c d e f g h
```

2. Rd8#!

The second rook slides to d8, giving check along rank 8. Between d8 and g8, the squares e8 and f8 are empty. The king on g8 is in check.

Can the king move? f8 and h8 are attacked by the rook along rank 8. The pawns block f7, g7, h7. Can the bishop on c8 help? It sits to the LEFT of the rook on d8, not between the rook and the king. And bishops cannot capture along ranks (only diagonals), so it cannot take the rook on d8.

Checkmate.

The key lesson: Black's rook was the only piece guarding the back rank. When White sacrificed one rook to remove that defender, the second rook had a clear path to deliver mate. This is called a **deflection sacrifice:** you give up material to lure a defender away from its job.

Critical position FEN: `2b3k1/p4ppp/8/8/8/6P1/5P1P/6K1 b - - 0 1` *(after 2. Rd8#)*

12.6 Annotated Game 2: The Stalemate Trap

This fragment shows what happens when the winning side gets careless.

Set up your board to this position: White king on h6, White queen on f6, White pawn on g5. Black king on h8. Nothing else.

```
8  . . . . . . . k
7  . . . . . . . .
6  . . . . . Q . K
5  . . . . . . P .

1  . . . . . . . .
   a b c d e f g h
```

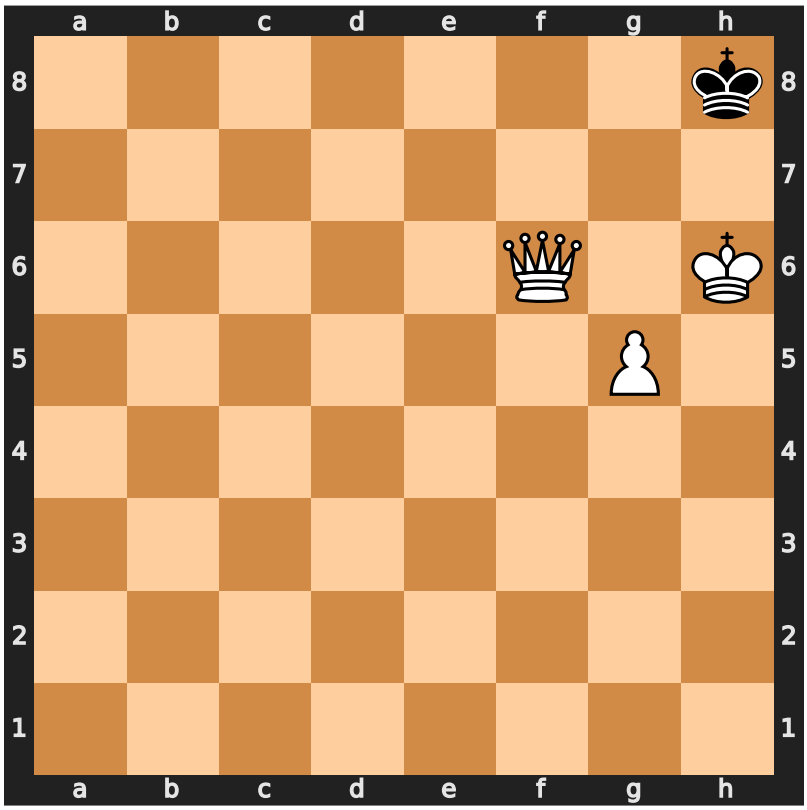

Figure 12.15: Chess Position

White is completely winning. White has a queen and a pawn, while Black has only a king trapped in the corner. Checkmate should be easy. White has three different checkmates available: Qf8#, Qd8#, and Qg7#.

Pause and look: Can you find one of the checkmates? Try before reading on.

The easiest is **Qf8#.** The queen moves to f8, checking the king on h8 along rank 8. The king cannot go to g7 (queen attacks it) or h7 (the White king on h6 controls h7). Nowhere to run. Checkmate.

But what if White does not see the checkmate and plays a "safe-looking" move instead?

1. Qf7??

White moves the queen to f7, perhaps thinking about pushing the pawn. But look at what happens to the Black king.

```

2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

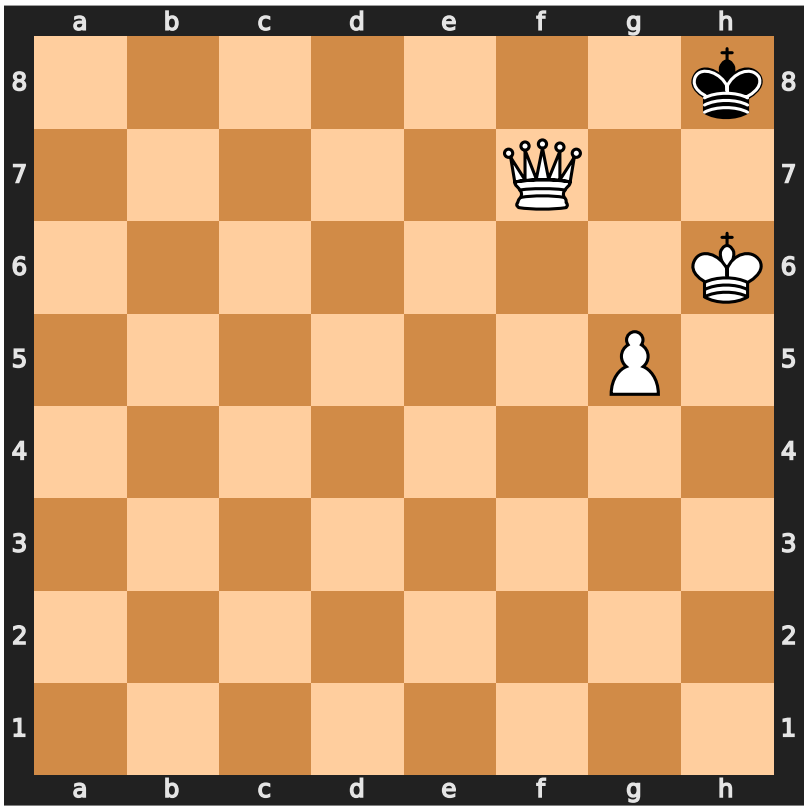

Figure 12.16: Chess Position

Is the king in check? The queen on f7 attacks along rank 7, the f-file, and diagonals. It attacks g8 (diagonally) and h7 (along rank 7). But it does NOT attack h8 directly. The king is NOT in check.

Can the king move? - **g8:** The queen attacks g8 (diagonally from f7). - **g7:** The queen attacks g7 (along rank 7, and the White king controls it too). - **h7:** The White king on h6 controls h7, and the queen attacks it along rank 7.

No legal moves. No check. **Stalemate!** The game is a draw.

White had checkmate in one move (Qf8#) but played Qf7 instead and accidentally drew. The queen controlled too many squares around the enemy king without actually giving check.

The lesson: When you are about to win, look for checkmate FIRST. Do not play "safe" moves that might accidentally remove all your opponent's legal moves.

Rest Marker. The annotated games are done. Excellent work following along on your board. Now it is time for exercises. You can do them all at once, or spread them out over several days. There is no rush.

12.7 Exercises

12.7.1 Section A: Is It Check, Checkmate, or Stalemate? (Exercises 2.1–2.10)

For each position, determine whether the king is in check, checkmate, stalemate, or none of these.

Exercise 2.1 **Position:** White king on a1, White rook on d1. Black king on d8. No other pieces. Black to move.

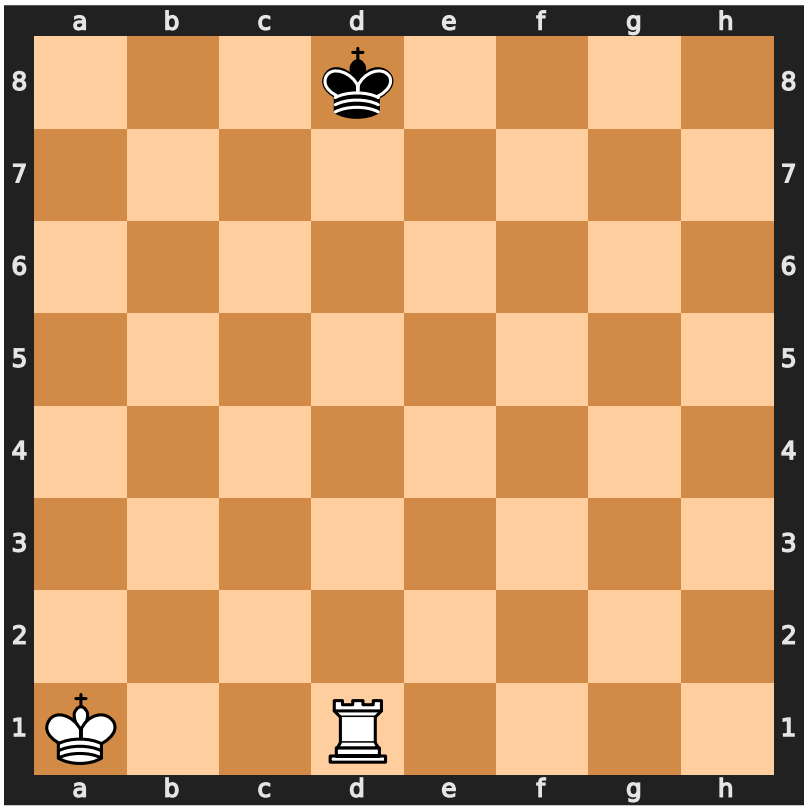

Figure 12.17: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** What does the rook on d1 attack? **Hint 2:** The rook attacks along the d-file: d2, d3, d4, d5, d6, d7, d8. **Hint 3:** The king is in check. Can it move to c8, e8, c7, or e7? **Solution: Check.** The rook checks along the d-file. The king escapes to c8, e8, c7, or e7 (none of those squares are attacked by the rook or the White king). Why this works: the rook only controls the d-file and rank 1, so squares on other files are safe.

Exercise 2.2 **Position:** White rook on a8, White king on g1. Black king on g8, Black pawns on f7, g7, h7. Black to move.

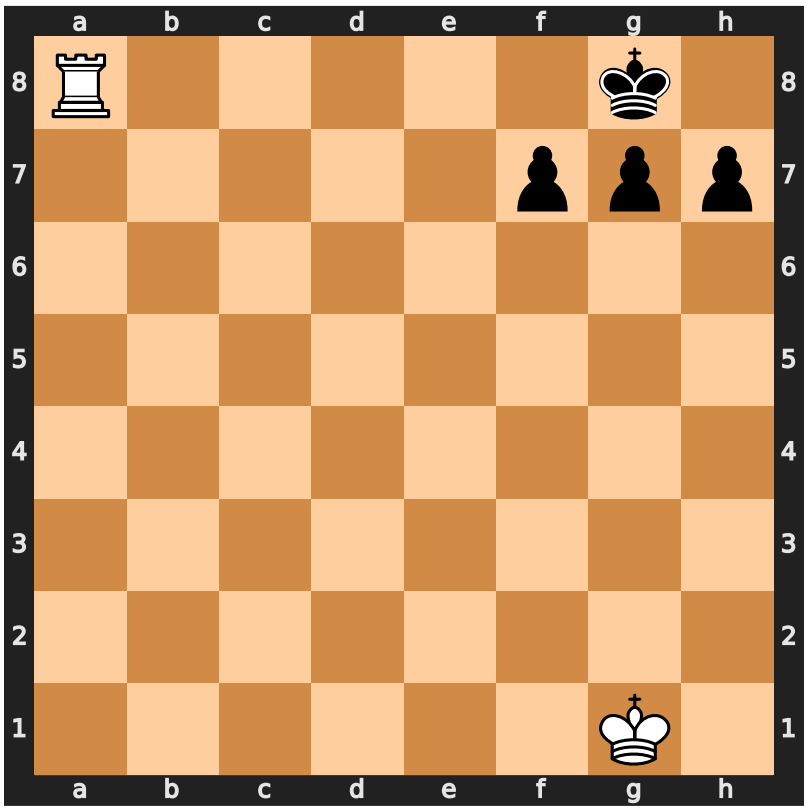

Figure 12.18: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The rook on a8 attacks along the entire 8th rank. **Hint 2:** Can the king move to f8 or h8? Both are on rank 8. **Hint 3:** f7, g7, and h7 are blocked by pawns. All rank-8 squares are attacked. **Solution: Checkmate.** The rook checks along rank 8. The king cannot move to f8 or h8 (rook controls rank 8) and the pawns block f7, g7, h7. No piece can block or capture. This is a classic back rank mate.

Exercise 2.3 **Position:** White queen on b6, White king on c1. Black king on a8. No other pieces. Black to move.

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** Does the queen on b6 attack a8? Check the b-file, rank 6, and diagonals from b6. **Hint 2:** a8 is NOT on the b-file, NOT on rank 6, and NOT on any diagonal from b6. **Hint 3:** The king is not in check. Can it move to a7, b8, or b7? **Solution: Stalemate.** The queen does not attack a8, so the king is not in check. But a7 (queen diagonal), b8 (queen file), and b7 (queen file) are all controlled. No legal moves, no check = stalemate. The game is a draw.

Exercise 2.4 **Position:** White king on a1, White bishop on c4. Black king on f7. No other pieces. Black to move.

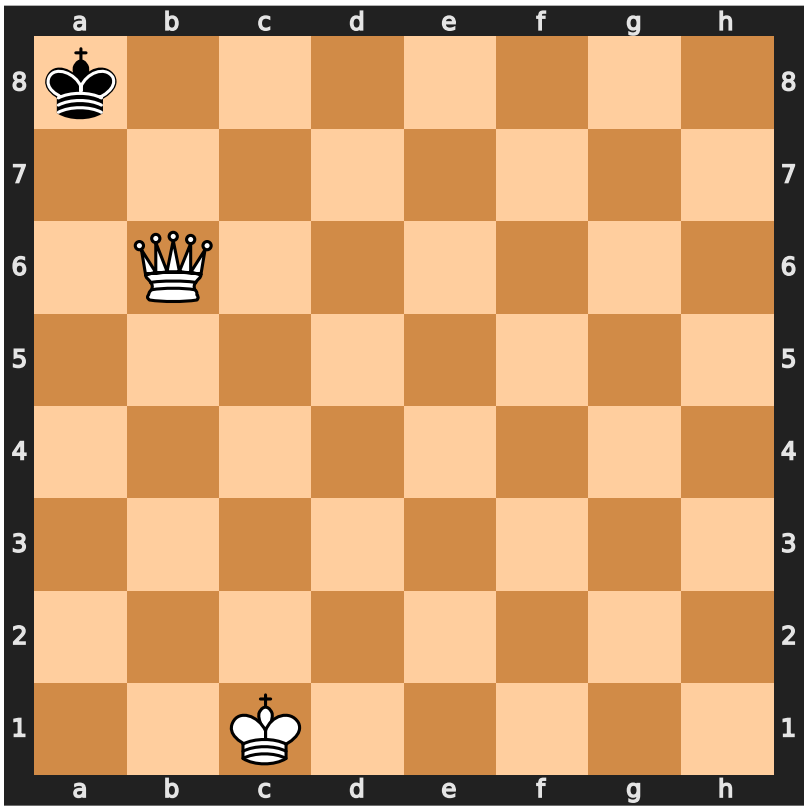

Figure 12.19: Chess Position

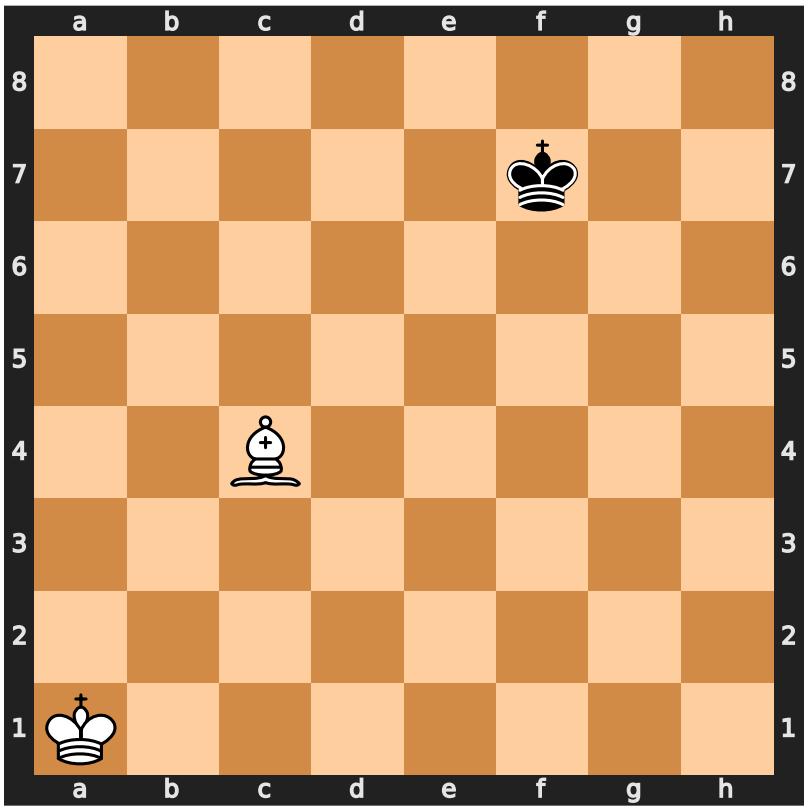

Figure 12.20: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The bishop on c4 attacks along two diagonals. **Hint 2:** One diagonal goes c4-d5-e6-f7. Does it reach f7? **Hint 3:** Yes! The king is in check. But it has many escape squares. **Solution: Check.** The bishop checks along the diagonal c4-d5-e6-f7. The king can escape to f8, e8, g7, e7, g6, or f6 (all safe from the bishop and the distant White king). Not checkmate.

Exercise 2.5 **Position:** White queen on g7, White king on h6. Black king on h8. No other pieces. Black to move.

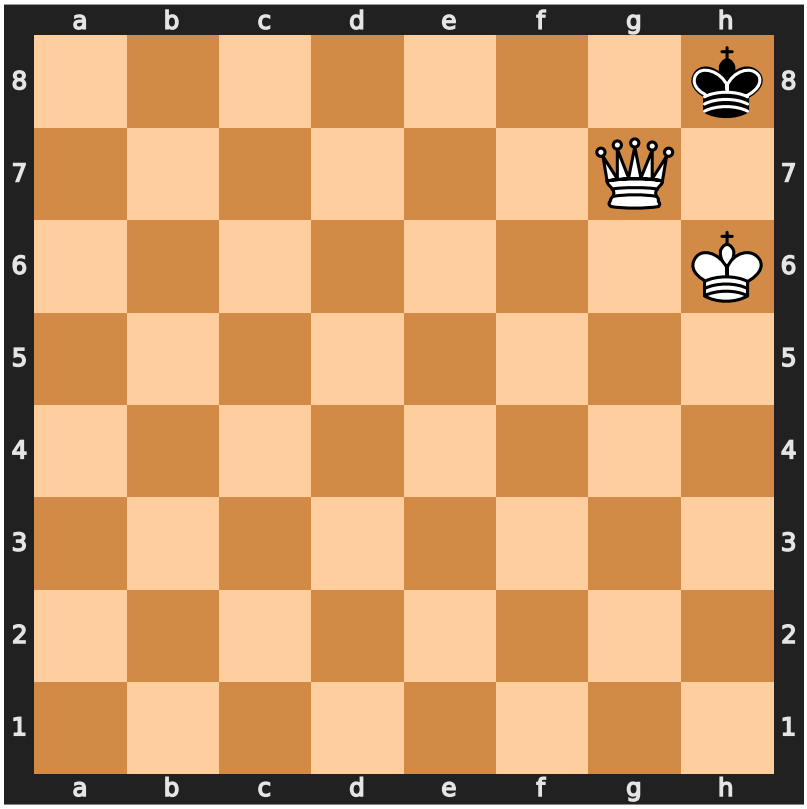

Figure 12.21: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The queen on g7 attacks diagonally. Does it reach h8? **Hint 2:** g7 to h8 is one square diagonally. Yes, check. **Hint 3:** Can the king go to g8? The queen controls g8 (same file). h7? The White king controls h7. **Solution: Checkmate.** The queen checks diagonally. g8 is attacked by the queen (g-file), and h7 is controlled by the White king on h6. No escape, no blocks, no captures.

Exercise 2.6 **Position:** White king on a1, White knight on f6. Black king on e8. No other pieces. Black to move.

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** A knight on f6 attacks which squares? **Hint 2:** From f6, the knight attacks d5, d7, e4, e8, g4, g8, h5, h7. Does it hit e8? **Hint 3:** Yes! But can the king escape to f8, d8, or f7? **Solution: Check.** The knight attacks e8. The king escapes to f8, d8, f7, or e7 (the knight attacks d7 but not these squares). Not checkmate.

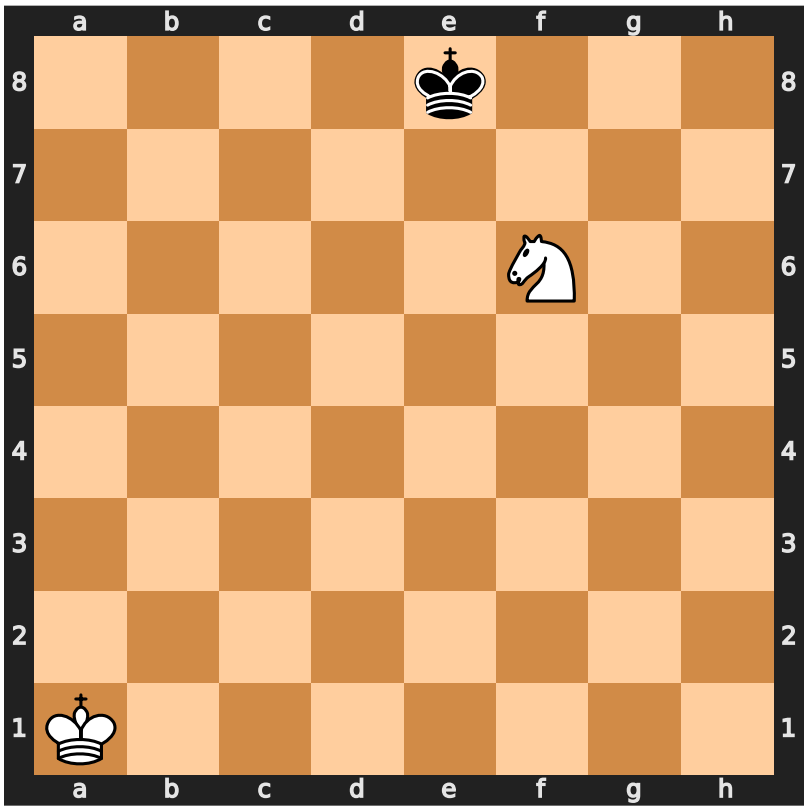

Figure 12.22: Chess Position

Exercise 2.7 **Position:** White rook on b8, White rook on a7, White king on g1. Black king on e8. No other pieces. Black to move.

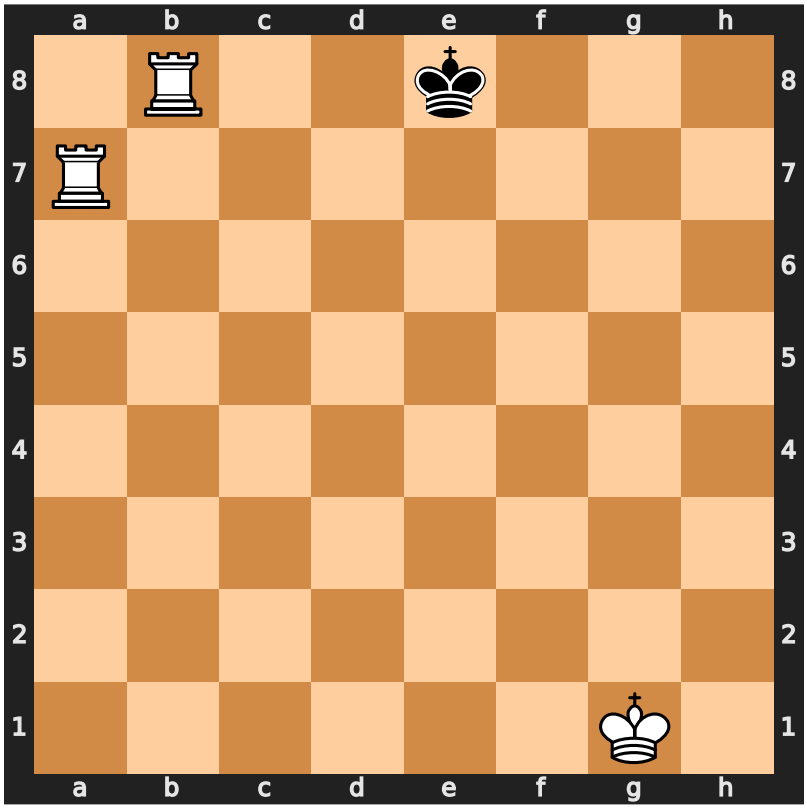

Figure 12.23: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The rook on b8 attacks along rank 8. Does it reach e8? **Hint 2:** Between b8 and e8: c8, d8 are empty. Yes, check. **Hint 3:** Can the king move to d7, f7? The rook on a7 attacks the entire 7th rank. **Solution: Checkmate.** The rook on b8 checks along rank 8 (c8, d8, e8 are all attacked). The rook on a7 controls the entire 7th rank, blocking d7, e7, and f7. The king has no escape: f8 is on rank 8 (attacked), d8 is on rank 8 (attacked). Classic two-rook "ladder" checkmate.

Exercise 2.8 **Position:** White king on e6, White pawn on e7. Black king on e8. No other pieces. Black to move.

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The pawn on e7 attacks d8 and f8. Does it attack e8? **Hint 2:** Pawns attack diagonally, never straight ahead. e8 is NOT attacked. **Hint 3:** The king is not in check. But can it move anywhere? Check d8, f8, d7, f7. **Solution: Stalemate.** The pawn attacks d8 and f8 diagonally. The White king controls d7 and f7. The king on e8 is not in check, but has zero legal moves. Draw! This is the most common stalemate trap in king-and-pawn endings.

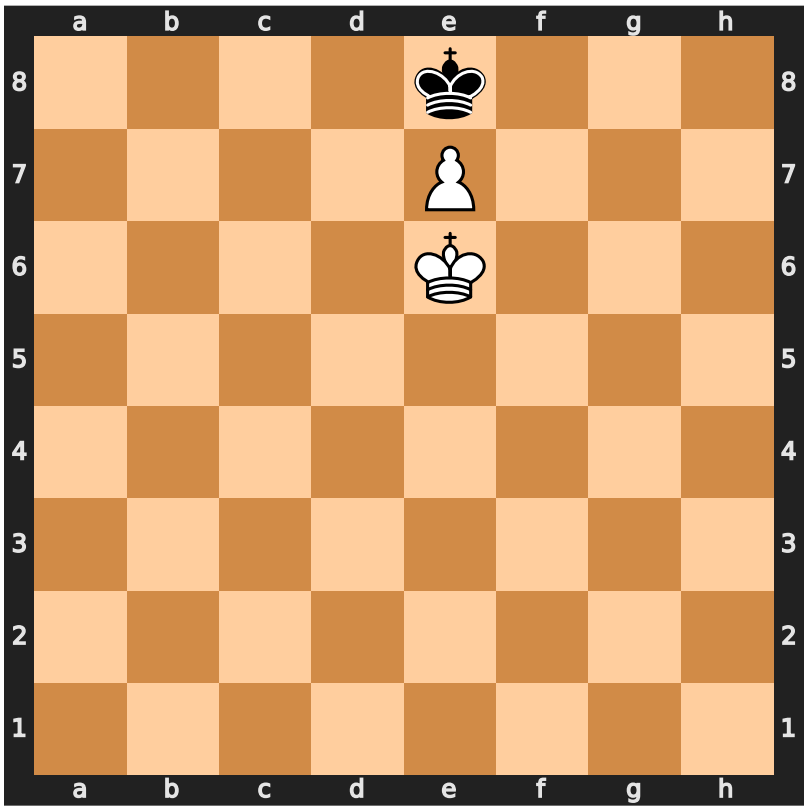

Figure 12.24: Chess Position

Exercise 2.9 **Position:** White king on d1, White pawn on c4. Black king on d5. No other pieces. Black to move.

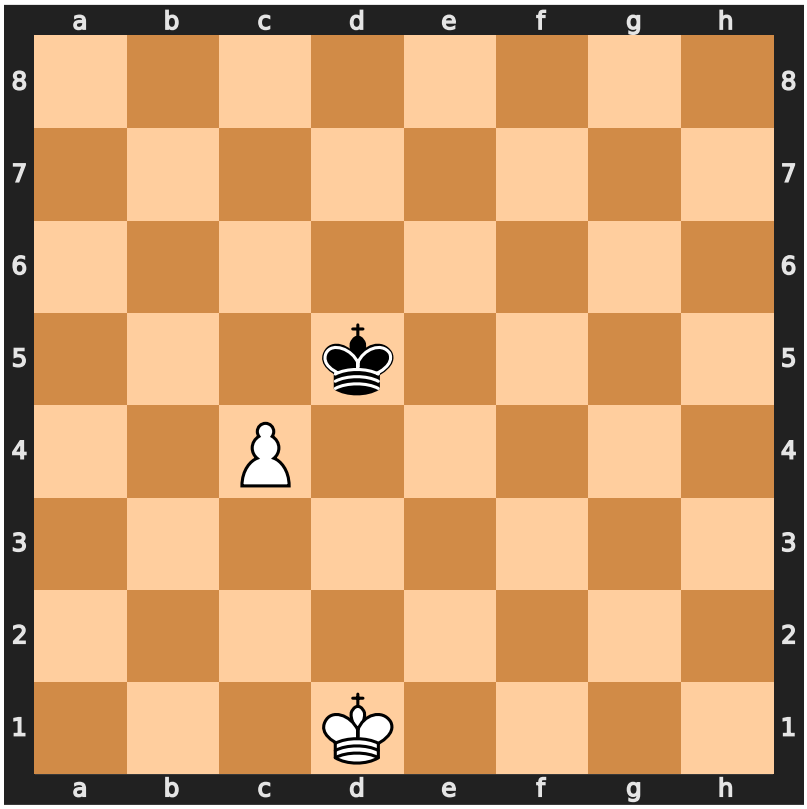

Figure 12.25: Chess Position

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** The pawn on c4 attacks which squares? **Hint 2:** A White pawn on c4 attacks b5 and d5 (diagonally forward for White). **Hint 3:** The king is in check from the pawn! But it has many escape squares. **Solution: Check.** The pawn on c4 attacks d5 diagonally. The king can escape to c6, d6, e6, c5, d4, e5, e4, or even capture the pawn with Kxc4. Not checkmate.

Exercise 2.10 **Position:** White queen on f5, White king on g1. Black king on h8, Black pawn on g7. No other pieces. Black to move.

Task: Is the Black king in check, checkmate, or stalemate? **Hint 1:** Does the queen on f5 attack h8? **Hint 2:** f5 diagonals: e6, d7, etc. on one; g6, h7 on another. f5 along rank 5. f5 along f-file. None reach h8. **Hint 3:** The king is NOT in check and NOT in stalemate (the g7 pawn can move to g6 or g5). **Solution: None of the above.** The queen does not check the king, so it is not check or checkmate. And Black has legal moves (the g7 pawn can advance to g6 or g5), so it is not stalemate either. It is simply Black's turn to play a normal move.

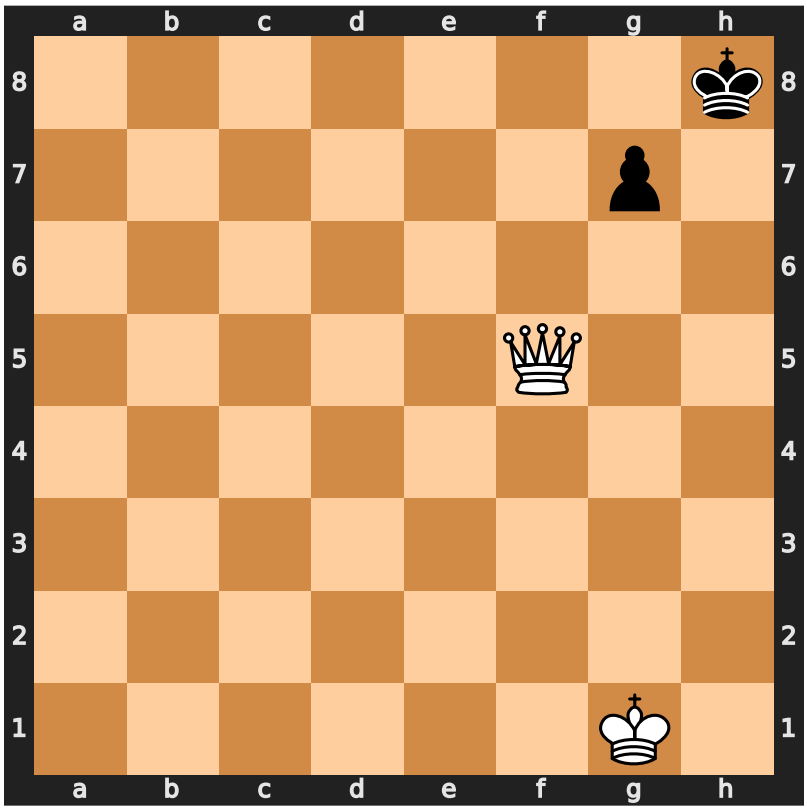

Figure 12.26: Chess Position

12.7.2 Section B: Find Checkmate in 1 Move (Exercises 2.11–2.25)

White to move. Find the move that delivers checkmate.

Exercise 2.11 **Position:** White rook on a1, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

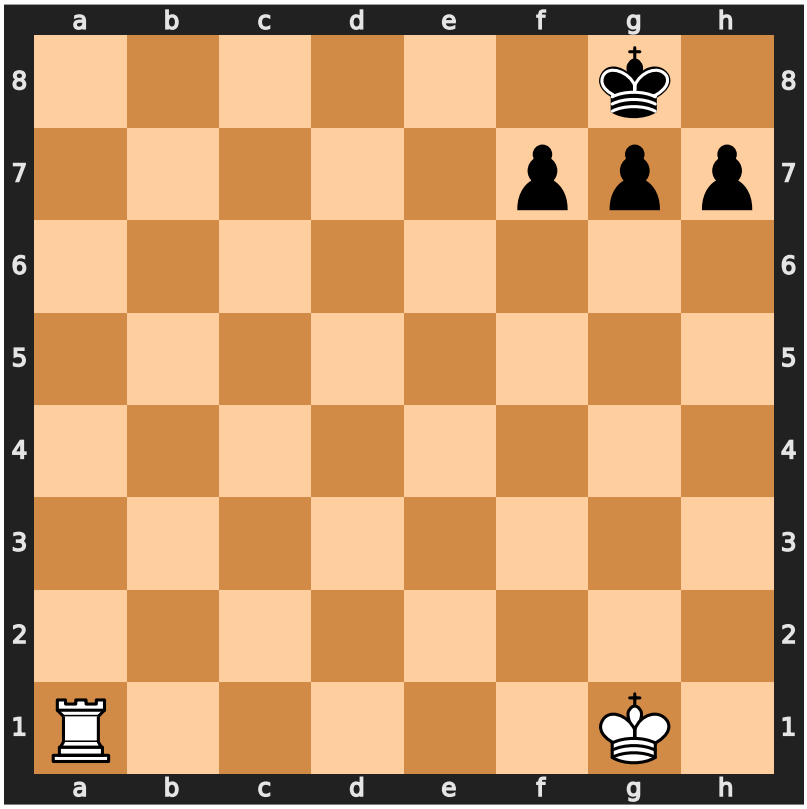

Figure 12.27: Chess Position

Task: Find checkmate in one move. **Hint 1:** The Black king is trapped behind three pawns on the 8th rank. **Hint 2:** What piece can reach the 8th rank and give check? **Hint 3:** The rook can slide all the way from a1 to a8. **Solution: 1. Ra8#.** The rook delivers check along the 8th rank. The king cannot go to f8 or h8 (rook controls rank 8). Pawns block f7, g7, h7. Back rank mate!

Exercise 2.12 **Position:** White queen on c1, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

Task: Find checkmate in one move. **Hint 1:** Same back rank weakness as the previous exercise. **Hint 2:** The queen can also attack along ranks, like a rook. **Hint 3:** Send the queen to the 8th rank where it checks along the entire row. **Solution: 1. Qc8#.** The queen delivers check along rank 8 (c8 to g8 is a clear line). f8 and h8 are controlled. Pawns block the 7th rank.

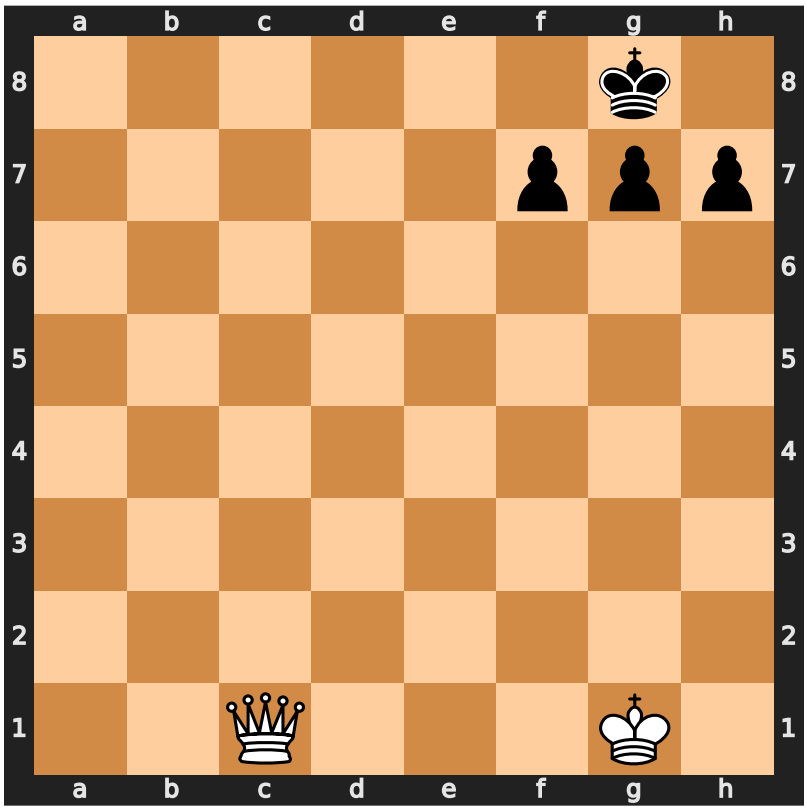

Figure 12.28: Chess Position

Exercise 2.13 **Position:** White queen on a2, White king on g1. Black king on h8, Black pawns on g7, h7.

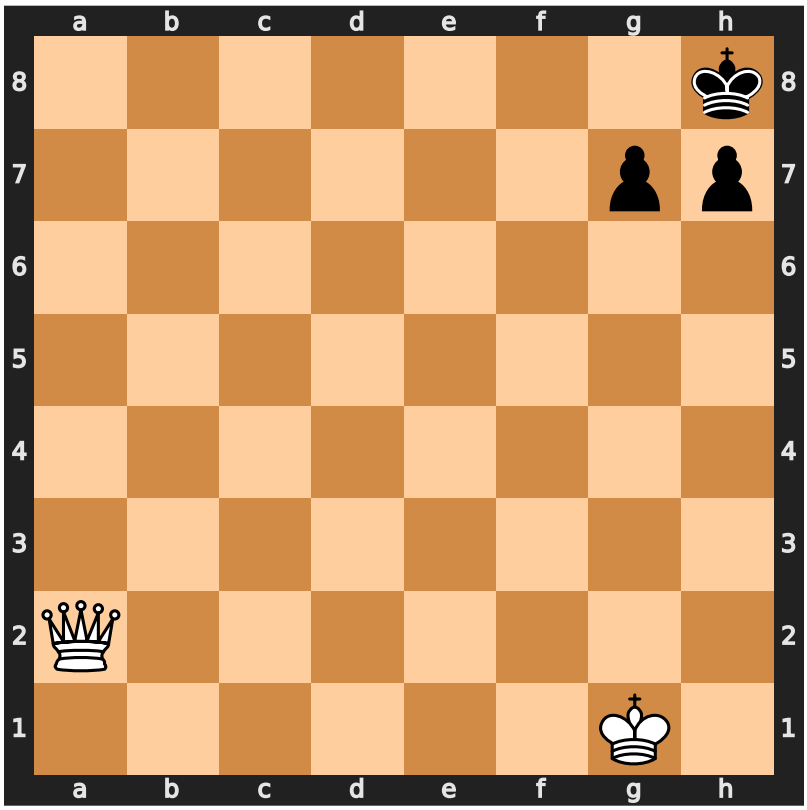

Figure 12.29: Chess Position

Task: Find checkmate in one move. **Hint 1:** Can the queen reach the 8th rank? **Hint 2:** The queen on a2 can go to a8 along the a-file. **Hint 3:** From a8, the queen checks along rank 8 all the way to h8. **Solution: 1. Qa8#.** The queen checks along rank 8. g8 is attacked (rank 8), g7 and h7 are blocked by pawns. No escape.

Exercise 2.14 **Position:** White knight on h6, White king on g1. Black king on h8, Black rook on g8, Black pawns on g7, h7.

Task: Find checkmate in one move. **Hint 1:** The Black king is boxed in by its own pieces. **Hint 2:** What piece can jump over obstacles to deliver check? **Hint 3:** A knight on h6 can jump to f7. From f7, it attacks h8. **Solution: 1. Nf7#.** The knight jumps to f7, attacking h8. The king is smothered: g8 has the rook, g7 and h7 have pawns. Classic smothered mate!

Exercise 2.15 **Position:** White rook on d1, White king on b1. Black king on b8, Black pawns on a7, b7, c7.

Task: Find checkmate in one move. **Hint 1:** The Black king is trapped behind three pawns, just like a back rank mate. **Hint 2:** The rook can reach the 8th rank along the d-file. **Hint 3:** From

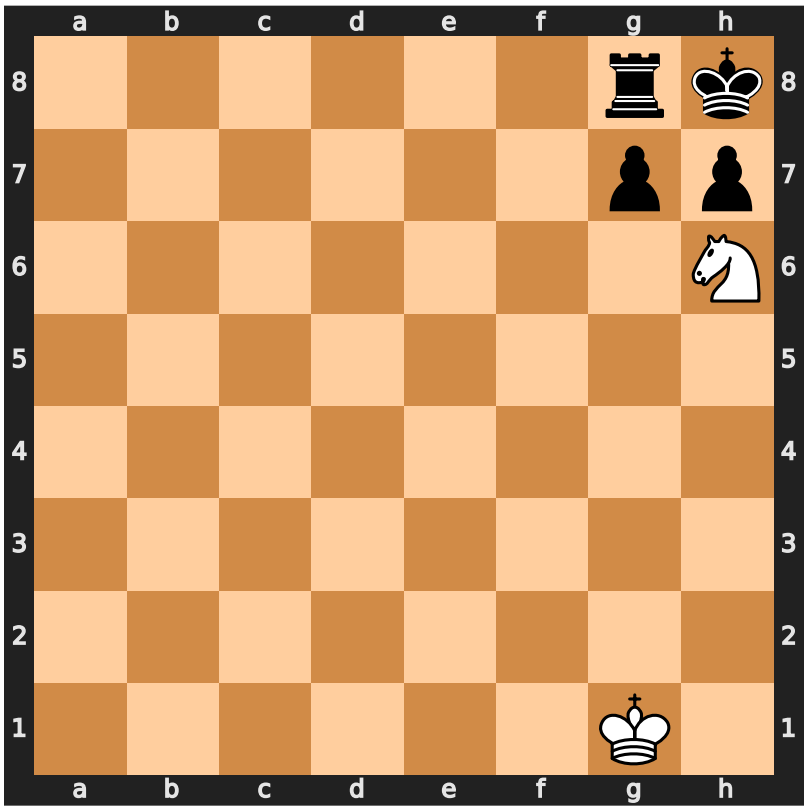

Figure 12.30: Chess Position

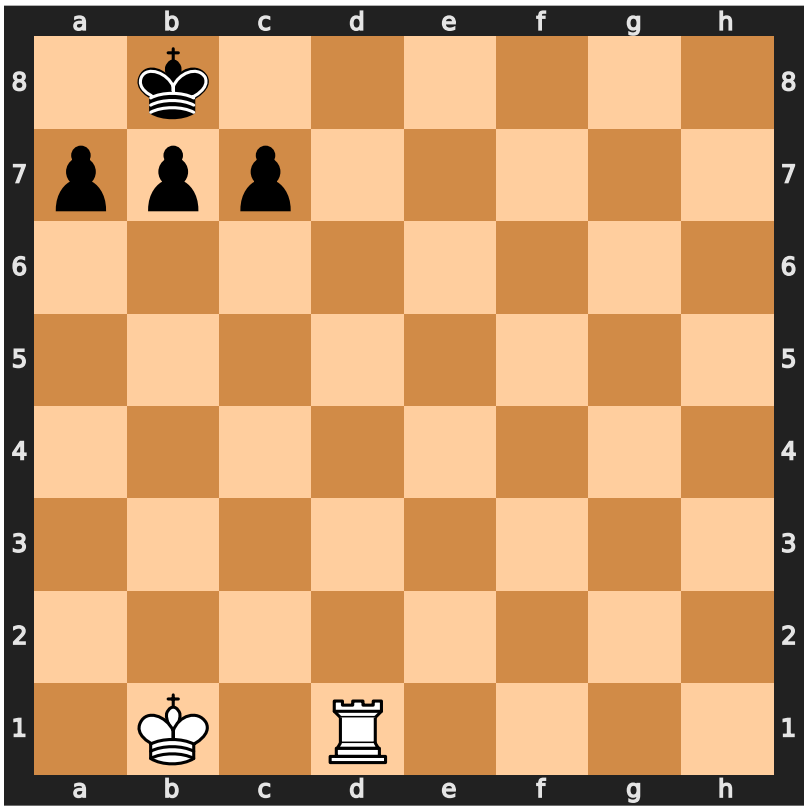

Figure 12.31: Chess Position

d8, the rook checks along rank 8 toward b8. **Solution: 1. Rd8#.** The rook checks along rank 8. a8 is attacked by the rook. c8 is attacked by the rook. The pawns block a7, b7, c7. Checkmate.

Exercise 2.16 **Position:** White queen on e7, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

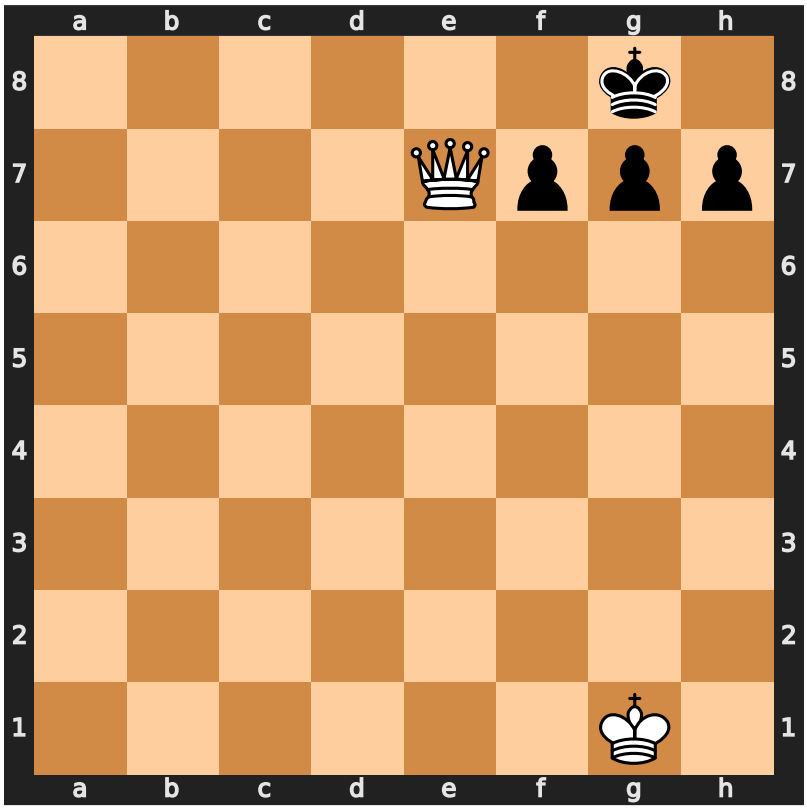

Figure 12.32: Chess Position

Task: Find checkmate in one move. **Hint 1:** The queen is already very close to the Black king. **Hint 2:** Where can the queen go to deliver check on the 8th rank? **Hint 3:** Both Qe8 and Qd8 are checkmate. Find either one. **Solution: 1. Qe8#** (or 1. Qd8#). The queen delivers check along rank 8. The king cannot escape: f8 is attacked (rank 8), h8 is attacked (rank 8), and the pawns block the 7th rank. Both Qe8# and Qd8# work.

Exercise 2.17 **Position:** White queen on a1, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

Task: Find checkmate in one move. **Hint 1:** The queen on a1 can reach the 8th rank in one move. **Hint 2:** Think about the a-file. The queen can slide from a1 to a8. **Hint 3:** From a8, the queen attacks along the entire 8th rank. **Solution: 1. Qa8#.** The queen travels up the a-file to a8, then checks along rank 8 to g8. All escape squares are blocked. Back rank mate with the queen.

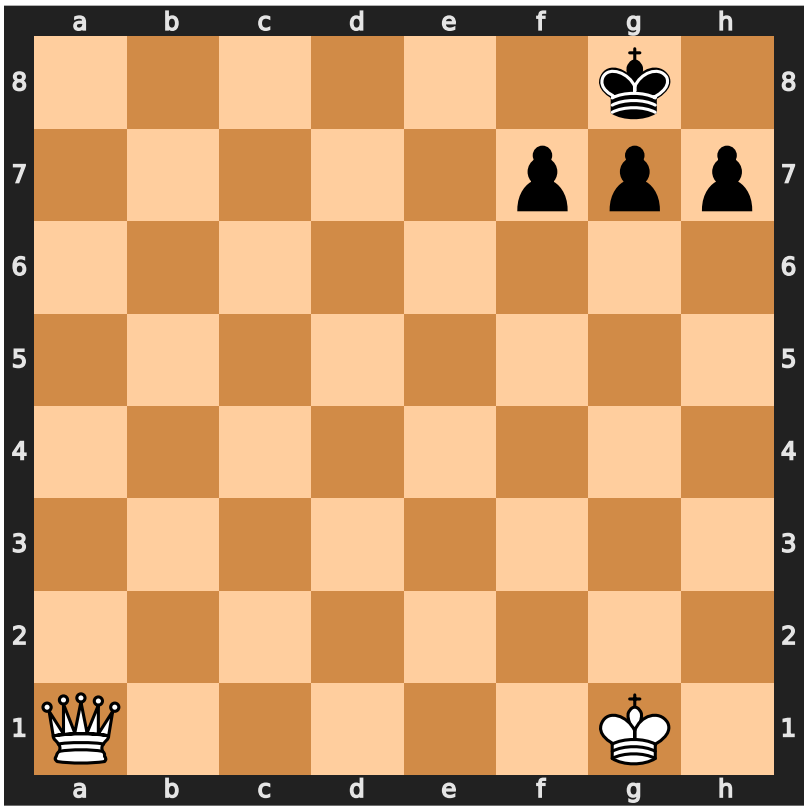

Figure 12.33: Chess Position

Exercise 2.18 **Position:** White queen on a1, White king on g1. Black king on h8, Black pawns on f7, g7, h7.

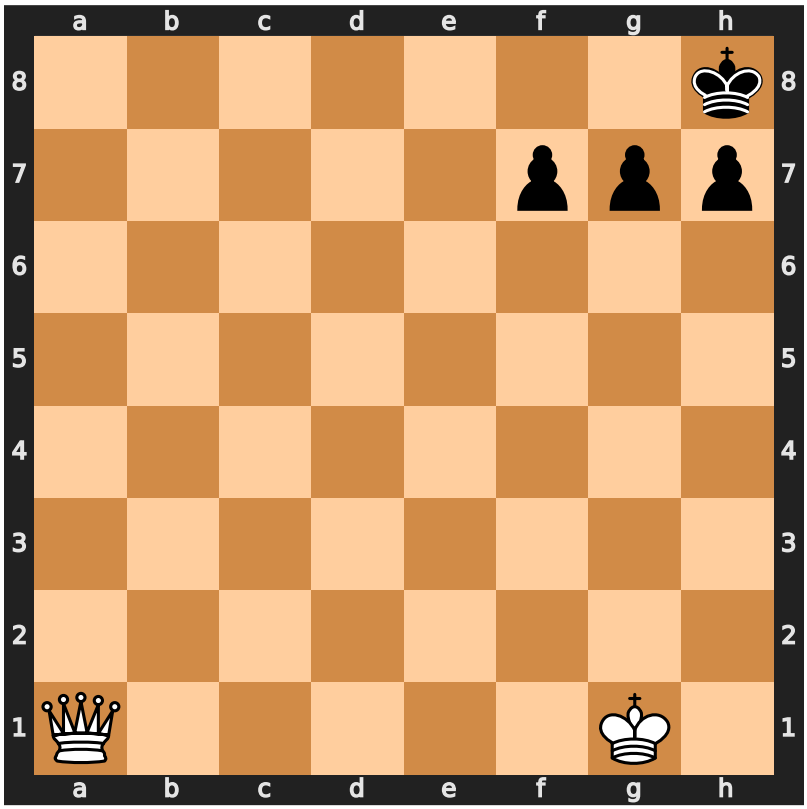

Figure 12.34: Chess Position

Task: Find checkmate in one move. **Hint 1:** Same idea as 2.17, but the king is on h8 instead of g8. **Hint 2:** Does Qa8 still work? Check if the queen on a8 attacks h8. **Hint 3:** From a8, the queen attacks along rank 8: b8, c8, d8, e8, f8, g8, h8. Yes! **Solution: 1. Qa8#.** Even with the king on h8, the queen on a8 controls the entire 8th rank. g8 attacked. g7 and h7 blocked by pawns. Checkmate.

Exercise 2.19 **Position:** White queen on d1, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

Task: Find checkmate in one move. **Hint 1:** The queen needs to reach the 8th rank. **Hint 2:** The queen on d1 can go to d8 along the d-file. **Hint 3:** From d8, the queen checks along rank 8 to g8. **Solution: 1. Qd8#.** The queen checks along rank 8. f8 and h8 are both attacked. Pawns block f7, g7, h7. Checkmate.

Exercise 2.20 **Position:** White king on d6, White pawn on d7, White rook on f1. Black king on d8. No other pieces.

Task: Find checkmate in one move. **Hint 1:** The pawn on d7 attacks c8 and e8 diagonally. The White king controls c7, d7, and e7. **Hint 2:** The Black king is almost completely boxed in. One

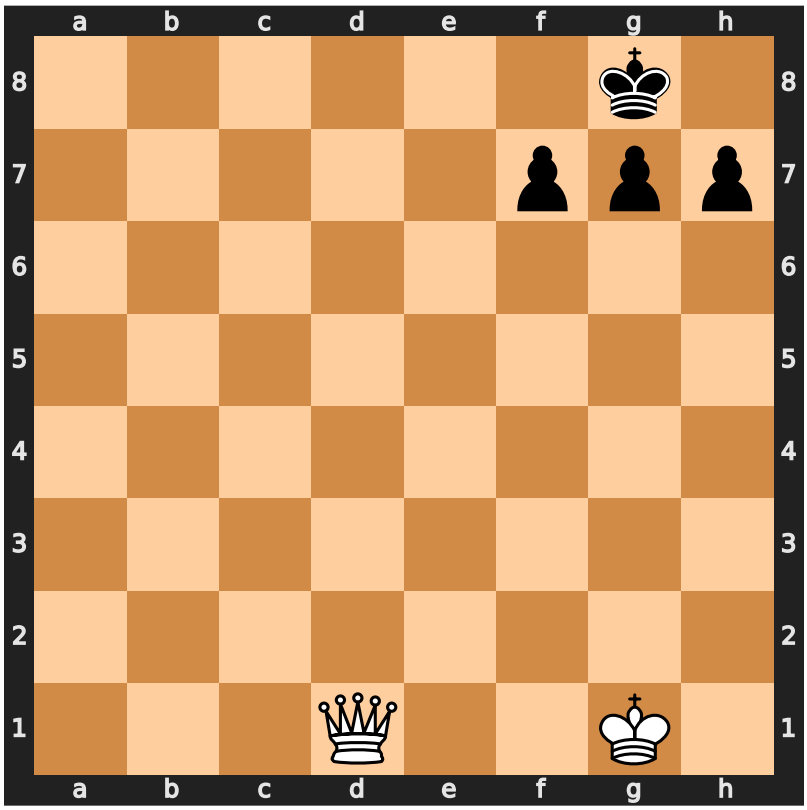

Figure 12.35: Chess Position

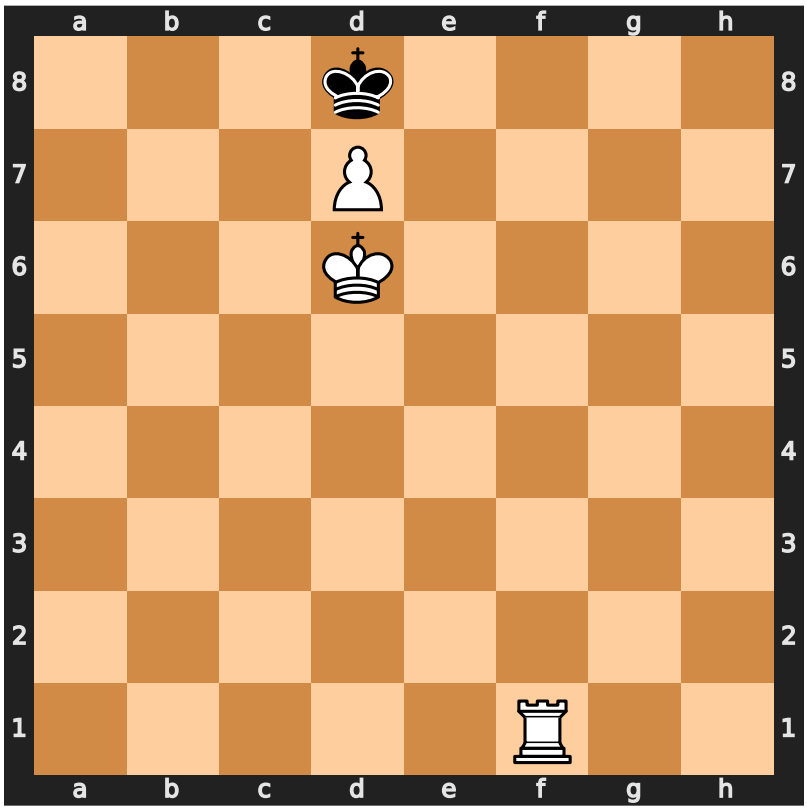

Figure 12.36: Chess Position

rook move finishes it. **Hint 3:** Where can the rook deliver check on a square the king cannot escape from? **Solution: 1. Rf8#.** The rook checks on f8 (along rank 8 toward d8). The king cannot go to c8 (pawn attacks c8), e8 (pawn attacks e8), c7, d7, or e7 (White king controls all three). Checkmate.

Exercise 2.21 **Position:** White rook on h1, White king on a6. Black king on a8. No other pieces.

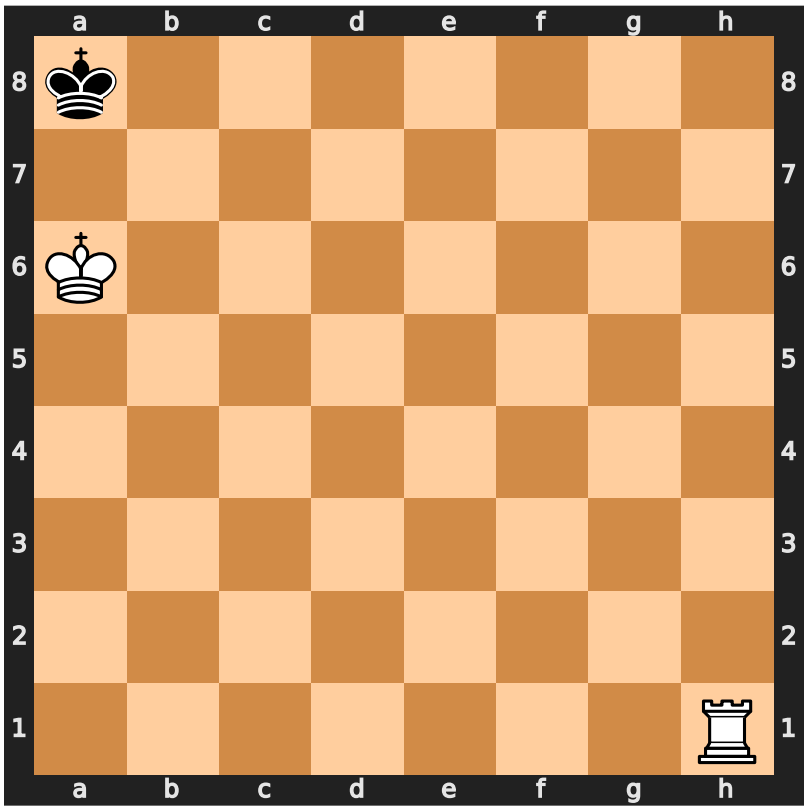

Figure 12.37: Chess Position

Task: Find checkmate in one move. **Hint 1:** The Black king is in the corner with the White king nearby. **Hint 2:** The rook on h1 can reach h8 along the h-file. **Hint 3:** From h8, the rook checks along rank 8. The White king blocks b7. **Solution: 1. Rh8#.** The rook checks along rank 8 from h8 to a8. The king cannot go to b8 (rook controls b8) or b7 (White king controls b7 from a6). Checkmate.

Exercise 2.22 **Position:** White rook on c6, White king on b6. Black king on a8. No other pieces.

Task: Find checkmate in one move. **Hint 1:** The White king on b6 controls a7 and b7. **Hint 2:** The rook on c6 can reach c8. **Hint 3:** From c8, the rook checks along rank 8 to a8. **Solution: 1. Rc8#.** The rook checks along rank 8. b8 is attacked by the rook. a7 and b7 are controlled by the White king. Checkmate.

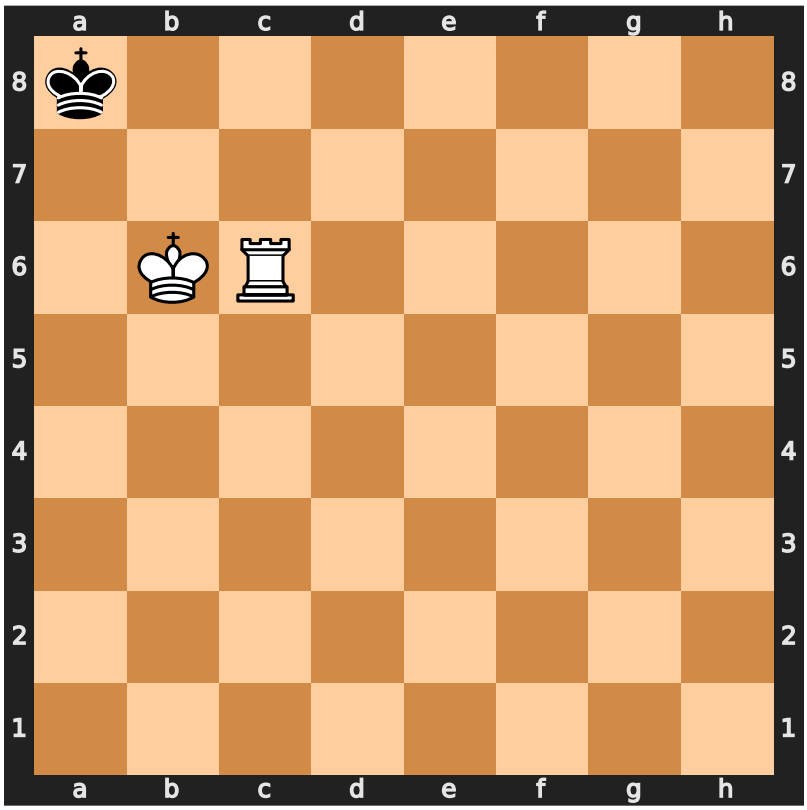

Figure 12.38: Chess Position

Exercise 2.23 **Position:** White rook on a7, White queen on b1, White king on g1. Black king on g8, Black pawns on f7, g7, h7.

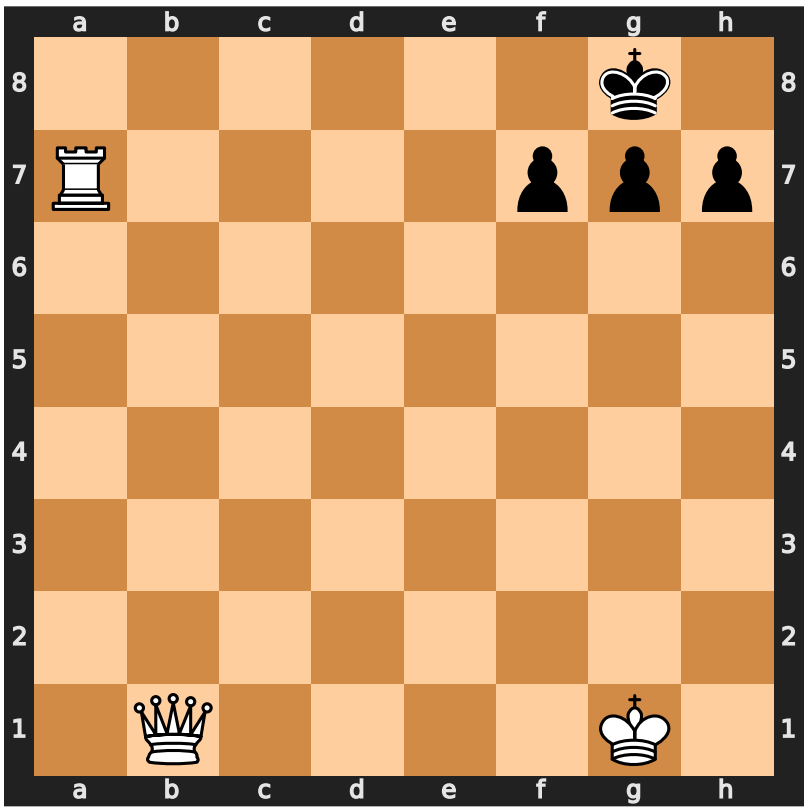

Figure 12.39: Chess Position

Task: Find checkmate in one move. **Hint 1:** There are two different checkmate moves. Can you find both? **Hint 2:** The rook on a7 can reach a8 (back rank mate). Or the queen on b1 can reach b8. **Hint 3:** Both Ra8# and Qb8# deliver checkmate along the 8th rank. **Solution: 1. Ra8#** (or 1. Qb8#). Both moves deliver check along rank 8 with the king trapped behind its pawns. Two checkmates for the price of one position!

Exercise 2.24 **Position:** White queen on c3, White king on h1. Black king on g8, Black pawns on f7, g7, h7.

Task: Find checkmate in one move. **Hint 1:** The queen needs to reach the 8th rank. **Hint 2:** Can the queen go from c3 to c8? Yes, along the c-file. **Hint 3:** From c8, the queen attacks along rank 8 to g8. **Solution: 1. Qc8#.** The queen checks along rank 8. f8 and h8 are attacked. The pawns block the 7th rank. Checkmate.

Exercise 2.25 **Position:** White rook on a2, White king on h1. Black king on h8, Black pawns on f7, g7, h7.

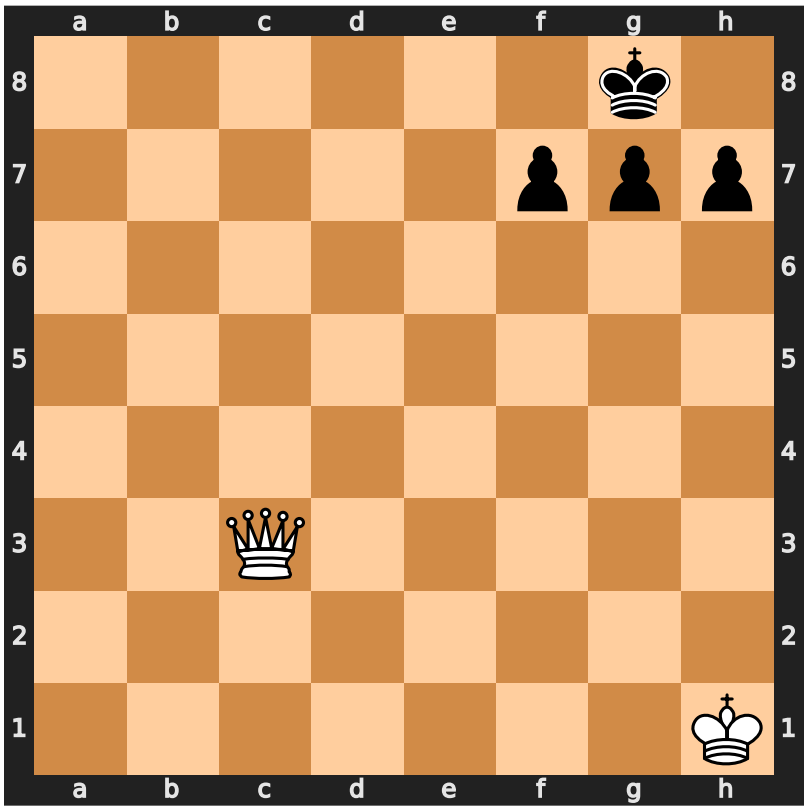

Figure 12.40: Chess Position

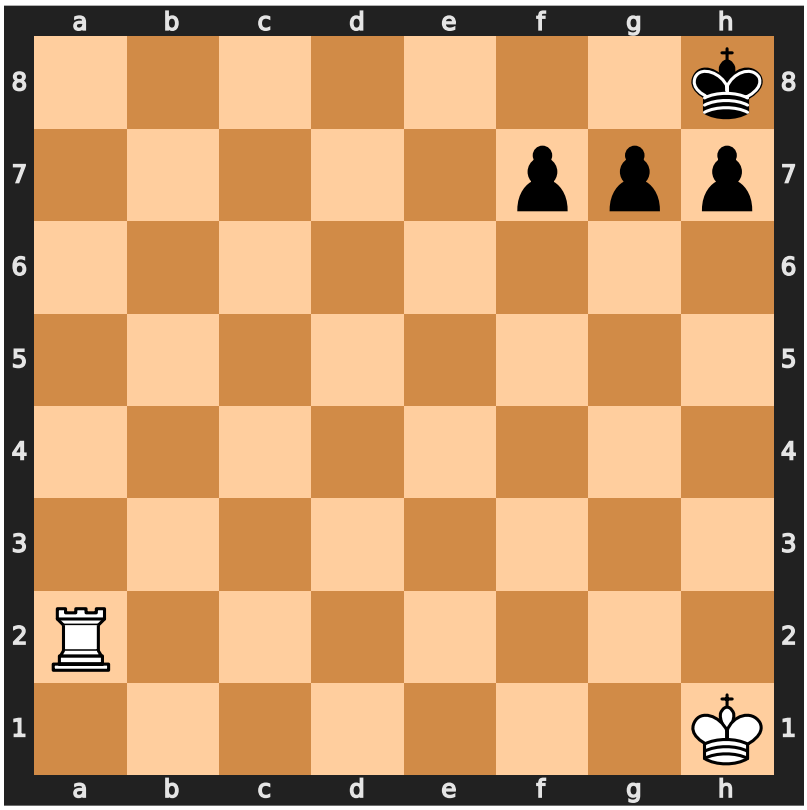

Figure 12.41: Chess Position

Task: Find checkmate in one move. **Hint 1:** The rook on a2 can reach the 8th rank. **Hint 2:** The rook travels up the a-file: a2, a3, ..., a8. **Hint 3:** From a8, the rook checks along rank 8 to h8. **Solution: 1. Ra8#.** Back rank mate. The rook checks along the entire 8th rank. g8 is attacked. The pawns block g7, f7, h7. Checkmate.

12.7.3 Section C: How Does the King Escape Check? (Exercises 2.26–2.30)

The king is in check. Find ALL the ways to escape.

Exercise 2.26 **Position:** White king on e1. Black king on e8, Black knight on f3. White to move (White is in check).

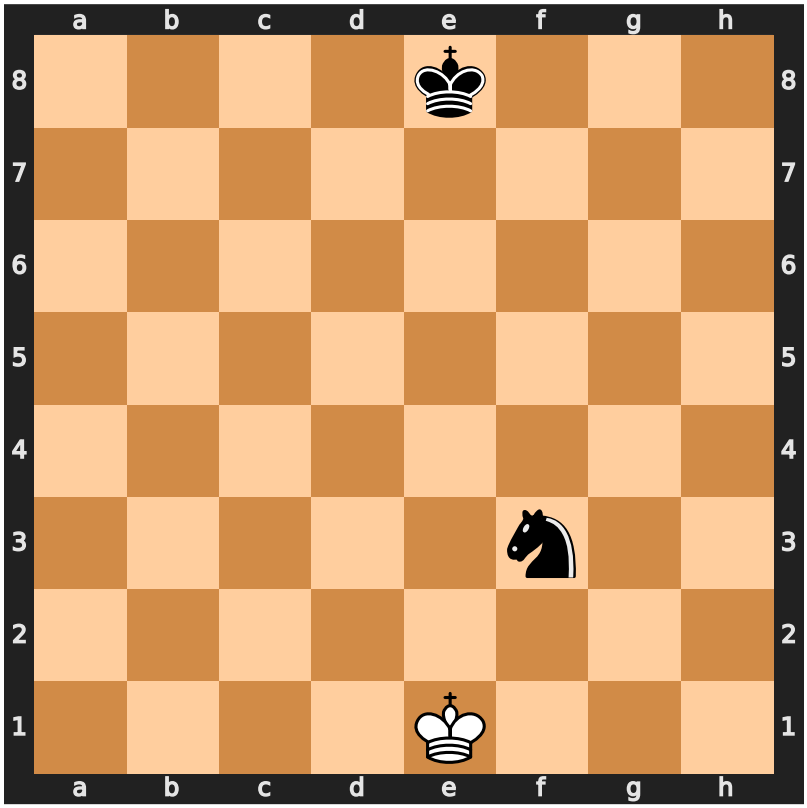

Figure 12.42: Chess Position

Task: The knight on f3 checks the White king. Find all legal moves. **Hint 1:** Can you block a knight's check? **Hint 2:** No! Knights jump over pieces, so blocking never works against a knight. **Hint 3:** The king must move. Which squares around e1 are safe from the knight and the Black king? **Solution:** The king can move to **d1, d2, f1, or f2.** (e2 is attacked by the knight from f3. Blocking is impossible against a knight.) Why this works: against a knight check, the king must move (unless you can capture the knight).

Exercise 2.27 **Position:** White king on d1. Black king on e8, Black bishop on a4. White to move (White is in check).

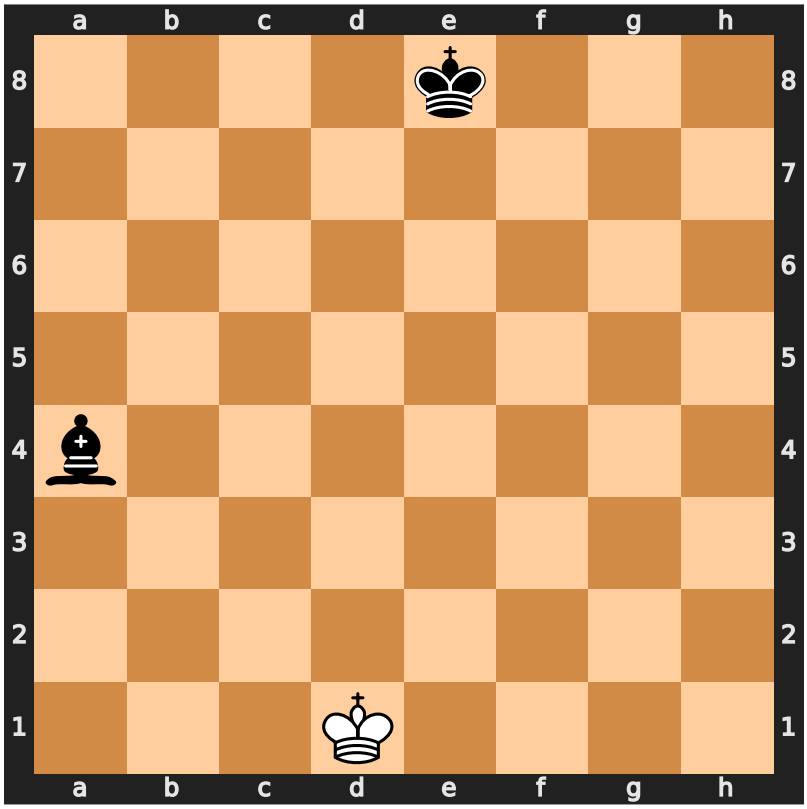

Figure 12.43: Chess Position

Task: The bishop on a4 checks the White king along the diagonal. Find all legal moves. **Hint 1:** The king can move. But can it also block? **Hint 2:** White has no pieces to block with (only the king). Can the king capture the bishop? **Hint 3:** a4 is too far from d1 to capture. The king must move to a safe square. **Solution:** The king can move to **c1, c2, e1, or e2.** (d2 is still on the a4-d1 diagonal, so the bishop attacks it.) The king cannot reach a4 to capture.

Exercise 2.28 **Position:** White king on e1. Black king on e8, Black bishop on d2. No other pieces. White to move (in check).

Task: The bishop on d2 checks the White king (d2 to e1 is diagonal). Find all legal moves. **Hint 1:** Can the king capture the bishop? **Hint 2:** d2 is adjacent to e1. Yes, the king can go to d2 and take the bishop! **Hint 3:** What other moves are available? Check each adjacent square. **Solution:** The king can move to **Kxd2** (capturing the bishop), **Kf2, Ke2, Kf1, or Kd1.** Five legal moves! Kxd2 is likely the best because it removes the attacker.

Exercise 2.29 **Position:** White queen on d1, White king on e1. Black king on d8. Black to move (Black is in check).

Task: The queen on d1 checks the Black king along the d-file. Find all legal moves. **Hint 1:** Can

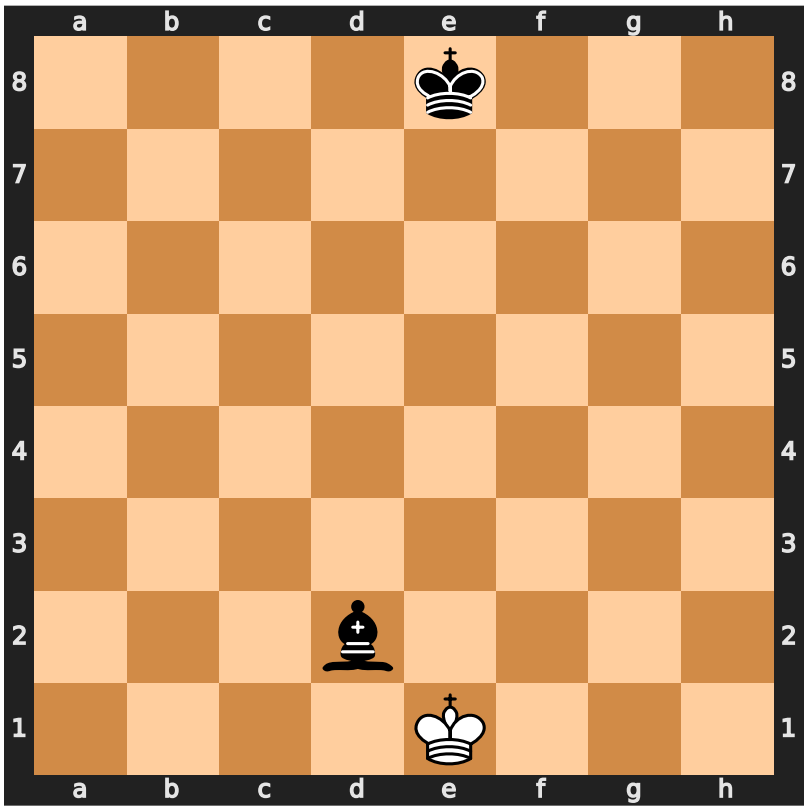

Figure 12.44: Chess Position

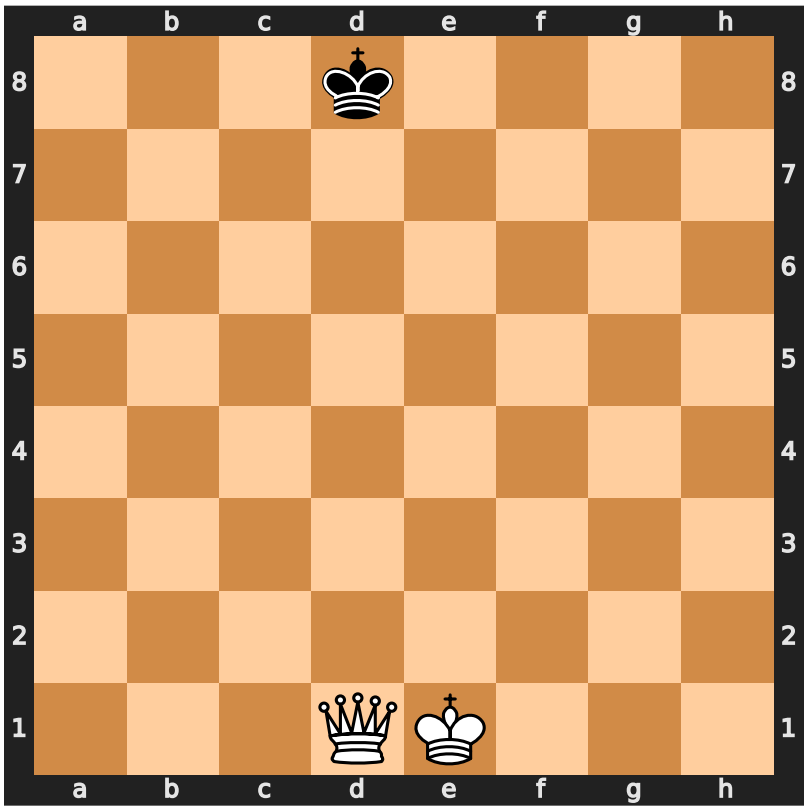

Figure 12.45: Chess Position

the king step off the d-file? **Hint 2:** c8, e8, c7, e7 are all off the d-file. But are any attacked by the queen? **Hint 3:** The queen on d1 attacks the d-file and also diagonals (e2, f3…) and rank 1. Does it attack c8, e8, c7, or e7? **Solution:** The king can move to **c8, e8, c7, or e7.** All four squares are off the d-file and not on any queen-controlled line from d1. Four escape routes.

Exercise 2.30 **Position:** White king on e1, White bishop on f1. Black king on c5, Black rook on a1. White to move (in check).

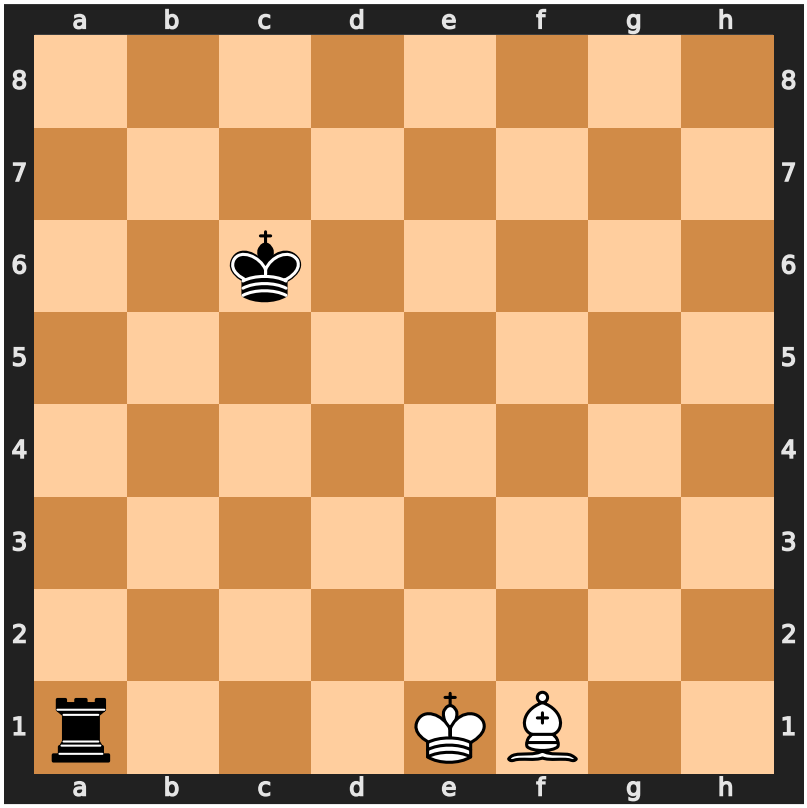

Figure 12.46: Chess Position

Task: The rook on a1 checks the White king along rank 1. Find all legal moves. **Hint 1:** Can the king move? Can anything block? **Hint 2:** Kf2 steps off rank 1. Ke2 steps off rank 1. What about the bishop on f1? **Hint 3:** The king can move to f2 or e2. Can it go to d2? Check if anything attacks d2. **Solution:** The king can move to **Kf2**, **Ke2**, or **Kd2.** The rook on a1 attacks all of rank 1 and the a-file, but d2 is on rank 2 (not rank 1) and is not on the a-file, so it is safe. All three escape squares are legal. Three escape routes.

12.7.4 Section D: Avoid the Stalemate! (Exercises 2.31–2.35)

White is winning. Find a move that wins the game WITHOUT accidentally stalemating Black.

Exercise 2.31 **Position:** White king on b6, White queen on a5. Black king on a8. No other pieces. White to move.

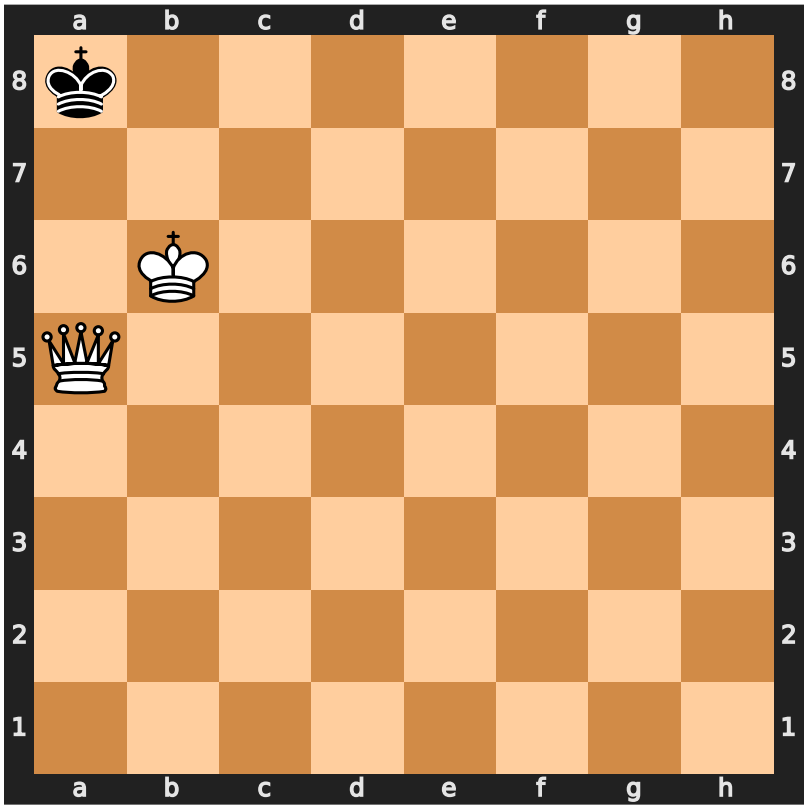

Figure 12.47: Chess Position

Task: Find a checkmate. Be careful: one natural-looking queen move stalemates! **Hint 1:** Qb6 looks natural (queen next to king for support). But check what happens to Black's moves after Qb6. **Hint 2:** After Qb6, the king on a8 has no legal moves and is NOT in check. Stalemate! **Hint 3:** Instead of Qb6, look for a direct checkmate. **Solution: 1. Qa7#** (or 1. Kc7#). The queen on a7 checks the king on a8 along the a-file, and the White king controls b7 and b8. Alternatively, 1. Kc7# works: the king moves to c7, and this puts Black in checkmate because… wait, Kc7 does not give check. Let me re-examine. Actually, Kc7 creates a position where Black has no moves: a7 (controlled by queen on a5), b8 (hmm, is b8 controlled?). Since Kc7 does not give check, it could be stalemate. **The safe winning move is 1. Qa7#.** Do NOT play 1. Qb6?? which is stalemate.

Exercise 2.32 **Position:** White king on f6, White queen on e5. Black king on f8. No other pieces. White to move.

Task: Find checkmate. Avoid stalemate. **Hint 1:** The queen on e5 has many powerful moves. But you need check, not just control. **Hint 2:** Qe7 looks strong, but does it give check? And does it leave Black with legal moves? **Hint 3:** Look for a queen move to the 8th rank that delivers checkmate. **Solution: 1. Qb8#** (or 1. Qe8#). The queen delivers check along rank 8. The king on f8 cannot go to g8 (queen controls it from rank 8), g7 (queen attacks diagonally or White king controls it), e8 (queen rank 8), e7 (White king controls it from f6). Checkmate. Why this works: the queen and king work together to cover all escape squares while delivering check.

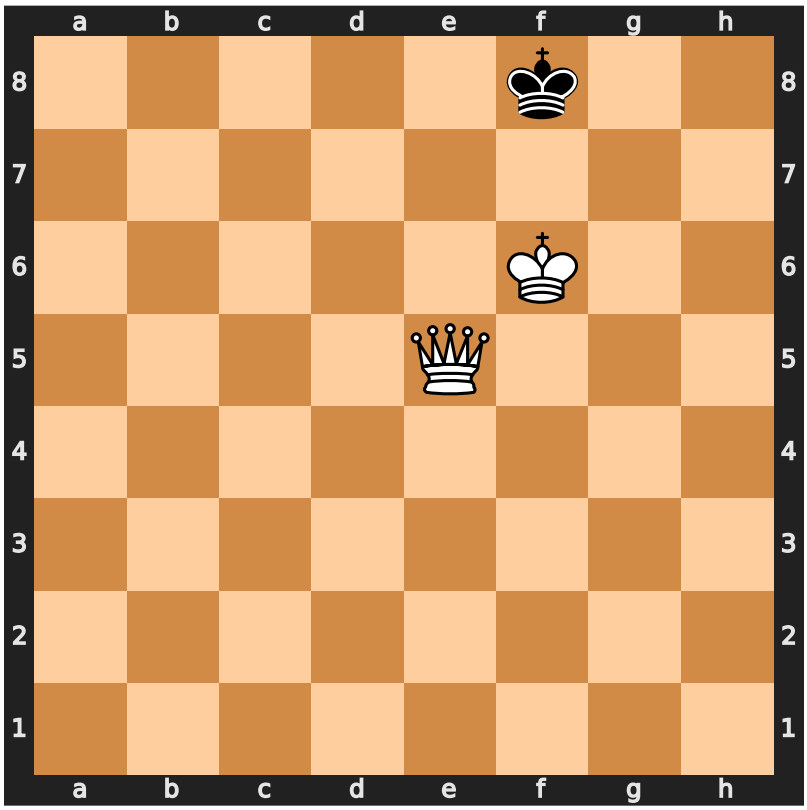

Figure 12.48: Chess Position

Exercise 2.33 **Position:** White king on g6, White queen on f5. Black king on h8, Black pawn on g7. No other pieces. White to move.

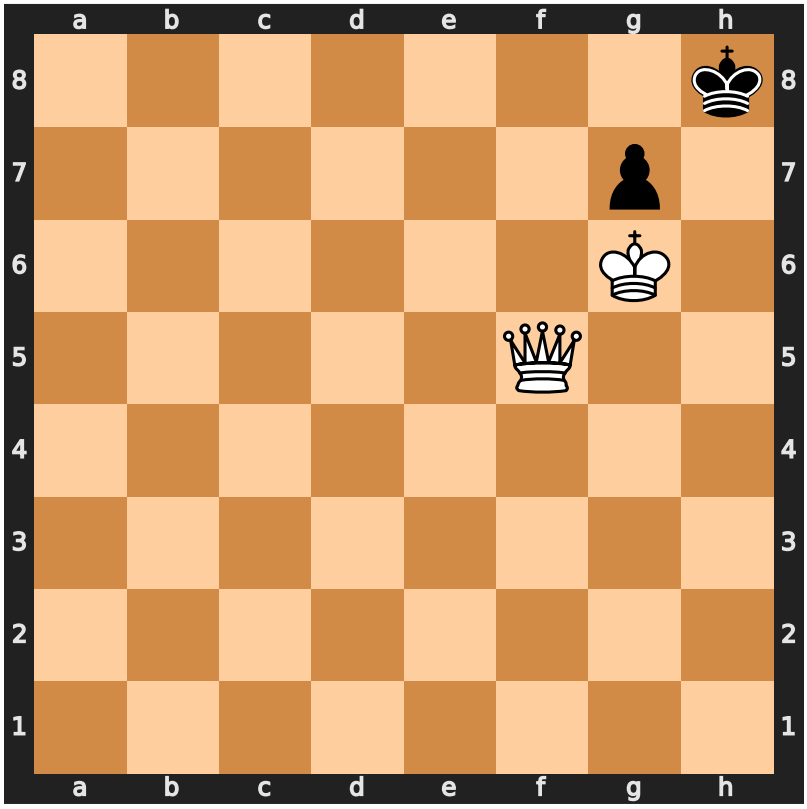

Figure 12.49: Chess Position

Task: Find checkmate. One move stalemates, another checkmates. Choose wisely! **Hint 1:** Qf7 is tempting (attacks g7 and controls lots of squares). But what happens? **Hint 2:** After Qf7, does Black have any legal moves? g7 cannot move (queen attacks g7 and queen blocks? Actually queen on f7 doesn't attack g7… wait, f7 to g7 is adjacent along rank 7. YES it does). Then check: Kh8, h7 controlled by Kg6. g8 controlled by Qf7 diagonal. g7 pawn blocked by queen. Stalemate! **Hint 3:** Instead of Qf7, look for a direct checkmate on f8 or h6. **Solution: 1. Qf8#** (or 1. Qc8#). The queen on f8 checks the king on h8 along rank 8 (f8-g8-h8). The king cannot go to g8 (queen controls it), h7 (White king controls h7 from g6), and the g7 pawn blocks that square. Checkmate. Do NOT play 1. Qf7?? which is stalemate.

Exercise 2.34 **Position:** White king on a6, White queen on e6. Black king on a8. No other pieces. White to move.

Task: Find checkmate. Several queen moves stalemate. **Hint 1:** Moving the queen too close to a8 might take away all Black's moves without giving check. **Hint 2:** You need the queen to give CHECK on a square where the king has no escape. **Hint 3:** Try a queen move that reaches the 8th rank. **Solution: 1. Qe8#** (or 1. Qd8# or 1. Qa2#). The queen on e8 checks along rank 8. b8 is attacked by the queen. a7 and b7 are controlled by the White king. Checkmate.

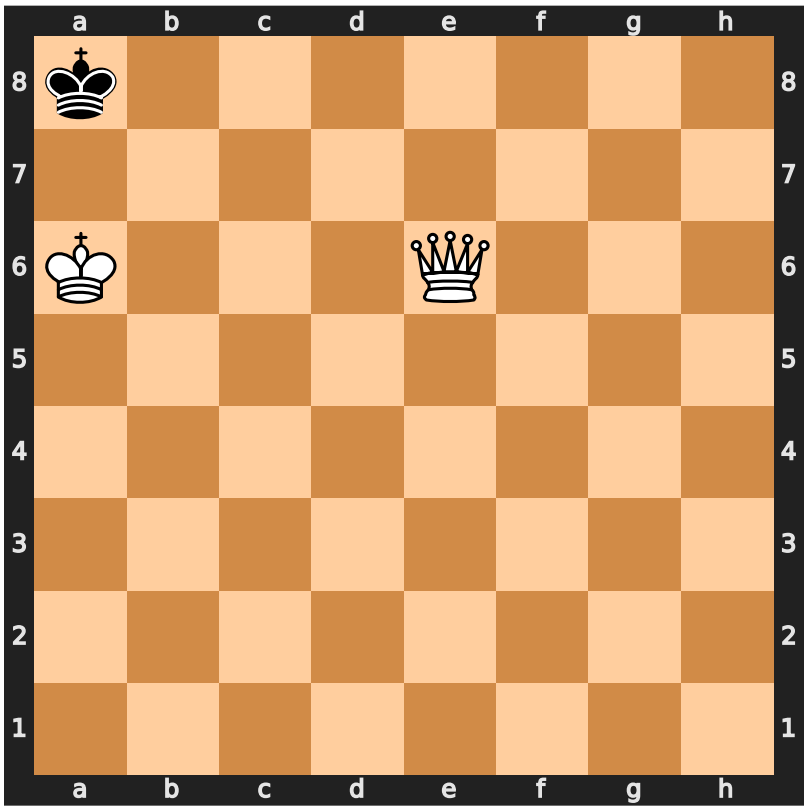

Figure 12.50: Chess Position

Exercise 2.35 **Position:** White king on f6, White queen on g5. Black king on f8, Black pawn on f7, Black pawn on h7. White to move.

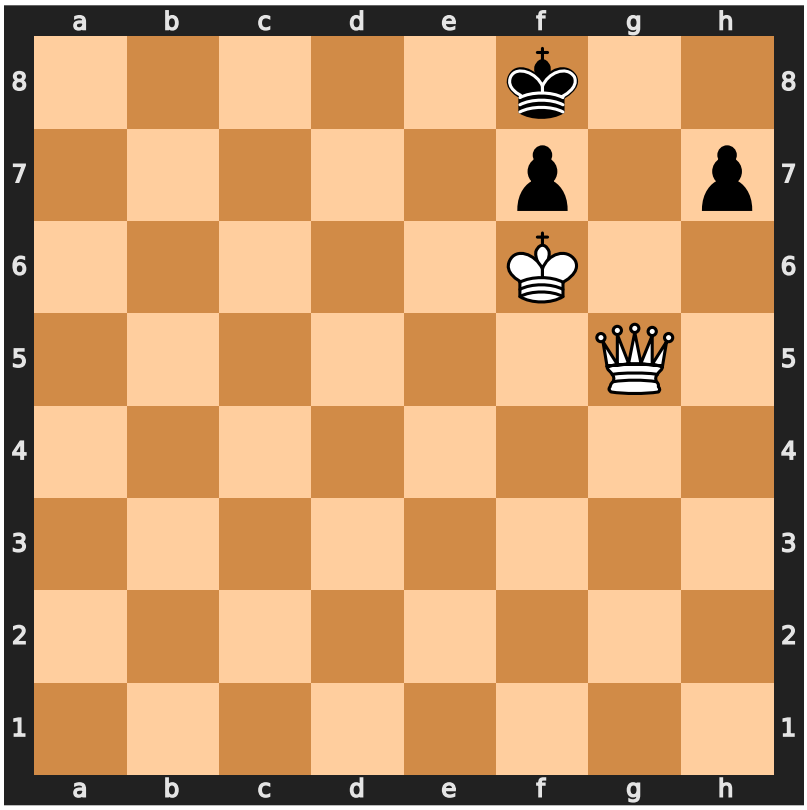

Figure 12.51: Chess Position

Task: Find the fastest checkmate. Do not let Black escape. **Hint 1:** The queen is very close to the Black king. **Hint 2:** Which square gives check while covering all escape squares? **Hint 3:** Qg7 gives check from g7. After Qg7+, is it checkmate? **Solution: 1. Qg8#.** The queen moves to g8, checking the king on f8 (adjacent square). The king cannot go to e8 (queen controls rank 8), e7 (White king on f6 controls e7), or f7 (own pawn). The queen also controls g7 from g8. Checkmate.

12.7.5 Section E: Find Checkmate in 2 Moves (Exercises 2.36–2.40)

White to move. Find the two-move sequence that forces checkmate.

Exercise 2.36 **Position:** The same position from Annotated Game 1. White king on g1, White rook on c1, White rook on d1, White pawns on f2, g3, h2. Black king on g8, Black rook on c8, Black bishop on e6, Black pawn on a7, Black pawns on f7, g7, h7.

Task: Find checkmate in two moves (forced). **Hint 1:** Black's back rank is weak. The rook on c8 is the only guard. **Hint 2:** Remove the guard! Sacrifice a rook on c8. **Hint 3:** After Rxc8+ Bxc8, what does the second rook do? **Solution: 1. Rxc8+ Bxc8 2. Rd8#.** The first rook sacrifices

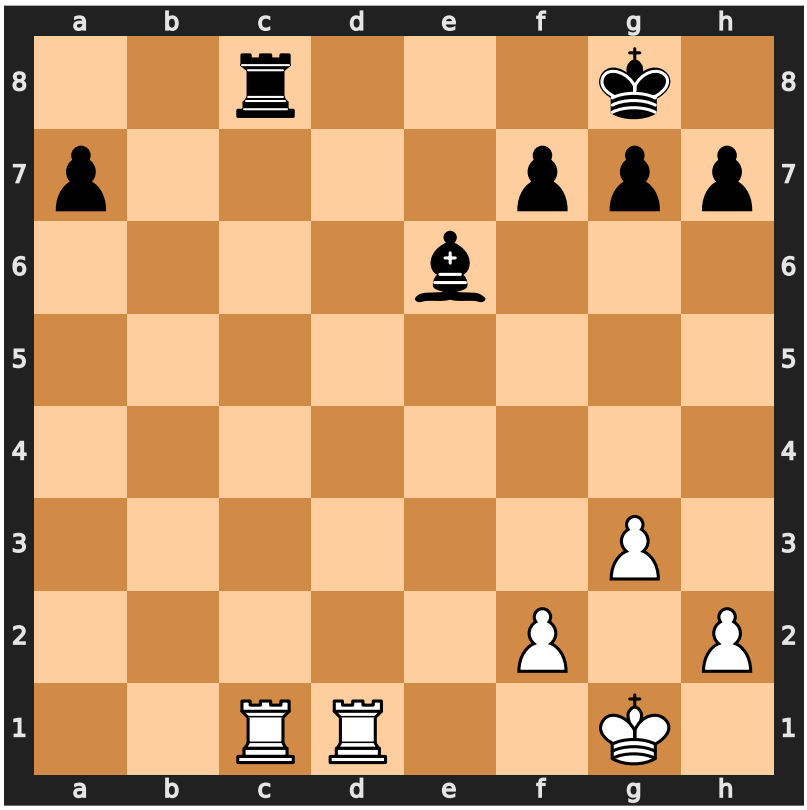

Figure 12.52: Chess Position

on c8, forcing the bishop to recapture (the only legal response). Then the second rook delivers back rank mate on d8. The bishop on c8 cannot block or capture because bishops move diagonally, and d8 is not diagonal from c8.

Exercise 2.37 **Position:** White king on a1, White rook on b1, White rook on c1. Black king on a4. No other pieces.

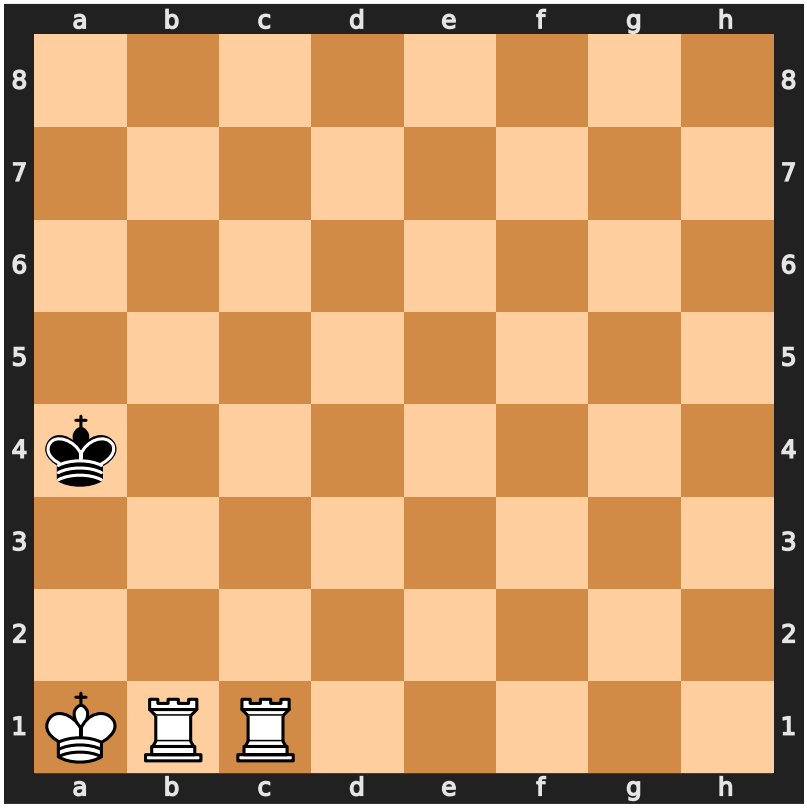

Figure 12.53: Chess Position

Task: Find checkmate in two moves. **Hint 1:** The two rooks can work together like a staircase. **Hint 2:** Give check with one rook to push the king toward the edge, then mate with the other. **Hint 3:** Try Rc4+ first. The king must leave rank 4. Then the other rook delivers. **Solution: 1. Rc4+ Ka3 2. Ra4#.** After Rc4+, the king steps to a3 (or Ka5). If …Ka3, then Ra4# checks along rank 4 and the a-file. The king cannot go to b3 (Rc4 still controls rank 4? No, it moved… actually after Rc4+ Ka3, the rooks are on b1 and c4. Then 2. Ra4#: but where does Ra4 come from? Rb1 to a4? That is not along a rank or file. Let me re-examine.) After 1. Rc4+ Ka3, White plays 2. Rb3#. The rook on b1 moves to b3, checking the king on a3 along the b-file? No, b3 to a3 is along rank 3. So Rb3+ checks along rank 3. King tries a2 (Rb3 controls rank 3, not a2. Ka1 controls a2). a4 (Rc4 controls a4 along rank 4). b2 (Ka1 controls b2? a1 adjacent: a2, b1, b2. YES Ka1 controls b2). So a2 and b2 are controlled by White king, a4 controlled by Rc4. Checkmate. **1. Rc4+ Ka3 2. Rb3#.** The two rooks work as a ladder, taking turns giving check to push the king to the edge.

Exercise 2.38 **Position:** White king on g6, White queen on f5. Black king on h8, Black pawn on g7. White to move.

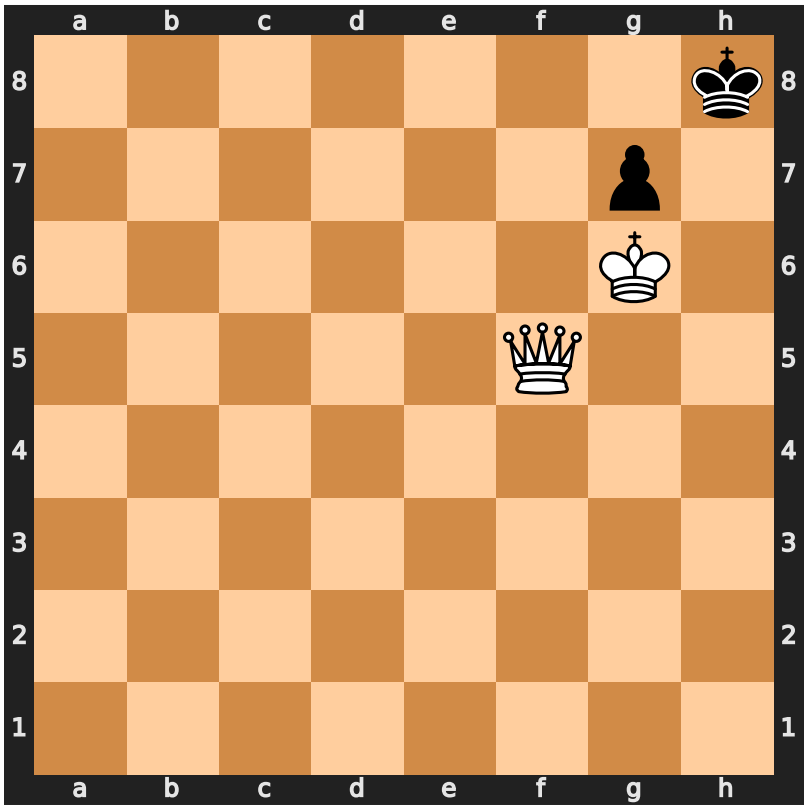

Figure 12.54: Chess Position

Task: Find checkmate in one move. Careful: one tempting move is a stalemate trap! **Hint 1:** Qf7 looks natural, attacking g7. But after Qf7, does Black have any moves? **Hint 2:** After Qf7, the king has no legal moves and is NOT in check. Stalemate! **Hint 3:** Instead, deliver check on the 8th rank. **Solution: 1. Qf8#** (or 1. Qc8#). The queen checks along rank 8. g8 is attacked. h7 is controlled by the White king. g7 is Black's own pawn. Checkmate. Do NOT play 1. Qf7??, which is stalemate.

Exercise 2.39 **Position:** White king on c6, White queen on e6. Black king on a8, Black pawn on a7. No other pieces.

Task: Find checkmate. Several queen moves accidentally stalemate. **Hint 1:** If you play a queen move that takes away all of Black's moves without giving check, it is stalemate. **Hint 2:** You need the queen to give CHECK on a square where the king cannot escape. **Hint 3:** Which queen move reaches the 8th rank while the White king covers b7? **Solution: 1. Qe8#** (or 1. Qd8#). The queen checks along rank 8. b8 is attacked by the queen. a7 is blocked by Black's own pawn. b7 is controlled by the White king. Checkmate.

Exercise 2.40 **Position:** Same as Annotated Game 2 starting position. White king on h6, White queen on f6, White pawn on g5. Black king on h8.

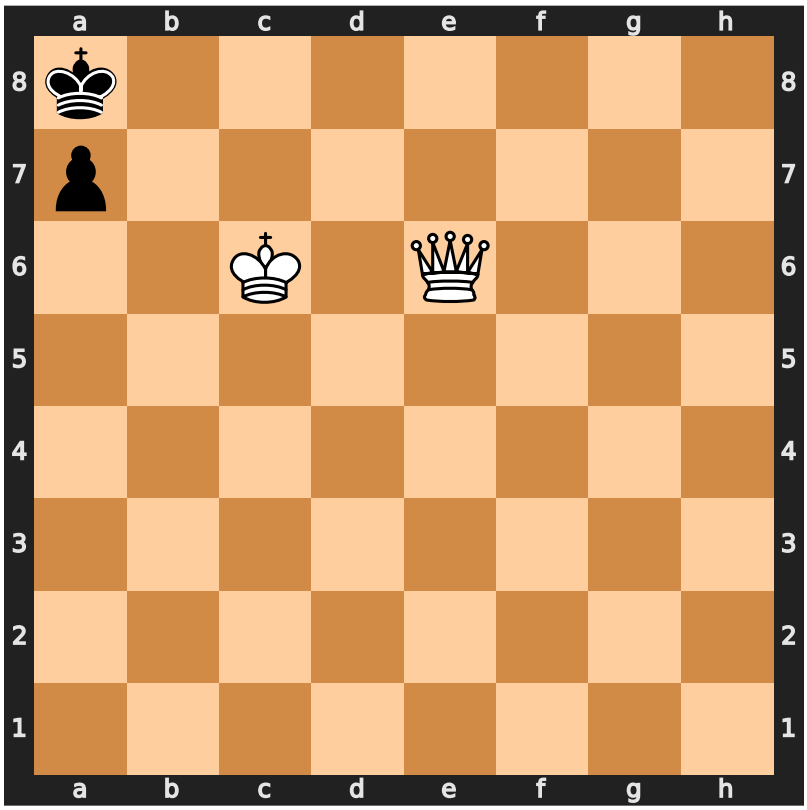

Figure 12.55: Chess Position

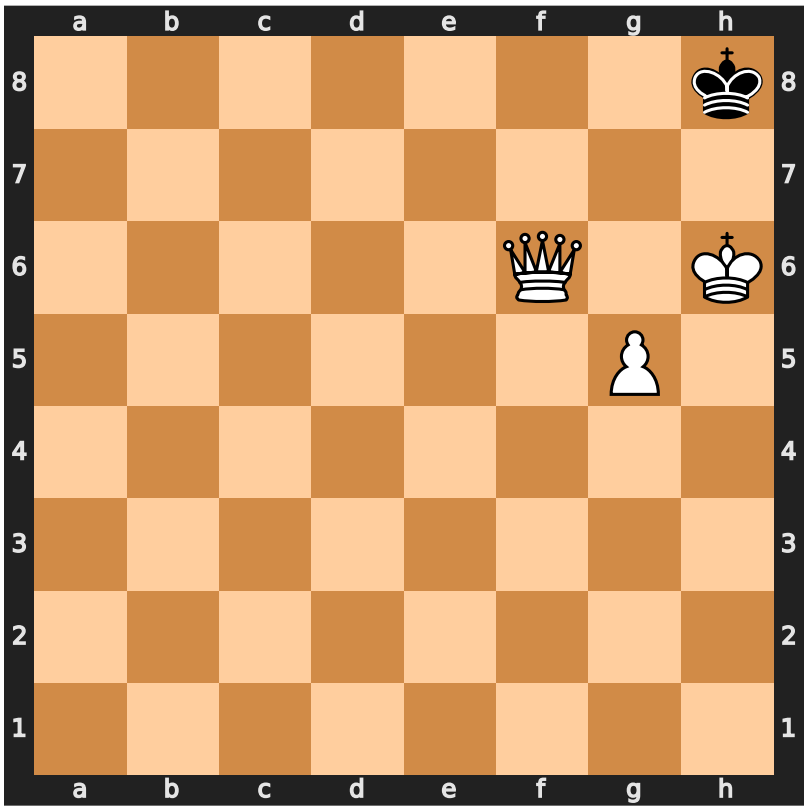

Figure 12.56: Chess Position

Task: Find checkmate in one move. There are three checkmates available. Can you find all three? **Hint 1:** The queen on f6 can reach many squares. Look for checks on the 8th rank. **Hint 2:** Qf8#, Qd8#, and Qg7# are all checkmate. Verify each one. **Hint 3:** After Qg7#: the queen checks from g7 (diagonal to h8). King cannot go to g8 (Qg7 controls it). h7 (controlled by king h6). Checkmate. **Solution: 1. Qf8#** (queen checks along rank 8), **1. Qd8#** (queen checks along rank 8), or **1. Qg7#** (queen checks diagonally, king trapped). All three are checkmate. The trap to avoid is 1. Qf7?? which is stalemate. If you found all three, excellent pattern recognition!

12.8 Key Takeaways

1. **Check** means the king is under attack and must be answered immediately. There are three escapes: move, block, or capture.
2. **Checkmate** means the king is in check with no escape. The game is over.
3. **Stalemate** means no legal moves and no check. The game is a **draw.**
4. The **back rank mate** is the most common checkmate pattern. Give your king "luft" (an escape square) to prevent it.
5. **Scholar's Mate** works in 4 moves if the opponent ignores the threat to f7. Defend f7 with …g6 or …Qe7 to stop it.
6. **Smothered mate** uses a knight against a king boxed in by its own pieces.
7. When winning with a big advantage, **check for stalemate** before every move. Make sure your opponent has at least one legal move unless you are delivering checkmate.
8. When losing, **look for stalemate** tricks. A draw is better than a loss.

12.9 Practice Assignment

1. **Set up a board** and practice delivering the back rank mate pattern 5 times. Place the defending king behind three pawns and practice sliding a rook to the back rank.

2. **Play 5 games** on Lichess (lichess.org) or against a friend. In each game, pay special attention to back rank safety. Ask yourself after every move: "Is my back rank safe? Is my opponent's back rank weak?"

3. **Stalemate drill:** Set up a queen and king versus a lone king on a physical board. Practice delivering checkmate without stalemate. Do this at least 3 times until you can do it smoothly.

4. **Scholar's Mate defense:** Play the opening 1. e4 e5 2. Bc4 against a friend or computer. When your opponent plays 3. Qh5, practice defending with 3…g6 or 3…Qe7.

12.10 Progress Check

Answer these questions to test your understanding:

- ☐ Can you name the three ways to escape check?
- ☐ Can you explain the difference between checkmate and stalemate?

- ☐ Can you set up and deliver a back rank mate?
- ☐ Can you defend against Scholar's Mate?
- ☐ Can you identify when a position is stalemate vs. checkmate?

If you checked all five boxes, you are ready for Chapter 3! If not, review the sections you are unsure about. There is no rush.

Rest Marker. You have completed Chapter 2. Outstanding work. You now understand the three most important concepts in chess: check, checkmate, and stalemate. Everything that follows builds on this foundation. Take a break. You have earned it.

"If you've made it this far, you already understand more about chess than most casual players ever will."

Chapter 13

Chapter 3: Special Moves — Castling, En Passant, Promotion

Rating Range: Beginner (0–500)

"You must take your opponent into a deep dark forest where 2+2=5, and the path leading out is only wide enough for one." — Mikhail Tal

---

13.1 What You'll Learn

- How to castle your king to safety (and when you should not)
- The strangest rule in chess: en passant, and exactly when you can use it
- How to promote a pawn into a queen, rook, bishop, or knight
- Why special moves exist and how they change the game
- How to spot moments when a special move wins on the spot

13.2 Part 1: Castling

Castling is the only move in chess where two pieces move at the same time. Your king slides two squares toward a rook, and that rook jumps over the king to land on the other side. It looks strange the first time you see it. But once you understand it, you will use it in almost every game.

Castling does two things at once. It tucks your king behind a wall of pawns, keeping it safe. And it brings your rook toward the center, where it can join the fight. That two-for-one deal makes castling one of the best moves you can play in the opening.

There are two types of castling: kingside and queenside.

13.2.1 Kingside Castling (O-O)

Kingside castling is the most common. Your king moves two squares toward the h-file rook, and that rook hops over to the other side.

Set up your board: Place the White king on e1 and a White rook on h1. Remove all pieces between them (f1 and g1 must be empty). Now slide the king from e1 to g1. Then pick up the rook from h1 and place it on f1. That is kingside castling.

For Black, it works the same way on the 8th rank. The king moves from e8 to g8, and the rook moves from h8 to f8.

Before and after:

Piece	Before	After
King	e1	g1
Rook	h1	f1

Kingside castling is written as **O-O** in chess notation. Two capital letter Os separated by a hyphen.

13.2.2 Queenside Castling (O-O-O)

Queenside castling works the same way, but toward the a-file rook. The king slides two squares in that direction, and the rook jumps over to the other side.

Set up your board: Place the White king on e1 and a White rook on a1. Remove all pieces between them (b1, c1, and d1 must be empty). Slide the king from e1 to c1. Then pick up the rook from a1 and place it on d1.

For Black: the king moves from e8 to c8, and the rook moves from a8 to d8.

Before and after:

Piece	Before	After
King	e1	c1
Rook	a1	d1

Queenside castling is written as **O-O-O** in chess notation. Three Os.

Notice something: the king always moves exactly two squares when castling, no matter which side. But on the queenside, the rook travels three squares instead of two. That is because there is one extra square between the king and the a-file rook.

13.2.3 The Five Rules of Castling

Castling is special, and special moves come with rules. All five of these conditions must be true for castling to be legal. If even one fails, you cannot castle.

Rule 1: The king has not moved yet this game. Not even once. If your king moved to f1 on move 3 and then back to e1 on move 4, you have lost the right to castle. Forever. No take-backs.

Rule 2: The rook has not moved yet this game. Same idea. If the rook you want to castle with has moved at any point, castling with that rook is gone. You can still castle with the other rook if it has not moved.

Rule 3: No pieces between the king and the rook. Every square between them must be empty. For kingside castling, that means f1 and g1 (or f8 and g8). For queenside, that means b1, c1, and d1 (or b8, c8, and d8).

Rule 4: The king is not currently in check. You cannot castle out of check. If someone is attacking your king right now, you need to deal with that first. You might be able to castle on a later turn once the check is resolved.

Rule 5: The king does not pass through or land on a square attacked by an enemy piece. This one trips people up. During castling, the king crosses through one square and lands on another. Neither of those squares can be under attack. The rook, however, CAN pass through an attacked square. Only the king's path matters.

Here is a memory trick for the five rules:

> **"My king and rook stay still, the path is clear, I'm not in check, and no one's aiming at where I'm going."**

That single sentence covers all five conditions.

13.2.4 Why Castle?

Two reasons, and both are important.

King safety. In the starting position, your king sits in the center of the board, right in the line of fire. Pieces develop, files open, and suddenly your king is vulnerable. Castling moves it to the side of the board, behind a row of pawns that act like a shield. Most attacks in chess target the king, and a castled king is much harder to attack than one stuck in the center.

Rook activation. Your rooks start in the corners, boxed in by knights and pawns. They need open files to be useful. Castling brings a rook toward the center, where it can control important files and support your other pieces. After castling, your rooks can also connect with each other along the back rank, protecting each other.

13.2.5 When to Castle

A good rule for beginners: **try to castle within your first ten moves.** You do not need to rush it on move 4 or 5, but you should be working toward it. Develop your knights and bishops first (they need to get out of the way anyway), and then castle as soon as the path is clear.

If your opponent is already developing pieces aggressively, castle sooner rather than later. An uncastled king in an open position is an invitation for an attack.

13.2.6 When NOT to Castle

Sometimes, rarely, castling is not the best choice. Here are a few situations:

- **The position is closed.** If pawns are locked in the center and files are shut, your king may actually be safe in the center. This is uncommon at the beginner level but worth knowing.

- **Castling into an attack.** If your opponent has already pushed pawns toward your kingside and is aiming pieces that way, castling kingside could walk your king into danger. Consider castling the other way, or keeping your king in the center for a moment.
- **The endgame has arrived.** If most of the pieces have been traded off, your king is actually stronger in the center, where it can help fight for pawns. In the endgame, the king is a warrior, not a target.

For now, at your level, castle in almost every game. The rare exceptions will become clear with experience.

This is a natural stopping point. Take a break if you need one. The king is safe now, and so are you.

13.3 Part 2: En Passant

En passant is the most confusing rule in chess. If it does not make sense right away, that is completely normal. Read through this section slowly, set up your board, and walk through it step by step. By the end, you will have it.

The name comes from French and means "in passing." It describes a special pawn capture that can only happen under very specific conditions.

13.3.1 How En Passant Works

Here is the setup. Your pawn is on the 5th rank (that means rank 5 for White, or rank 4 for Black). Your opponent has a pawn on its starting square, two files away or one file away from yours. On their turn, they push that pawn forward two squares, landing it right beside your pawn.

Normally, pawns capture diagonally. And normally, if an enemy pawn lands beside yours, you cannot take it because it is beside you, not diagonally in front of you. But en passant is the exception.

When an opponent's pawn advances two squares and lands directly beside your pawn on the 5th rank, you may capture it **as if it had only moved one square forward.** Your pawn moves diagonally to the square the enemy pawn "passed through," and the enemy pawn is removed from the board.

Set up your board: Place a White pawn on e5. Place a Black pawn on d7. Now move the Black pawn two squares forward from d7 to d5. It lands right beside your pawn on e5.

You can now capture en passant. Pick up your White pawn from e5, place it on d6, and remove the Black pawn from d5. Your pawn ends up on d6 (where the Black pawn would have been if it had only moved one square), and the Black pawn on d5 is gone.

That is en passant.

13.3.2 The One-Move Rule

Here is the part that surprises people: **you can only capture en passant on the very next move.** If you do not take it immediately, the option disappears. You cannot wait a turn and then decide to capture en passant later. It is a "use it or lose it" rule.

This is the single most important thing to remember about en passant. The opportunity exists for exactly one move and then it is gone forever.

13.3.3 Why Does This Rule Exist?

In the original version of chess, pawns could only move one square forward at a time. The two-square opening advance was added later to speed up the game. But this created a problem: a pawn could use the two-square advance to sneak past an enemy pawn that was already deep in enemy territory.

En passant was invented to fix this. It ensures that a pawn cannot use the two-square advance to dodge capture. If you could have captured the pawn had it only moved one square, you can still capture it, even though it jumped two.

Think of it this way: the pawn tried to sneak past your pawn. En passant is your pawn saying, "I saw that."

13.3.4 Common Beginner Questions

"Can I capture en passant whenever two pawns are side by side?" No. En passant only works when the enemy pawn has JUST advanced two squares on the previous move. If the pawn reached that square in any other way (moving one square at a time over two turns, for example), en passant does not apply.

"Can my pawn capture en passant if it is on the 4th rank?" No. Your pawn must be on the 5th rank. For White, that is rank 5. For Black, that is rank 4. That is the only rank where en passant can happen.

"Does en passant come up often?" More often than you would expect. Once you know the rule, you will start to see the opportunities. In some games, en passant is the winning move.

Set up your board for one more example: Place a White pawn on c5 and a Black pawn on b7. Move the Black pawn from b7 to b5 (two squares). Now your White pawn on c5 can capture en passant. Pick up the White pawn, move it to b6, and remove the Black pawn from b5.

Practice this a few times until the motion feels natural. Place pawns, advance two squares, capture diagonally to the "passed through" square, remove the enemy pawn.

Good place to stop and practice. Set up five en passant positions on your board and capture each one. Once it feels automatic, keep reading.

13.4 Part 3: Promotion

When a pawn reaches the other end of the board, something wonderful happens. It transforms into a more powerful piece. This is called promotion, and it is one of the most exciting moments in chess.

13.4.1 How Promotion Works

When your pawn reaches the 8th rank (for White) or the 1st rank (for Black), you MUST replace it with another piece. You cannot leave it as a pawn. You choose one of four options:

- **Queen** (most common)
- **Rook**
- **Bishop**
- **Knight**

You cannot promote to a king. And you cannot keep it as a pawn. It must become one of the four pieces listed above.

The new piece is placed on the square where the pawn arrived. The pawn is removed and the new piece takes its place. This all happens on a single move.

13.4.2 Almost Always Choose Queen

The queen is the most powerful piece on the board. It can move in any direction, as far as it wants. In the vast majority of positions, promoting to a queen is the correct choice.

If you are ever unsure what to promote to, pick the queen. You will be right about 99% of the time.

Set up your board: Place a White pawn on e7 and a Black king on a8 (out of the way). White's king on g1. Now push the pawn from e7 to e8. Remove the pawn and replace it with a White queen. That is promotion.

13.4.3 Underpromotion: When a Queen Is NOT the Best Choice

Sometimes, rarely, you should promote to a knight instead of a queen. This is called "underpromotion" because you are choosing a less powerful piece. But there is a reason: a knight can do something a queen cannot. It can give check from squares a queen cannot reach, and it can fork two pieces at once.

If promoting to a knight gives check and forks the enemy king and queen, that is better than getting a queen that does not give check.

Set up your board: Place a White pawn on e7, a Black king on c7, and a Black queen on g7. White king on g1.

If you play e8=Q (promote to queen), you get a queen, but the Black queen on g7 is still there. You have no immediate advantage.

If you play e8=N+ (promote to knight with check!), the knight on e8 attacks both the Black king on c7 and the Black queen on g7. The king must move, and then your knight captures the queen. You just won a queen by promoting to a knight instead of a queen.

This is rare, but when it happens, it is brilliant. Keep an eye out for knight promotion forks.

13.4.4 Can You Have Two Queens?

Yes! If you promote a pawn to a queen, you will have two queens on the board at the same time. There is no limit. If you promote multiple pawns, you could theoretically have nine queens (the

original plus eight promoted pawns). That will probably never happen in a real game, but it is legal.

In practice, most games are decided long before a second queen appears. But in endgames where both sides are racing to promote, having a new queen first is often the difference between winning and losing.

Set up your board: Place White pawns on a7 and c7, with the White king on e5 and the Black king on h8. Promote both pawns: a8=Q and c8=Q. Now White has two queens and a king against a lone king. That is an overwhelming advantage.

Three special moves learned! Excellent work. This is a great place to rest. Come back fresh for the annotated games.

13.5 Annotated Game Fragment 1: The King That Forgot to Castle

This fragment shows what happens when one side castles and the other does not. Watch how king safety decides the game.

Set up your board with the starting position.

1. e4 e5 Both sides grab a share of the center. Standard and solid.

2. Nf3 Nc6 White develops a knight and attacks the e5 pawn. Black defends it with the knight.

3. Bc4 Nf6 White develops the bishop to an active square, eyeing the f7 pawn (a common target). Black develops a knight and attacks the e4 pawn.

4. d3 h6?! White plays a solid move, protecting the e4 pawn. Black plays h6, which is not a terrible move, but it is slow. Black should be thinking about development and castling. This pawn move does not help with either.

5. O-O Bc5

Pause and look. White has castled. The king is tucked safely behind the f2, g2, and h2 pawns. The rook on f1 is now active and ready to work. Meanwhile, Black's king is still in the center on e8. Black has developed one bishop but has not started the castling process.

6. c3 d6 White prepares d4 to challenge the center. Black plays a slow move. Black should be castling. Every move spent not castling is a move closer to danger.

7. d4 exd4 White opens the center. This is exactly what Black's king does not want. When the center opens, the side with the uncastled king is usually in trouble.

8. cxd4 Bb6 The bishop retreats. Black is now three moves away from castling (at minimum: bishop out of the way, then O-O). But the center is open, and White is fully developed.

9. d5! Ne7 White pushes the pawn, gaining space and forcing the knight to retreat. Black is getting squeezed.

10. Nc3 Ng4?

Pause and look. Black sends the knight on an adventure instead of castling. This is a classic beginner mistake: going for an attack before your king is safe. Black should have played O-O this move.

11. h3 Nf6 12. Bg5!

Set up your board with this position.

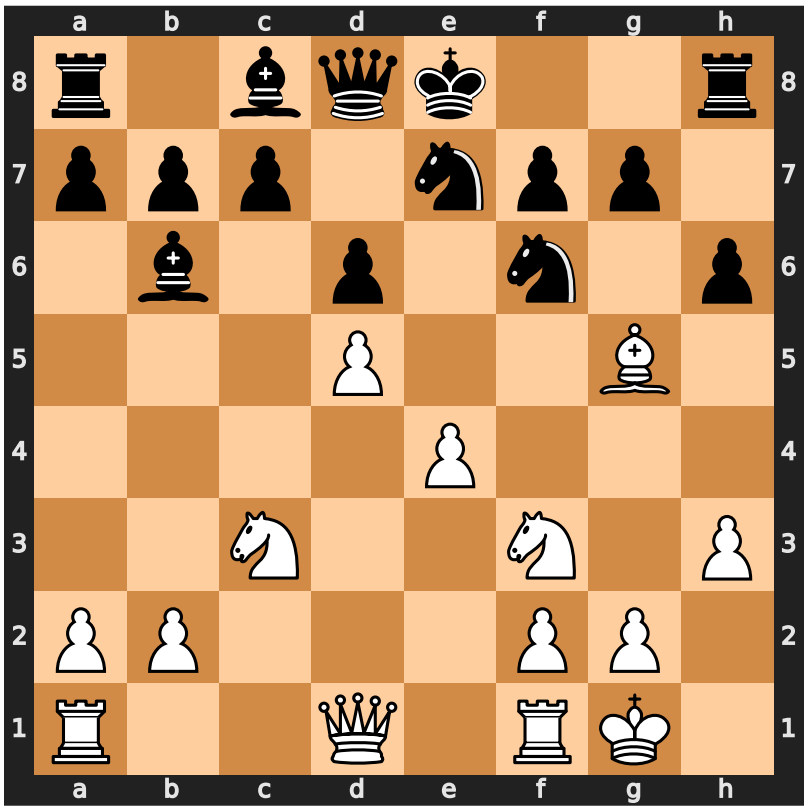

Figure 13.1: Chess Position

White pins the knight on f6 to the queen. Everything White has done has been purposeful: develop, castle, open the center, attack. Black's king is still on e8, and now the pin makes castling even harder. If Black castles kingside, the pin on the knight creates tactical problems.

This game illustrates a simple truth: **the side that castles first usually controls the game.** White castled on move 5. Black never castled at all. By move 12, White has a dominant position and Black is struggling to survive.

The lesson: castle early. Do not get distracted.

13.6 Annotated Game Fragment 2: The Promotion Race

This fragment shows a pawn endgame where both sides race to promote. The side that promotes first, with the right timing, wins.

Set up your board.

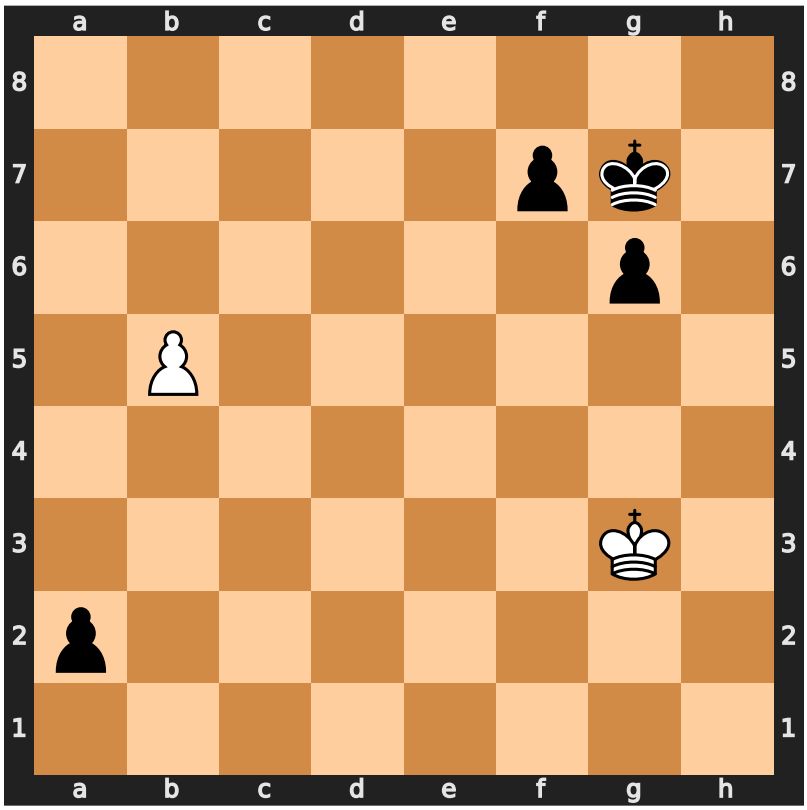

Figure 13.2: Chess Position

Position: White has a pawn on b5, king on g3. Black has a pawn on a2, king on g7, and a pawn on g6. Both sides have passed pawns racing toward promotion.

Pause and look. White's pawn on b5 needs three moves to promote (b6, b7, b8). Black's pawn on a2 needs just one move to promote (a1). But it is White's turn.

1. b6 a1=Q White pushes. Black promotes! Black now has a queen. Things look bad for White, right?

2. b7 Not so fast. White's pawn is on b7, one square from promotion. Black has a brand new queen but needs to stop the pawn.

2...Qa5

Pause and look. The queen needs to get in front of the pawn or give check. Qa5 does not stop b8=Q. Can Black stop it?

3. b8=Q White promotes too! Now both sides have queens.

Set up your board with the new position.

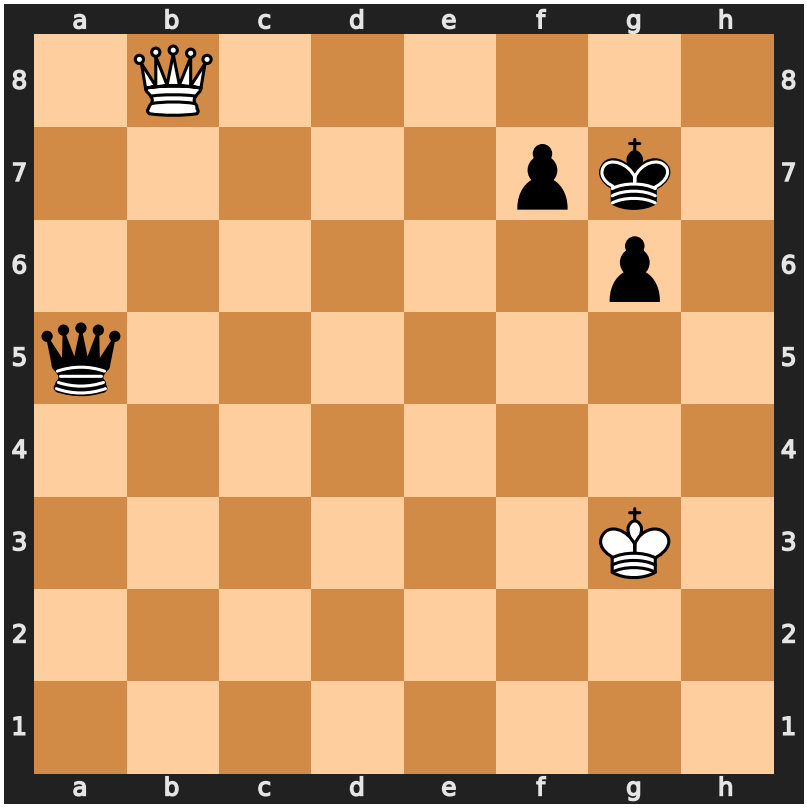

Figure 13.3: Chess Position

This is now a queen endgame. Black promoted first but could not stop White's pawn. White promoted second but is now equal in material.

The lesson here is about **timing.** In a promotion race, it is not always about who promotes first. It is about what you can do with your new queen. Can you give check? Can you stop the other pawn? Can you create threats?

In this position, the game is roughly equal, with both sides having a queen and king with one pawn. But imagine if White had promoted with check, forcing the Black king to move before Black's queen could set up. That small advantage in timing can decide the game.

Key takeaway from both fragments: 1. Castle early to protect your king (Fragment 1). 2. In pawn races, every tempo matters. Count the moves before promoting (Fragment 2).

Take a break before the exercises. Get a drink, stretch, and come back ready to solve puzzles.

13.7 Exercises

13.7.1 Castling Exercises

Exercise 3.1 **Position:** White: King on e1, Queen on d1, Bishop on f1, Knight on g1, Rook on h1, pawns on d2, e4, f2, g2, h2. Black: King on e8 with a standard setup minus the e-pawn.

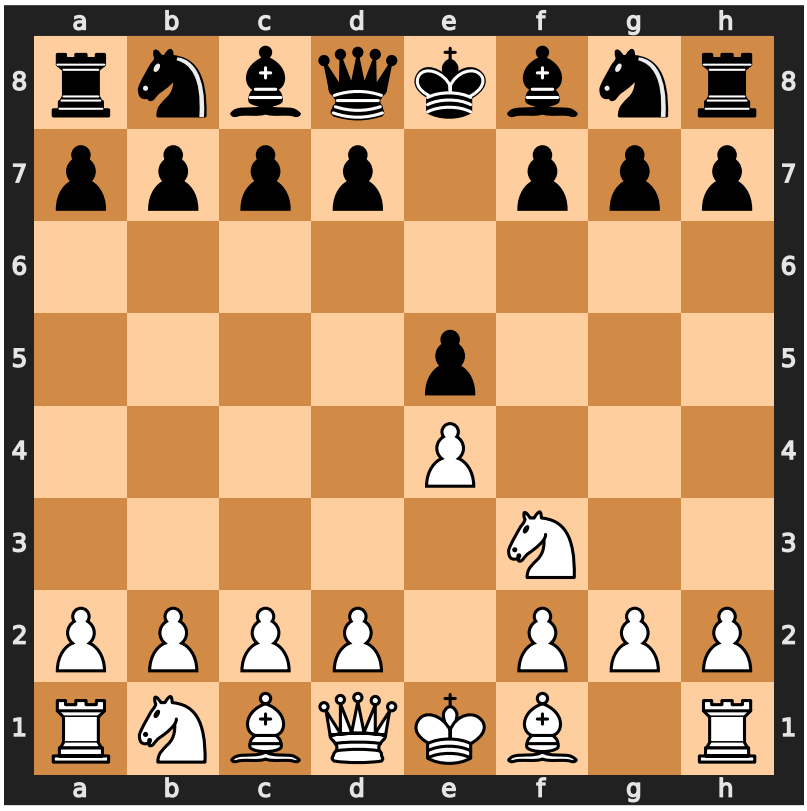

Figure 13.4: Chess Position

Task: Can White castle kingside right now? **Hint 1:** Look at the squares between the king on e1 and the rook on h1. **Hint 2:** What piece is sitting on f1? **Hint 3:** For castling, every square between king and rook must be empty. **Solution: No.** The bishop on f1 is between the king and the rook. White cannot castle kingside until the bishop moves. **Why this works:** Rule 3 says no pieces can be between the king and the rook.

Exercise 3.2 **Position:** White: King on e1, Rook on h1, Bishop on d3, Knight on f3, pawns on a2 through d2, f2 through h2. Black: King on e8 with pieces developed.

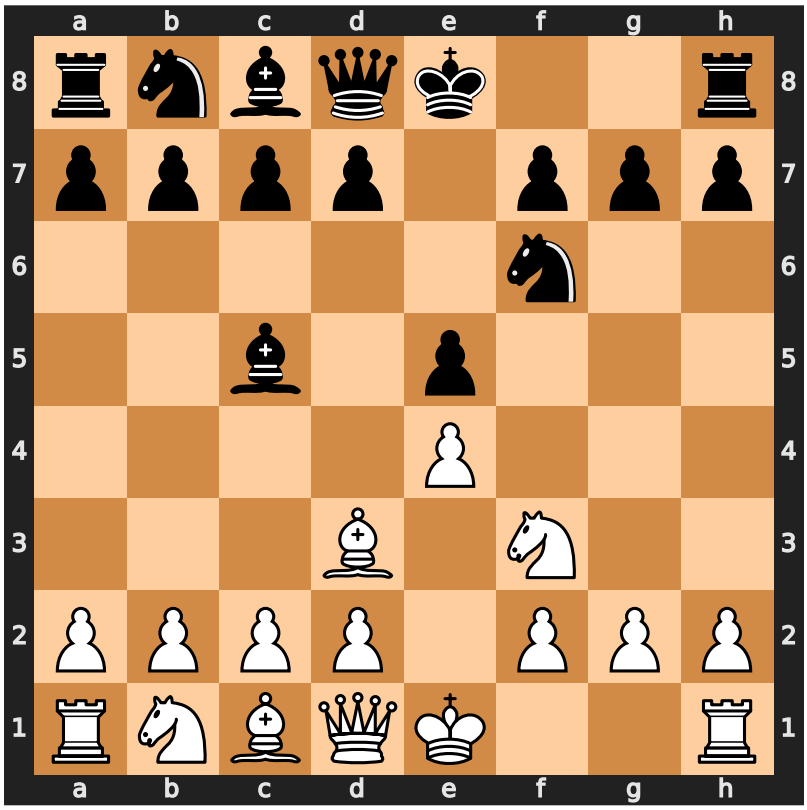

Figure 13.5: Chess Position

Task: Can White castle kingside right now? **Hint 1:** Check the squares between the king and the h1 rook. **Hint 2:** Is f1 empty? Is g1 empty? **Hint 3:** Are all five castling conditions met? **Solution: Yes!** The path is clear (f1 and g1 are empty), the king and rook have not moved, the king is not in check, and no enemy piece attacks f1 or g1. White can castle with O-O. **Why this works:** All five conditions are satisfied.

Exercise 3.3 **Position:** White: King on e1, Rook on h1, Bishop on d3, Knight on f3 (f1 and g1 are empty). Black: King on e8, Bishop on b4 giving check along the b4-e1 diagonal.

Task: Can White castle kingside right now? **Hint 1:** Is the White king currently under attack? **Hint 2:** Look at the Black bishop on b4. What diagonal does it control? **Hint 3:** The diagonal b4-c3-d2-e1 reaches the king. **Solution: No.** The Black bishop on b4 is giving check along the b4-c3-d2-e1 diagonal. You cannot castle while in check (Rule 4). White must deal with the check first. **Why this works:** You must resolve check before you can castle.

Exercise 3.4 **Position:** White: King on e1, Rook on h1 (f1 and g1 empty). Black: King on e8, Bishop on b5 aiming at the a6-f1 diagonal.

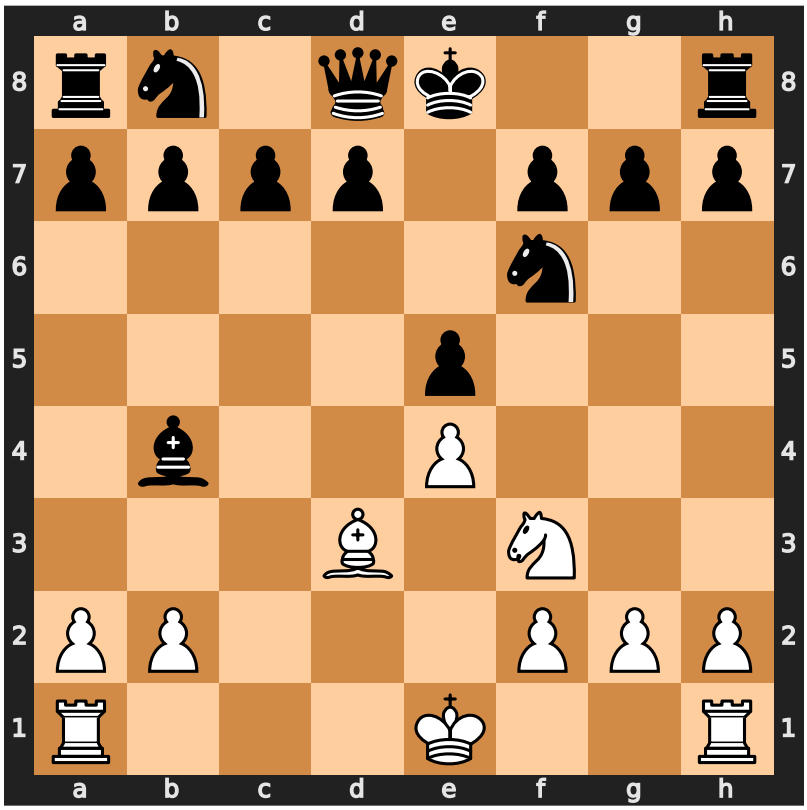

Figure 13.6: Chess Position

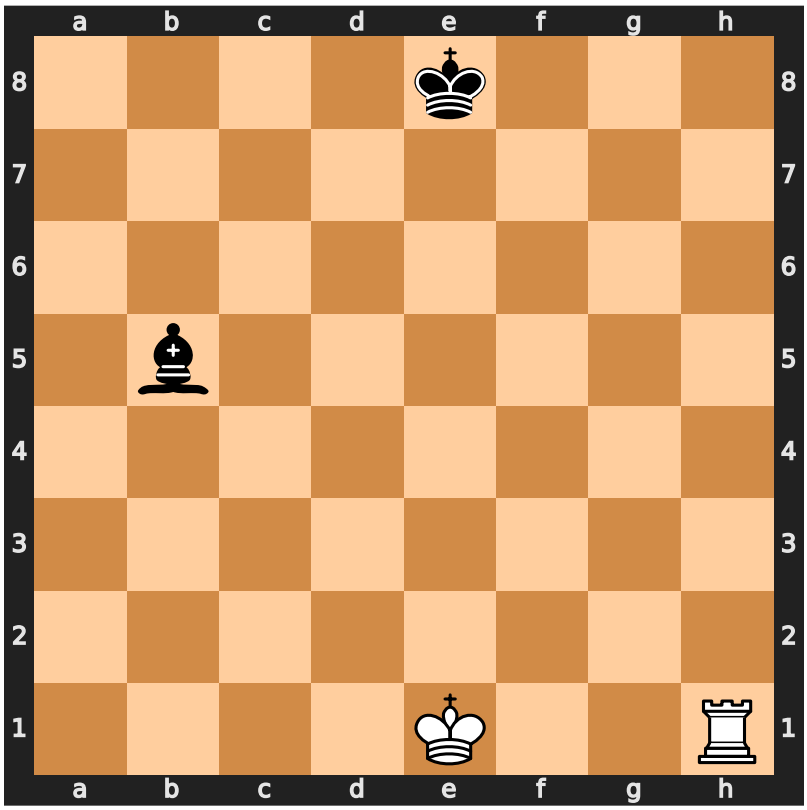

Figure 13.7: Chess Position

Task: Can White castle kingside? **Hint 1:** The king is not in check. Good. But look at where the king travels during castling. **Hint 2:** The king moves from e1 through f1 to g1. Is f1 safe? **Hint 3:** The Black bishop on b5 controls the diagonal b5-c4-d3-e2-f1. **Solution: No.** The Black bishop on b5 attacks f1. When castling kingside, the king passes through f1. Rule 5 says the king cannot pass through an attacked square. **Why this works:** Even though the king is not in check, it would move through danger on f1.

Exercise 3.5 **Position:** White: King on e1, Rook on h1, Knight on f3 (g1 is empty). Black: King on e8, Rook on g8 controlling the g-file.

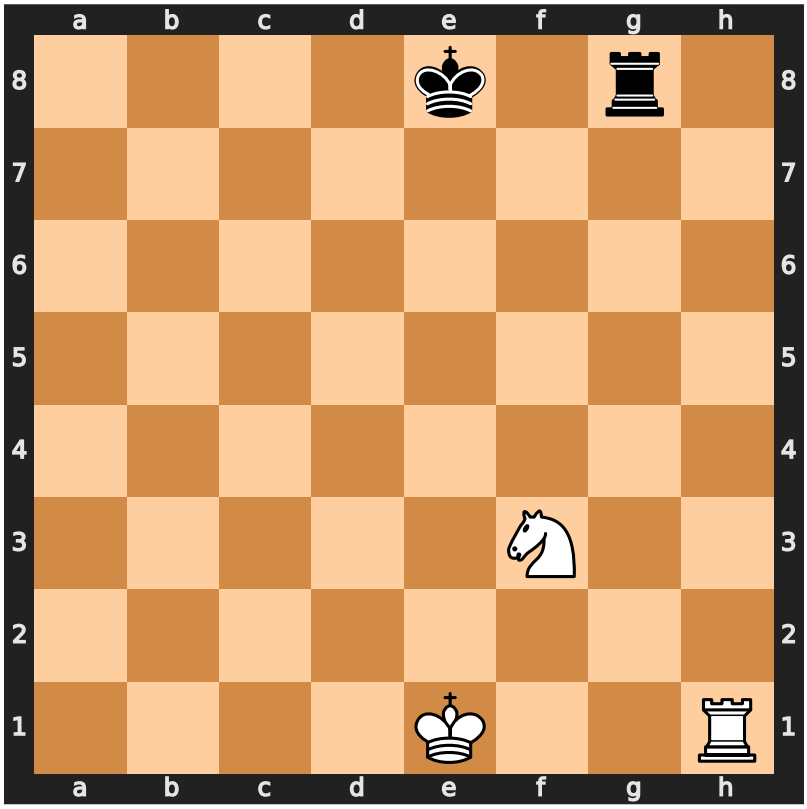

Figure 13.8: Chess Position

Task: Can White castle kingside? **Hint 1:** The king would move from e1 to g1. Is g1 safe? **Hint 2:** Look at the Black rook on g8. What file does it control? **Hint 3:** The rook controls the entire g-file, including g1. **Solution: No.** The Black rook on g8 attacks g1 through the open g-file. When castling, the king would land on g1, which is under attack. Rule 5 prohibits this. **Why this works:** The king cannot land on a square controlled by an enemy piece.

Exercise 3.6 **Position:** White: King on e1, Rook on a1 (b1, c1, and d1 are empty). Black: King on e8, Rook on b3 controlling the b-file.

Task: Can White castle queenside? **Hint 1:** The Black rook on b3 controls the b-file, including b1. Does this prevent queenside castling? **Hint 2:** During queenside castling, which squares does

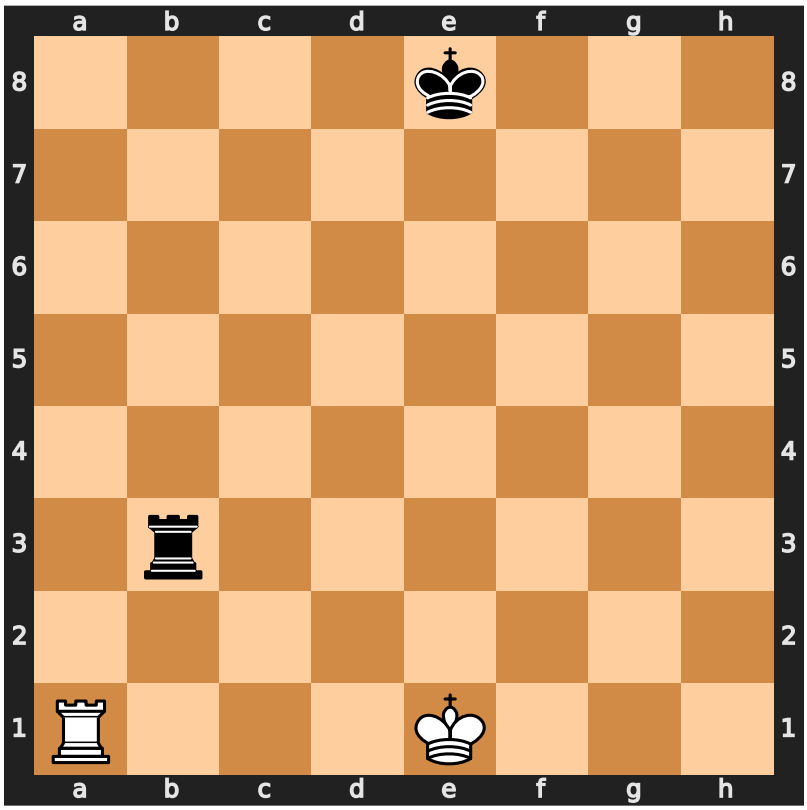

Figure 13.9: Chess Position

the KING pass through? (Not the rook, the king.) **Hint 3:** The king moves from e1 through d1 to c1. It does not pass through b1. **Solution: Yes!** This is a common trick question. The rook on b3 attacks b1, but the KING never passes through or lands on b1. The king travels e1, d1, c1. Only the rook passes through b1. Rule 5 only applies to the king's path, not the rook's path. **Why this works:** The rook can pass through attacked squares; only the king's squares matter.

Exercise 3.7 **Position:** White: King on e1, Rook on h1 (f1 and g1 empty). However, the game record shows that White's rook started on h1, moved to h3 on move 5, and returned to h1 on move 8.

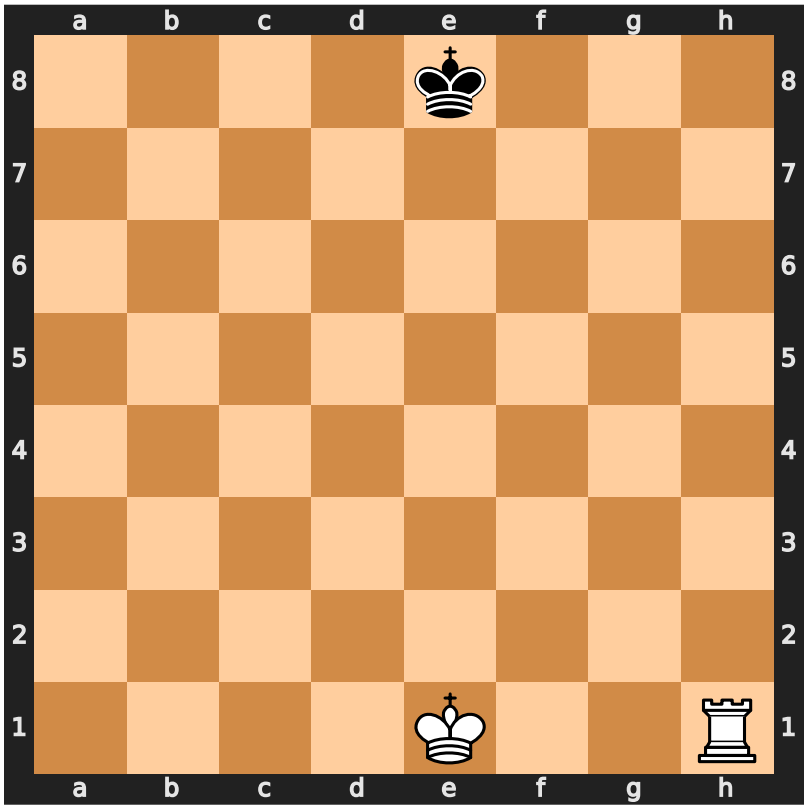

Figure 13.10: Chess Position

Task: Can White castle kingside? **Hint 1:** The rook is on h1 and the king is on e1. The path is clear. But look at the game record. **Hint 2:** Has the rook moved during this game? **Hint 3:** Once a rook moves, castling rights with that rook are permanently lost, even if the rook returns to its starting square. **Solution: No.** Even though the rook is back on h1, it moved earlier in the game. Rule 2 requires the rook to have NEVER moved. There are no take-backs. The castling right is gone forever. Notice the FEN shows "-" for castling rights, confirming this. **Why this works:** Castling tracks the entire game history, not just the current position.

Exercise 3.8 **Position:** White: King on e1, Rook on h1 (f1 and g1 empty). Black: King on e8, Queen on d6. The position looks a bit scary with Black's queen in the center, but study the squares carefully.

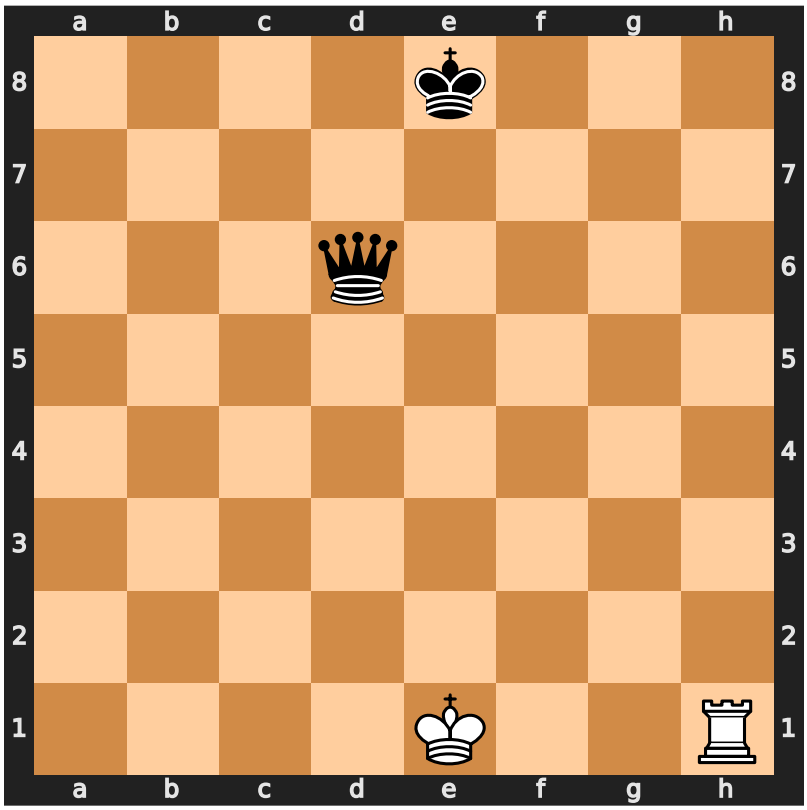

Figure 13.11: Chess Position

Task: Can White castle kingside? **Hint 1:** Is the king in check? What squares does the Black queen on d6 attack? **Hint 2:** The queen controls the d-file, the 6th rank, and several diagonals. Does it attack e1, f1, or g1? **Hint 3:** Check each square: e1 (king is here, not under attack from d6), f1 (not on the queen's rank, file, or any diagonal from d6), g1 (not on any line from d6). **Solution: Yes!** The Black queen on d6 looks threatening, but it does not attack e1, f1, or g1. The king is not in check, the path is clear, and no square is attacked. Castling is legal. **Why this works:** Always check the specific squares, not just how "scary" the enemy piece looks. Positions can be deceptive.

13.7.2 En Passant Exercises

Exercise 3.9 **Position:** White pawn on e5. Black has just played d7-d5 on the previous move, and the Black pawn now sits on d5, right beside your pawn.

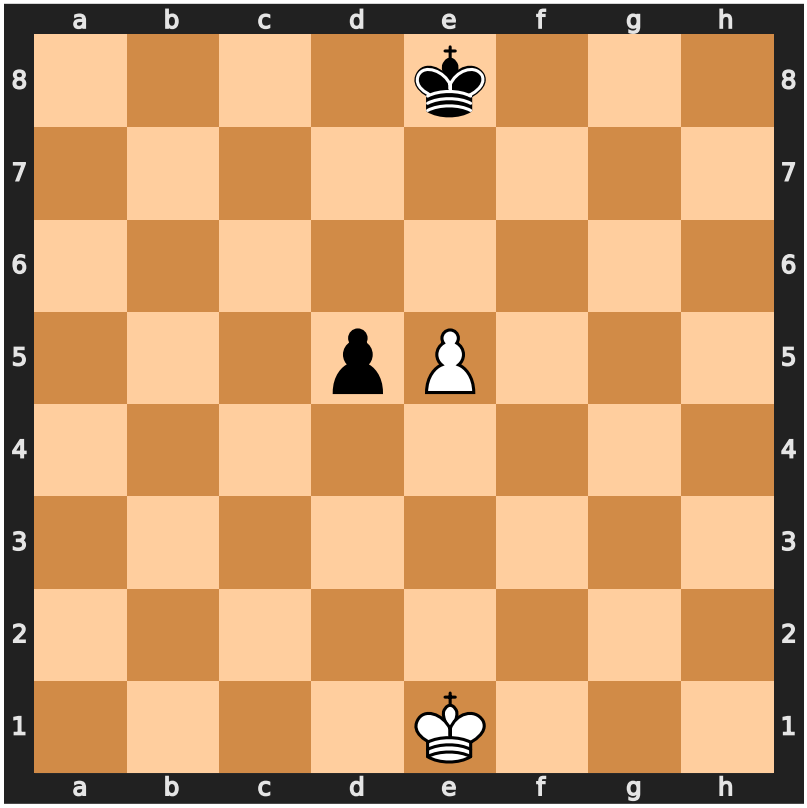

Figure 13.12: Chess Position

Task: Is en passant legal for White? **Hint 1:** Is your pawn on the 5th rank? **Hint 2:** Did the enemy pawn just advance two squares? **Hint 3:** Look at the FEN. The en passant target square is listed as "d6." **Solution: Yes!** Your pawn is on the 5th rank (e5), and Black's pawn just advanced two squares from d7 to d5. You can capture en passant with exd6, moving your pawn from e5 to d6 and removing the Black pawn from d5. **Why this works:** All en passant conditions are met, and the FEN confirms the target square is d6.

Exercise 3.10 **Position:** White pawn on e5, Black pawn on d5. The position looks identical to Exercise 3.9, but Black's pawn moved to d5 THREE moves ago, not on the last move.

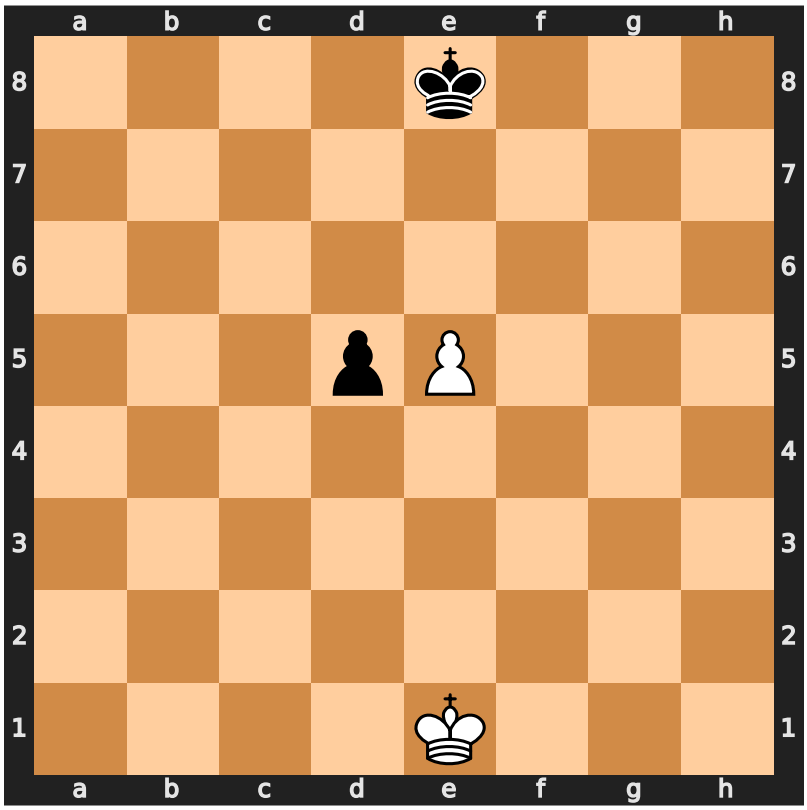

Figure 13.13: Chess Position

Task: Is en passant legal for White? **Hint 1:** When did the Black pawn arrive on d5? **Hint 2:** En passant has a strict timing requirement. What is it? **Hint 3:** Look at the FEN. What does the en passant field show? **Solution: No.** The position looks the same as 3.9, but the Black pawn moved to d5 several moves ago. En passant can only be captured on the very next move after the two-square advance. The FEN confirms this: the en passant field shows "-" (no en passant available). **Why this works:** En passant is "use it or lose it." Miss your chance and it is gone.

Exercise 3.11 **Position:** White pawns on c5 AND e5. Black has just played d7-d5. The Black pawn on d5 is beside BOTH White pawns.

Task: Can White capture en passant? If so, with which pawn? **Hint 1:** Both the c5 and e5 pawns are on the 5th rank, beside the d5 pawn. **Hint 2:** Both pawns meet the en passant conditions. **Hint 3:** White can choose either one, but must pick only one. **Solution: Yes, with either pawn!** White can play cxd6 (moving the c5 pawn to d6) OR exd6 (moving the e5 pawn to d6). Both captures are legal en passant. You must choose one. You cannot capture with both. **Why this works:** Any pawn on the 5th rank that is adjacent to the pawn that just advanced two squares can capture en passant.

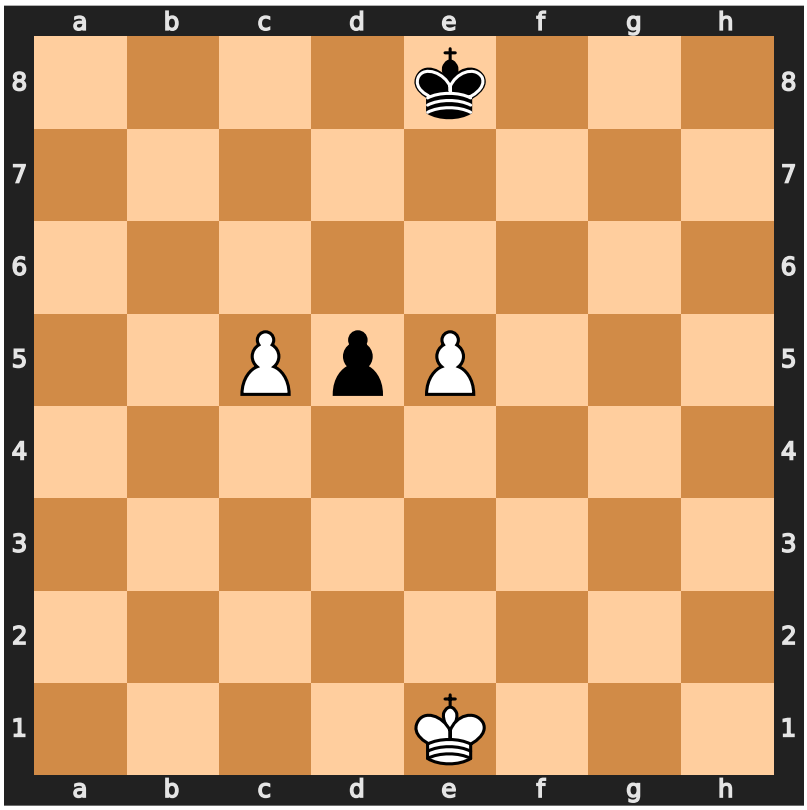

Figure 13.14: Chess Position

Exercise 3.12 **Position:** White King on f5, White pawn on e5. Black King on e8, Black rook on h5, Black pawn has just played g7-g5, landing beside the White pawn.

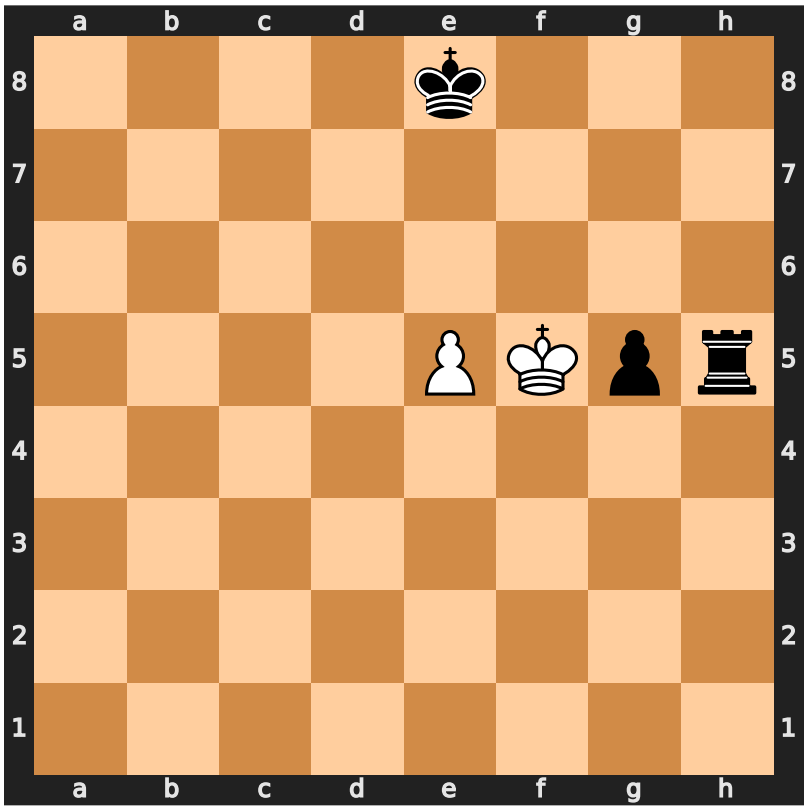

Figure 13.15: Chess Position

Task: Can White capture en passant with exg6? **Hint 1:** All the normal en passant conditions look met. But is there something else to check? **Hint 2:** What happens to the 5th rank after the pawn on e5 moves to g6 and the pawn on g5 is removed? **Hint 3:** The rook on h5 would have a clear line to the king on f5 along the 5th rank. **Solution: No!** If White plays exg6 en passant, the pawn leaves e5 and the captured pawn is removed from g5. This opens the 5th rank completely, and the Black rook on h5 would attack the White king on f5. You can never make a move that leaves your own king in check, not even en passant. **Why this works:** The "no exposing your king to check" rule overrides everything else, including en passant.

Exercise 3.13 **Position:** White pawn on d5, Black pawn on e5. The pawns are side by side on the 5th rank. But it is not Black's pawn that just moved. Black played Ng8-f6 last move.

Task: Is en passant legal for White? **Hint 1:** The pawns are beside each other. But what was Black's last move? **Hint 2:** En passant requires the enemy pawn to have JUST advanced two squares. **Hint 3:** Black's last move was a knight move, not a pawn move. The en passant field is "-". **Solution: No.** Even though the pawns are side by side on the 5th rank, Black's pawn did not just advance two squares. En passant is only triggered by an immediate two-square pawn advance. Since Black's last move was Ng8-f6 (a knight move), no en passant is available. **Why this works:** The trigger for en passant is the two-square advance itself, not the resulting position.

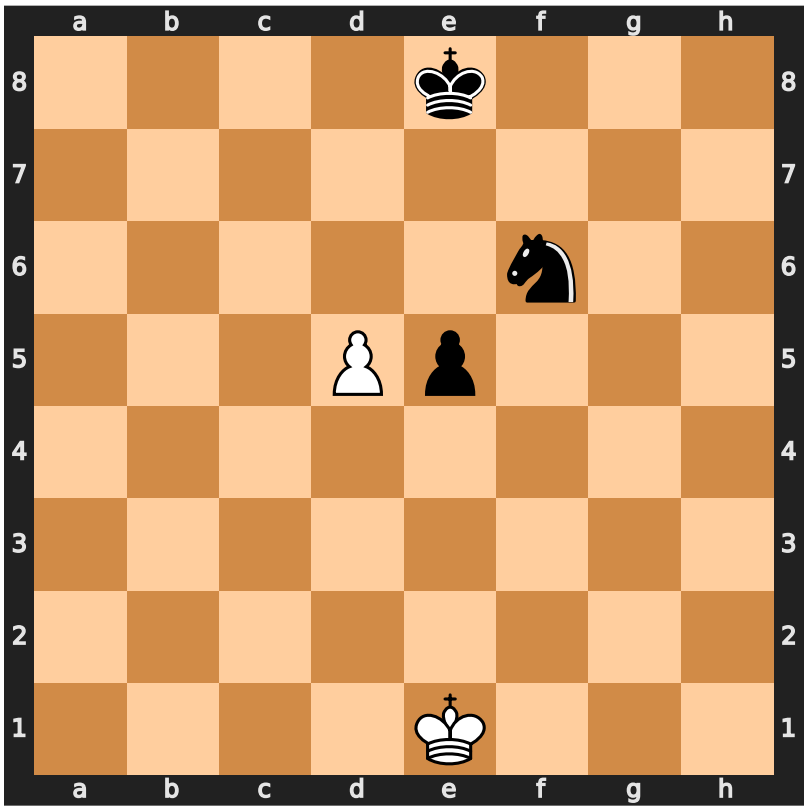

Figure 13.16: Chess Position

13.7.3 Promotion Exercises

Exercise 3.14 **Position:** White: King on g1, pawn on d7. Black: King on e8, Rook on b8.

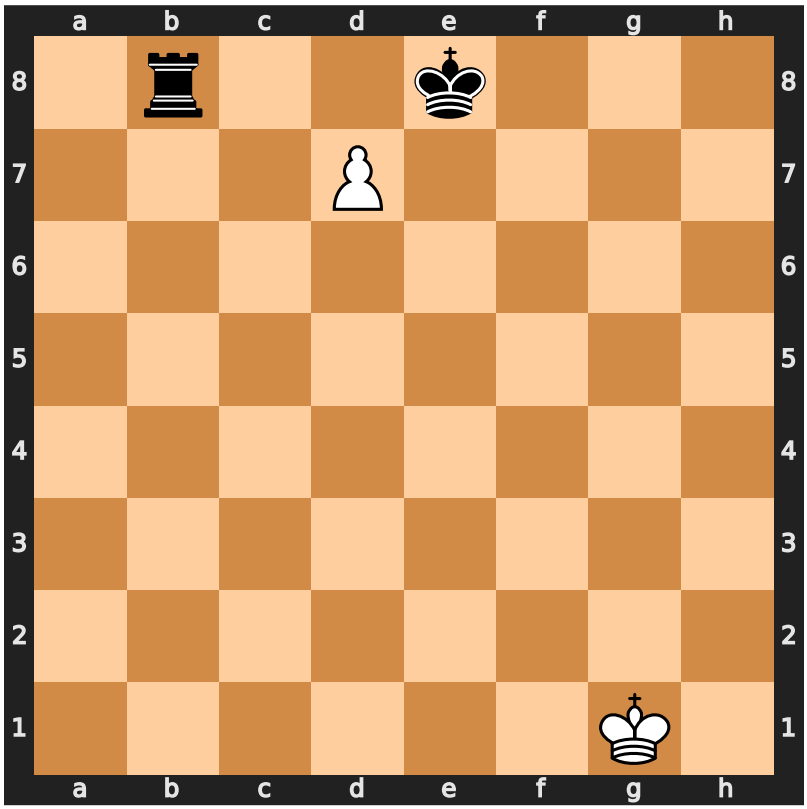

Figure 13.17: Chess Position

Task: White's pawn is one square from promotion. What should it promote to? **Hint 1:** What is the strongest piece? **Hint 2:** Does promoting to a queen create any problems here (stalemate, etc.)? **Hint 3:** d8=Q+ gives check and attacks the rook on b8. **Solution: Queen!** Play d8=Q+. The new queen gives check to the Black king and simultaneously attacks the rook on b8. After the king moves, White captures the rook and has a queen vs. nothing. **Why this works:** The queen is the strongest piece, and here it gives check while winning the rook.

Exercise 3.15 **Position:** White: King on g1, pawn on e7. Black: King on c7, Queen on g7.

Task: What should the pawn promote to? **Hint 1:** If you promote to a queen, do you win anything right away? **Hint 2:** What piece can attack two squares at once in an L-shape? **Hint 3:** A knight on e8 attacks both c7 and g7. **Solution: Knight!** Play e8=N+. The knight on e8 gives check to the king on c7 and simultaneously attacks the queen on g7. This is a fork! The king must move, and then White plays Nxg7, winning the queen. Promoting to a queen would NOT create this fork. **Why this works:** The knight is the only piece that can fork from e8 to both c7 and g7. Underpromotion wins material.

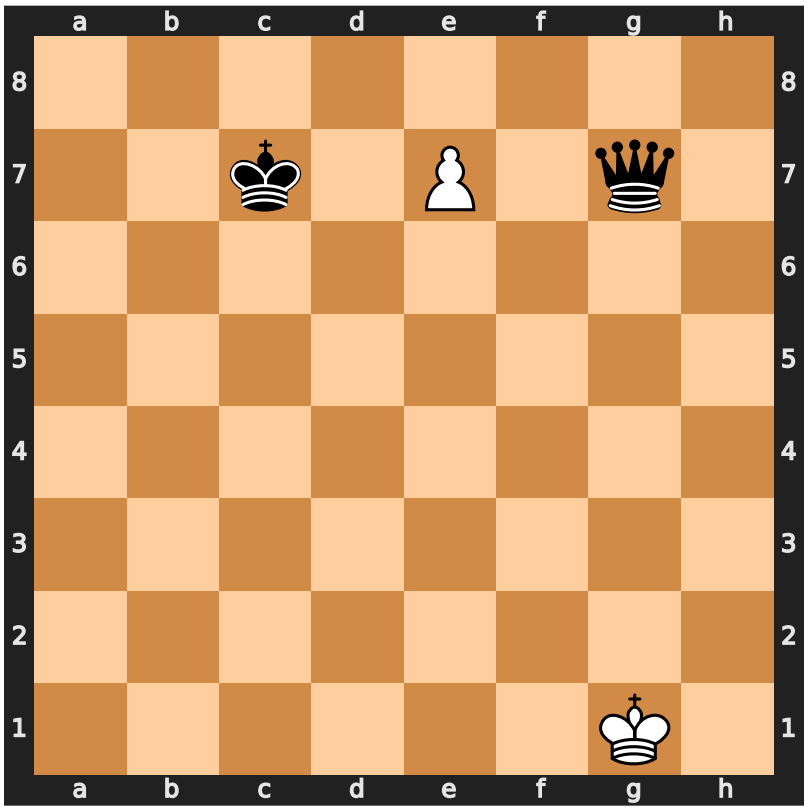

Figure 13.18: Chess Position

Exercise 3.16 **Position:** White: King on h1, pawn on a7. Black: King on h8, no other pieces.

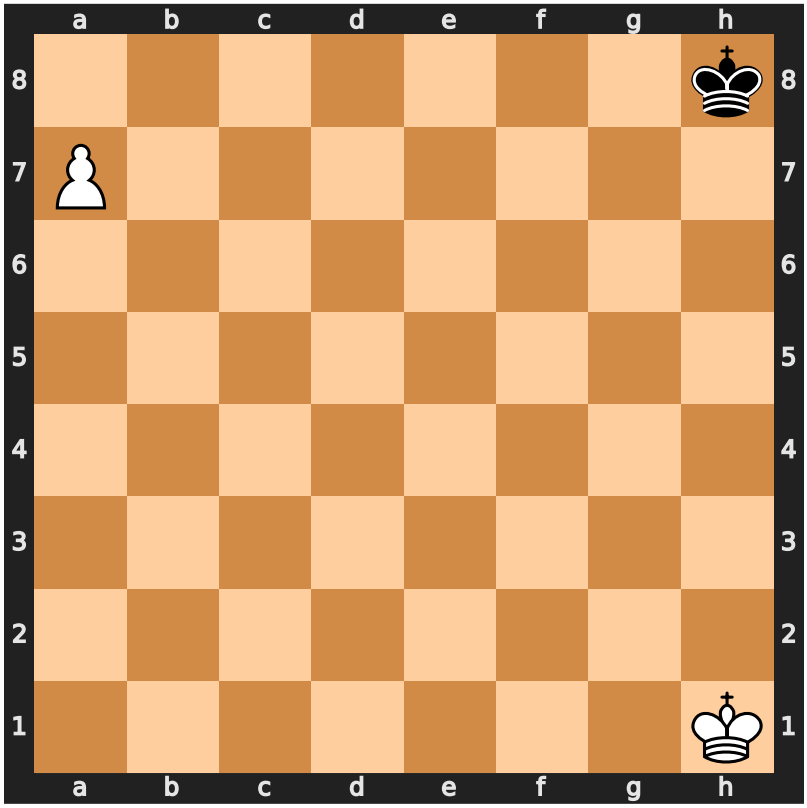

Figure 13.19: Chess Position

Task: What should the pawn promote to? **Hint 1:** There are no enemy pieces to worry about. **Hint 2:** You want the strongest possible piece. **Hint 3:** A new queen will make checkmating the lone king straightforward. **Solution: Queen!** Play a8=Q. With a queen and king against a lone king, checkmate is simple. There is no reason to underpromote here. The queen is always correct when there are no tricks to worry about. **Why this works:** When in doubt, promote to a queen. It is correct the vast majority of the time.

Exercise 3.17 **Position:** White: King on g2, pawn on f7. Black: King on d6, Rook on c7.

Task: What should the pawn promote to? **Hint 1:** If f8=Q, the new queen is powerful, but check whether the rook can capture or trade immediately. **Hint 2:** What if you promote to a knight? Where does a knight on f8 give check? **Hint 3:** A knight on f8 attacks d7 and e6. The king on d6 can reach e6 in one move, but d7 is right next to the king. Does Nf8 fork anything? **Solution: Knight!** Play f8=N+. The knight on f8 attacks e6 and d7. The king on d6 is adjacent to d7, which means… wait, does Nf8 check Kd6? A knight on f8 attacks d7, e6, g6, and h7. The king on d6 is NOT directly attacked (d6 is not a knight-hop from f8). So Nf8 is NOT check. In that case, **Queen** is correct: f8=Q. The queen on f8 is a powerful piece. If Black plays Rxf7+, White recaptures with Qxf7, and White has a queen against nothing. Actually, f8=Q puts pressure on the board, and after any rook move, White's queen dominates. **Why this works:** Always check if

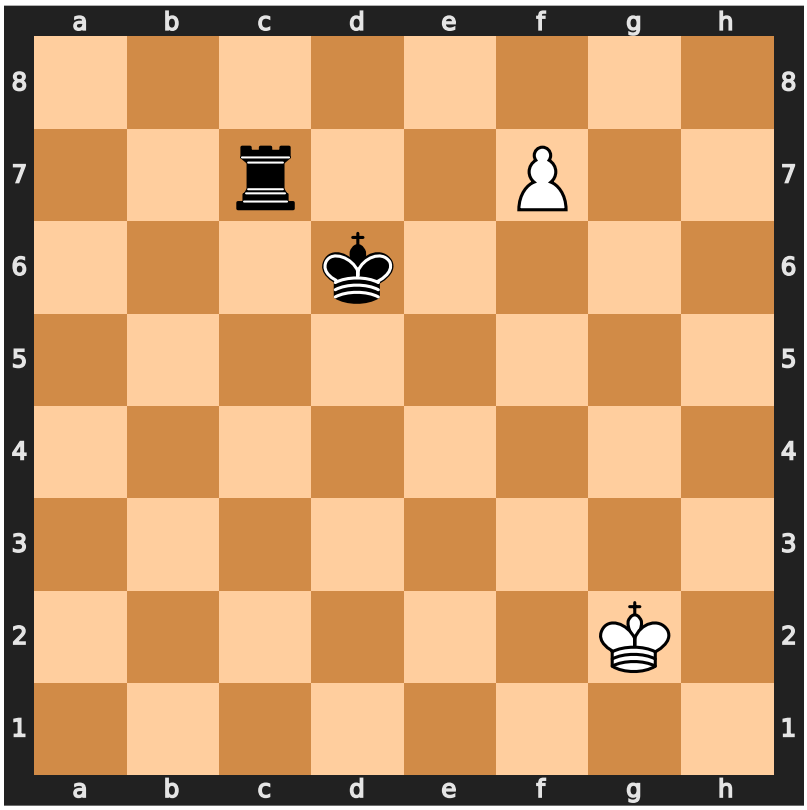

Figure 13.20: Chess Position

underpromotion gives a concrete advantage (check, fork, mate). If it does not, promote to queen.

13.7.4 Find the Winning Move Exercises

Exercise 3.18 **Position:** White: King on e1, Rook on h1, Knight on f3, Bishop on c4, pawns on d4, e5, f2, g2, h2. Black: Queen on h4, Knight on g4, threatening Qxf2 mate.

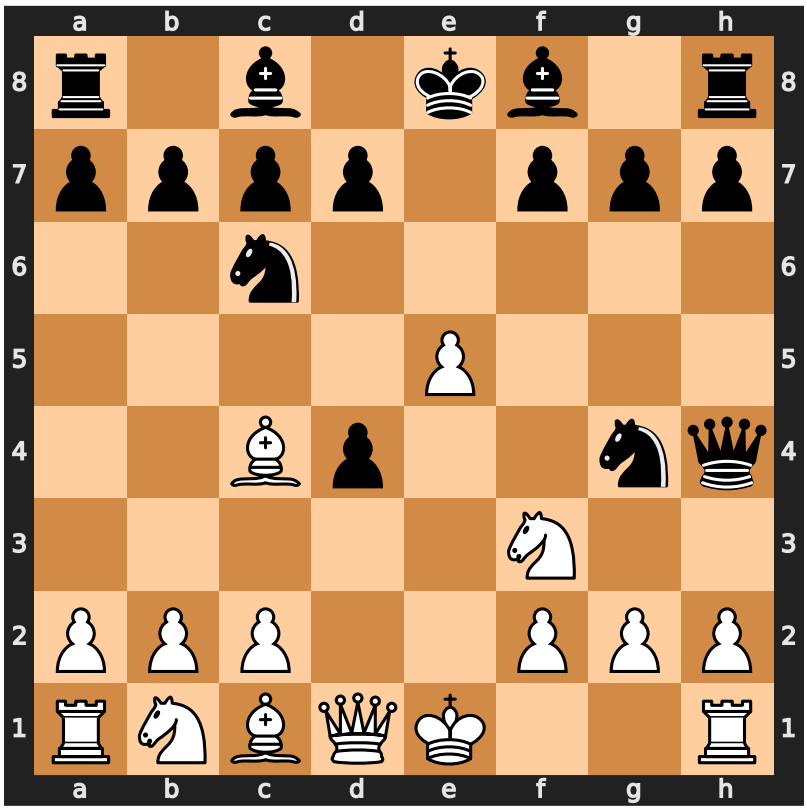

Figure 13.21: Chess Position

Task: Find the best move for White. Your king is in danger, but you have a special move available. **Hint 1:** Your king is on e1 with f1 and g1 empty. **Hint 2:** Black is threatening Qxf2#. You need to move your king immediately. **Hint 3:** Castling moves the king to g1, behind the pawn wall, escaping all threats. **Solution:** **O-O!** Castle kingside. The king escapes to g1, safely behind the f2, g2, and h2 pawns. Black's attack fizzles because the queen and knight cannot reach the king behind the pawn shield. The rook on f1 is now also active. **Why this works:** Castling solves both problems at once: king safety and piece development. It is the best defensive move on the board.

Exercise 3.19 **Position:** White: King on g1, pawns on d5, f2, g2, h2. Black: King on g8, pawn has just played c7-c5, pawns on f7, g7, h7.

Task: Find the best move for White. **Hint 1:** Black just played c7-c5. Your pawn is on d5. Does this trigger anything? **Hint 2:** En passant! dxc6 captures the pawn and puts your pawn on c6. **Hint 3:** A pawn on c6 is a dangerous passed pawn, only two squares from promotion. **Solution:**

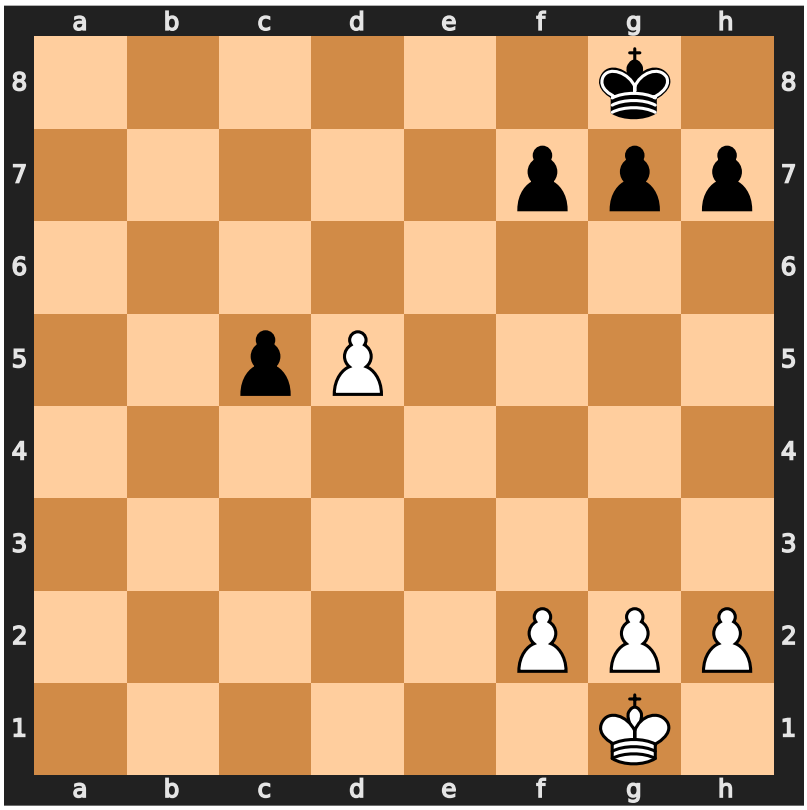

Figure 13.22: Chess Position

dxc6 (en passant)! Capture the c5 pawn en passant. Your pawn lands on c6, creating a powerful passed pawn that is just two squares from the 8th rank. Black will struggle to stop it. **Why this works:** En passant here does not just capture a pawn. It creates a winning passed pawn. Always look for en passant opportunities that create strategic advantages.

Exercise 3.20 **Position:** White: King on e6, pawn on d7. Black: King on g8, Rook on a8.

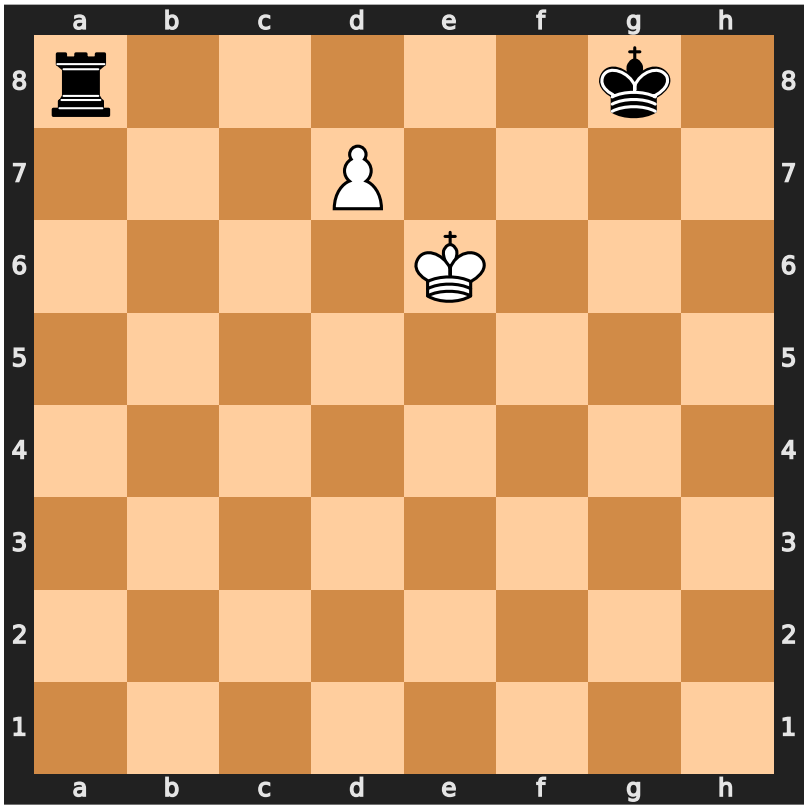

Figure 13.23: Chess Position

Task: Find the winning move for White. **Hint 1:** The pawn on d7 is one square from promotion. **Hint 2:** Push it! What should you promote to? **Hint 3:** d8=Q wins a queen. The Black rook cannot stop it. **Solution: d8=Q!** Promote to queen. The new queen dominates the board. The Black rook on a8 cannot capture on d8 because the White king on e6 protects that square (e6 to d7 is adjacent, and d8 is adjacent to… actually, let's check: Ke6 protects d7, but does it protect d8? e6 to d8 is a knight hop, not an adjacent square. So the queen on d8 is not directly protected by the king.) However, after d8=Q, White has a queen versus a rook, which is a huge material advantage. **Why this works:** A queen is worth about 9 points, a rook about 5. This material advantage is winning.

Exercise 3.21 **Position:** White: King on e1, Rook on h1, Rook on a1, Bishop on g5 pinning a Black knight on f6, Knight on c3, pawns on d4, e4, f2, g2, h2. Black: King on e8, Queen on d7, Rook on a8, Rook on h8, Knight on f6, Bishop on e7, pawns on a7, b7, c7, d6, g7, h7.

Task: White has an interesting castling opportunity. Find the best move. **Hint 1:** White can

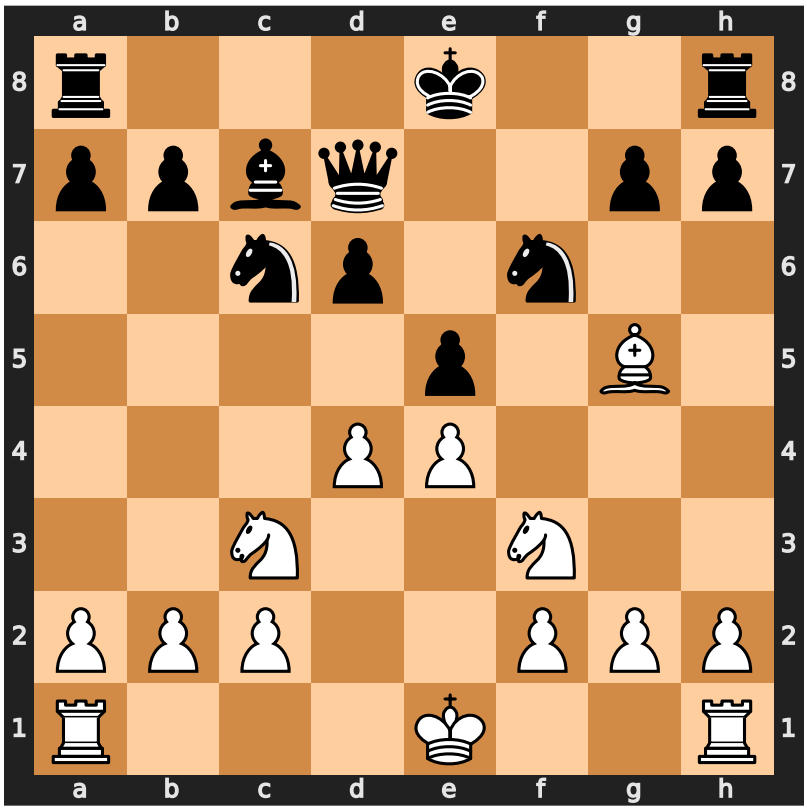

Figure 13.24: Chess Position

castle either kingside or queenside. Which one puts more pressure on Black? **Hint 2:** Look at the d-file. After queenside castling, the rook lands on d1, directly facing Black's queen on d7. **Hint 3:** O-O-O puts the rook on d1 with tempo, pressuring the queen. **Solution: O-O-O!** Castle queenside. The king goes to c1 (safe), and the rook lands on d1, putting immediate pressure on the Black queen on d7 along the semi-open d-file. This is castling "with tempo" because it gains time by threatening the queen. Black must respond to the pressure on d7 before doing anything else. **Why this works:** The best moves in chess do two things at once. This castle tucks the king to safety AND creates an immediate threat.

Exercise 3.22 **Position:** White: King on g1, pawns on f5, g3, h4. Black: King on g8, pawns on f7, g7, h7. Black has just played g7-g5, trying to challenge White's pawn chain.

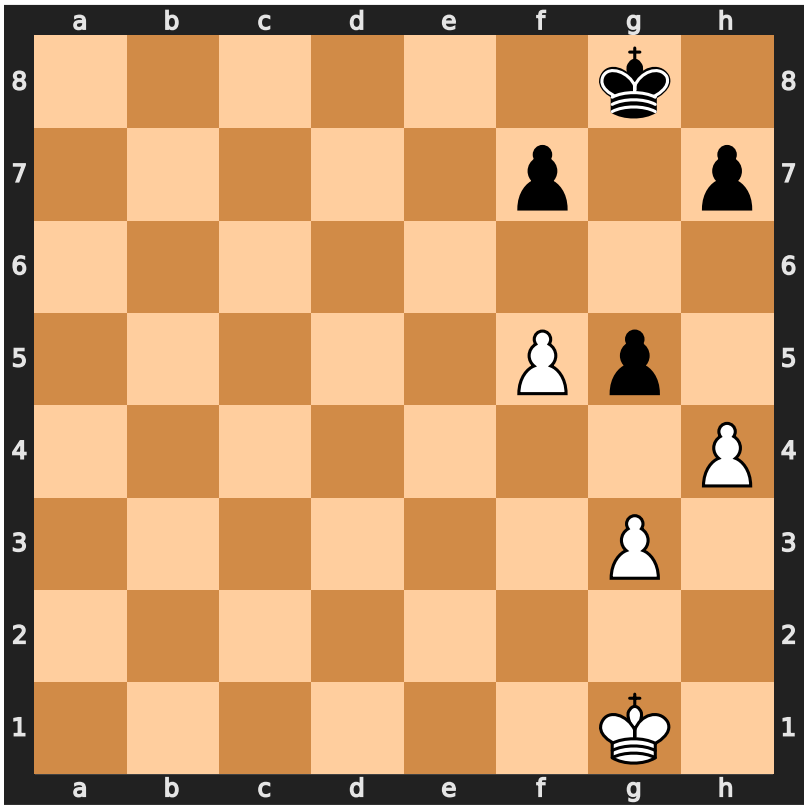

Figure 13.25: Chess Position

Task: Find the best move for White. Look carefully at the pawn structure. **Hint 1:** Black just played g7-g5. Your pawn is on f5. What special capture is available? **Hint 2:** fxg6 en passant. But is it good? **Hint 3:** After fxg6, you also threaten gxh7+ or g7, creating two connected passed pawns. **Solution: fxg6 (en passant)!** Capture en passant. After fxg6, White threatens gxh7 and gxf7+. Black cannot defend both sides. For example, after fxg6 fxg6, hxg5, White's g-pawn becomes a dangerous passer. Alternatively, after fxg6 hxg6, White plays h5, creating a passed pawn on the h-file. **Why this works:** The en passant capture blows open Black's pawn structure and creates winning passed pawns.

Exercise 3.23 **Position:** White: King on a1, pawn on b7. Black: King on d8, Queen on a7, Rook on c8.

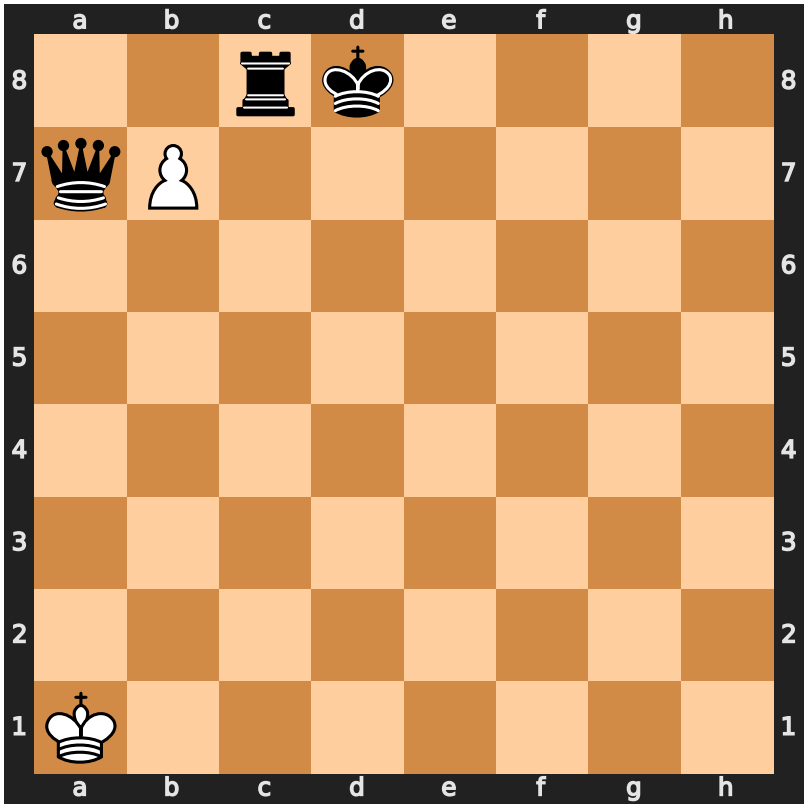

Figure 13.26: Chess Position

Task: The pawn on b7 is ready to promote, but Black's queen on a7 and rook on c8 are defending. Find the winning move. **Hint 1:** b8=Q would be met by Rxc8… wait, no: b8=Q and the queen is on b8 while the rook is on c8. Can the rook capture? **Hint 2:** What if you promote to knight? Where does a knight on b8 attack? **Hint 3:** A knight on b8 attacks a6, c6, and d7. The king is on d8, adjacent to d7. Is that check? **Solution: bxc8=Q+!** The pawn captures the rook on c8 and promotes to a queen with check. The king on d8 must move (Ke7 or Kd7). White now has a queen and is winning. Note that b8=Q (without capturing) fails because Rxb8 simply takes the new queen, and b8=N does not give check since a knight on b8 attacks a6, c6, and d7 — none of which is the king's square d8. The key is the capture-promotion. **Why this works:** Combining a capture with promotion gives White a huge material advantage.

Exercise 3.24 **Position:** White: King on e1, Rook on a1, Rook on f1, Queen on d2, Knight on c3, pawns on a2, b2, c2, e4, f2, g2, h2. Black has a balanced position.

Task: Can White castle in this position? Examine both kingside and queenside. **Hint 1:** For queenside castling, check if b1, c1, and d1 are empty. **Hint 2:** Look at the first rank: Ra1, empty b1, Bc1… the bishop on c1 is in the way. **Hint 3:** White cannot castle queenside right now because of the bishop on c1. **Solution: White cannot castle in this position.** The bishop on c1 blocks queenside castling, and the knight on g1 blocks kingside castling. White needs to develop these

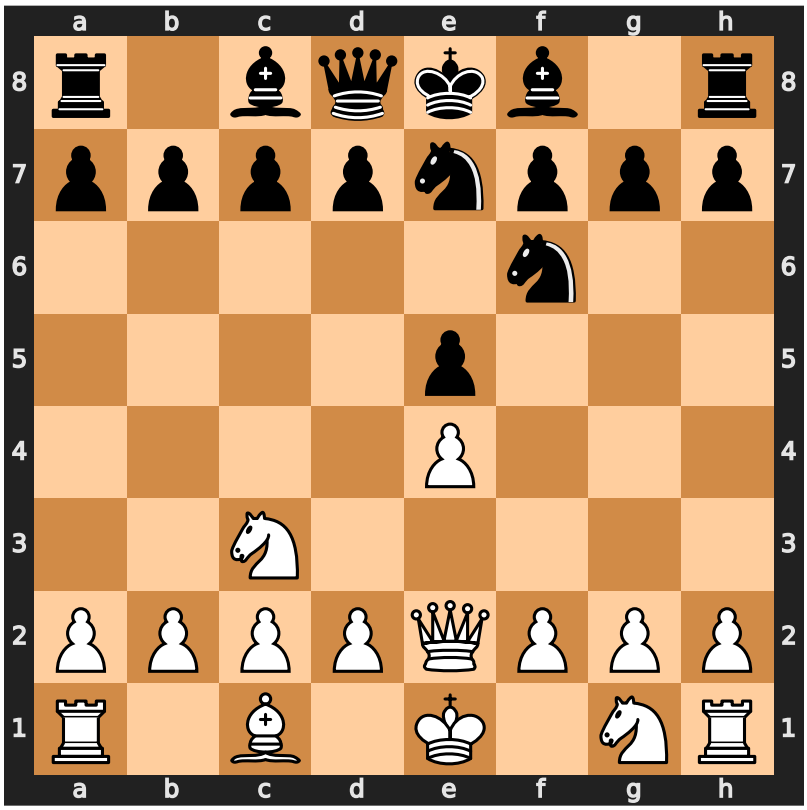

Figure 13.27: Chess Position

pieces first. The lesson: develop your minor pieces (bishops and knights) early so that castling becomes available. **Why this works:** Rule 3 requires all squares between king and rook to be empty.

Exercise 3.25 **Position:** White: King on e3, pawn on a6. Black: King on e6, pawn on h4. No other pieces. Both sides have passed pawns racing to promote.

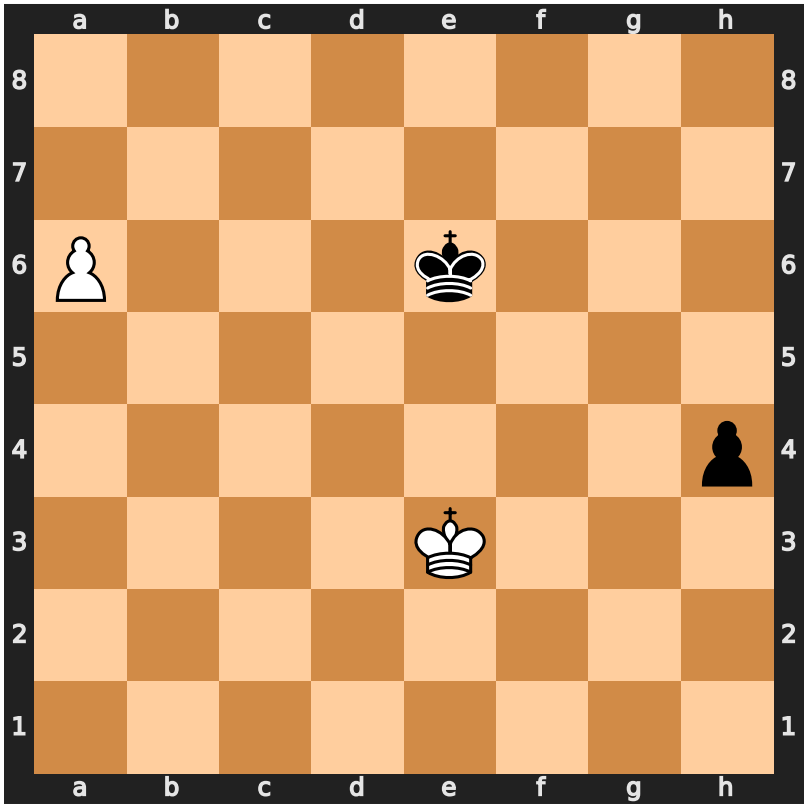

Figure 13.28: Chess Position

Task: Count the moves. Can White promote the a-pawn before Black promotes the h-pawn? Who wins the race? **Hint 1:** White's pawn on a6 needs two moves to promote: a7, then a8=Q. **Hint 2:** Black's pawn on h4 needs three moves to promote: h3, h2, h1=Q. **Hint 3:** White promotes in two moves, Black in three. White promotes first! But then White needs to use the new queen to stop Black's pawn. **Solution:** White wins the race. **1. a7 h3 2. a8=Q h2.** White has a queen. Now **3. Qf3!** (or any move that stops the h-pawn). The queen easily blocks the h-pawn and eventually captures it. White then uses the queen and king to deliver checkmate. **Why this works:** In promotion races, count the moves. The side that promotes first usually wins, as long as the new queen can stop the opponent's pawn. One tempo ahead is all it takes.

13.8 Key Takeaways

1. **Castling** protects your king and activates your rook in a single move. Try to castle within your first ten moves in every game.
2. **All five castling conditions** must be met: king has not moved, rook has not moved, no pieces between them, not in check, and the king does not pass through or land on an attacked square.
3. **En passant** is a special pawn capture that can only happen immediately after an opponent's pawn advances two squares to land beside yours. It is a "use it or lose it" rule.
4. **Promotion** transforms a pawn into a queen, rook, bishop, or knight when it reaches the last rank. Promote to a queen in almost every situation.
5. **Underpromotion to a knight** is the most common exception, usually because it creates a fork or gives check.

13.9 Practice Assignment

Complete these tasks with a real board or on a chess website:

1. **Castling drill.** Set up the starting position. Play a game against yourself (or a computer) where you must castle before move 8. Do this five times, alternating between kingside and queenside castling.
2. **En passant practice.** Set up a White pawn on e5 and practice capturing en passant with pawns landing on d5, f5, and c5. Repeat until the motion is automatic.
3. **Promotion practice.** Play five games (against a computer on easy difficulty) where your only goal is to get a pawn to the other side of the board. Do not worry about winning. Just practice pushing pawns and promoting them.
4. **Combination search.** Play three games online (any time control). In each game, look for at least one opportunity to use a special move. After the game, review whether you spotted every en passant and castling opportunity.

13.10 Progress Check

Answer these questions honestly:

☐ Can you castle kingside and queenside correctly, with the king and rook on the right squares?
☐ Can you name all five castling conditions from memory?
☐ Can you set up and execute an en passant capture without hesitation?
☐ Do you understand that en passant must be played immediately or the chance is lost?
☐ Can you promote a pawn and explain when to choose a knight over a queen?
☐ Can you spot a special move opportunity during a game (not just in exercises)?

If you checked four or more boxes, you are ready to move on. If not, go back and practice the sections that feel shaky. There is no rush. Every grandmaster learned these moves one at a time, just like you are doing right now.

End of Chapter 3. Well done! You now know every legal move in chess. Every single one. That is a real achievement. Take a break. Go outside, get some fresh air, and let it sink in. When you come back, we will start putting it all together.

Chapter 14

Chapter 4: Piece Values and When to Trade

Rating Range: Beginner (200-600)

"You may learn much more from a game you lose than from a game you win. You will have to lose hundreds of games before becoming a good player." — Jose Raul Capablanca

---

14.1 What You'll Learn

- How many points each chess piece is worth, and why the king is priceless
- Why two bishops working together are stronger than you might expect
- How the value of a piece changes depending on where it sits and what surrounds it
- When trading pieces helps you win, and when it throws away your advantage
- How to count material at a glance and decide if a trade is smart or reckless

---

14.2 Part 1: The Point System

Every chess piece has a value. Not a price tag you will find printed on the box, but a number that players have agreed on over hundreds of years of experience. These values help you answer one of the most common questions in chess: *Should I make this trade?*

The system is simple. The pawn is the smallest unit, worth one point. Everything else is measured in pawns.

Piece	Symbol	Value
Pawn	P	1 point
Knight	N	3 points
Bishop	B	3 points

Piece	Symbol	Value
Rook	R	5 points
Queen	Q	9 points
King	K	Infinite

Look at that table for a moment. A knight is worth three pawns. A rook is worth five. A queen is worth nine, making it the most powerful piece you can trade. And the king? The king is worth everything. You cannot trade it, capture it, or give it away. If you lose your king, you lose the game. That is why its value is infinite.

14.2.1 What These Numbers Mean in Practice

When you trade a piece, you want to come out even or ahead. If you give up a knight (3 points) and capture a rook (5 points), you gained 2 points of material. That is a good trade. If you give up a rook (5 points) and only capture a knight (3 points), you lost 2 points. That is a bad trade, unless you had a very good reason for it.

Here are some common trades and what they mean:

You Give Up	You Capture	Point Change	Good Trade?
Pawn (1)	Pawn (1)	Even	Depends
Knight (3)	Bishop (3)	Even	Depends
Bishop (3)	Rook (5)	+2 points	Yes!
Knight (3)	Pawn (1)	-2 points	Bad
Rook (5)	Bishop (3)	-2 points	Bad
Queen (9)	Rook + Bishop (8)	-1 point	Usually bad
Queen (9)	Two Rooks (10)	+1 point	Usually good

Notice the word “usually.” These values are guidelines, not laws. A knight sitting on a perfect square in the center of the board can be worth more than a rook stuck behind its own pawns. Position matters. We will talk about that soon.

14.2.2 The “Exchange”

Chess players have a special word for trading a minor piece (knight or bishop) for a rook. This is called “winning the exchange” or “losing the exchange.”

- **Winning the exchange** means you gave up a knight or bishop (3 points) and captured a rook (5 points). You gained about 2 points.
- **Losing the exchange** means you gave up a rook (5 points) and only got a knight or bishop (3 points). You lost about 2 points.

You will hear this term constantly. “White won the exchange on move 14.” “Black sacrificed the exchange for a strong attack.” Now you know what it means.

14.2.3 The Queen vs. Two Rooks

Is a queen worth more than two rooks? Let us do the math. A queen is 9 points. Two rooks are 10 points. So two rooks are technically worth more. But in practice, the queen is a single, flexible piece that can attack from any direction. Two rooks need coordination. They need open files and ranks to work together.

The short answer: two rooks are slightly stronger than a queen if they are active and coordinated. A queen is stronger if the rooks are passive or disconnected. At your level, do not worry too much about this. Just know that the trade is close to even.

14.2.4 Three Minor Pieces vs. a Queen

Three knights and bishops (9 points total) against a queen (9 points) is another interesting matchup. Three minor pieces can be very powerful because they control many squares at once. A queen is one piece that can only be in one place. In most positions, three minor pieces have a slight edge, especially if they work together. But a lone queen can sometimes run circles around clumsy minor pieces.

Again, at your level, the key idea is: the math says it is roughly even, and the position decides who is better.

Set up your board: Place the starting position. Now remove White's queen and add a White knight on d4 and a White bishop on c4 (in addition to the pieces already there). White now has three extra minor pieces instead of a queen. Play a few moves and see how it feels. The minor pieces control a lot of squares, but they cannot strike across the whole board the way a queen can.

Good stopping point. You now know the point values. Take a break if you need one, and come back ready to learn about the bishop pair.

14.3 Part 2: The Bishop Pair

Knights and bishops are both worth 3 points. So they should be equal, right? Not exactly. There is a hidden bonus that changes things: the bishop pair.

A single bishop can only ever reach half the squares on the board. A bishop that starts on a light square will spend the entire game on light squares. It will never touch a dark square. That means 32 squares on the board are forever off limits to that bishop.

But two bishops together? One covers the light squares and the other covers the dark squares. Together, they reach every square on the board. That combination is worth more than the sum of its parts.

14.3.1 How Much Is the Bishop Pair Worth?

Chess experts have studied this for over a century. The general agreement is that the bishop pair gives you about half a point of extra value. So instead of $3 + 3 = 6$, two bishops together are worth about 6.5 points. Some strong players value them even higher.

That half point might not sound like much. But in a close game, half a point is the difference between winning and drawing. It is roughly the value of having an extra half-pawn, and games are won and lost over single pawns all the time.

14.3.2 Why the Bishop Pair Is Strong

Set up your board: Place a White bishop on c4 and a White bishop on f4. Now place a Black knight on c6 and a Black knight on f6. Clear everything else off the board except the kings (White king on e1, Black king on e8).

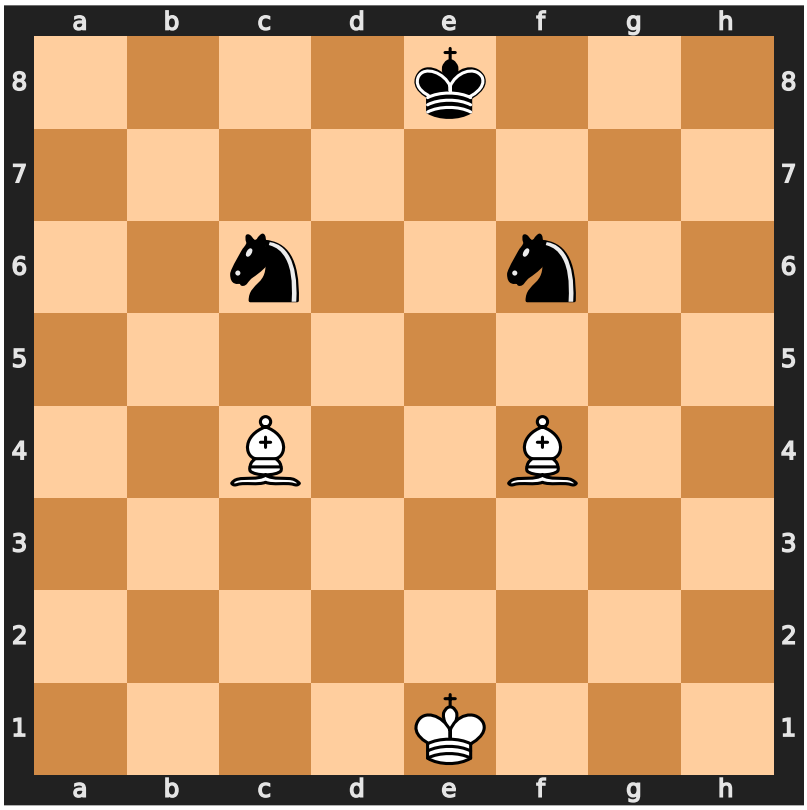

Figure 14.1: Chess Position

Look at what the bishops can do. The bishop on c4 controls the long diagonal from a2 to g8. The bishop on f4 controls the c1-h6 diagonal. Together, they create a web of long-range threats that stretches across the entire board. The knights? They control a few squares each, but they need several moves to cross from one side of the board to the other.

Now imagine pushing some pawns forward. If the center opens up and diagonals become clear, those bishops will only get stronger. Long, open diagonals are a bishop's dream. Knights cannot compete with bishops when the board opens up.

This is the heart of the bishop pair advantage. In open positions, with clear diagonals and few pawns blocking the way, two bishops dominate the board.

14.3.3 When the Bishop Pair Does NOT Matter

The bishop pair is not always an advantage. If the position is closed, with pawns locked together and no open diagonals, the bishops have nowhere to aim. In those positions, knights can hop over the pawn chains and find strong outposts. A locked position with lots of pawns is a knight's paradise.

So the bishop pair bonus comes with a condition: you need open or semi-open positions to use it. If your opponent has the bishop pair, one of your best strategies is to keep the position closed. Lock up the pawns. Block the diagonals. Make those bishops feel like tall people in a low-ceiling room.

Nice work. You understand the bishop pair now. Rest here if you like. The next section talks about how piece values change depending on the position.

14.4 Part 3: When Values Change

The point system is a starting guide. A helpful shortcut. But chess is more complicated than simple arithmetic. A piece's real value depends on where it sits, what surrounds it, and what the position demands. Let us look at the most important factors.

14.4.1 Knights Love Closed Positions

A closed position has lots of pawns locked together in the center. The pawns form walls that block long-range pieces like bishops and rooks. But knights do not care about walls. Knights jump. They hop right over pawns, landing on squares that bishops can never reach.

Set up your board: Place White pawns on d4 and e5. Place Black pawns on d5 and e6. This creates a locked pawn chain in the center. Now place a White knight on d2 and a White bishop on c1.

The bishop on c1 is stuck. The pawns block its diagonals in almost every direction. It has no clear line to aim at. But the knight on d2? It can hop to f3, then to e5 or g5, jumping over the pawns into active squares. In this kind of position, the knight is clearly better than the bishop.

This is why trading a knight for a bishop is not always a good idea. If the position is closed, that knight might be worth 4 or even 5 points in practice, while the bishop is struggling to find useful work.

14.4.2 Bishops Love Open Positions

An open position has few pawns in the center. The central files and diagonals are clear. Bishops can aim across the entire board, controlling squares from a distance.

Set up your board: Remove all the center pawns from the previous example. Now place a White bishop on c4 and a White knight on d2. With the center open, the bishop on c4 controls the long diagonal from a2 to g8. It pins, threatens, and attacks from far away. The knight on d2 is still a slow, short-range piece that needs several moves to reach the other side of the board.

In open positions, a bishop is often worth more than a knight. Some players estimate it at 3.25 or even 3.5 points in these situations.

14.4.3 Rooks Need Open Files

A rook is worth 5 points, but only if it has something to do. A rook stuck behind its own pawns, with no open files to use, is like a sports car stuck in traffic. All that power, going nowhere.

Set up your board: Place a White rook on a1 with White pawns on a2, b2, and c2 in front of it. The rook has no open file. It cannot move forward. It is almost useless.

Now clear the a-pawn. Remove it from a2. Suddenly the a-file is open, and the rook on a1 has a highway stretching all the way to a8. That rook just went from a sleepy bystander to an active threat.

The lesson: put your rooks on open files. If there are no open files, make one by trading or pushing a pawn.

14.4.4 A Rook on the Seventh Rank

There is a special bonus for rooks. When a rook reaches the seventh rank (the second-to-last row, where your opponent's pawns started), it becomes extremely powerful. From the seventh rank, a rook can:

1. Attack pawns that have not moved, eating them from the side
2. Cut off the enemy king, trapping it on the back rank
3. Work with another rook on the seventh rank to create deadly threats

Set up your board: Place a White rook on d7, a Black king on g8, and Black pawns on a7, b7, f7, g7, and h7. Look at how the rook attacks the a7, b7, and f7 pawns while also cutting the king off from the center. This rook is a monster.

A rook on the seventh rank is often said to be worth an extra pawn, effectively making it a 6-point piece. Two rooks on the seventh rank together can win games almost by themselves.

14.4.5 Connected Rooks

Two rooks that can see each other along a rank or file are called "connected rooks." They protect each other and double their power. Connected rooks on an open file can crash into the enemy position like a battering ram.

Set up your board: Place White rooks on d1 and e1. They are connected along the first rank and both aim down their respective files. Now imagine the d-file is open. Both rooks can swing over: Rd1, Red1. Two rooks on one open file is one of the most powerful setups in chess.

Connected rooks are stronger than two rooks working alone. Always try to connect your rooks after castling.

This is a great place to pause. You have learned how position changes piece values. Come back fresh for the next section on trading.

14.5 Part 4: When to Trade

Knowing piece values is one thing. Knowing *when* to trade is where the real skill lives. Even if a trade is mathematically even, it might help one side more than the other. Here are the most

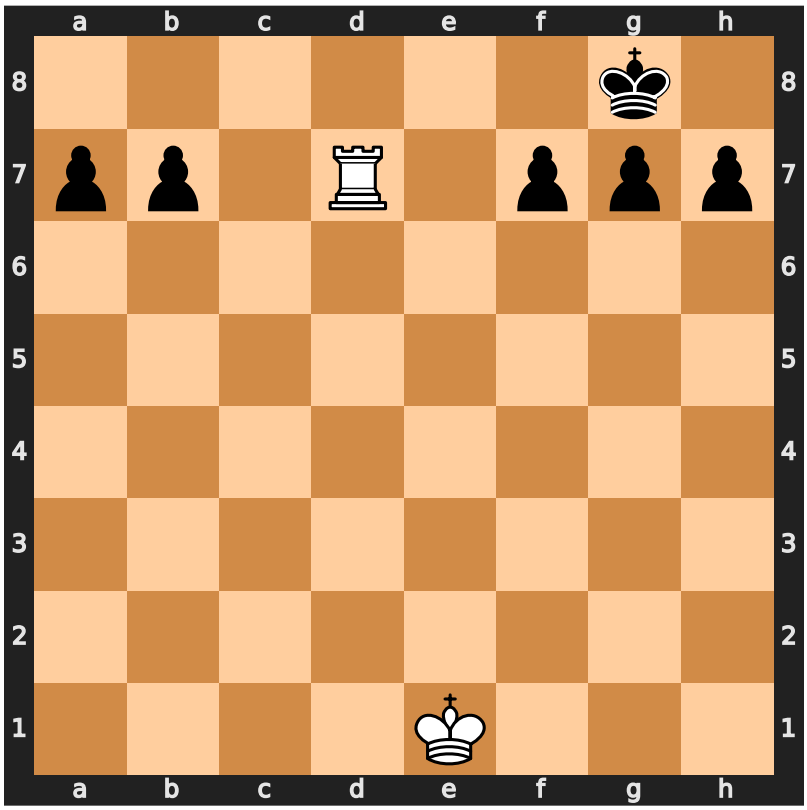

Figure 14.2: Chess Position

important guidelines.

14.5.1 Trade When You Are Ahead in Material

This is the single most important trading rule for beginners. If you have more material than your opponent, trade pieces. Every trade brings you closer to a simpler position where your extra material matters more.

Think about it this way. If you are up a full queen and the board has twenty pieces on it, your opponent still has plenty of weapons to create counterplay. But if you trade down to just your extra queen versus nothing? Game over. The fewer pieces on the board, the harder it is for the side with less material to fight back.

The rule of thumb: If you are up material, trade pieces (not pawns). If you are down material, trade pawns (not pieces), because you need your remaining pieces for counterplay.

Why not trade pawns when you are ahead? Because your extra piece needs something to attack. Pawns are targets. If all the pawns disappear, even an extra piece might not be enough to win. Keep the pawns on the board so your extra material has work to do.

14.5.2 Trade When It Improves Your Pawn Structure

Sometimes a trade creates doubled pawns for your opponent or fixes your own damaged pawns. These trades are worth making even if the material stays equal.

Set up your board: Place a White bishop on g5 pinning a Black knight on f6. Black has pawns on f7, g7, and h7. If White plays Bxf6 and Black recaptures with gxf6, Black now has doubled f-pawns (pawns on f6 and f7) and an open g-file pointing at Black's king. White gave up a bishop for a knight (an even trade in points), but the damage to Black's pawn structure was worth it.

14.5.3 Trade to Remove Your Opponent's Active Piece

If your opponent has one piece that is doing all the work, trade it off. Remove the star player. Without their best piece, your opponent's position often falls apart.

Set up your board: Place a Black knight on d5, right in the center of the board. It is protected by a pawn on e6 and attacks squares on c3, e3, f4, b4, f6, b6, c7, and e7. This knight is a monster. If you have a bishop that can take it, trade that bishop for the knight. Yes, it is an "even" trade in points, but removing that powerful knight is worth far more than 3 points.

14.5.4 Do NOT Trade Your Good Pieces for Bad Ones

Every position has "good" pieces and "bad" pieces. A good bishop controls open diagonals. A bad bishop is blocked by its own pawns. A good knight sits on a strong outpost. A bad knight is stuck on the edge of the board.

Here is the key: do not trade YOUR good pieces for your OPPONENT'S bad pieces. That helps them, not you. If you have a beautiful bishop on a long diagonal and your opponent has a sad bishop trapped behind pawns, keep both bishops on the board. Your good bishop will keep causing problems while their bad bishop continues to suffer.

Trade your BAD pieces for their GOOD pieces whenever you can. That improves your position and weakens theirs.

14.5.5 Do NOT Trade When You Are Behind in Material

If you are down material, you want chaos. You want complications. You want as many pieces on the board as possible, because more pieces mean more chances for your opponent to make a mistake.

Trading when you are behind simplifies the position, and a simple position with less material is almost always losing. If you are down a rook, the last thing you want is to trade queens and reach an endgame. You want to keep the queens on, aim them at the opponent's king, and hope for a swindle.

14.5.6 Summary: Trading Checklist

Before making any trade, ask yourself:

1. **Am I ahead in material?** If yes, trade! Simplify.
2. **Am I behind in material?** If yes, avoid trades. Keep it complicated.
3. **Does this trade help my pawn structure?** If yes, consider it.
4. **Does this trade remove their best piece?** If yes, probably worth it.
5. **Am I trading my good piece for their bad piece?** If yes, stop! Do not do it.
6. **Does this trade help my opponent more than me?** If yes, find a different plan.

If you check this list before every trade, you will make better decisions than most players at your rating.

Great stopping point. Get up, stretch, grab a snack. The trading rules are the most important part of this chapter, and you just learned them. Let them settle before continuing.

14.6 Part 5: Counting Material

Before you can decide whether to trade, you need to know who is ahead. Counting material quickly and accurately is a skill every chess player needs.

14.6.1 The Quick Count Method

Do not add up every single piece on the board. That takes too long. Instead, count only the *differences*. Look at what each side has and cancel out the matching pieces.

Example: White has: Queen, 2 Rooks, 1 Bishop, 1 Knight, 6 Pawns Black has: Queen, 2 Rooks, 2 Bishops, 5 Pawns

Cancel out the matching pieces: - Queens: even (cancel them out) - Rooks: even (cancel them out) - White has 1 Bishop + 1 Knight. Black has 2 Bishops. Cancel one bishop from each side. Left over: White has 1 Knight, Black has 1 Bishop. That is even (3 = 3). - Pawns: White has 6, Black has 5. White is up one pawn.

Result: White is ahead by one pawn.

See how fast that was? You did not need to add up 9+5+5+3+3+6. You just looked at the differences. Practice this method, and you will be able to count material in seconds.

14.6.2 When Material Does Not Matter

Sometimes a player is down material but has a winning position. This happens when:

1. **Checkmate is coming.** If you can force checkmate in three moves, it does not matter that your opponent has an extra queen. Checkmate ends the game.
2. **You have a strong attack.** A fierce attack on the enemy king can be worth more than a piece or two. If all your pieces are aimed at the opponent's king and their extra material is on the other side of the board doing nothing, your attack is what matters.
3. **You have a passed pawn about to promote.** A pawn one square away from becoming a queen is worth nearly 9 points. Material counts change fast when promotion is near.
4. **Your opponent's pieces are trapped or useless.** An extra rook that cannot move is worth zero in practical terms.

These are exceptions, not the rule. In the vast majority of positions, the side with more material wins. But knowing the exceptions helps you avoid panicking when the math does not tell the whole story.

14.7 Part 6: A Preview of Sacrifices

Before we move on, let us talk about one of the most exciting ideas in chess: the sacrifice.

A sacrifice is when you give up material on purpose. You trade a piece for something less valuable, or you give up a piece for nothing at all. That sounds wild. Why would you do that?

Because sometimes what you get in return is worth more than the material you gave up. A sacrifice might give you:

- **A checkmate attack.** You sacrifice a knight to rip open the pawns around the enemy king, then your queen and rook deliver checkmate. The knight is gone, but so is the game.
- **A winning positional advantage.** You give up a pawn to get a dominant outpost for your knight, or to open a file for your rook. The pawn is gone, but your pieces become so powerful that you win the material back later, often with interest.
- **Time.** You sacrifice material to develop your pieces faster or to prevent your opponent from castling.

The difference between a sacrifice and a blunder is simple: a sacrifice gives you something real in return. A blunder gives you nothing. If you give up a piece and get checkmate, that is a brilliant sacrifice. If you give up a piece and get nothing, that is a mistake.

We will explore sacrifices in much greater depth in Chapter 6, when we study forks, pins, and tactical patterns. For now, just know that sacrifices exist, they are not mistakes when done with purpose, and they are one of the most beautiful parts of chess.

Excellent work getting through all the theory. Take a good break here. When you come back, three annotated games will show you these ideas in action.

14.8 Annotated Game Fragments

These three short games show piece values and trading decisions in action. Set up each position on your board and play through the moves slowly. Read the commentary for every move. There is no rush.

14.8.1 Game Fragment 1: "Trading Down to Win"

This game shows the most important rule: when you are ahead in material, trade pieces to simplify.

Set up your board:

White: King on g1, Queen on d3, Rook on d1, Knight on f3, Bishop on c4, Pawns on a2, b2, d4, f2, g2, h2

Black: King on g8, Queen on d7, Rook on d8, Knight on f6, Pawns on a7, b7, d6, f7, g7, h7

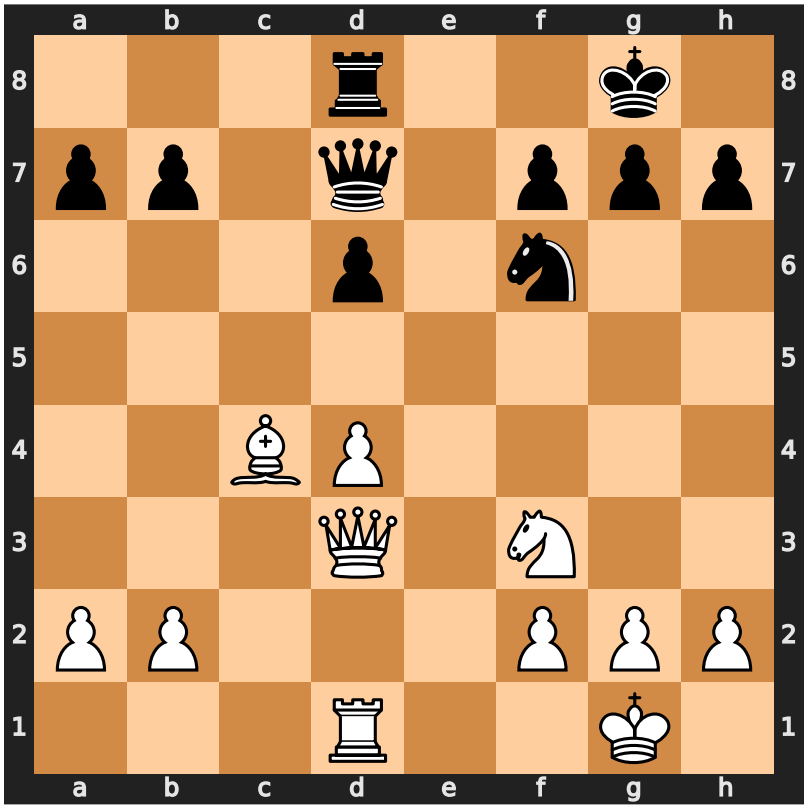

Figure 14.3: Chess Position

White has a Queen, Rook, Knight, and Bishop. Black has a Queen, Rook, and Knight. Count the material: White has an extra bishop. That is 3 points ahead. White should simplify.

1. Qxd7

White trades queens immediately. "Why would you give up your queen?" a beginner might ask. Because Black has to give up a queen too! After the trade, White still has the extra bishop. But now there are fewer pieces on the board, which makes it harder for Black to create counterplay.

1... Rxd7

Black recaptures with the rook. The queens are gone. Notice how much quieter the position feels. With queens off the board, there are fewer threats and fewer tricks. That is exactly what White wants.

2. Rxd7 Nxd7

White trades rooks too! Again, the trade is even (rook for rook), but every trade brings White closer to a simple endgame. Now the position has just minor pieces and pawns. White has a Bishop and Knight. Black has only a Knight. White's extra bishop will be the difference.

Pause and look. After just two trades, the board is nearly empty. White has Kg1, Nf3, Bc4, and six pawns. Black has Kg8, Nd7, and six pawns. White is ahead by a full bishop, and there is nothing Black can do about it. White will use the bishop and knight together to win Black's pawns, then promote a pawn to a queen.

FEN after 2... Nxd7: `6k1/pp1n1ppp/3p4/8/2BP4/5N2/PP3PPP/6K1 w - - 0 3`

3. Nd2

White repositions the knight toward the center. No rush. White is winning and can take time to improve the pieces.

3... Kf8 4. Ne4

The knight lands on a strong central square, attacking d6. Black's pawn on d6 is now a target.

4... Ke7 5. Nxd6

White captures a pawn. The extra bishop helped control the board while the knight moved in for the kill. White is now up a bishop AND a pawn. The rest is a matter of technique.

What this game teaches: When you are ahead in material, trade pieces. Queens first, then rooks. Reach a simple endgame where your extra material wins the game.

14.8.2 Game Fragment 2: "Two Bishops Rule the Open Board"

This game shows the bishop pair in action. In an open position with few center pawns, two bishops control everything.

Set up your board:

White: King on g1, Rook on e1, Bishop on b2, Bishop on d3, Pawns on a2, b3, f2, g2, h2

Black: King on g8, Rook on e8, Knight on c6, Knight on d7, Pawns on a7, b6, f7, g7, h7

Look at this position carefully. The center is wide open. There are no pawns on d4, d5, e4, or e5. The board is a playground for long-range pieces. White has two bishops. Black has two knights.

1. Bf5

White moves the bishop from d3 to f5, aiming at the kingside. Now the bishop on f5 controls the c8-h3 diagonal, and the bishop on b2 controls the long a1-h8 diagonal. Together, they cover light squares and dark squares across the entire board.

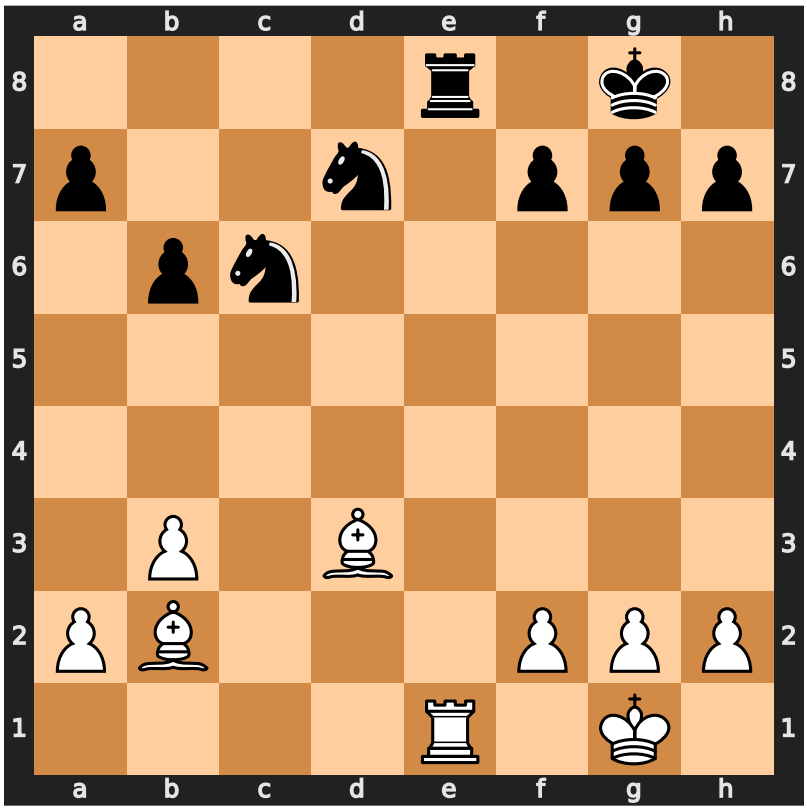

Figure 14.4: Chess Position

Pause and look. Where can Black's knights go? The knight on c6 could go to d4 or e5, but both squares are exposed to White's bishops. The knight on d7 is passive, blocked by its own pieces. Knights need outposts (protected squares where they can sit safely), and this position has none for Black.

1... Nd4 2. Rxe8+ Nxe8

White trades rooks. Remember, trading is fine when your remaining pieces are better than your opponent's remaining pieces. White's two bishops in an open position are worth more than Black's two knights.

FEN after 2... Nxe8: `4n1k1/p4ppp/1p6/5B2/3n4/1P6/PB3PPP/6K1 w - - 0 3`

3. Ba3

The dark-squared bishop swings to a3, aiming at the f8 square and controlling the a3-f8 diagonal. Now both bishops cut across the board in different directions.

3... Kf8?

Black moves the king into the line of fire. The bishop on a3 now pins Black's king to the f8 square.

4. Bh7!

The light-squared bishop slides to h7, threatening to trap the knight on e8 (which cannot easily escape with the king stuck on f8). White's two bishops have created a net that the knights cannot escape.

4... Ne6 5. Bb2

White repositions the dark-squared bishop back to b2, controlling the long diagonal and keeping pressure on g7. White has total control of the board. The two bishops dominate both color complexes, and Black's knights have no good squares.

What this game teaches: In open positions, the bishop pair is a major advantage. Bishops aim across the whole board, while knights need outposts to be effective. If you have two bishops, open the position. If your opponent has two bishops, keep it closed.

14.8.3 Game Fragment 3: "A Sacrifice That Wins the Game"

This game shows that material is not everything. Sometimes giving up a piece wins faster than keeping it.

Set up your board:

White: King on g1, Queen on d1, Rook on f1, Bishop on c1, Knight on g5, Pawns on a2, b2, c2, d4, e5, g2, h2

Black: King on g8, Queen on d8, Rook on f8, Bishop on c8, Knight on d5, Pawns on a7, b7, c7, e6, f7, g7, h6

White has an interesting position. The knight on g5 is aiming at f7 and h7. The pawn on e5 supports the knight's aggression. Black's knight on d5 is strong, but Black's king looks a bit exposed after …h6 pushed the pawn forward.

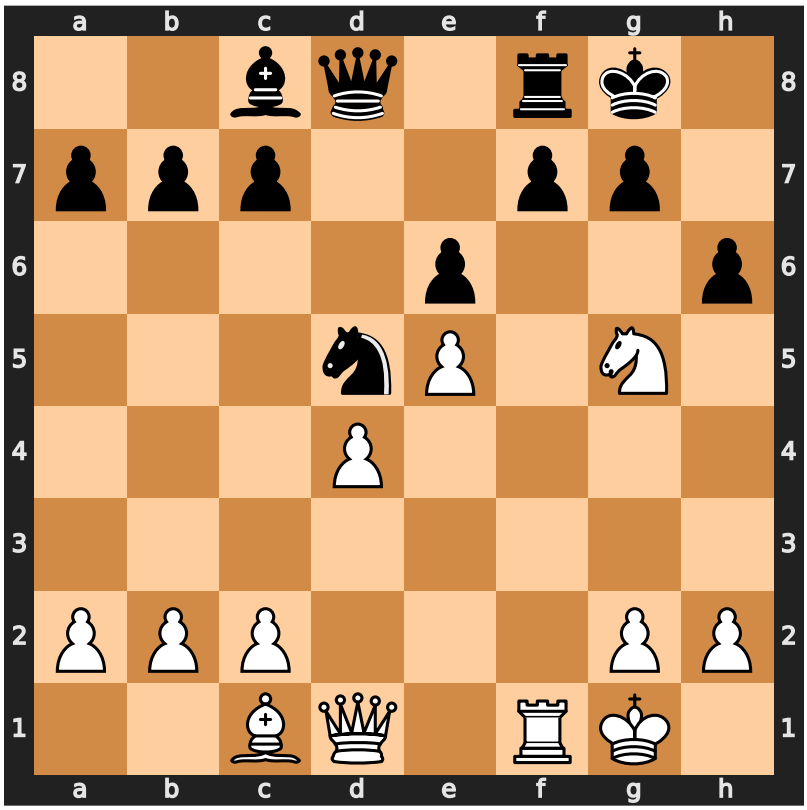

Figure 14.5: Chess Position

1. Nxf7!

A sacrifice! White gives up a knight (3 points) to capture the pawn on f7 (1 point). In pure material, White loses 2 points. But look at what happens.

1... Rxf7

Black captures the knight. Black is now up a piece. But look at the position.

2. Qh5!

The queen enters the attack, threatening Qxf7+ and other nasty moves. The f7-rook is now under pressure, and Black's king is exposed.

Pause and look. Black's king has a gaping hole on f7 (the pawn is gone). The queen on h5 threatens to capture on f7 with check. Black is up a knight, but White has a ferocious attack.

FEN after 2. Qh5: `2bq2k1/ppp2rp1/4p2p/3nP2Q/3P4/8/PPP3PP/2B2RK1 b - - 0 2`

2... Qe8

Black tries to block the attack by putting the queen on e8, defending f7.

3. Qxh6!

White captures the h6 pawn with the queen. Now White threatens Qg6 or Qh7+ followed by Qh8 checkmate. The attack is overwhelming.

3... Rf8 4. Qg6

White plays Qg6, threatening Qh7 checkmate. Black cannot defend. The knight sacrifice on f7 ripped open the king's shelter, and White's queen and rook are too powerful.

4... Nf4 5. Rxf4!

White captures the knight, and now Rf4-f7 or Rf4-h4 are coming. Black's position is collapsing.

What this game teaches: A sacrifice is NOT a blunder when you get an attack in return. White gave up a knight (3 points) but got an unstoppable attack. The 3 points of material were worth much less than the checkmate threats White created. When you see a chance to open up your opponent's king, calculate carefully. Sometimes the best move is giving something away.

Three games complete! That was a lot of chess. Take a solid break here. When you come back, 50 exercises are waiting. Do them in batches of 10. There is no hurry.

14.9 Exercises

Work through these at your own pace. Try each one before reading the hints. If you get stuck, read one hint at a time. Do not jump straight to the solution. Struggling is how your brain builds chess muscles.

14.9.1 Section A: Who's Ahead in Material? (Exercises 4.1–4.10)

For each position, count the material for both sides using the point system. Then answer: who is ahead, and by how much?

Exercise 4.1 **Position:** White: King on e1, Queen on d1, Rook on a1, Bishop on c1, Knight on g1, Pawns on a2, b2, d4, f2, g2, h2. Black: King on e8, Queen on d8, Rook on a8, Knight on b8, Knight on g8, Pawns on a7, b7, d5, f7, g7, h7.

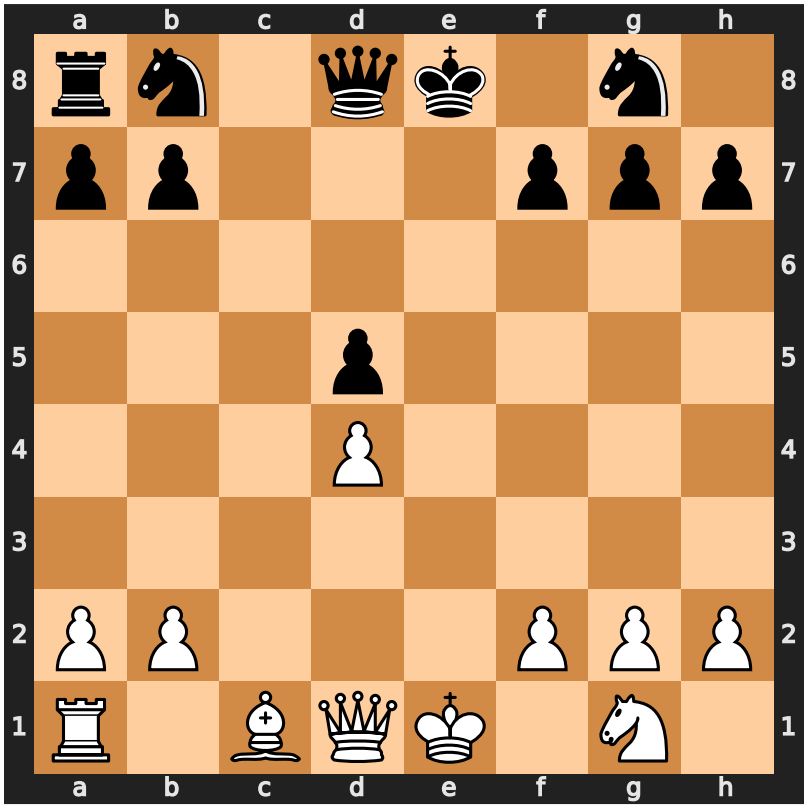

Figure 14.6: Chess Position

Task: Count the material for both sides. Who is ahead? **Hint 1:** Write down each piece and its point value for White, then do the same for Black. **Hint 2:** White has Q(9)+R(5)+B(3)+N(3) = 20 in pieces. Black has Q(9)+R(5)+N(3)+N(3) = 20 in pieces. **Hint 3:** Both sides have 6 pawns (6 points each). Are the pieces equal too? **Solution: Material is equal.** White has Q+R+B+N+6P = 26 points. Black has Q+R+N+N+6P = 26 points. Both sides have 26 points. No one is ahead. **Why this works:** Bishop and knight are both worth 3 points, so B+N = N+N in simple point counting.

Exercise 4.2 **Position:** White: King on g1, Queen on d2, Rook on e1, Rook on d1, Bishop on g2, Knight on f3, Pawns on a2, b2, c3, f2, g3, h2. Black: King on g8, Queen on c7, Rook on e8, Rook on d8, Bishop on e7, Pawns on a7, b7, c6, f7, g7, h7.

Task: Who is ahead in material? **Hint 1:** Cancel matching pieces. Both sides have queens, two rooks. That is even. **Hint 2:** White has B+N (6 points in minor pieces). Black has B (3 points in minor pieces). **Hint 3:** White has 6 pawns, Black has 6 pawns. Even there. So the difference is in the minor pieces. **Solution: White is ahead by 3 points (one knight).** White has an extra knight on f3 that Black does not match. All other pieces cancel out. **Why this works:** Use the

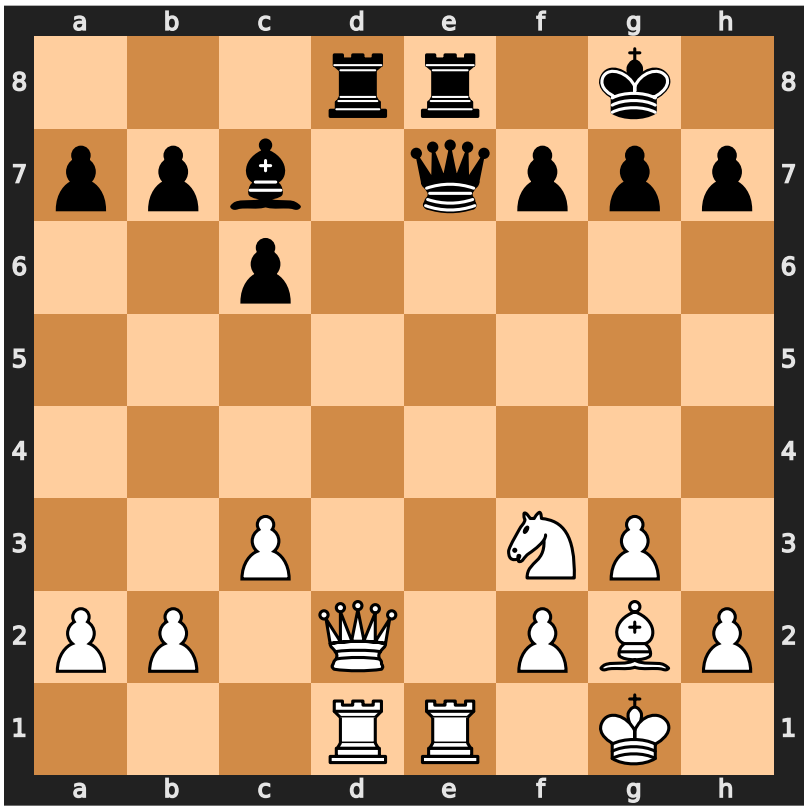

Figure 14.7: Chess Position

cancellation method. Match pieces one-for-one, and whatever is left over is the difference.

Exercise 4.3 **Position:** White: King on g1, Queen on e2, Rook on a1, Bishop on b5, Pawns on a2, b2, d4, f2, g2, h2. Black: King on g8, Queen on e7, Rook on a8, Rook on f8, Pawns on a7, b7, d5, f7, g7, h7.

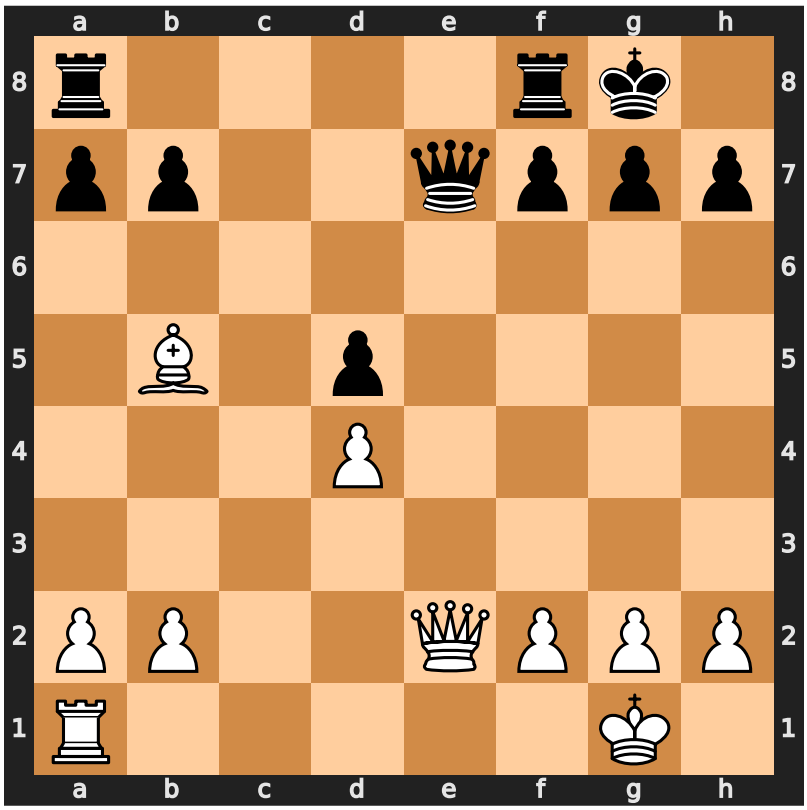

Figure 14.8: Chess Position

Task: Who is ahead in material, and by how much? **Hint 1:** White has Q+R+B+6P. Black has Q+2R+6P. Cancel the queens and one rook each. **Hint 2:** Left over: White has a Bishop (3). Black has a Rook (5). **Hint 3:** Black's extra rook minus White's extra bishop = 5-3 = 2 points. **Solution: Black is ahead by 2 points.** Black has the exchange (an extra rook vs. White's bishop). In other words, White has "lost the exchange." **Why this works:** R(5) - B(3) = 2 points in Black's favor.

Exercise 4.4 **Position:** White: King on g1, Queen on d1, Rook on a1, Rook on f1, Bishop on c4, Bishop on g5, Knight on c3, Pawns on a2, b2, d4, e4, f2, g2, h2. Black: King on g8, Queen on d8, Rook on a8, Rook on f8, Bishop on e7, Bishop on c8, Knight on f6, Pawns on a7, b7, c7, d6, e5, f7, g7, h7.

Task: Who is ahead in material? **Hint 1:** Count White's pieces: Q+2R+2B+N = 9+10+6+3 = 28 in pieces, plus 8 pawns = 36. **Hint 2:** Count Black's pieces: Q+2R+2B+N = 9+10+6+3 = 28 in pieces, plus 8 pawns = 36. **Hint 3:** Both totals are the same. **Solution: Material is exactly**

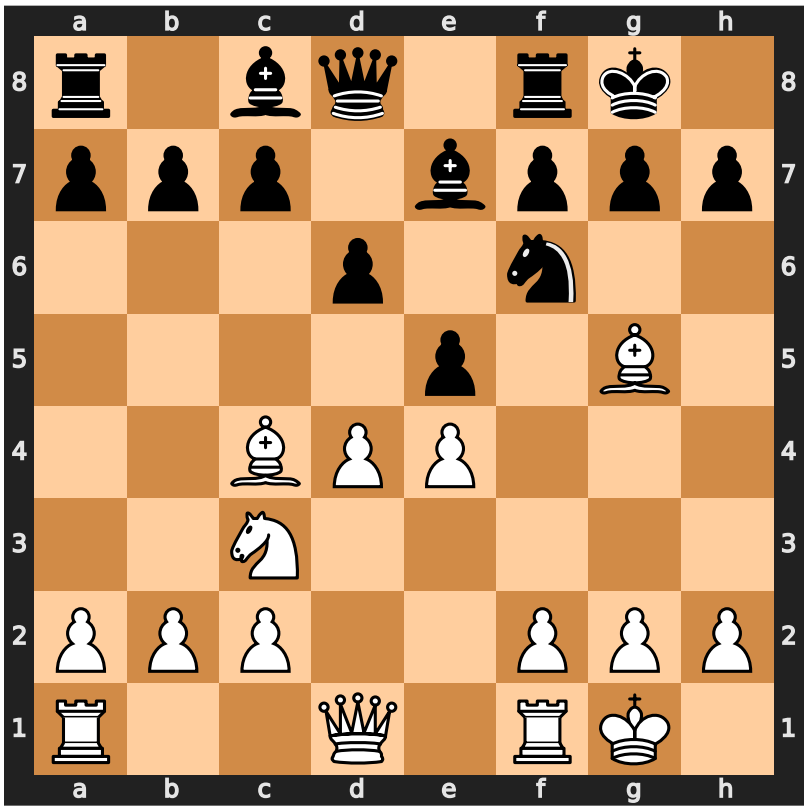

Figure 14.9: Chess Position

equal. Both sides have a full army with the same pieces and the same number of pawns. No one is ahead. **Why this works:** In many games, material stays equal for a long time. The advantage comes from position, not points.

Exercise 4.5 **Position:** White: King on g1, Rook on e1, Bishop on d3, Knight on d4, Pawns on a2, b2, f2, g2, h2. Black: King on g8, Rook on e8, Bishop on c8, Pawns on a7, b7, f7, g7, h7.

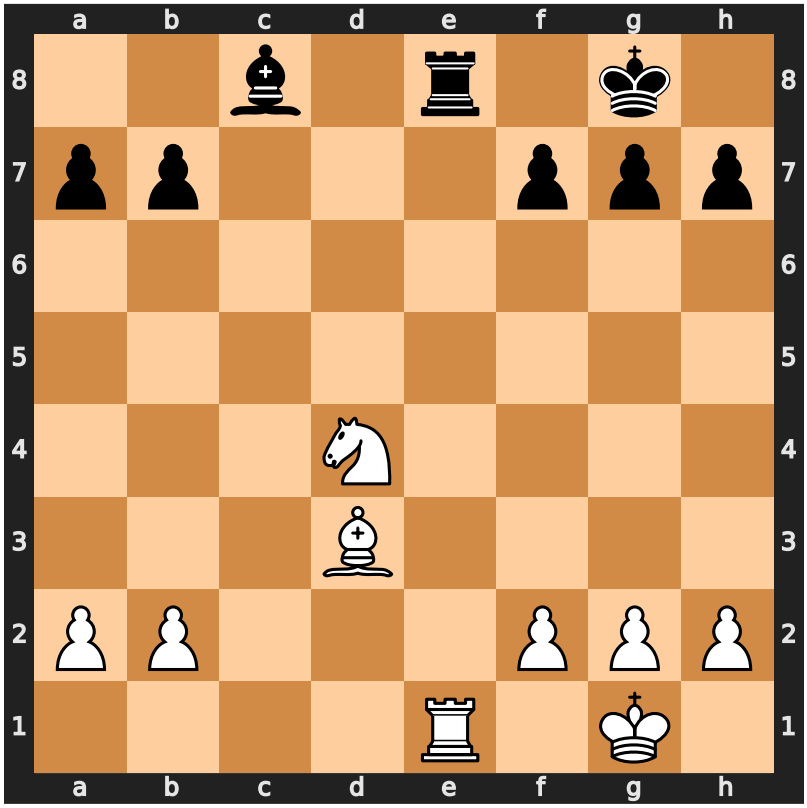

Figure 14.10: Chess Position

Task: Who is ahead, and by how much? **Hint 1:** Cancel matching pieces: both have a rook and a bishop. That leaves… **Hint 2:** White has an extra knight (3 points). Black has nothing to match it. **Hint 3:** Pawns: White has 5, Black has 5. Even. **Solution: White is ahead by 3 points (one knight).** After canceling matched pieces, White has an extra Nd4 with no equivalent on Black's side. **Why this works:** Cancellation makes it easy. R=R, B=B, pawns even. Only the knight is left over.

Exercise 4.6 **Position:** White: King on g1, Queen on c2, Rook on d1, Bishop on e3, Pawns on a2, b2, c3, f2, g2, h2. Black: King on g8, Queen on b6, Rook on d8, Knight on d5, Pawns on a7, b7, c7, f7, g7, h7.

Task: Who is ahead in material? **Hint 1:** Cancel queens and rooks. Both have one of each. **Hint 2:** White has B(3)+6P. Black has N(3)+6P. **Hint 3:** B = N = 3 points. Pawns are equal. **Solution: Material is equal.** Bishop equals knight in the point system, both sides have one rook,

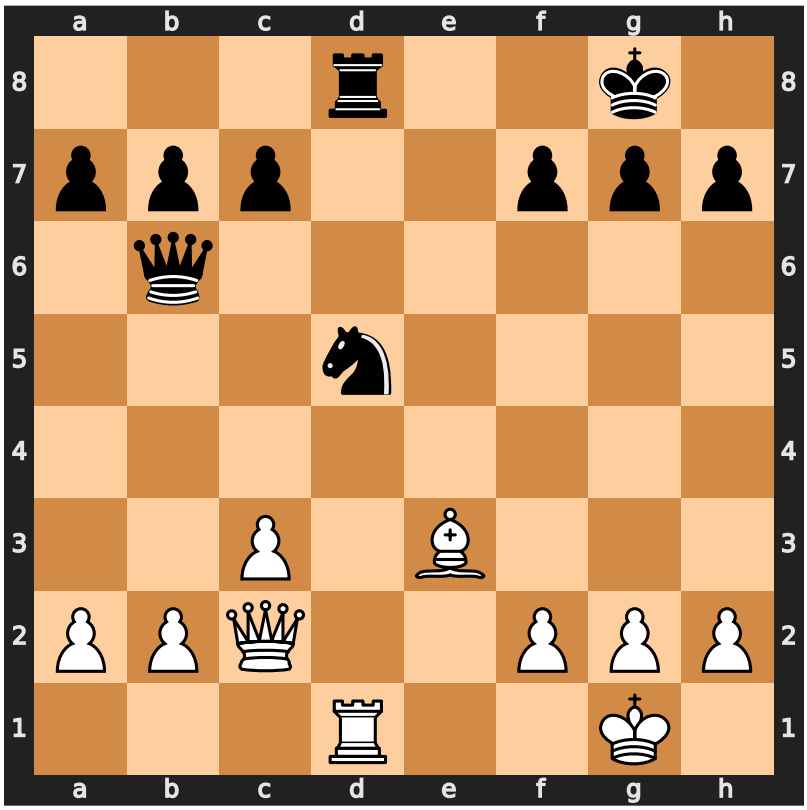

Figure 14.11: Chess Position

one queen, and six pawns. **Why this works:** B(3) = N(3). The position might favor one side over the other, but the raw material count is even.

Exercise 4.7 **Position:** White: King on g1, Queen on e2, Rook on a1, Knight on f3, Pawns on a2, b2, d4, f2, g2, h2. Black: King on g8, Rook on a8, Rook on f8, Bishop on g7, Knight on c6, Pawns on a7, b7, d5, f7, g7, h7.

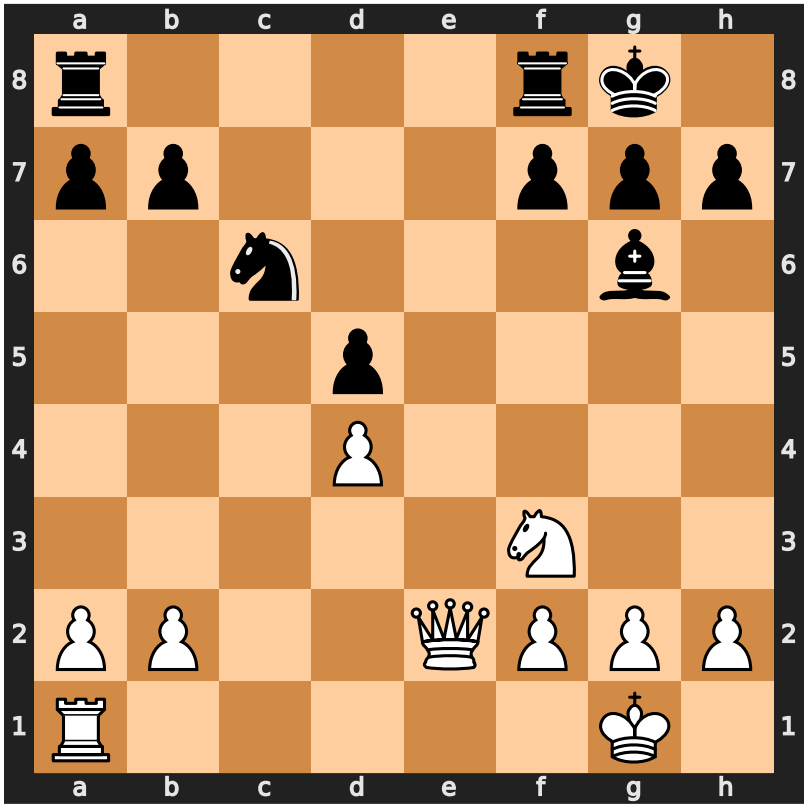

Figure 14.12: Chess Position

Task: Who is ahead, and by how much? **Hint 1:** White has Q+R+N = 9+5+3 = 17 in pieces. Black has 2R+B+N = 10+3+3 = 16 in pieces. **Hint 2:** White's queen (9) vs Black's extra rook + bishop (5+3=8). White is ahead by 1 point in pieces. **Hint 3:** Pawns: White has 6, Black has 6. Even. So White leads by 1 point total. **Solution: White is ahead by 1 point.** White's queen is worth more than Black's extra rook and bishop combined (9 vs 8). **Why this works:** Q(9) vs R+B(8) gives White a 1-point edge. This is a close material balance where position will matter a lot.

Exercise 4.8 **Position:** White: King on g1, Queen on d2, Bishop on f1, Knight on d4, Pawns on a2, b2, c2, f2, g2, h2. Black: King on g8, Rook on a8, Rook on f8, Bishop on c8, Knight on f6, Pawns on a7, b7, c7, f7, g7, h7.

Task: Who is ahead and by how much? **Hint 1:** White has Q+B+N = 9+3+3 = 15 in pieces. Black has 2R+B+N = 10+3+3 = 16 in pieces. **Hint 2:** Black has 1 more point in pieces. But

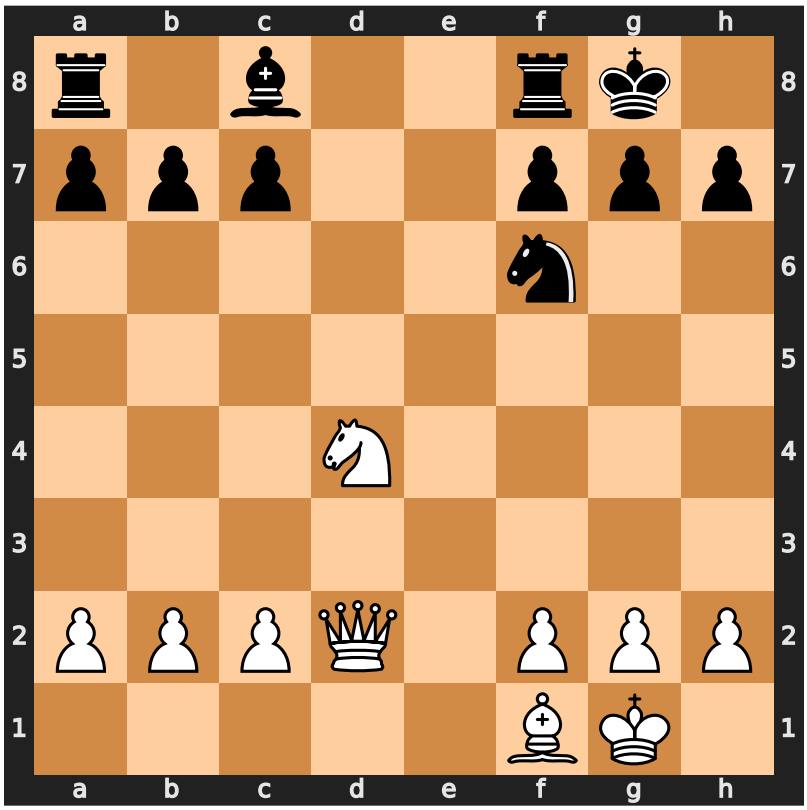

Figure 14.13: Chess Position

check pawns: White has 6, Black has 6. Even. **Hint 3:** Black is slightly ahead. The two rooks (10) outweigh White's queen (9). **Solution: Black is ahead by 1 point.** Black has two rooks (10 points) while White has a queen (9 points). The other pieces and pawns cancel out. **Why this works:** Two rooks (10) vs queen (9) = 1 point advantage for the rooks. But remember, this is close, and the queen can be dangerous if the position is open.

Exercise 4.9 **Position:** White: King on g1, Queen on a4, Rook on d1, Pawns on a2, b2, f2, g2, h2. Black: King on g8, Rook on d8, Bishop on c5, Knight on c6, Knight on e5, Pawns on a7, b7, f7, g7, h7.

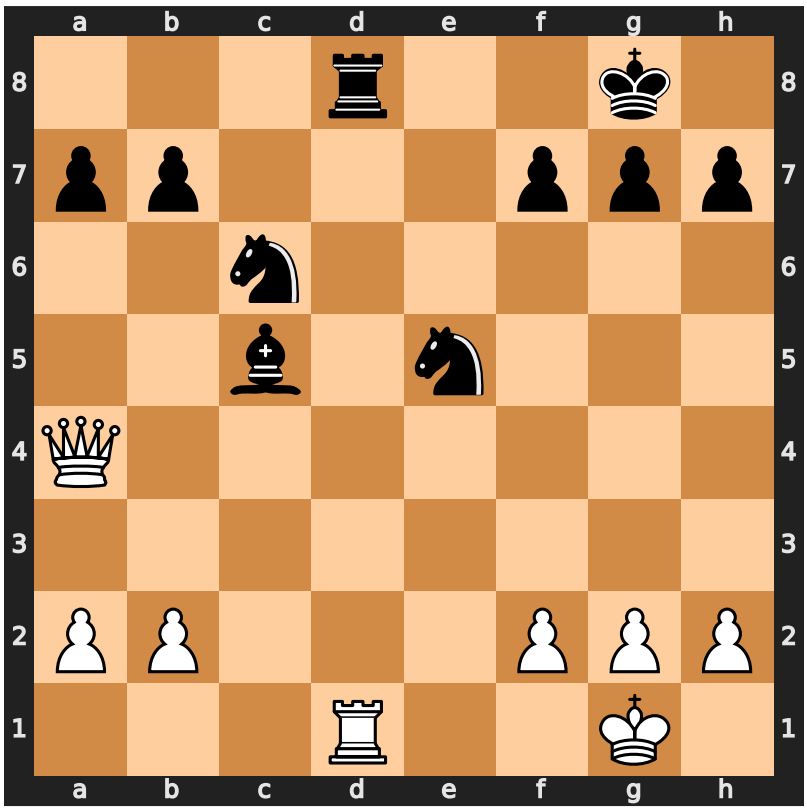

Figure 14.14: Chess Position

Task: Who is ahead in material? **Hint 1:** White has Q+R = 14 in pieces plus 5 pawns. Black has R+B+N+N = 14 in pieces plus 5 pawns. **Hint 2:** Q(9) = R(5)+B(3)+N(3)? That is 9 vs 11. **Hint 3:** Wait. White has Q+R = 9+5 = 14. Black has R+B+2N = 5+3+3+3 = 14. The piece values are equal! **Solution: Material is equal.** White has Q+R = 14 points in pieces. Black has R+B+2N = 14 points in pieces. Both have 5 pawns. Despite the very different piece combinations, the point count is identical. **Why this works:** A queen (9) equals a bishop and two knights (3+3+3=9). The rooks cancel each other.

Exercise 4.10 **Position:** White: King on g1, Rook on c1, Rook on f1, Bishop on e2, Pawns on a2, b3, d4, f2, g2, h2. Black: King on g8, Queen on e7, Knight on d5, Pawns on a7, b7, e6, f7, g7, h7.

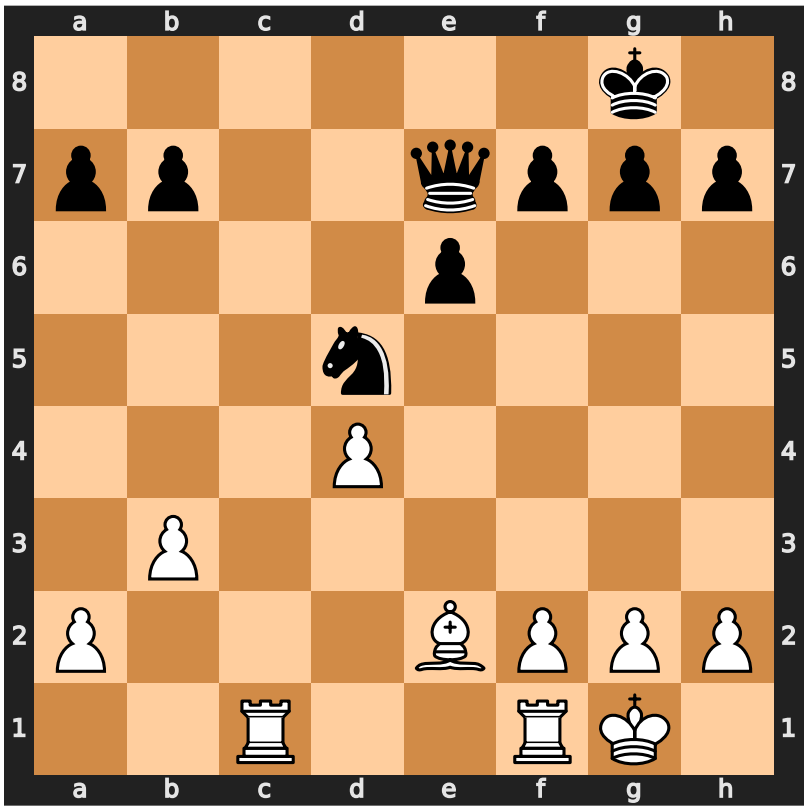

Figure 14.15: Chess Position

Task: Who is ahead and by how much? **Hint 1:** White has 2R+B = 10+3 = 13 in pieces. Black has Q+N = 9+3 = 12 in pieces. **Hint 2:** White leads by 1 point in pieces. Pawns: White has 6, Black has 6. Even. **Hint 3:** White is ahead by 1 point total. Two rooks plus a bishop vs queen plus a knight. **Solution: White is ahead by 1 point.** White's 2R+B (13) vs Black's Q+N (12) gives White a slim edge. **Why this works:** Two rooks (10) are worth more than a queen (9) by 1 point, and B=N, so the difference is that 1-point rook advantage.

Ten exercises done! Great work. Take a break if you need one. The next set focuses on trading decisions.

14.9.2 Section B: Should You Make This Trade? (Exercises 4.11–4.25)

For each position, a trade is possible. Decide whether White should make it, and explain why.

Exercise 4.11 **Position:** White: King on g1, Queen on d4, Rook on e1, Bishop on c4, Pawns on a2, b2, f2, g2, h2. Black: King on g8, Queen on d7, Rook on e8, Knight on f6, Pawns on a7, b7, d6, f7, g7, h7. White is ahead by a full bishop. White can play Qxd7.

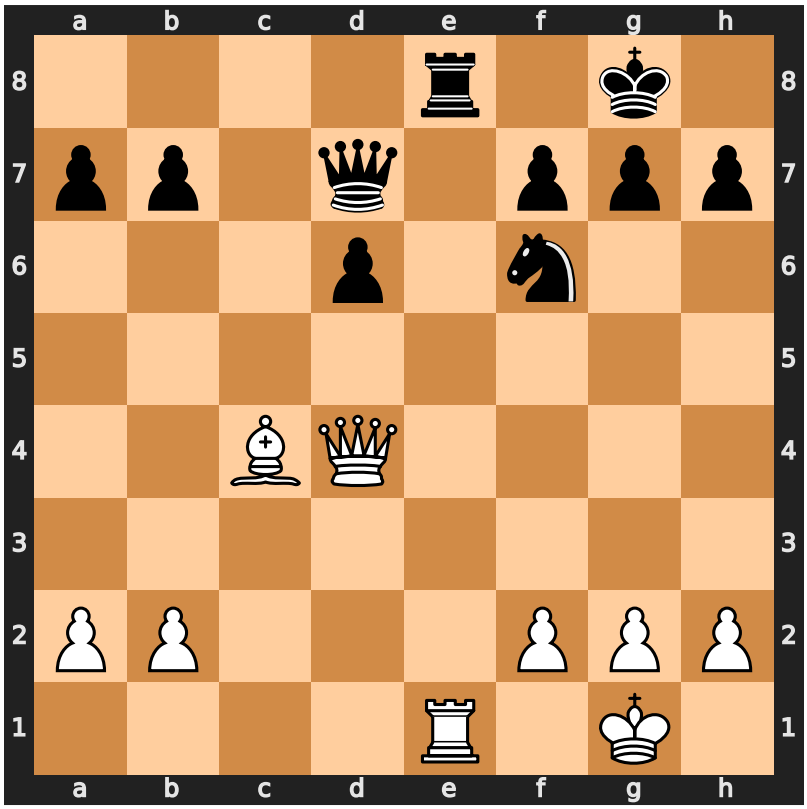

Figure 14.16: Chess Position

Task: Should White trade queens with Qxd7? **Hint 1:** White is up a bishop (3 points). What does the "trade when ahead" rule say? **Hint 2:** Trading queens simplifies. Fewer pieces means

Black has less counterplay. **Hint 3:** After Qxd7 Nxd7 (or Rxe1+ first), White still has the extra bishop and a simpler position to convert. **Solution: Yes, trade queens!** White is ahead by 3 points. Trading queens removes Black's strongest attacking piece and brings the game closer to a simple endgame where the extra bishop will decide the game. **Why this works:** When ahead in material, simplify. Trading the most powerful remaining piece is usually the fastest route to victory.

Exercise 4.12 **Position:** White: King on g1, Queen on d1, Rook on e1, Knight on c3, Pawns on a2, b2, d4, f2, g2, h2. Black: King on g8, Queen on d8, Rook on e8, Rook on a8, Bishop on c5, Knight on f6, Pawns on a7, b7, d5, f7, g7, h7. White is down the exchange (has N where Black has an extra R). White can play Qd1xd5 capturing a pawn, but Black would recapture Qxd5 Nxd5.

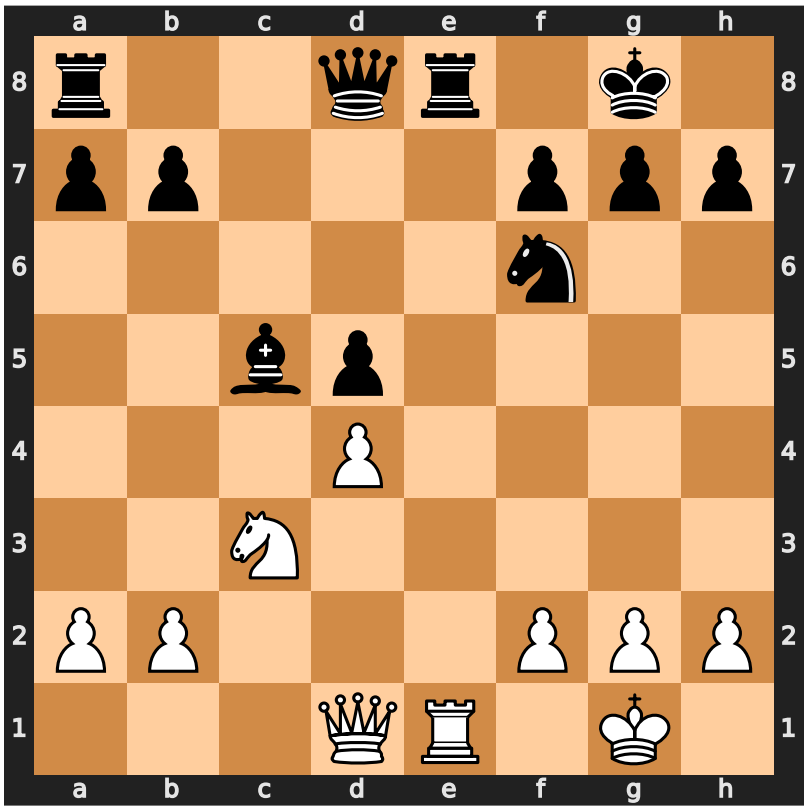

Figure 14.17: Chess Position

Task: Should White trade queens? **Hint 1:** White is BEHIND in material. What does the rule say about trading when behind? **Hint 2:** If White trades queens, the game simplifies. In a simple position, Black's extra rook will dominate. **Hint 3:** White should avoid trading and look for complications instead. **Solution: No, do not trade queens!** White is down material (Black has an extra rook vs White's knight). Trading queens simplifies the game and helps Black. White should keep the queens on the board and look for tactical chances. **Why this works:** When behind in material, keep pieces on. Complexity creates chances for your opponent to go wrong.

Exercise 4.13 **Position:** White: King on g1, Bishop on g5, Knight on f3, Pawns on d4, e5, f2,

g2, h2. Black: King on g8, Knight on f6, Pawns on d5, e6, f7, g7, h7. White can play Bxf6, and Black would recapture gxf6.

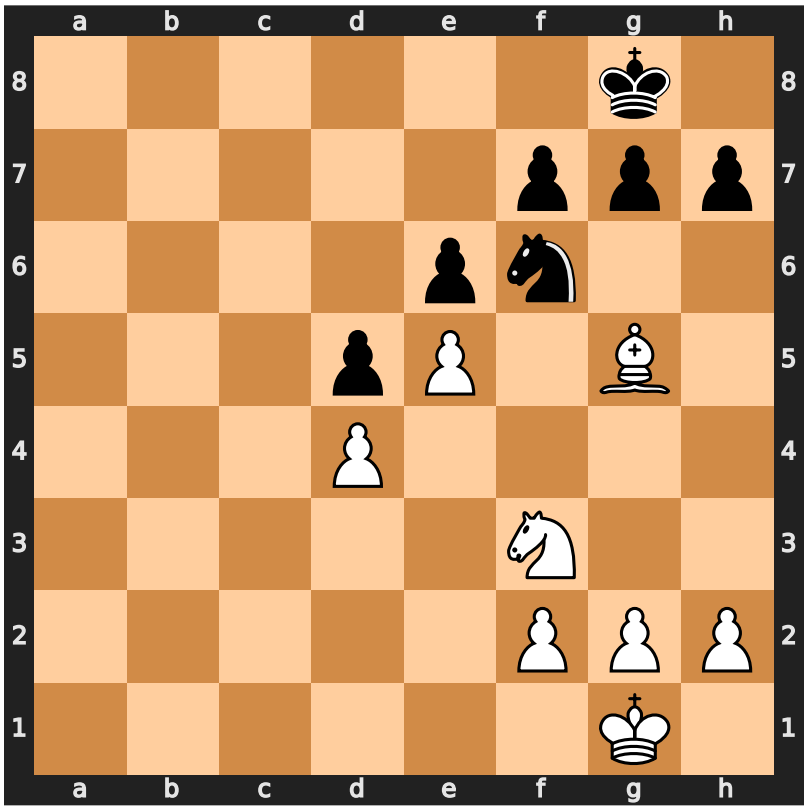

Figure 14.18: Chess Position

Task: Should White play Bxf6? **Hint 1:** It is an even trade in points (bishop 3 = knight 3). So look at what else changes. **Hint 2:** After gxf6, Black has doubled f-pawns (f6 and f7). That is damaged pawn structure. **Hint 3:** After gxf6, the g-file opens toward Black's king. That could be useful for White later. **Solution: Yes, this is a good trade.** Although B=N in points, after gxf6, Black gets doubled pawns and a weakened king. The trade damages Black's pawn structure and opens lines near Black's king. **Why this works:** Even trades can be excellent when they create weaknesses in your opponent's position. Doubled pawns and an open g-file are real problems for Black.

Exercise 4.14 **Position:** White: King on g1, Rook on d1, Rook on e1, Bishop on f4, Pawns on a2, b2, c2, f2, g2, h2. Black: King on g8, Rook on d8, Rook on e8, Bishop on d6, Pawns on a7, b7, c7, f7, g7, h7. Material is equal. White can trade bishops with Bxd6 cxd6 (or …Rxd6).

Task: Should White play Bxd6? **Hint 1:** Is White's bishop "good" or "bad"? It is on f4, actively placed with open diagonals. **Hint 2:** Is Black's bishop "good" or "bad"? It is on d6, also fairly active. **Hint 3:** If White plays Bxd6 cxd6, Black gets a doubled d-pawn but also opens the c-file for the rook. **Solution: This trade is about equal and depends on the plan.** If White wants to target the doubled d-pawns, Bxd6 cxd6 is reasonable. But White's bishop on f4 is active and useful. There is no clear advantage to trading here. **Why this works:** Not every trade needs

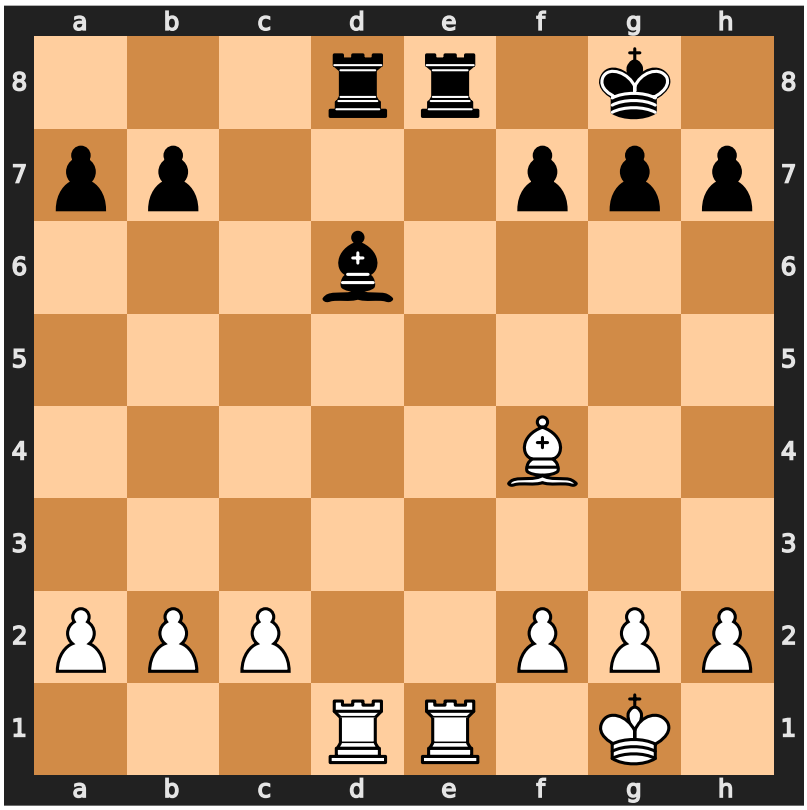

Figure 14.19: Chess Position

to be made. When both bishops are roughly equal in activity, and the resulting pawn structure changes are mixed, keeping the tension can be better.

Exercise 4.15 **Position:** White: King on g1, Queen on e2, Rook on d1, Bishop on g2, Pawns on a2, b2, c3, e4, f2, g3, h2. White is up a full piece (extra bishop). Black: King on g8, Queen on e7, Rook on d8, Pawns on a7, b7, c6, d5, f7, g7, h7.

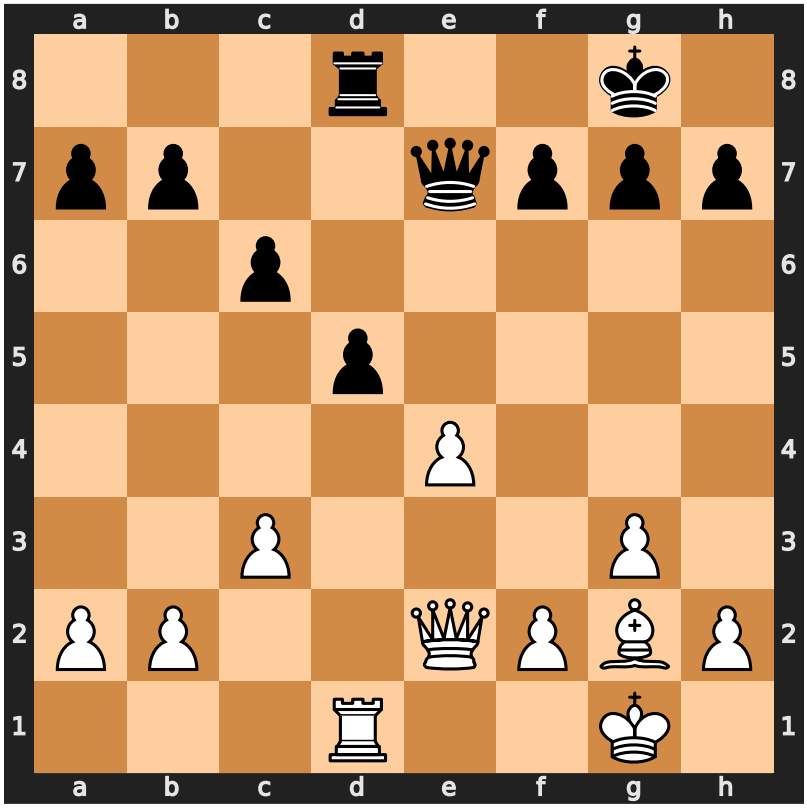

Figure 14.20: Chess Position

Task: White can play Rxd8+ Qxd8, Qxe7. Should White trade rooks and then queens? **Hint 1:** White is up a bishop. Should White simplify? **Hint 2:** Yes! Every trade makes the extra bishop more dominant. **Hint 3:** After Rxd8+ Qxd8, White still has Q+B vs Q. Trading queens next leaves B+pawns vs pawns. Easy win. **Solution: Yes, absolutely trade!** White is up a full piece. Trading rooks and queens leads to a simple endgame where White's extra bishop and pawns will crush Black's lone pawns. **Why this works:** When ahead in material, trade everything. A bishop and pawns vs just pawns is a textbook win.

Exercise 4.16 **Position:** White: King on g1, Queen on h5, Rook on f1, Bishop on c4, Pawns on d4, e5, f2, g2, h2. Black: King on g8, Queen on d7, Rook on f8, Knight on e7, Pawns on c6, d5, f7, g7, h7. White has a strong attack. White can play Qxd7 trading queens.

Task: Should White trade queens with Qxd7? **Hint 1:** Material is roughly equal. White has Q+R+B. Black has Q+R+N. Same points. **Hint 2:** But look at White's queen on h5. It is aiming

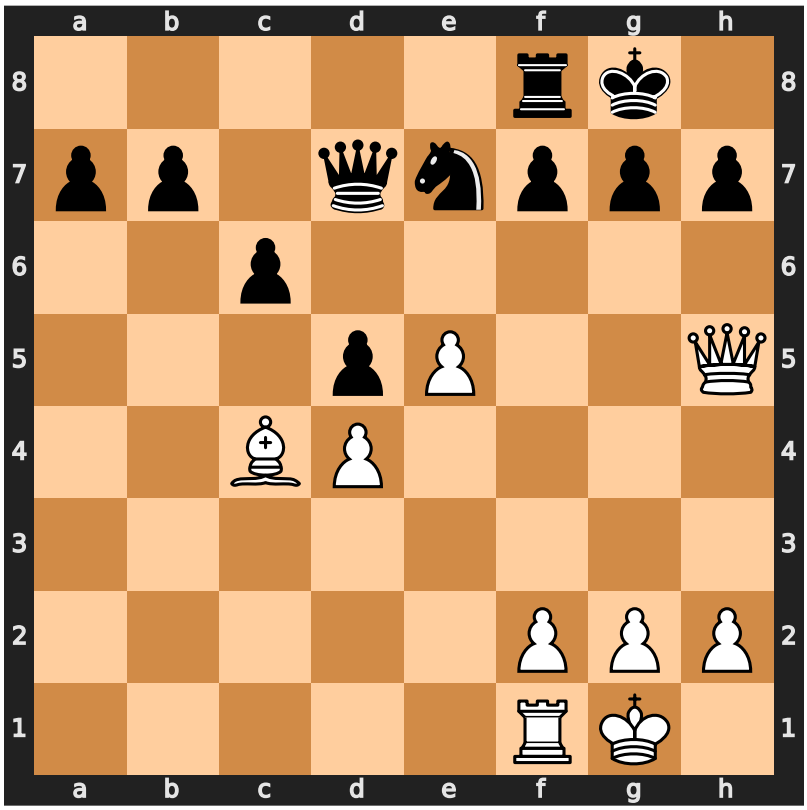

Figure 14.21: Chess Position

at the kingside. Does White have attacking chances? **Hint 3:** If White trades queens, the attack disappears. The resulting endgame is roughly equal. **Solution: No, do not trade queens here.** White's queen on h5 creates threats against Black's king. Trading queens removes all attacking chances and leads to a dull, equal endgame. White should keep the queens on and press the attack with moves like Rf3 or Qg4. **Why this works:** Even when material is equal, do not trade away your attacking pieces. A queen aiming at the enemy king is worth keeping.

Exercise 4.17 **Position:** White: King on g1, Queen on d2, Rook on d1, Bishop on e2, Knight on d4, Pawns on a2, b2, c2, f2, g2, h2. Black: King on g8, Queen on c7, Rook on d8, Bishop on b7, Knight on c5, Pawns on a7, b6, e6, f7, g7, h7. Material is equal. White can play Nxe6 fxe6. This improves Black's center pawns structure but damages the f-file.

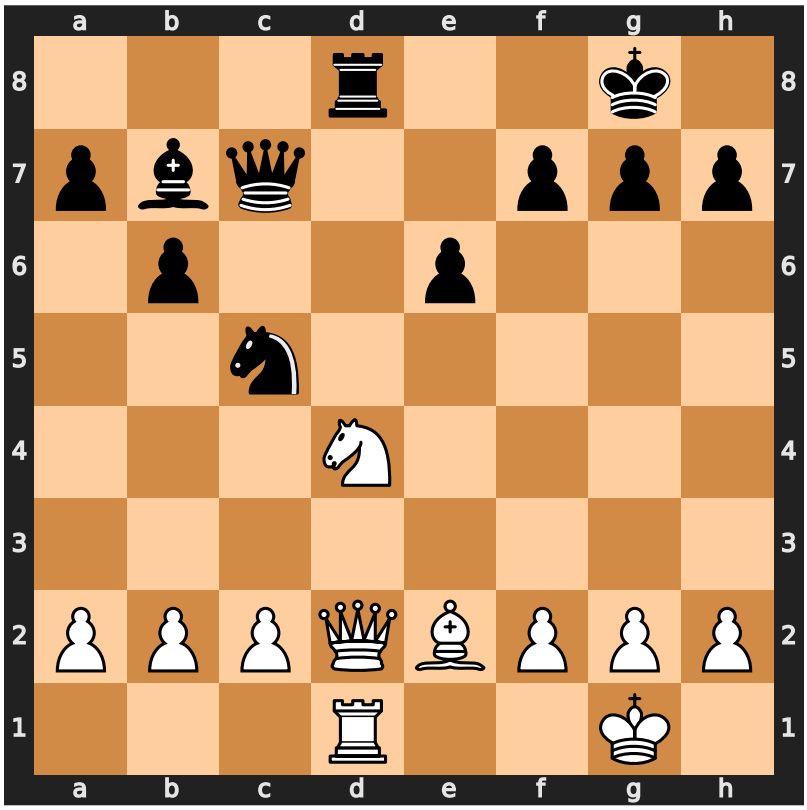

Figure 14.22: Chess Position

Task: Black's knight on c5 is very active, controlling d3, e4, a4, and b3. Should White play Nxc5, trading knights? **Hint 1:** White's knight on d4 is also well-placed. Is White trading a good piece for a good piece? **Hint 2:** After Nxc5 bxc5, Black gets an isolated c-pawn but opens the b-file for the rook. **Hint 3:** More importantly, after Nxc5 bxc5, Black's bishop on b7 gains more scope on the long diagonal. **Solution: Probably not.** Both knights are actively placed. Trading them mostly helps Black by opening the b-file and activating the b7 bishop. White's knight on d4 is at least as good as Black's knight on c5. **Why this works:** Do not trade active pieces for equally active pieces without a clear reason. The resulting changes (open b-file, stronger b7 bishop) favor Black.

Exercise 4.18 **Position:** White: King on g1, Rook on e1, Bishop on d3, Pawns on a2, b2, c3, d4, f2, g2, h3. Black: King on g8, Rook on e8, Bishop on d6, Pawns on a7, b7, c6, d5, e4, f7, g7, h7. White can play Bxe4 dxe4, winning a pawn. But is this a good trade?

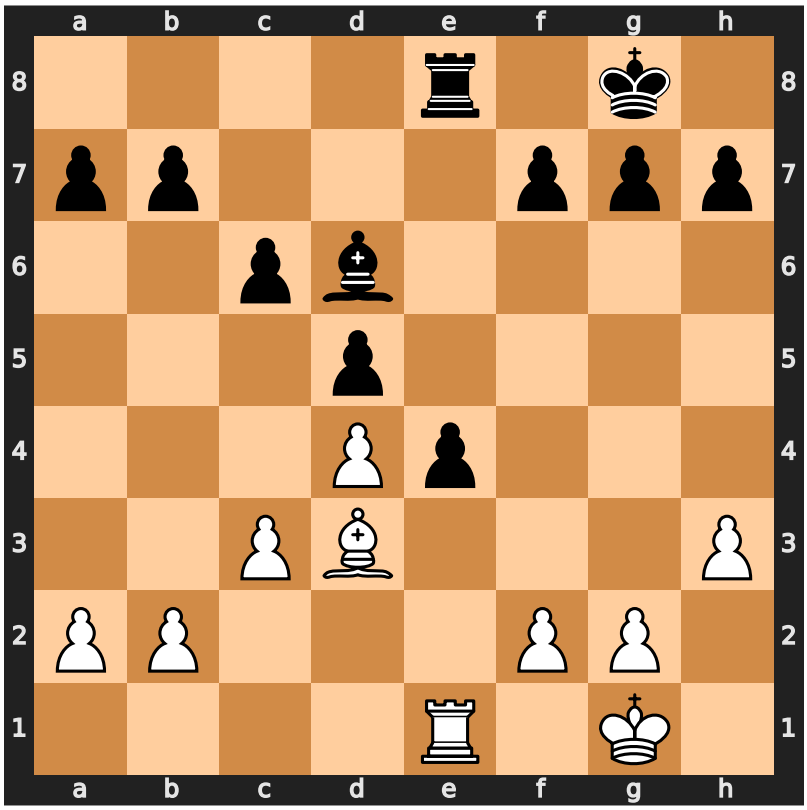

Figure 14.23: Chess Position

Task: Should White capture with Bxe4? **Hint 1:** White's bishop is on d3 and Black has a pawn on e4. After Bxe4, Black recaptures dxe4. White gave up a bishop to grab a pawn. What are the point values? **Hint 2:** White traded a bishop (3 points) for a pawn (1 point). That is a 2-point loss. Terrible trade! **Hint 3:** White should keep the bishop and not trade it for a pawn. **Solution: No! Do not play Bxe4.** White would lose a bishop (3 points) and only get a pawn (1 points). That is a 2-point loss. The bishop on d3 is valuable and should not be thrown away for a pawn. **Why this works:** Always check the value of what you give up vs. what you get. B(3) for P(1) = losing 2 points. Terrible trade.

Exercise 4.19 **Position:** White: King on g1, Queen on c2, Rook on a1, Rook on f1, Bishop on b2, Bishop on d3, Pawns on a2, c3, d4, f2, g2, h2. White has the bishop pair. Black: King on g8, Queen on e7, Rook on a8, Rook on f8, Bishop on c8, Knight on d5, Pawns on a7, c6, d6, f7, g7, h7. The position is open. White can play Bxd5 cxd5, trading a bishop for Black's knight.

Task: Should White trade the bishop for the knight on d5? **Hint 1:** White has the bishop pair. Trading a bishop for a knight destroys the bishop pair advantage. **Hint 2:** The position is open. Open positions favor the bishop pair. Why give that up? **Hint 3:** Keep both bishops! They work together to control the whole board. Find another plan. **Solution: No, do not trade.** White

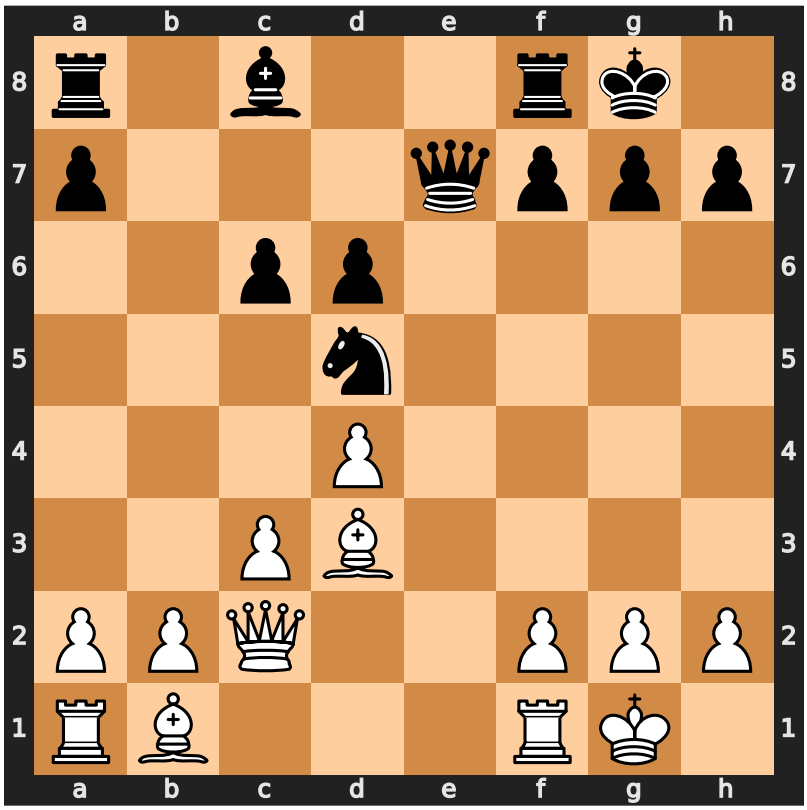

Figure 14.24: Chess Position

has the bishop pair in an open position. That is a significant advantage (about 0.5 extra points). Trading one bishop for a knight throws away that advantage for no gain. **Why this works:** The bishop pair is worth more than its raw point value in open positions. Giving up one bishop for a knight converts a B+B(6.5) into B+N(6). Keep the pair.

Exercise 4.20 **Position:** White: King on f1, Queen on d2, Rook on d1, Bishop on c1, Pawns on a2, b2, c2, e4, f3, g2, h2. White has NOT castled and the king is on f1. Black: King on g8, Queen on a5, Rook on d8, Bishop on g4, Pawns on a7, b7, c7, e5, f7, g7, h7. Black's bishop on g4 pins the f3 pawn and is very active. White can play Rxd8+ Qxd8, Qxd8+ and trade everything.

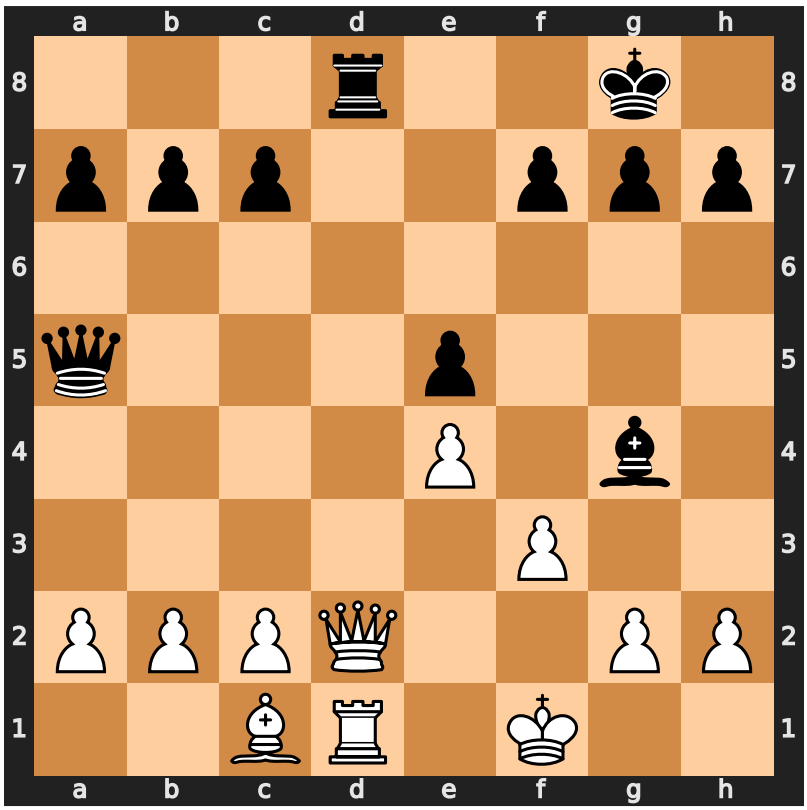

Figure 14.25: Chess Position

Task: Should White trade rooks and queens? **Hint 1:** Count material. White has Q+R+B = 17. Black has Q+R+B = 17. Equal. **Hint 2:** White's king is awkwardly placed on f1 (not castled). In a queen+rook middlegame, that could be dangerous. **Hint 3:** Trading down to a bishop endgame removes the danger to White's king. Both bishops would remain, and the position simplifies. **Solution: Yes, trading is a good idea.** White's king on f1 is exposed. Trading queens and rooks eliminates the danger. The resulting bishop endgame is roughly equal, which is better than risking an attack against the uncastled king. **Why this works:** Sometimes you trade not because you are ahead, but because you are in danger. Simplification can rescue a risky position.

Exercise 4.21 **Position:** White: King on g1, Queen on e2, Rook on e1, Knight on d4, Pawns

on a2, b2, c3, f2, g2, h2. Black: King on g8, Queen on b6, Rook on e8, Bishop on g7, Pawns on a7, b7, d5, f7, g7, h7. Material is equal. White can play Nf5, attacking the bishop and queen. But should White play Nxb6 axb6 instead?

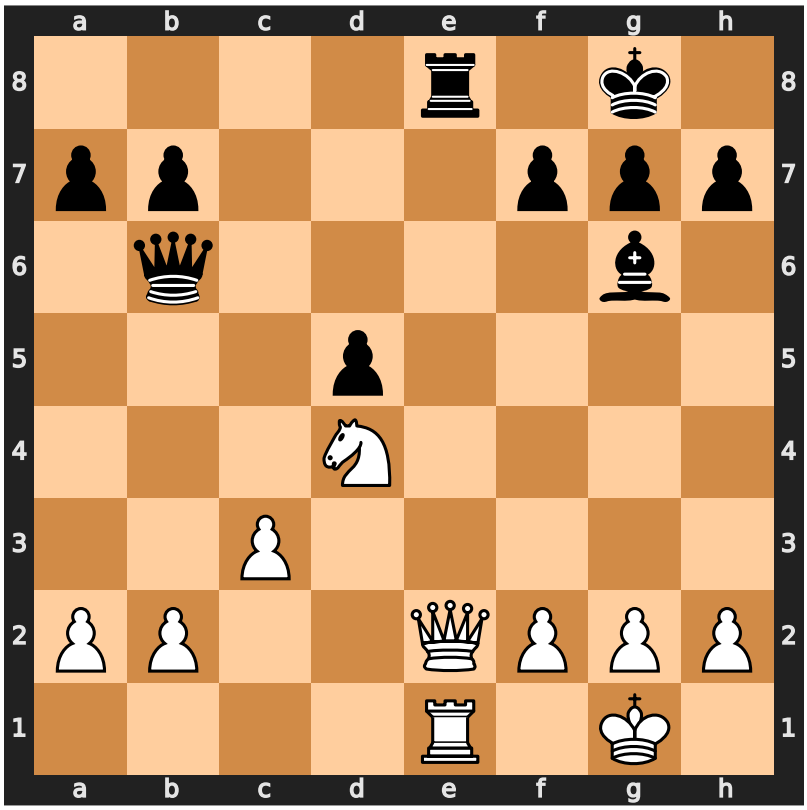

Figure 14.26: Chess Position

Task: Should White play Nd4-f5 (active move) or trade the knight for the queen's defense by playing into a sequence? **Hint 1:** The knight on d4 is beautifully placed. Moving it to f5 attacks Black's bishop and threatens Nd6. **Hint 2:** Nf5 keeps the knight active and creates threats. Do not trade an active piece when you have a strong move. **Hint 3:** Keep the pressure. Active pieces should stay active. **Solution: Play Nf5! Do not trade the knight away.** The knight on f5 will attack the bishop on g7 and threaten Nd6 forking the queen and rook. Active pieces create threats. Keeping them on the board is almost always better than trading them off for quiet equality. **Why this works:** Do not trade your most active piece unless you get something concrete in return. Nf5 creates real threats.

Exercise 4.22 Position: White: King on g1, Rook on c1, Bishop on e3, Pawns on a2, b3, c4, f2, g2, h2. Black: King on g8, Rook on c8, Knight on c6, Pawns on a7, b7, e6, f7, g7, h7. White can play Rxc6 bxc6, winning the exchange.

Task: Should White play Rxc6? **Hint 1:** White trades R(5) for N(3). White gains 2 points. That is winning the exchange. **Hint 2:** But wait. Is the rook doing something important? Is the knight doing something important? **Hint 3:** After Rxc6 bxc6, White wins the exchange but Black opens the b-file. Still, +2 points is significant. **Solution: Yes, win the exchange with**

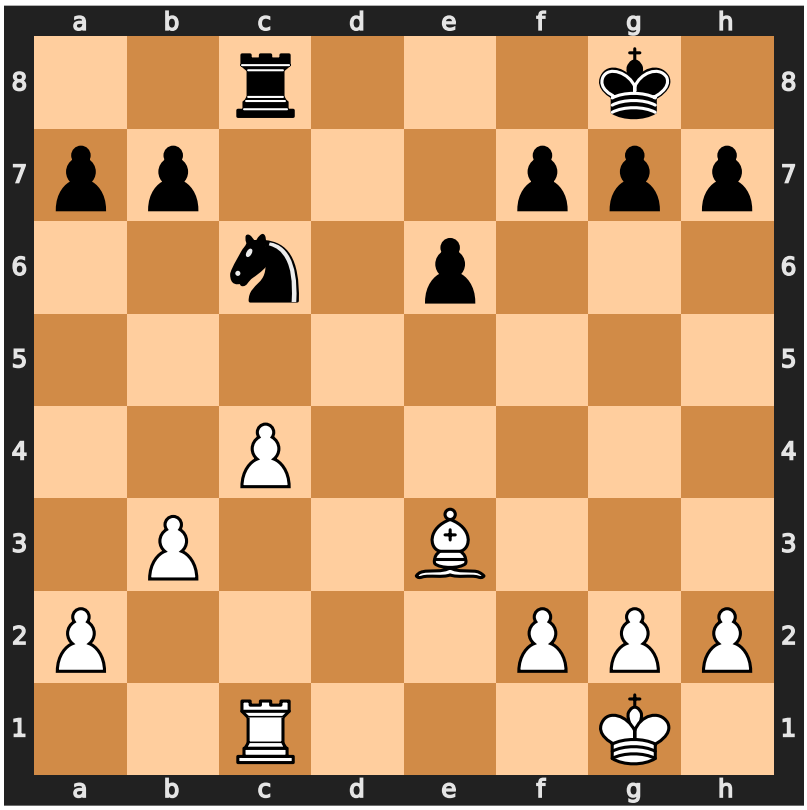

Figure 14.27: Chess Position

Rxc6! White gives up a rook (5) for a knight (3), gaining 2 points of material. The resulting position with an extra exchange is winning for White in most cases. **Why this works:** A 2-point material advantage is very significant. Unless Black gets a devastating attack in return, winning the exchange is almost always correct.

Exercise 4.23 **Position:** White: King on g1, Queen on h5, Rook on f1, Knight on g5, Pawns on c2, d4, e5, f2, g2, h2. Black: King on g8, Queen on d7, Rook on f8, Bishop on c8, Knight on e7, Pawns on c7, d5, f7, g7, h6. White has a strong attack. White can play Qxd7 trading queens.

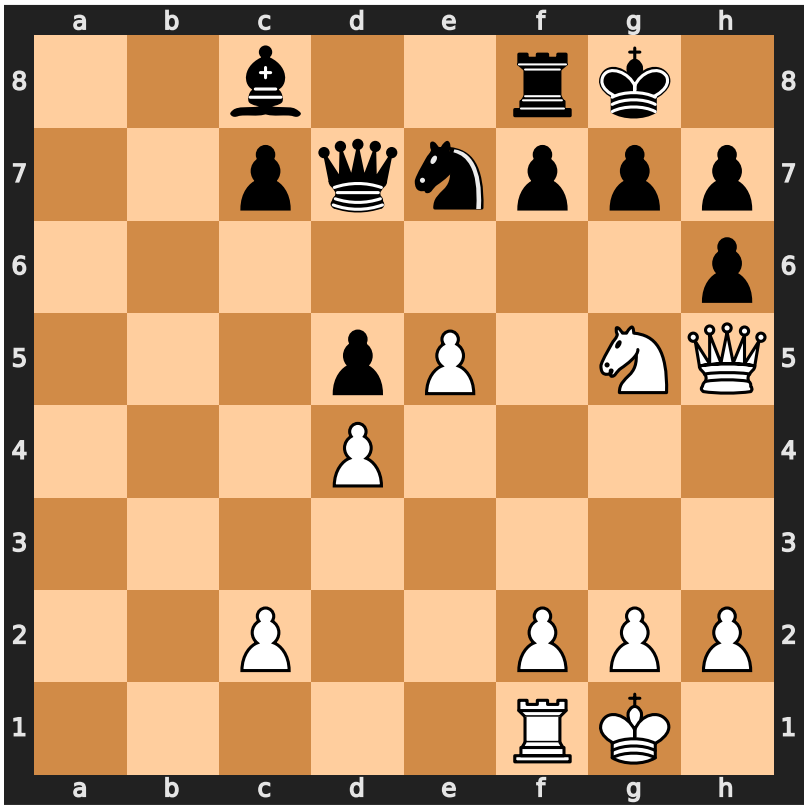

Figure 14.28: Chess Position

Task: Should White trade queens? **Hint 1:** White has a knight on g5 and a queen on h5, both aiming at the kingside. That looks like an attack. **Hint 2:** Trading queens removes the attacking piece (the queen). The attack would be over. **Hint 3:** Keep the queen and look for Qxh6, Qg6, or Nxf7 sacrifices instead. **Solution: No! Do not trade queens.** White has a powerful attack with Qh5 and Ng5 both targeting Black's king. Trading queens throws away all attacking chances. Instead, White should press the attack with moves like Qg6 or Nxf7. **Why this works:** Never trade your queen when you are attacking the enemy king, unless the trade leads to checkmate or wins even more material.

Exercise 4.24 **Position:** White: King on g1, Queen on d2, Rook on a1, Rook on e1, Bishop on d3, Knight on f3, Pawns on a2, b2, c3, d4, f2, g2, h2. Black: King on g8, Queen on c7, Rook on a8, Rook on e8, Bishop on g4, Knight on d5, Pawns on a7, b7, c6, e6, f7, g7, h7. Material is

equal. Multiple trades are possible. White could play Nxd5, or Bxh7+, or simply develop with Re5. **Task:** Should White trade knights with Nxd5 exd5 (or cxd5)? **Hint 1:** White's knight on f3 is defending but also somewhat passive. Black's knight on d5 is a powerful centralized piece. **Hint 2:** Trading the passive knight for the active knight is a good deal. White removes Black's best piece. **Hint 3:** After Nxd5 cxd5 (or exd5), Black's pawn structure is slightly weakened too. **Solution: Yes, trade knights with Nxd5.** White's knight on f3 is less active than Black's dominating knight on d5. Trading a less active piece for a more active one is good strategy. After Nxd5 exd5 (or cxd5), Black loses the powerful centralized knight and White's bishop on d3 gains more scope. **Why this works:** Trade your weaker pieces for your opponent's stronger pieces. White's Nf3 was adequate, but Black's Nd5 was outstanding. Removing it improves White's position.

Exercise 4.25 **Position:** White: King on g1, Queen on c2, Rook on d1, Rook on e1, Bishop on c1, Bishop on g2, Knight on e4, Pawns on a2, b2, c3, f2, g3, h2. Black: King on g8, Queen on d6, Rook on a8, Rook on f8, Bishop on e6, Knight on d7, Pawns on a7, b7, c5, f7, g7, h7. White can play Nxd6 Qxd6 (trading knight for the queen's position), or Nxc5 Nxc5. Several options exist.

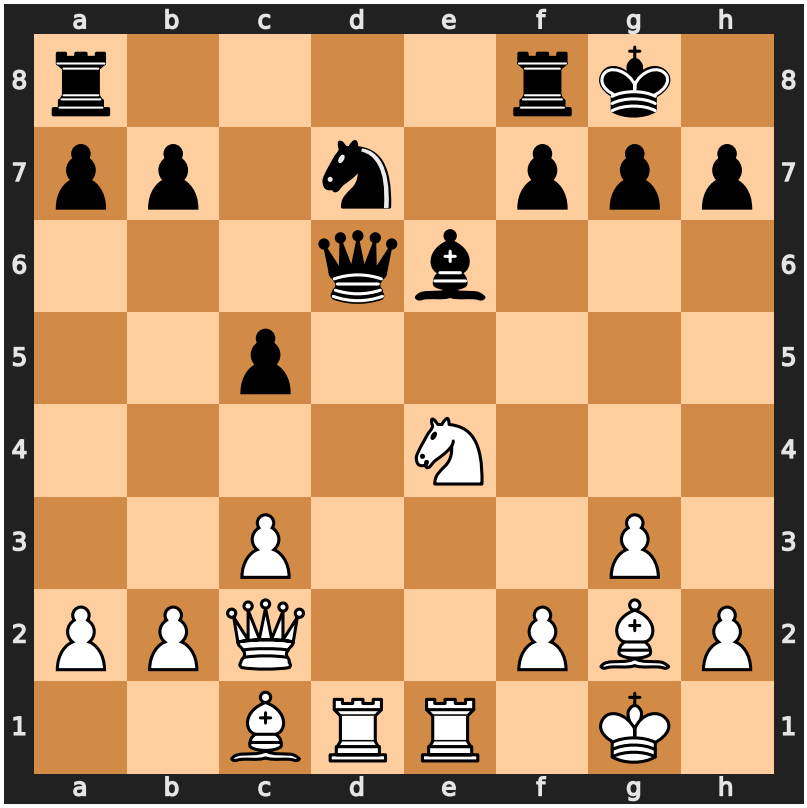

Figure 14.29: Chess Position

Task: White has many options. What is the best trading strategy? **Hint 1:** White has two bishops (bishop pair) in a position that could open up. That is valuable. **Hint 2:** Nxd6 removes a knight but also simplifies when White has the bishop pair advantage. Is that good? **Hint 3:** Consider Nxc5: after Nxc5, White trades the knight (which does not contribute to the bishop pair) and removes a pawn that was holding Black's center together. **Solution: Play Nxc5.** After Nxc5 Nxc5, White has traded the knight (a piece that was NOT part of the bishop pair) and removed

Black's c5 pawn. White keeps both bishops, and the position opens up slightly, which favors the bishop pair. Trading the knight is perfect because it preserves the real advantage (the bishops). **Why this works:** When you have the bishop pair, trade knights, not bishops. The knight is not part of your bishop pair advantage, so trading it away keeps your best asset on the board.

Twenty-five exercises complete! You are halfway through. This is an excellent place to stop and come back later. If you feel sharp, keep going.

14.9.3 Section C: Which Piece Is More Valuable HERE? (Exercises 4.26–4.35)

The point system says bishop = knight = 3 points. But the position changes everything. For each exercise, decide which piece is worth more in the specific position shown.

Exercise 4.26 **Position:** White: King on e1, Bishop on c4, Pawns on d4, e5, f4, g3. Black: King on e8, Knight on c6, Pawns on d5, e6, f5, g7. The center is locked with pawns on d4/d5 and e5/e6.

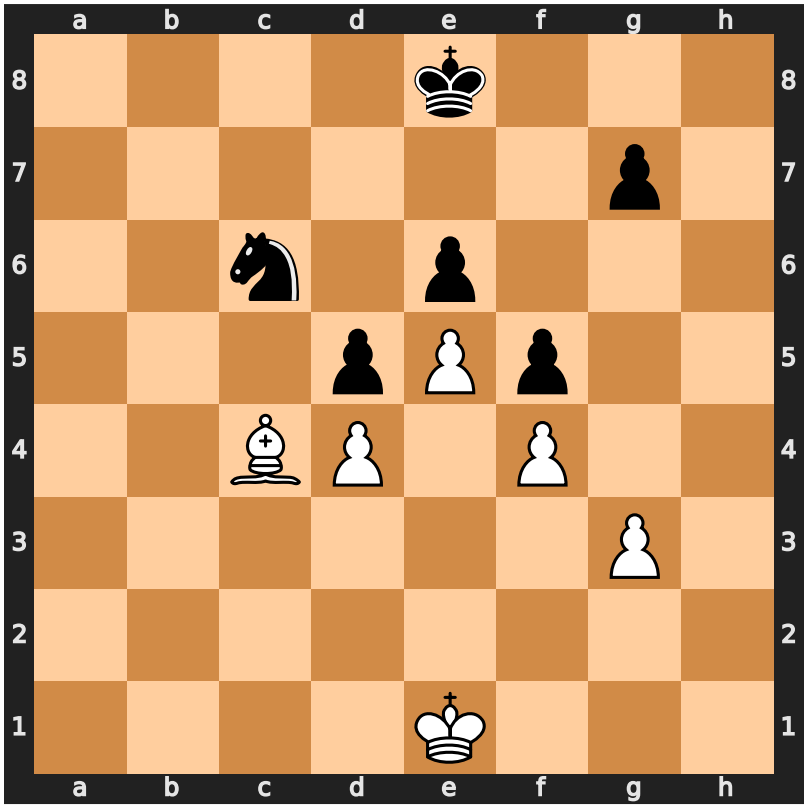

Figure 14.30: Chess Position

Task: Which is worth more here, the bishop or the knight? **Hint 1:** Look at the center. Pawns on d4/d5 and e5/e6 create a locked chain. **Hint 2:** The bishop on c4 has the d5 and e6 pawns in its way. Its diagonals are blocked. **Hint 3:** The knight on c6 can jump to e7, d8, a5, b4, bypassing all pawns. **Solution: The knight is worth more here.** The locked pawn chain blocks the bishop's

diagonals, making it nearly useless. The knight can hop over the pawns to active squares. In this closed position, the knight is worth about 4 points while the bishop is worth about 2. **Why this works:** Knights thrive in closed positions. Bishops suffer when diagonals are blocked.

Exercise 4.27 **Position:** White: King on e1, Knight on d2, Pawns on c2, f2, g2. Black: King on e8, Bishop on g7, Pawns on c7, f7, g6. The center is completely open (no center pawns at all).

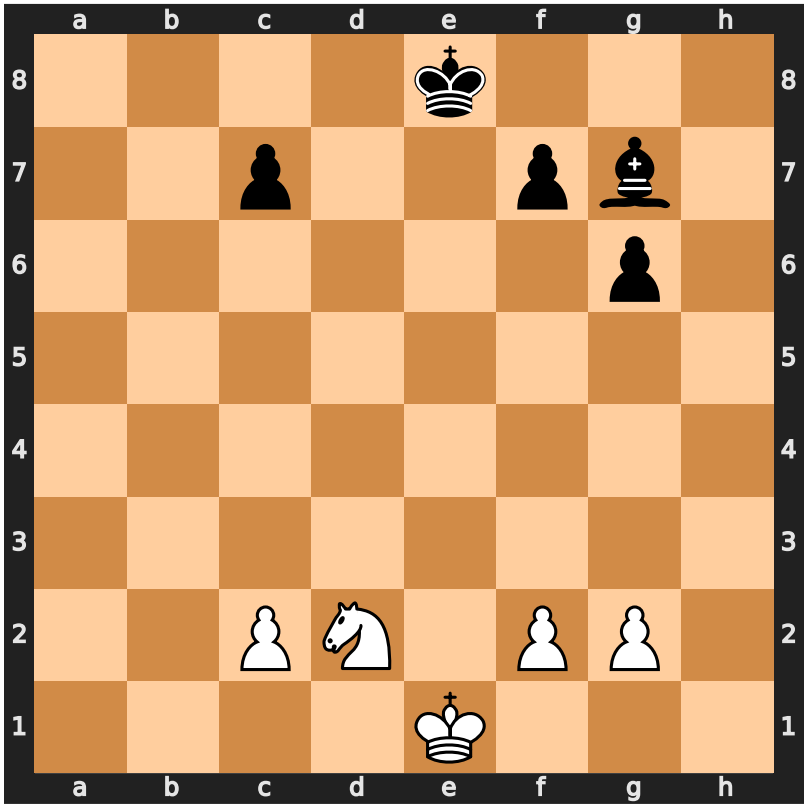

Figure 14.31: Chess Position

Task: Which is worth more here, the knight or the bishop? **Hint 1:** The center is wide open. No pawns on d4, d5, e4, or e5. **Hint 2:** The bishop on g7 controls the long diagonal from a1 to h8. It sees across the whole board. **Hint 3:** The knight on d2 is passive and needs many moves to reach the action on the other side. **Solution: The bishop is worth more here.** In this open position, the bishop controls the long a1-h8 diagonal and can influence the entire board. The knight is slow and clumsy in an open position. The bishop might be worth 3.5 points here, while the knight is about 2.5. **Why this works:** Bishops dominate in open positions where long diagonals are available.

Exercise 4.28 **Position:** White: King on g1, Rook on a1, Pawns on a2, b2, c2. The a-file has a White pawn on it. Black: King on g8, Rook on a8, Pawns on a7, b6, c7. Both rooks are on the a-file, but pawns block them.

Task: Which rook is more active? Which rook is "worth more" in practical terms? **Hint 1:** White's rook is on a1 behind the a2 pawn. The pawn blocks the rook. **Hint 2:** Black's rook

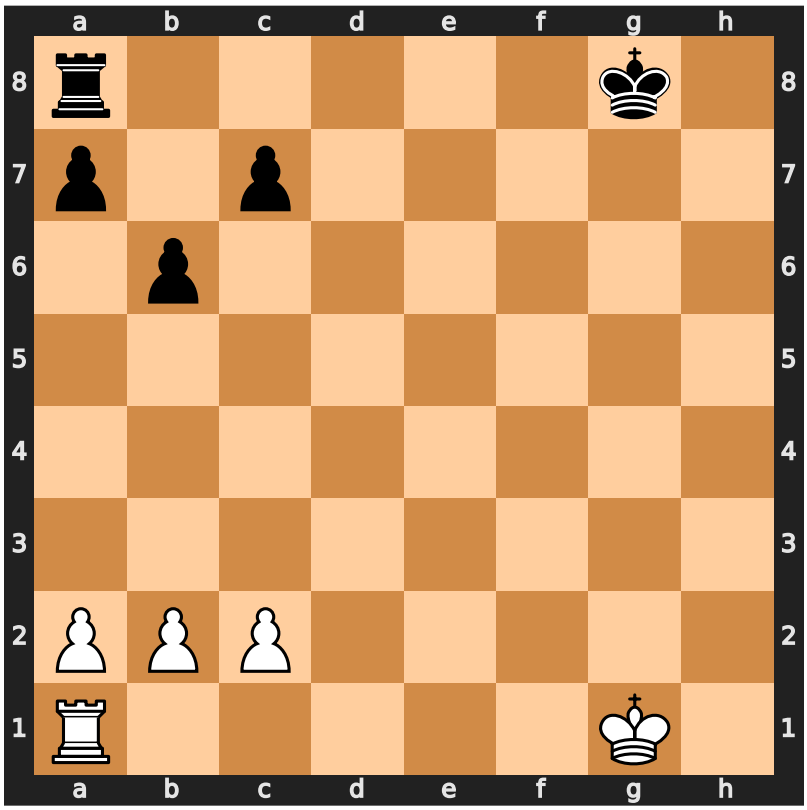

Figure 14.32: Chess Position

is on a8 behind the a7 pawn. Same problem. **Hint 3:** Both rooks are equally stuck. Neither is more active than the other. But if either pawn were to move or be traded… **Solution: Both rooks are equally passive.** Neither can use the a-file because their own pawns block them. In practical terms, both are worth less than their 5-point rating. The one that gets an open file first will suddenly become the stronger rook. **Why this works:** A rook's value depends entirely on having open files. Without one, a rook is an expensive decoration.

Exercise 4.29 **Position:** White: King on g2, Bishop on b2, Bishop on e2. Black: King on g7, Bishop on c8, Knight on f6. White has the bishop pair.

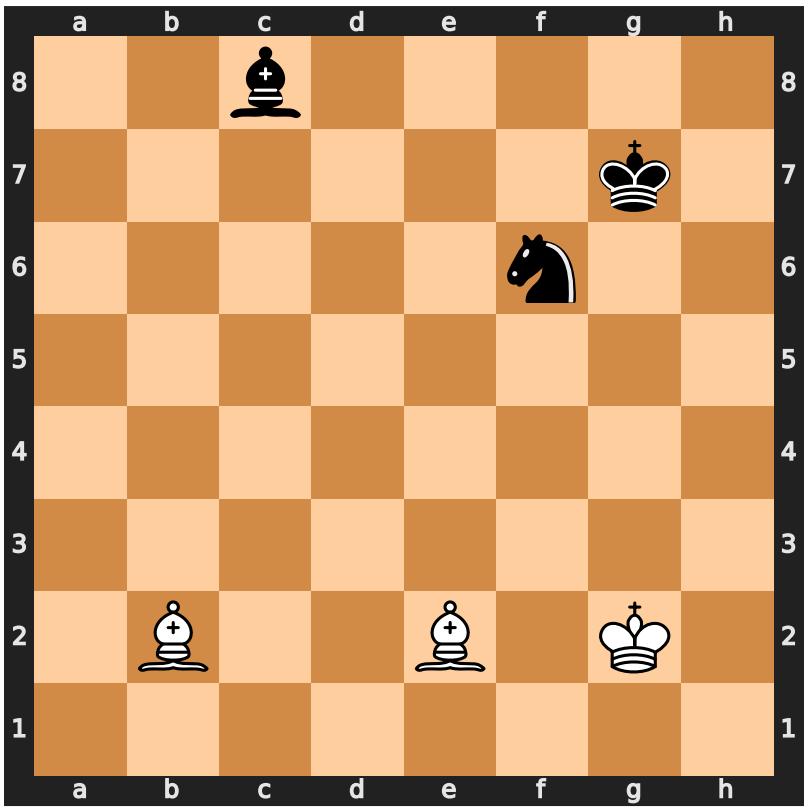

Figure 14.33: Chess Position

Task: Who has the better minor pieces, and why? **Hint 1:** White has two bishops. Black has one bishop and one knight. **Hint 2:** White's bishops cover both light and dark squares. Black's pieces cover mostly the same type of squares (the knight goes to both, but the bishop is limited to one color). **Hint 3:** The bishop pair gives White about a 0.5-point advantage. **Solution: White's bishop pair is better.** Two bishops cover all 64 squares between them. Black's bishop and knight are fine pieces, but they do not have the same combined reach. White holds roughly a half-point advantage from the bishop pair alone. **Why this works:** The bishop pair advantage is real and well documented. Two bishops complement each other in a way that bishop+knight cannot match.

Exercise 4.30 **Position:** White: King on g1, Knight on e5, Pawns on d4, f4, g3, h2. The knight is on a beautiful central outpost supported by pawns. Black: King on g8, Bishop on c8, Pawns on

d5, e6, f7, g7, h7. The bishop is blocked by its own pawns.

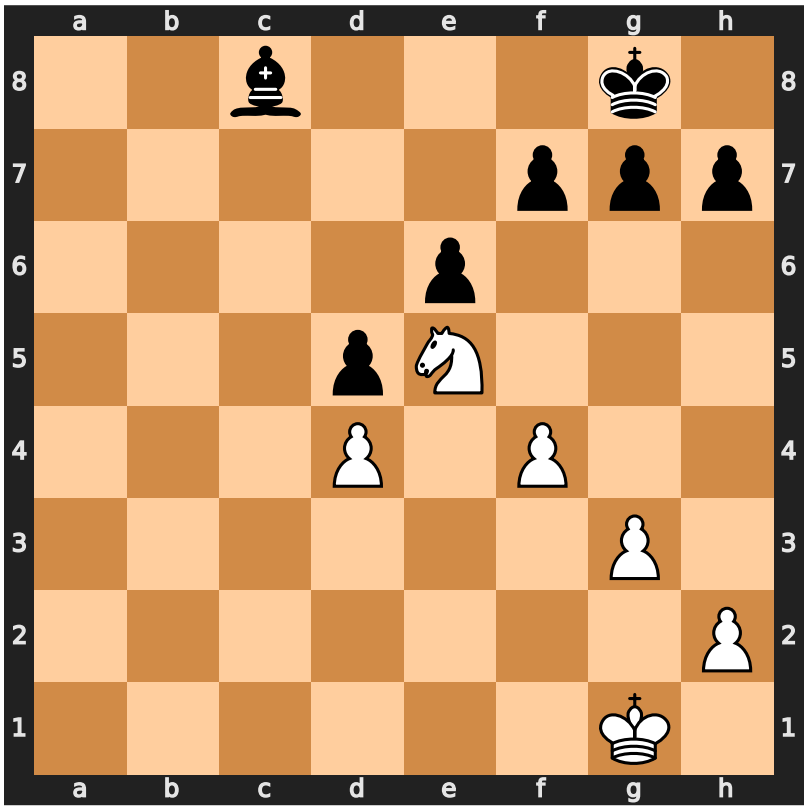

Figure 14.34: Chess Position

Task: Which is worth more, the knight on e5 or the bishop on c8? **Hint 1:** The knight on e5 is in the center, supported by the d4 and f4 pawns. It cannot be chased away. **Hint 2:** The bishop on c8 is stuck behind its own pawns on e6, d5, and f7. It has no good diagonals. **Hint 3:** A well-placed knight on an outpost can be worth 5 points. A blocked bishop can be worth 1-2 points. **Solution: The knight is worth MUCH more.** The knight on e5 is on a perfect outpost, protected by pawns, controlling important squares. The bishop on c8 is a "bad bishop" blocked by its own pawns with no active future. This knight might be worth 4-5 points in practice, while the bishop is worth 1-2. **Why this works:** Position changes everything. A knight on a permanent outpost is worth far more than a bishop trapped behind its own pawns.

Exercise 4.31 **Position:** White: King on g1, Rook on d7, Pawns on a2, b2, f2, g2, h2. The rook is on the seventh rank. Black: King on g8, Rook on a8, Pawns on a7, b7, f7, g7, h7. Black's rook is on the back rank.

Task: Which rook is more valuable in this position? **Hint 1:** White's rook is on the seventh rank, attacking b7 and f7. **Hint 2:** Black's rook is stuck on a8, defending the a7 pawn passively. **Hint 3:** A rook on the seventh rank is worth about a pawn more than a regular rook. **Solution: White's rook on d7 is far more valuable.** It attacks multiple pawns from the seventh rank and pins Black's pieces to defensive duties. Black's rook on a8 is passive, defending the a-pawn. White's rook is effectively a 6-point piece here, while Black's rook is stuck playing defense. **Why**

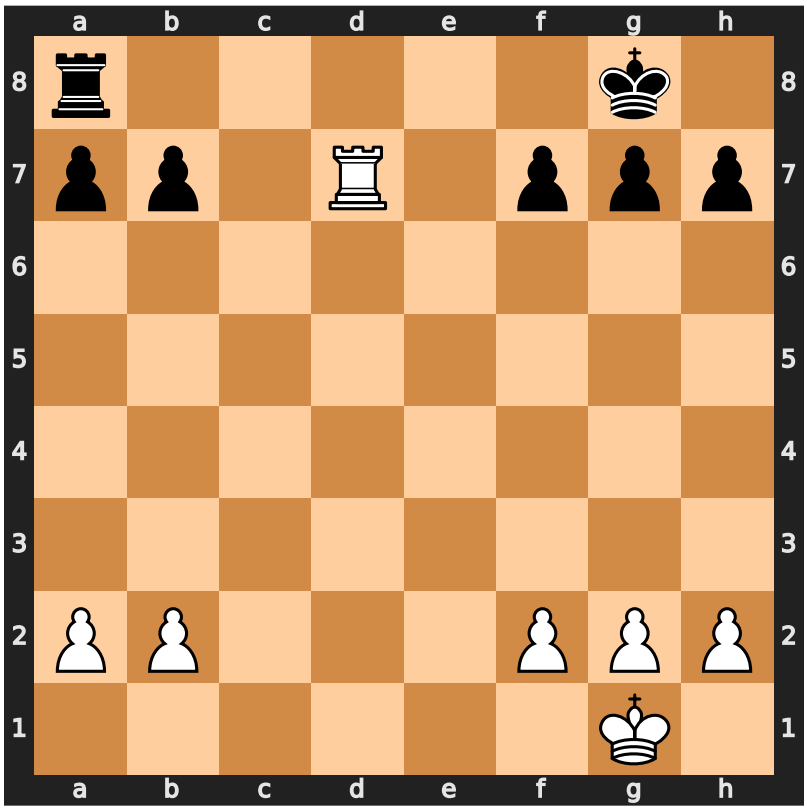

Figure 14.35: Chess Position

this works: A rook on the seventh rank is one of the most powerful setups in chess. It attacks pawns and restricts the enemy king.

Exercise 4.32 **Position:** White: King on e1, Bishop on e2, Pawns on a2, b3, c4, d3, e4, f3, g2, h3. White has 8 pawns, many on light squares. Black: King on e8, Knight on f6, Pawns on a7, b6, c5, d6, e5, f7, g7, h6.

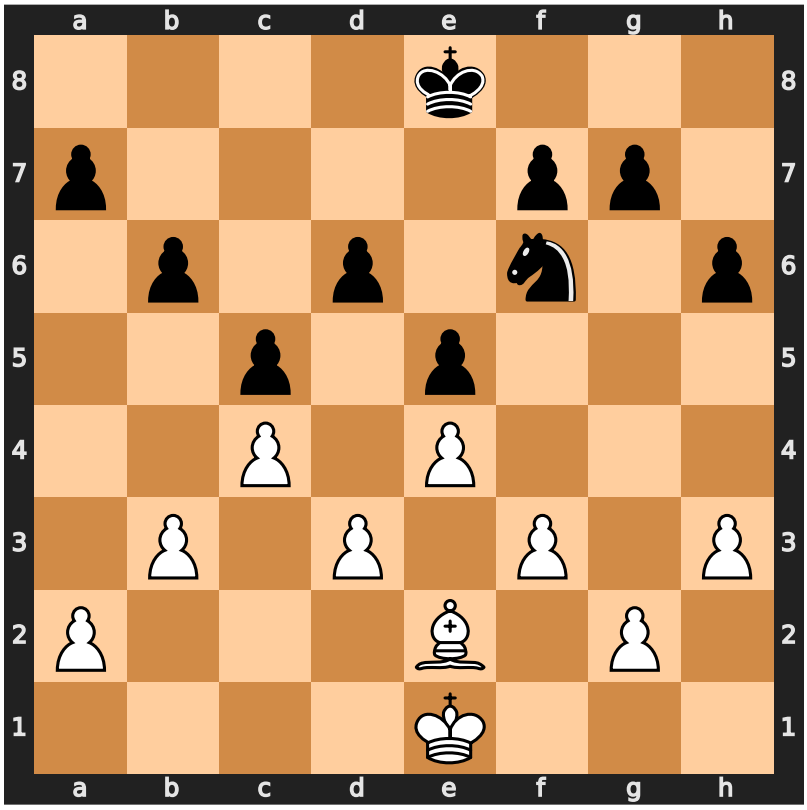

Figure 14.36: Chess Position

Task: Is White's bishop good or bad? **Hint 1:** White's bishop is on e2, a light square. Look at where White's pawns are. **Hint 2:** White's pawns are on a2, b3, c4, d3, e4, f3, g2, h3. Many of these are on light squares (b3, d3, f3, h3). **Hint 3:** A "bad bishop" is one blocked by its own pawns on the same color squares. White's pawns are clogging up the light squares. **Solution: White's bishop is bad.** It sits on e2 (a light square) and is blocked by its own pawns on b3, d3, f3, and h3, all of which are also on light squares. The bishop has very limited scope. Meanwhile, Black's knight on f6 is active and can hop to good squares. **Why this works:** When your pawns sit on the same color squares as your bishop, the bishop becomes "bad." It cannot move freely because its own pawns are in the way.

Exercise 4.33 **Position:** White: King on g1, Rook on d1, Rook on e1. Both rooks are connected on the first rank. Black: King on g8, Rook on a8, Rook on h8. Black's rooks are separated.

Task: Whose rooks are better positioned? **Hint 1:** White's rooks can see each other on the first rank. They are connected and can support one another. **Hint 2:** Black's rooks are on a8 and

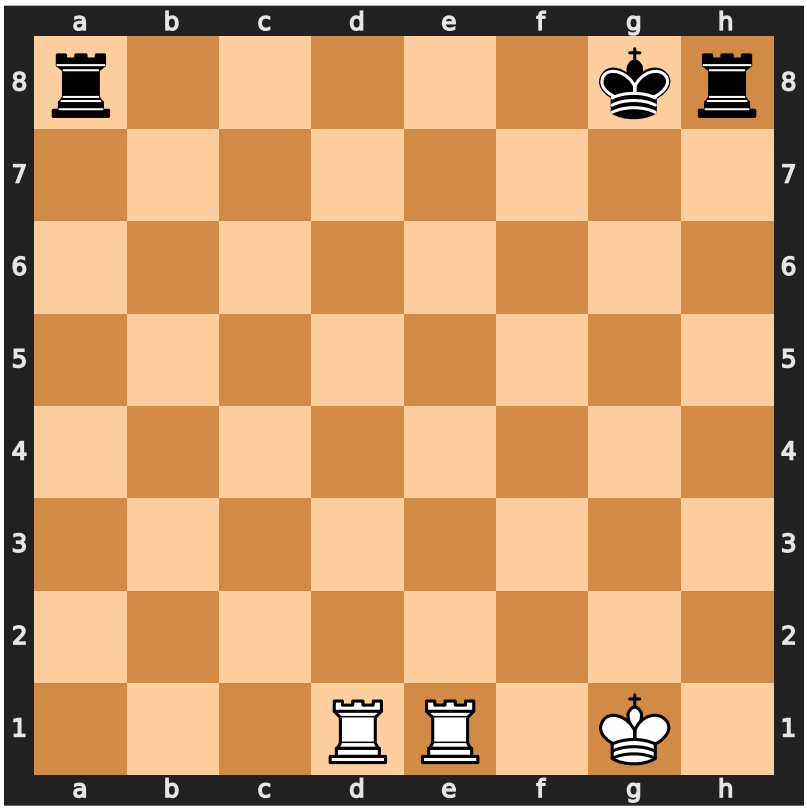

Figure 14.37: Chess Position

h8, on opposite corners. They cannot see each other because the king is in between. **Hint 3:** Connected rooks are always stronger than disconnected rooks. **Solution: White's rooks are better.** They are connected and can double on any file quickly (Rd7 and Re7, or both swing to the d-file). Black's rooks are disconnected, separated by the king on g8, and cannot easily coordinate. **Why this works:** Connected rooks protect each other and double their attacking power. Disconnected rooks fight alone.

Exercise 4.34 **Position:** White: King on g1, Bishop on a1, Pawns on d4, e5, f4. The bishop is in the corner. Black: King on g8, Knight on d5, Pawns on e6, f5. The knight is in the center.

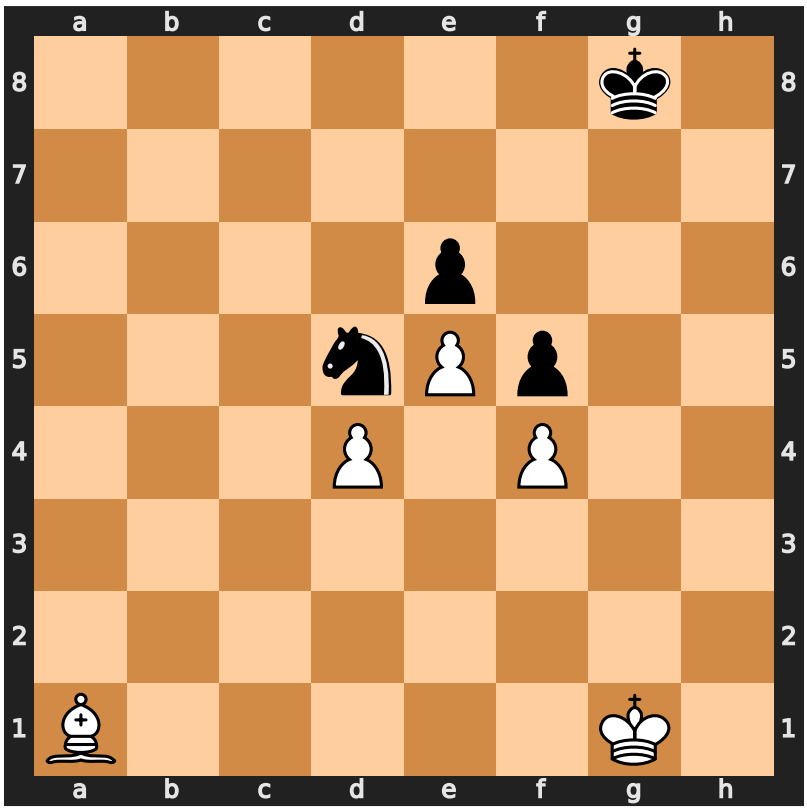

Figure 14.38: Chess Position

Task: Which minor piece is better here? **Hint 1:** The bishop on a1 is on the long diagonal. But does it have targets? **Hint 2:** The a1-h8 diagonal is mostly open, but the bishop aims at… empty squares. No Black pieces are in its path. **Hint 3:** The knight on d5 is perfectly centralized, attacking c3, e3, b4, f4, b6, f6, c7, e7. It is a monster. **Solution: The knight on d5 is much better.** It sits on a dominant central outpost, attacking 8 squares, and is protected by the e6 pawn. The bishop on a1, while on a long diagonal, has no real targets. The knight is worth about 4 points here, the bishop about 2-3. **Why this works:** Placement matters more than the piece's raw point value. A centralized knight on an outpost beats a corner bishop with no targets.

Exercise 4.35 **Position:** White: King on g1, Rook on d1, Bishop on f1, Knight on a1, Pawns on a2, b2, c3, f2, g2, h2. Black: King on g8, Rook on d8, Bishop on g7, Knight on e5, Pawns on

a7, b7, c6, f7, g6, h7.

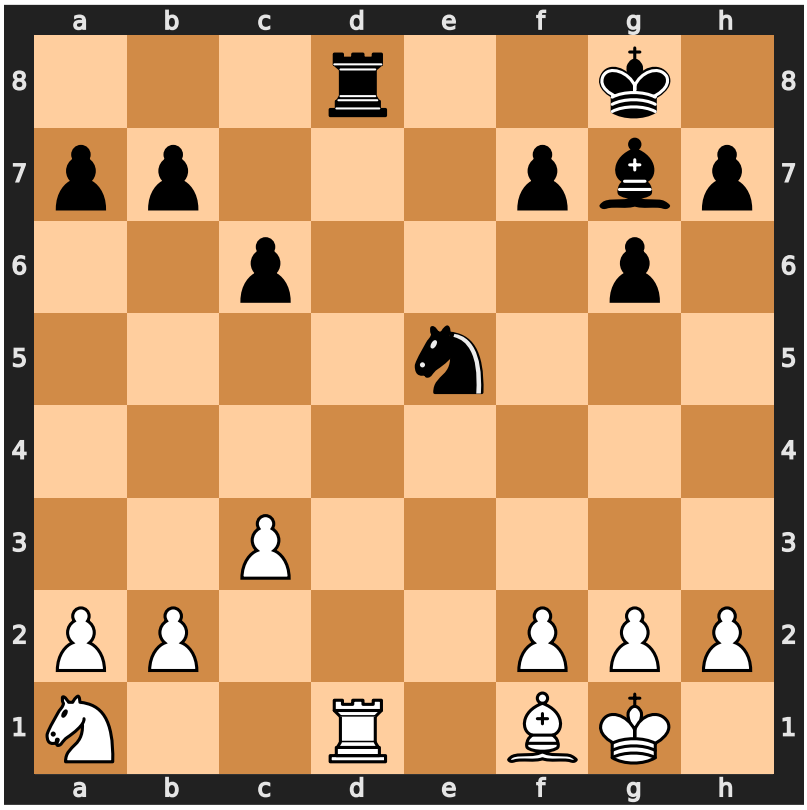

Figure 14.39: Chess Position

Task: Compare all four minor pieces. Rank them from most valuable to least valuable in this position. **Hint 1:** Black's knight on e5 is perfectly centralized. Black's bishop on g7 controls the long diagonal. **Hint 2:** White's bishop on f1 is passive, sitting on its starting square. White's knight on a1 is in the worst possible corner. **Hint 3:** Active, centralized pieces are worth more. Passive, corner pieces are worth less. **Solution: Ranking (best to worst): 1. Black's Ne5 (dominant outpost), 2. Black's Bg7 (active on long diagonal), 3. White's Bf1 (passive but has potential), 4. White's Na1 (worst possible square for a knight).** The position shows how placement changes value. Black's pieces are worth close to 4 points each. White's knight on a1 is worth about 1-2 points. **Why this works:** A knight in the corner controls only two squares. A knight in the center controls eight. Where a piece sits determines what it is worth.

14.9.4 Section D: Find the Winning Trade (Exercises 4.36–4.45)

Each position has a trade that wins material or reaches a winning endgame. Find it.

Exercise 4.36 **Position:** White: King on g1, Queen on d5, Rook on e1, Pawns on a2, b2, f2, g2, h2. Black: King on g8, Queen on e7, Rook on e8, Knight on c6, Pawns on a7, b7, f7, g7, h7. White is up a pawn. White can trade queens.

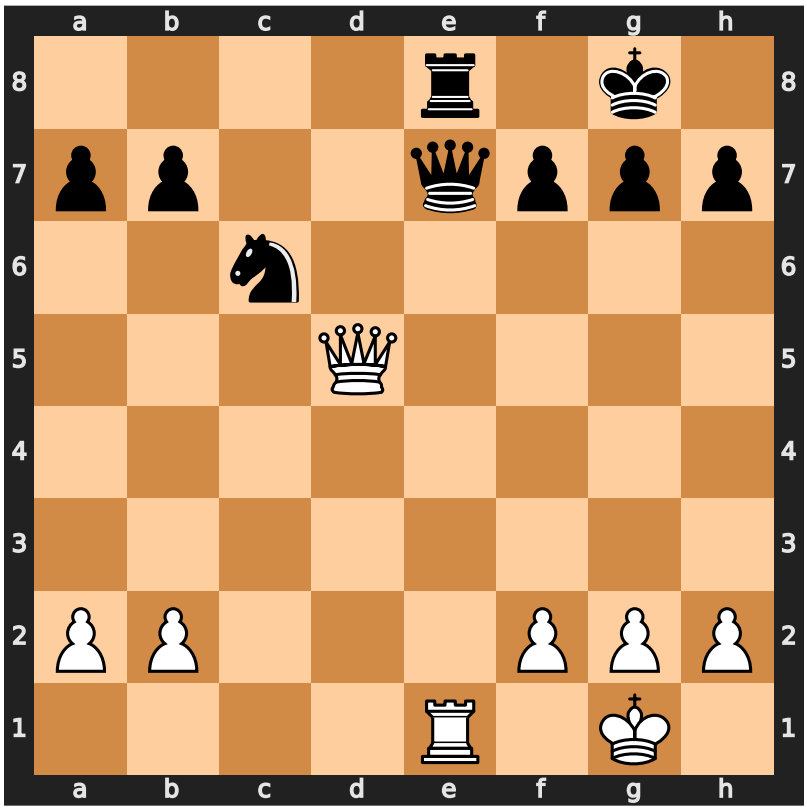

Figure 14.40: Chess Position

Task: Find the best trade for White. **Hint 1:** White is up a pawn. What should White do when ahead? **Hint 2:** White can play Qd7, which attacks the queen and threatens Qxe8+. Or White can play Qxe7 Rxe7, Rxe7. **Hint 3:** The simplest winning plan is Qxe7 Rxe7, then Rxe7. White trades everything and is up a pawn in the endgame. **Solution: Play Qxe7!** After Qxe7 Rxe7, Rxe7, White has traded queens and rooks, reaching a pawn endgame (or knight+pawn endgame) where the extra pawn wins. **Why this works:** When ahead in material, trade into a winning endgame. Even one extra pawn is enough to win when most pieces are off the board.

Exercise 4.37 **Position:** White: King on g1, Rook on e1, Bishop on d5, Pawns on a2, b2, f2, g2, h2, plus an extra pawn on c6. Black: King on g8, Rook on e8, Knight on d7, Pawns on a7, b7, f7, g7, h7.

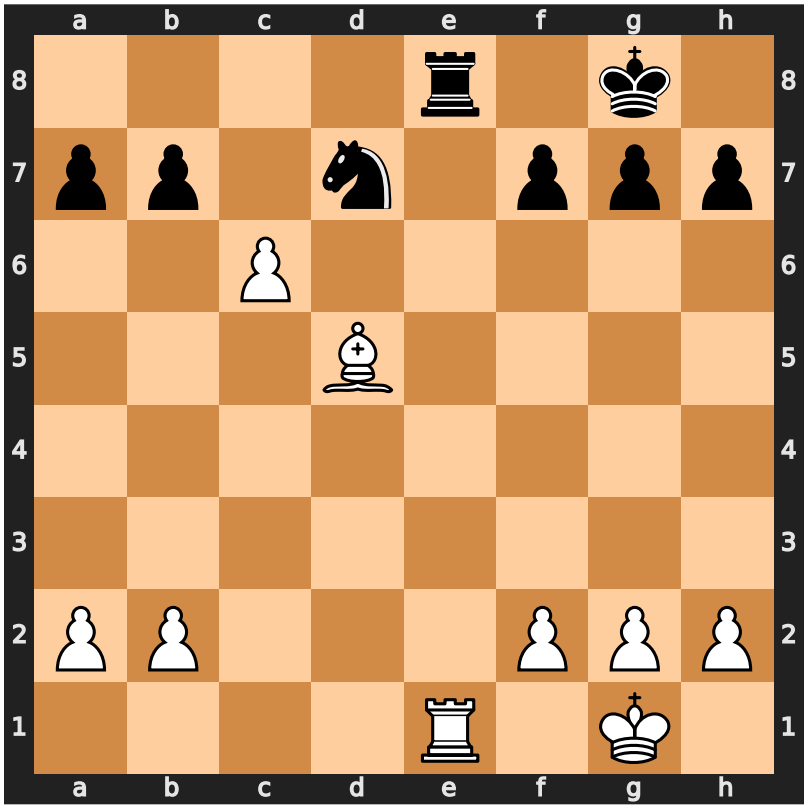

Figure 14.41: Chess Position

Task: White has an extra passed pawn on c6. Find the winning trade. **Hint 1:** If White trades rooks, the passed c-pawn will be hard to stop. **Hint 2:** Rxe8+ Nxe8, then the c-pawn marches forward. **Hint 3:** After Rxe8+ Nxe8, White plays c7 and the pawn will promote. **Solution: Play Rxe8+ Nxe8, then c7!** After trading rooks, the passed c-pawn on c7 is unstoppable. Black's knight cannot block it (Nd6 is met by Bxb7, and the pawn promotes). White wins. **Why this works:** Trade rooks when you have a passed pawn ready to promote. Without a rook to stop it, the pawn runs home.

Exercise 4.38 **Position:** White: King on g1, Queen on d4, Bishop on c4, Pawns on a2, f2, g2,

h2. Black: King on g8, Queen on d8, Bishop on e6, Pawns on a7, f7, g7, h7. White can play Bxe6, winning a bishop for a bishop (even), but then Qxd8 would be possible depending on the recapture.

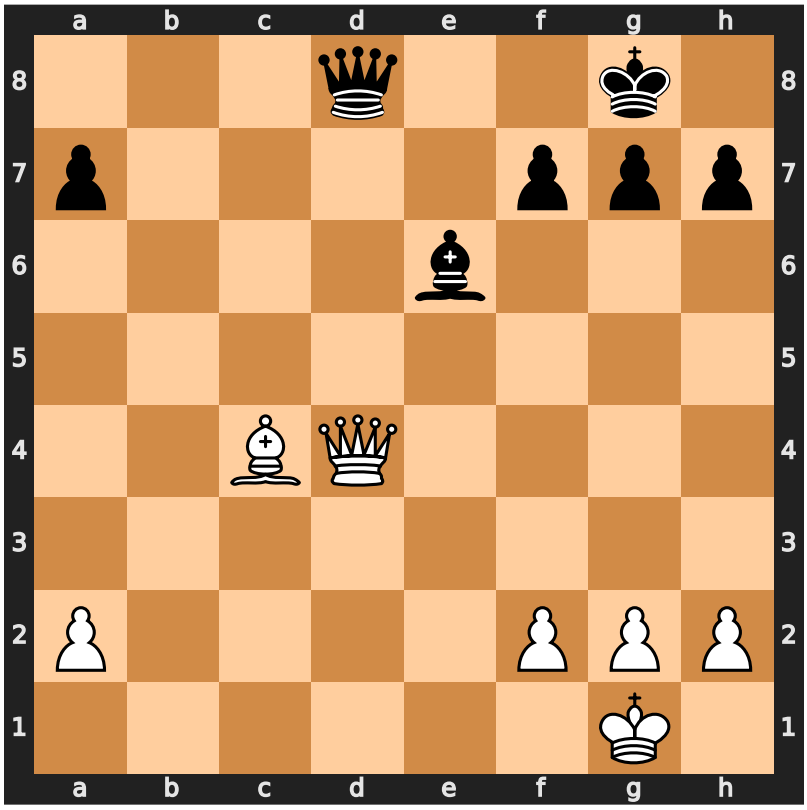

Figure 14.42: Chess Position

Task: Find the move that wins material. **Hint 1:** What if White plays Bxe6 fxe6? Then look at the position. Is there a follow-up? **Hint 2:** After Bxe6 fxe6, Black's f-file is open and the e6 pawn is weak. But more importantly… **Hint 3:** After Bxe6, Black must deal with the threat. If fxe6, then Qd7! threatens Qe8 checkmate and also attacks the e6 pawn. Or just Qxd8 first, then Bxe6. **Solution: Play Qxd8+ first!** After Qxd8+ Kf8 (or Kh8), White plays Bxe6 fxe6. White has traded queens and then captured a bishop for free. White ends up with B+4P vs 4P in the endgame, which wins easily. **Why this works:** Look for sequences. Trade queens first (when it forces a recapture), then grab the undefended piece.

Exercise 4.39 **Position:** White: King on g1, Rook on e1, Rook on d1, Bishop on g5, Pawns on a2, b2, c3, f2, g2, h2. Black: King on g8, Rook on e8, Rook on d8, Knight on f6, Pawns on a7, b7, c6, f7, g7, h6. Several trading sequences are possible. Find the best one.

Task: White can play Rxd8 Rxd8, Rxd8+ Kxd8, then what? Or Bxf6 first? Find the right sequence. **Hint 1:** If White plays Rxd8 Rxd8, Rxd8+ Kxd8, the bishop on g5 pins nothing because the king moved. White just traded rooks evenly. **Hint 2:** Try Bxf6 first. After Bxf6 gxf6, White has traded B for N (even in points). But now… **Hint 3:** After Bxf6 gxf6, White plays Rxd8 Rxd8, Rxd8+ Kxd8. White traded everything and Black has a damaged kingside with doubled f-pawns. That is a small advantage but not winning. **Solution: The best sequence is Rxd8**

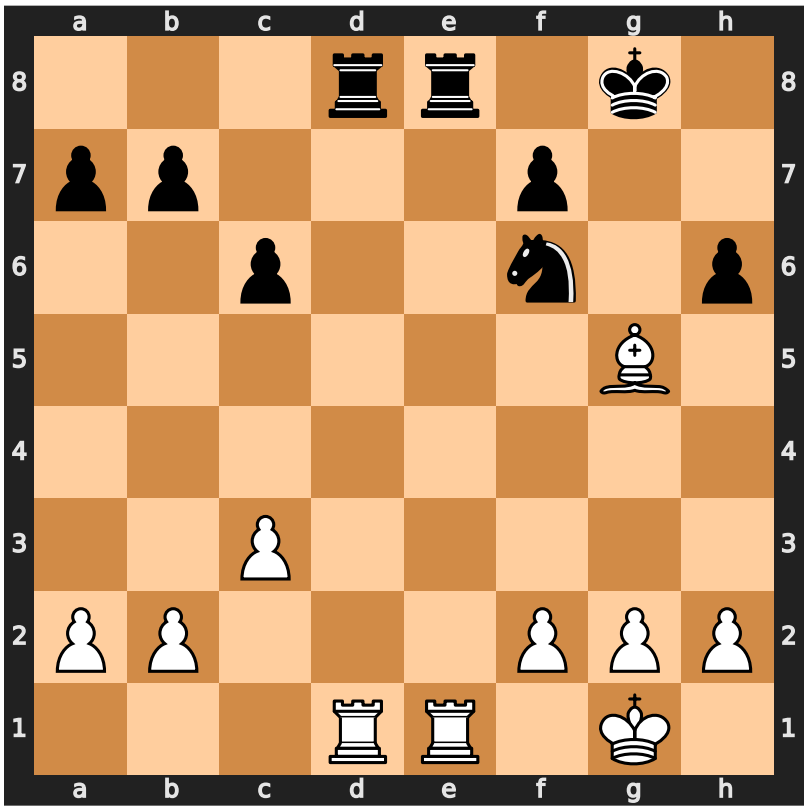

Figure 14.43: Chess Position

Rxd8, Bxf6! After trading one pair of rooks with Rxd8 Rxd8, White plays Bxf6! Now gxf6 (forced), and then Rxd8+ Kxd8. White traded B(3) for N(3), which is even, but Black ends up with doubled f-pawns and a weaker king position. The trade sequence matters. **Why this works:** The order of trades matters. By trading one rook first, White keeps the bishop active to inflict structural damage before completing the simplification.

Exercise 4.40 **Position:** White: King on f1, Queen on e2, Rook on d1, Pawns on a2, b3, c4, e4, f2, g2, h2. Black: King on g8, Queen on a5, Rook on d8, Knight on d4, Pawns on a7, b7, e5, f7, g7, h7. Black's knight on d4 is threatening White's queen.

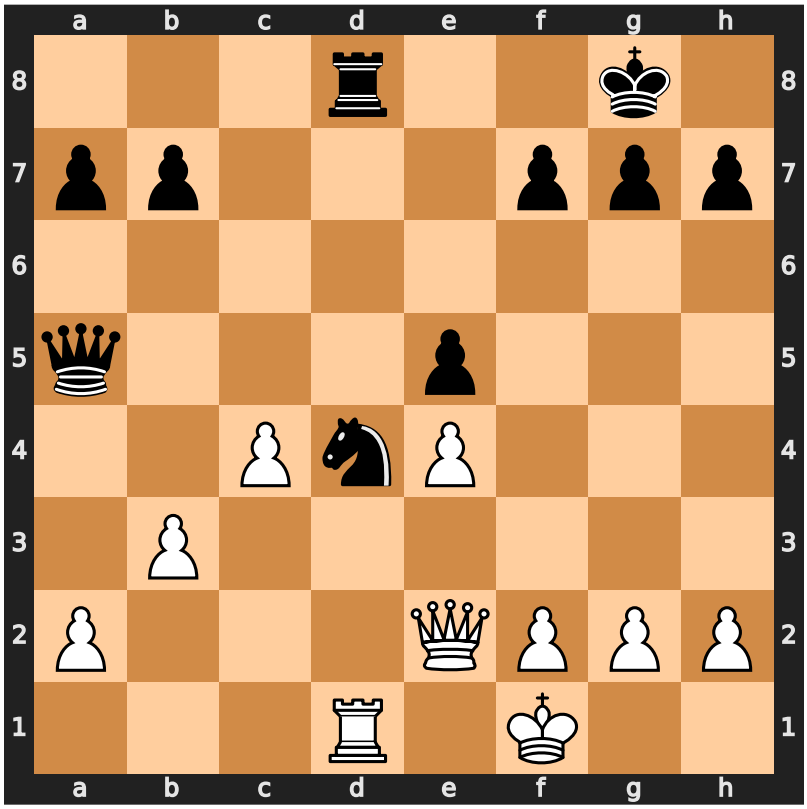

Figure 14.44: Chess Position

Task: Find the winning trade for White. **Hint 1:** Black's knight on d4 is attacking White's queen on e2 and threatening Nc2+. **Hint 2:** White should deal with the knight immediately. Rxd4! exd4 wins a knight for… a rook? No, Rxd4 captures the knight with the rook. **Hint 3:** If White plays Rxd4, Black recaptures Rxd4 (rook takes rook). White traded R(5) for N(3) and then Black took back R(5). White loses the exchange. Instead, look for a move that deals with the knight while keeping material. Try Qb5, trading queens first. **Solution: Play Qb5!** White moves the queen to b5, attacking Black's queen on a5 and threatening to trade queens. After Qxa5 Qxa5, White has simplified and the knight on d4 no longer has the queen to coordinate with. Then Rxd4 exd4 wins the knight cleanly. **Why this works:** Sometimes the winning trade requires preparation. Removing the enemy queen first makes capturing the knight safer and cleaner.

Exercise 4.41 **Position:** White: King on g1, Queen on d1, Rook on f1, Bishop on c4, Pawns on a2, c3, d4, f2, g2, h2. Black: King on g8, Queen on d7, Rook on f8, Bishop on e6, Pawns on a7, b6, d5, f7, g7, h7.

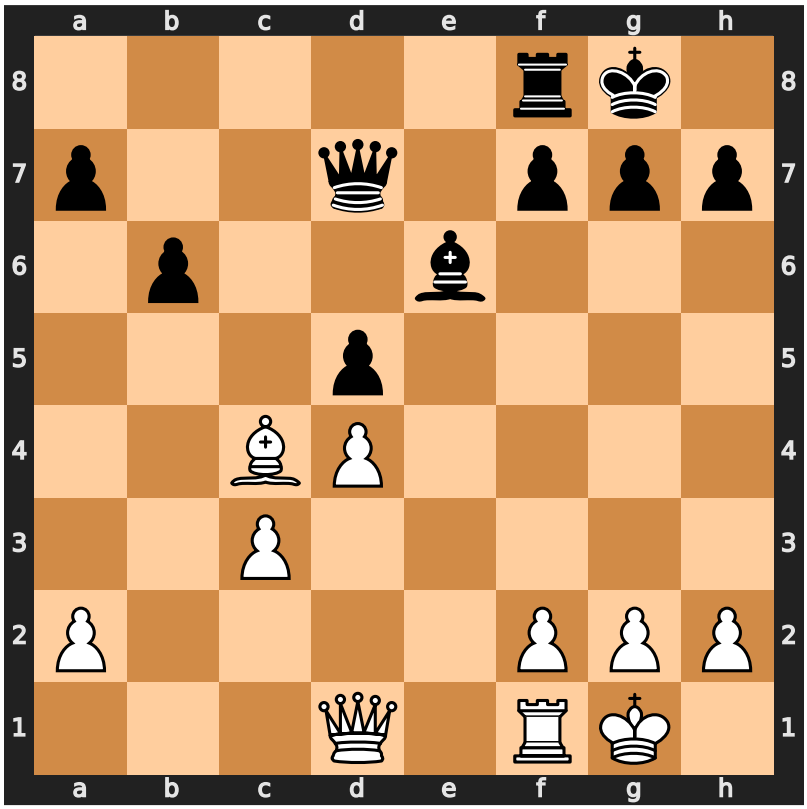

Figure 14.45: Chess Position

Task: Find the trade that wins a pawn. **Hint 1:** The bishops on c4 and e6 are facing each other. What if White plays Bxe6? **Hint 2:** After Bxe6 fxe6 (or Qxe6), Black's pawn structure changes. If fxe6, the d5 pawn is now undefended. **Hint 3:** After Bxe6 fxe6, White plays Qxd5! winning the d-pawn. The queen attacks d5 and e6 at the same time. **Solution: Play Bxe6! fxe6, then Qxd5!** White trades bishop for bishop (even), but then the d5 pawn is left unprotected. White picks it up with Qxd5, winning a pawn. **Why this works:** Trade the defender, then capture the target. The bishop on e6 was protecting d5. Remove the defender, then take the pawn.

Exercise 4.42 **Position:** White: King on g1, Rook on e1, Knight on d5, Pawns on a2, b2, f2, g2, h2. The knight is on a powerful outpost. Black: King on g8, Rook on e8, Bishop on f8, Pawns on a7, b7, c7, f7, g7, h7.

Task: Should White trade rooks with Rxe8? **Hint 1:** After Rxe8 Bxe8, White has Knight vs Bishop with equal pawns. **Hint 2:** The knight is on a dominant d5 outpost. The bishop on e8 (or f8) is passive. **Hint 3:** In the resulting endgame, White's knight dominates Black's bishop. The trade is good. **Solution: Yes, trade rooks with Rxe8!** After Rxe8 Bxe8, White's knight on d5 is far superior to Black's passive bishop. The resulting knight vs bishop endgame is clearly better for White. **Why this works:** Trade rooks when the resulting minor piece endgame favors you. White's dominating knight will win pawns in the endgame.

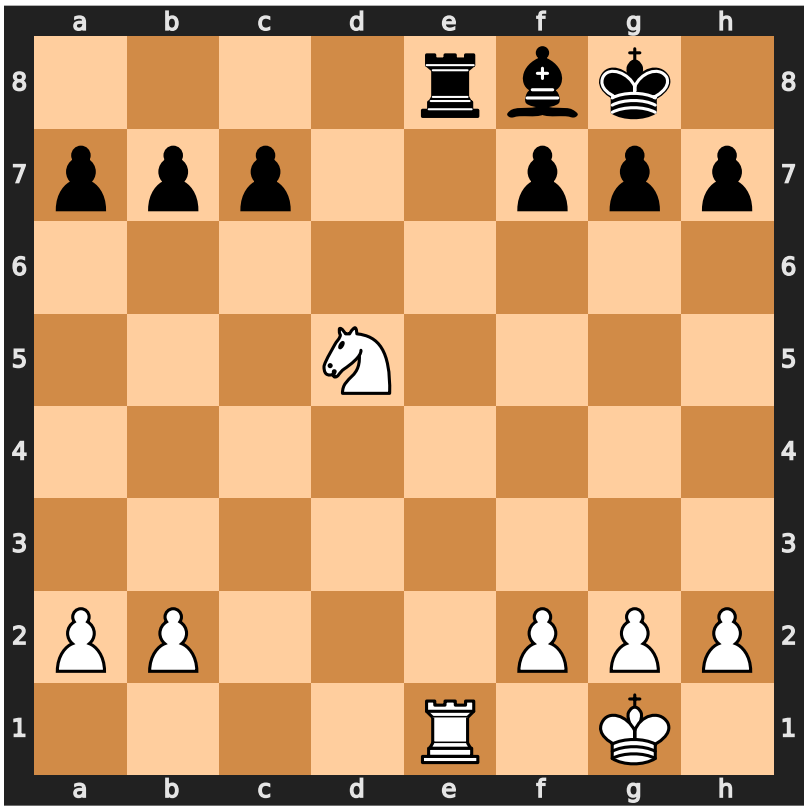

Figure 14.46: Chess Position

Exercise 4.43 **Position:** White: King on g1, Queen on f3, Rook on d1, Pawns on a2, b2, c3, e5, f2, g2, h2. Black: King on g8, Queen on c7, Rook on d8, Bishop on d5, Pawns on a7, b7, e6, f7, g7, h7. White can play Rxd5 exd5, Qxd5 forking the rook and winning material, but let us verify.

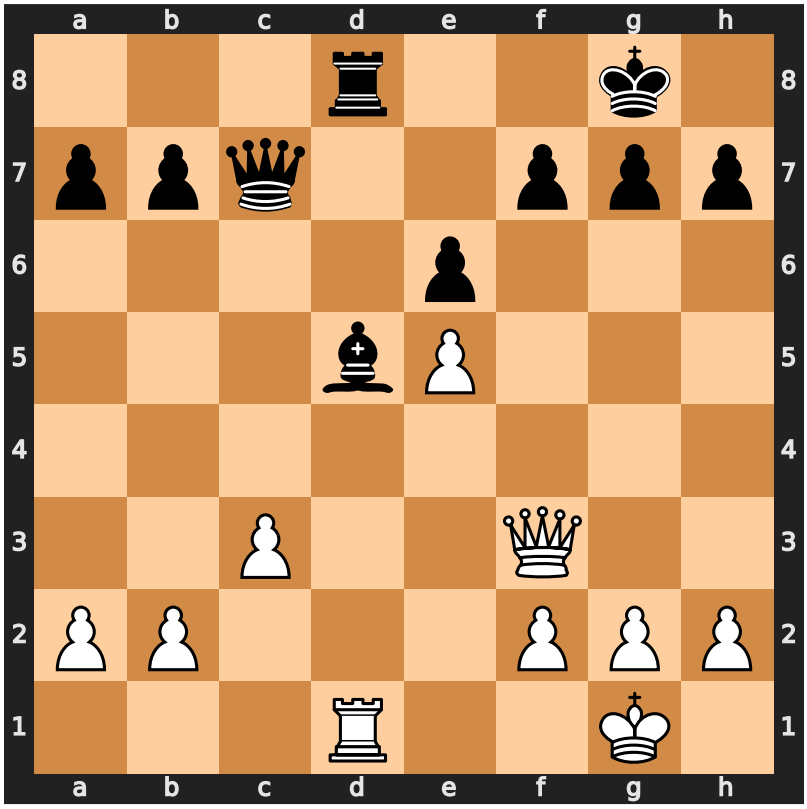

Figure 14.47: Chess Position

Task: Find the winning trade sequence. **Hint 1:** Black's bishop on d5 is blocking the d-file. What if White removes it? **Hint 2:** Rxd5! exd5, and now White's queen on f3 can attack the d5 pawn. Qxd5 captures. **Hint 3:** After Rxd5 exd5, Qxd5, White has won the exchange (gave up R for B, gaining 2 points) and also has a powerful queen on d5. **Solution: Play Rxd5! exd5, Qxd5, threatening Qxd8+.** After Rxd5 exd5, the queen captures on d5 with a powerful centralized position AND a direct threat against the rook on d8. Black must deal with the threat of Qxd8+. White ends up winning the rook or forcing a dominant position. **Why this works:** The tactic works because after removing the bishop defender, the queen on d5 attacks the d8 rook directly. White wins material through the sequence.

Exercise 4.44 **Position:** White: King on g1, Queen on d2, Rook on a1, Rook on f1, Bishop on g5, Pawns on a2, b2, c3, d4, f2, g2, h2. Black: King on g8, Queen on e7, Rook on a8, Rook on e8, Knight on f6, Knight on d5, Pawns on a7, b7, c6, e6, f7, g7, h7. White can play Bxf6, then Nxf6+ or Qxf6 or gxf6. Several recaptures.

Task: Find the best trade for White. **Hint 1:** Black has a powerful knight on d5 and a knight on f6. Which one is more dangerous? **Hint 2:** Bxf6 removes one knight. After Bxf6 Qxf6 (or Nxf6

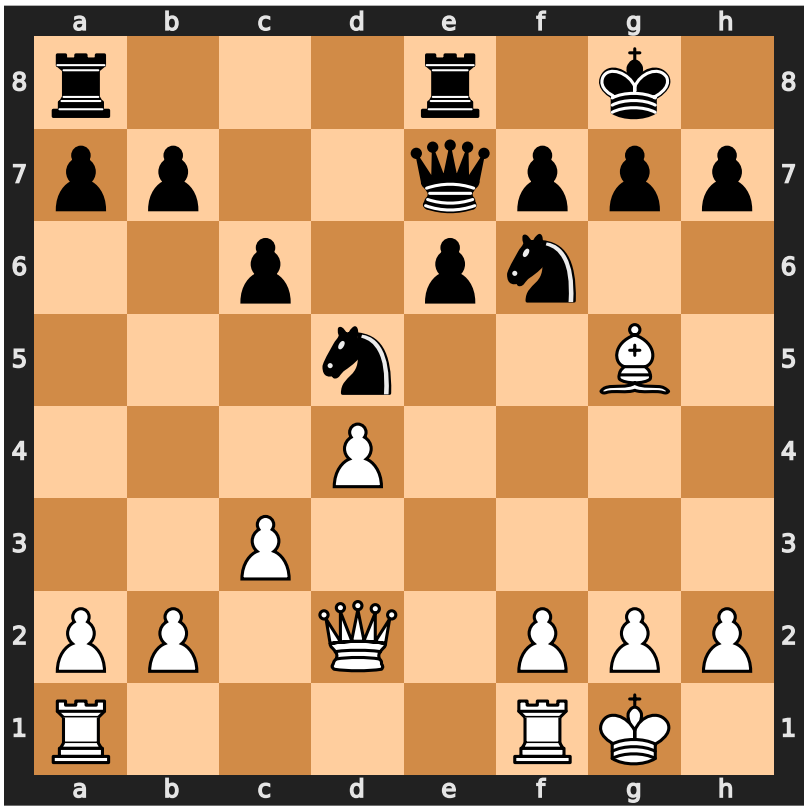

Figure 14.48: Chess Position

or gxf6), assess the result. **Hint 3:** After Bxf6 Nxf6 (keeping the queen active), White has traded the bishop for a knight. But the real target was to remove a defender of d5. Now White can play c4, pushing the other knight away. **Solution: Play Bxf6! followed by c4.** After Bxf6 Qxf6 (or Nxf6), White follows up with c4, challenging the knight on d5. The knight must retreat, giving White control of the center. The trade sequence removes a key defender and prepares to chase the other knight away. **Why this works:** Sometimes you trade one piece to attack another. Remove the f6 knight, then push c4 to dislodge the d5 knight. It is a two-step plan.

Exercise 4.45 **Position:** White: King on g1, Rook on d1, Rook on e1, Knight on d5, Pawns on a2, b2, c3, f2, g2, h2. Black: King on g8, Rook on d8, Rook on e8, Bishop on e6, Pawns on a7, b7, c6, f7, g7, h7. White's knight on d5 is powerful. Black can play Bxd5. Should White recapture with cxd5 or with Rxd5?

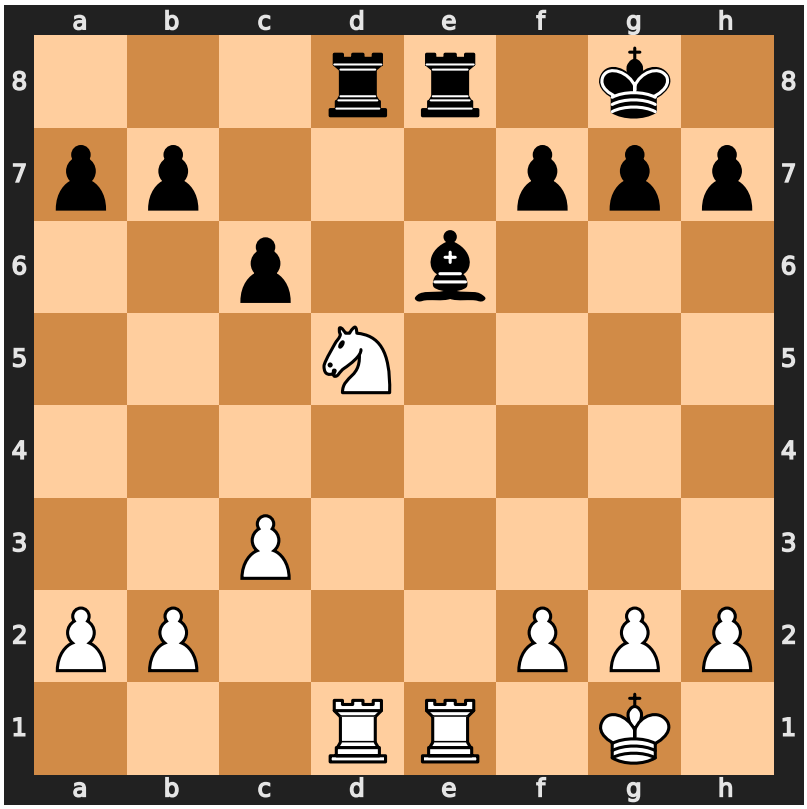

Figure 14.49: Chess Position

Task: After Black plays …Bxd5, which recapture is better for White: cxd5 or Rxd5? **Hint 1:** If cxd5, White gets a strong passed d-pawn on d5 but the c-file opens. **Hint 2:** If Rxd5 cxd5, the material is even (R+N vs R+B already, now White gets a pawn back). White keeps two rooks active on the d-file. **Hint 3:** Rxd5 is usually better because it keeps White's rooks active and maintains pressure down the d-file. After Rxd5 cxd5, both rooks control the open files. **Solution: Recapture with Rxd5.** After Rxd5 cxd5, White's remaining rook on e1 is active, and the d-file rook on d5 puts pressure on Black. Taking with the pawn (cxd5) blocks White's own rook on d1. Keep the files open for your rooks. **Why this works:** Recaptures matter. Rxd5 keeps the rooks active. cxd5 blocks the rook. Active rooks are almost always worth more than an extra center

pawn.

14.9.5 Section E: Sacrifice or Blunder? (Exercises 4.46–4.50)

For each position, one side gives up material. Decide whether it is a brilliant sacrifice (with a real purpose) or a blunder (giving up material for nothing).

Exercise 4.46 **Position:** White: King on g1, Queen on d1, Rook on e1, Knight on f3, Pawns on a2, b2, c2, d4, f2, g2, h2. Black: King on e8, Queen on d8, Rook on a8, Bishop on c8, Knight on c6, Pawns on a7, b7, d5, e4, f7, g7, h7. White plays Nxe4. Is this a blunder?

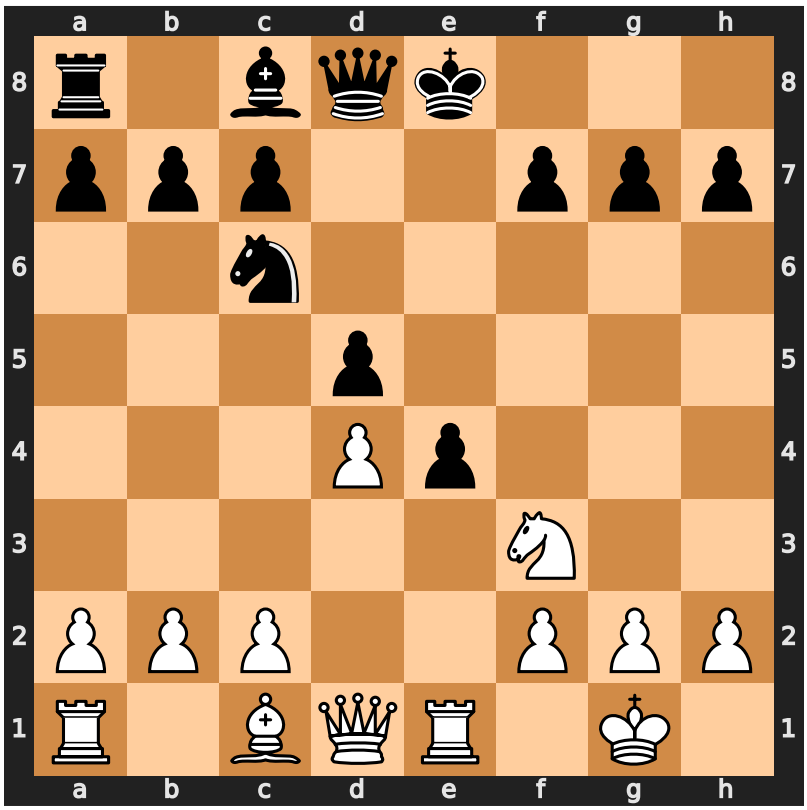

Figure 14.50: Chess Position

Task: White plays Nxe4, capturing a pawn with the knight. Is this a sacrifice, a blunder, or just a normal capture? **Hint 1:** The knight was on f3, and it captures the e4 pawn. White wins a pawn (1 point) for free. **Hint 2:** After Nxe4, is the knight safe? Can Black capture it? Black could play dxe4, and then what? **Hint 3:** After Nxe4 dxe4, White captured a pawn (1 point) but lost the knight (3 points). Net result: White loses 2 points of material for nothing. **Solution: Blunder!** After Nxe4?? dxe4, White has lost a knight (3 points) and only won a pawn (1 point). Net loss: 2 points. The knight moved to a square where it could be captured immediately. That is a blunder, not a sacrifice, because White gets nothing in return except a single pawn. **Why this works:** A real sacrifice gets something back (an attack, checkmate, a better position). This move gets nothing. It just loses a piece.

Exercise 4.47 **Position:** White: King on g1, Queen on h5, Rook on f1, Bishop on c4, Knight on g5, Pawns on c2, d4, e5, f2, g2, h2. Black: King on g8, Queen on e7, Rook on f8, Bishop on c8, Knight on d7, Pawns on a7, b7, d5, f7, g7, h6. White plays Nxf7! Rxf7, Bxd5.

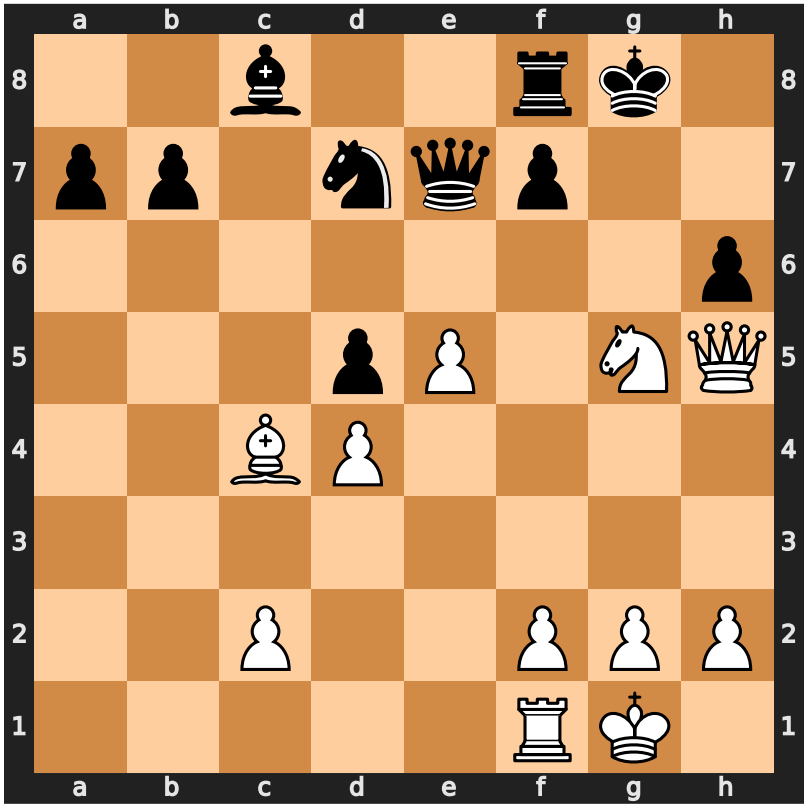

Figure 14.51: Chess Position

Task: White plays Nxf7. Sacrifice or blunder? **Hint 1:** After Nxf7 Rxf7, White has given up a knight (3) for a pawn (1). Down 2 points. But… **Hint 2:** After Nxf7 Rxf7, White plays Bxd5! attacking the rook on f7. The rook must move, and White has B(3) capturing P(d5=1). But the bishop on d5 also forks the rook on f7 and targets b7. **Hint 3:** After Nxf7 Rxf7, Bxd5, the bishop attacks the rook. Black plays Rf8, and White has won two pawns (f7 and d5) for a knight. But more importantly, the queen on h5 combined with the bishop creates a strong attack on the open kingside. **Solution: Sacrifice!** White gives up a knight (3 points) but wins two pawns (2 points) and opens up Black's king. The queen on h5 and bishop on d5 create powerful threats against g8. The knight was worth 3 points, but the attack White gets is worth far more. **Why this works:** A sacrifice that opens the king AND wins material back is a great deal. White gets two pawns plus a strong attack for one knight. That is a real sacrifice with real compensation.

Exercise 4.48 **Position:** White: King on g1, Queen on d1, Rook on e1, Bishop on g5, Knight on f3, Pawns on a2, b2, c2, d4, f2, g2, h2. Black: King on g8, Queen on d8, Rook on f8, Bishop on c8, Knight on f6, Pawns on a7, b7, c7, d5, e4, f7, g7, h6. Black plays …hxg5?? (capturing the bishop with the h-pawn).

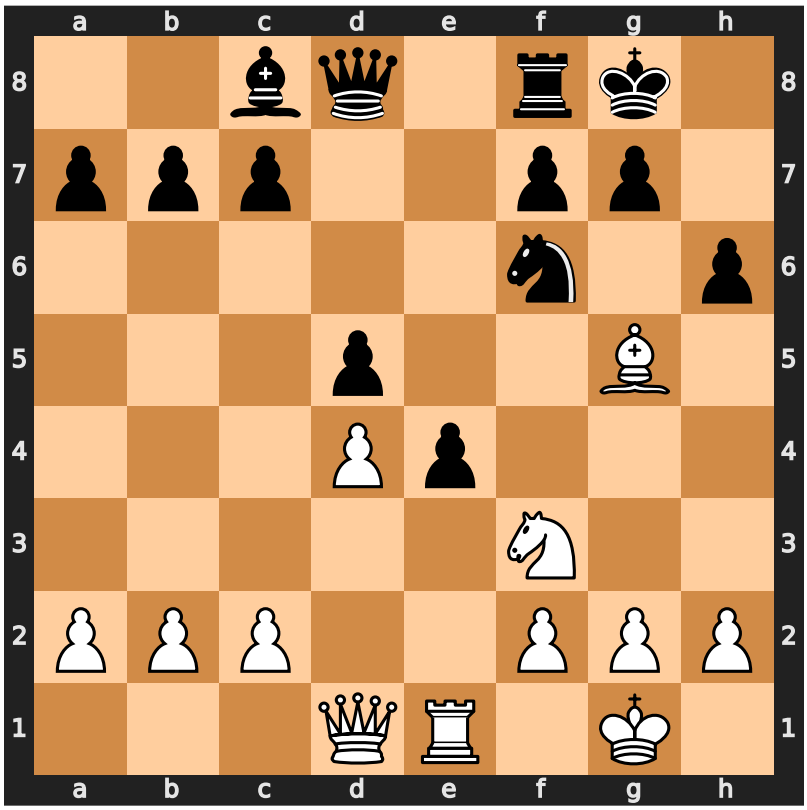

Figure 14.52: Chess Position

Task: Black plays …hxg5. Is this a blunder? **Hint 1:** Black captures the bishop on g5 with hxg5. Black wins a bishop (3 points). **Hint 2:** But what happens after hxg5? Is there a reply that hurts Black? **Hint 3:** After …hxg5??, White plays Nxg5! Now the knight on g5 threatens f7, and Black's king is exposed with the h-file open. White has Qh5 coming with threats of Qh7 checkmate. **Solution: Blunder by Black!** After hxg5?? Nxg5!, White's knight jumps into the attack. White threatens Qh5, then Qh7+ or Qxf7+. The open h-file and the knight on g5 create a devastating attack. Black won a bishop (3 points) but opened the floodgates to a mating attack. The "free" bishop was a trap. **Why this works:** Not every capture is a good idea. Taking the bishop opened the h-file and let White's knight into the attack. Black should have left the bishop on g5 and played a developing move instead.

Exercise 4.49 **Position:** White: King on g1, Queen on d1, Rook on a1, Rook on f1, Bishop on d3, Bishop on c1, Knight on f3, Pawns on a2, b2, c2, d4, f2, g2, h2. Black: King on g8, Queen on d8, Rook on a8, Rook on f8, Bishop on e7, Bishop on c8, Knight on f6, Pawns on a7, b7, c7, d5, e6, g7, h7. White plays Bxh7+! Kxh7, Ng5+ Kg8, Qh5.

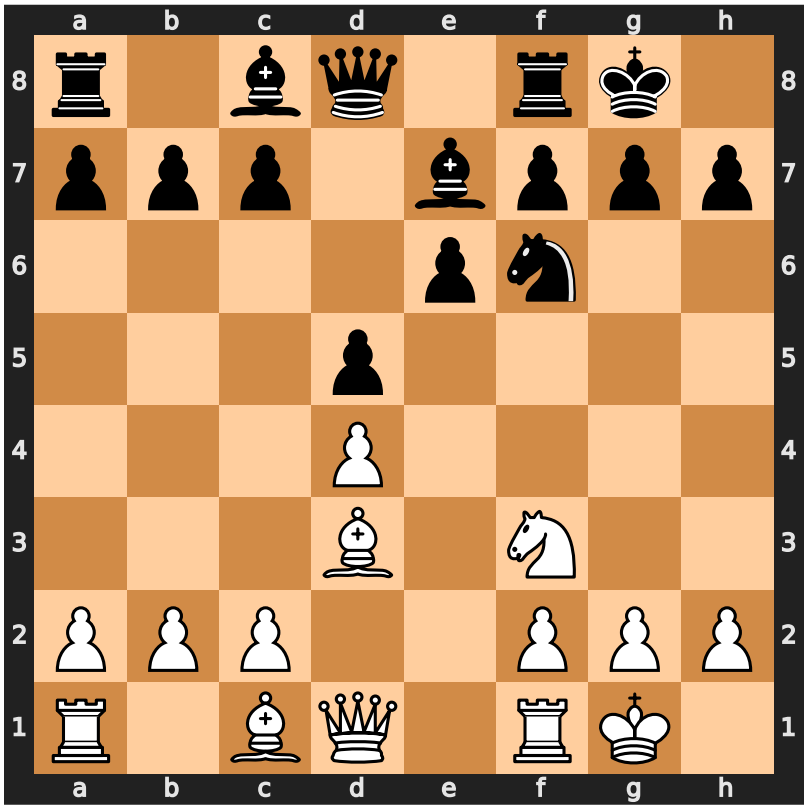

Figure 14.53: Chess Position

Task: White plays Bxh7+. This is the famous "Greek Gift" sacrifice. Is it a real sacrifice? **Hint 1:** After Bxh7+ Kxh7, Ng5+ Kg8 (or Kg6), Qh5. White has given up a bishop (3) for a pawn (1). Down 2 points. **Hint 2:** But after Ng5+ Kg8, Qh5, White threatens Qh7 checkmate. Black must deal with this. **Hint 3:** If Kg8 then Qh5 threatens Qh7#. Black plays Re8. White plays Qxf7+ Kh8, Qh5+ Kg8, Qh7+ Kf8, Qh8#. Checkmate! Or Black can try other defenses, but the attack is overwhelming. **Solution: Brilliant sacrifice!** The "Greek Gift" (Bxh7+ followed by

Ng5+ and Qh5) is one of the most famous sacrifice patterns in chess. White gives up a bishop (3 points) for a pawn (1 point), but the resulting attack against the exposed king is worth far more. In most versions of this pattern, White either forces checkmate or wins back the material with interest. **Why this works:** A sacrifice that leads to checkmate is the ultimate justification. Material means nothing if the king is trapped. This pattern appears in thousands of games, and you should learn to recognize it.

Exercise 4.50 **Position:** White: King on e1, Queen on d1, Rook on a1, Rook on h1, Bishop on f1, Knight on b1, Pawns on a2, b2, c2, d4, e4, f2, g2, h2. Black: King on g8, Queen on d8, Rook on a8, Rook on f8, Bishop on c5, Knight on f6, Pawns on a7, b7, c7, d6, f7, g7, h7. White has not castled. Black plays …Bxd4. Is this a sacrifice, blunder, or normal capture?

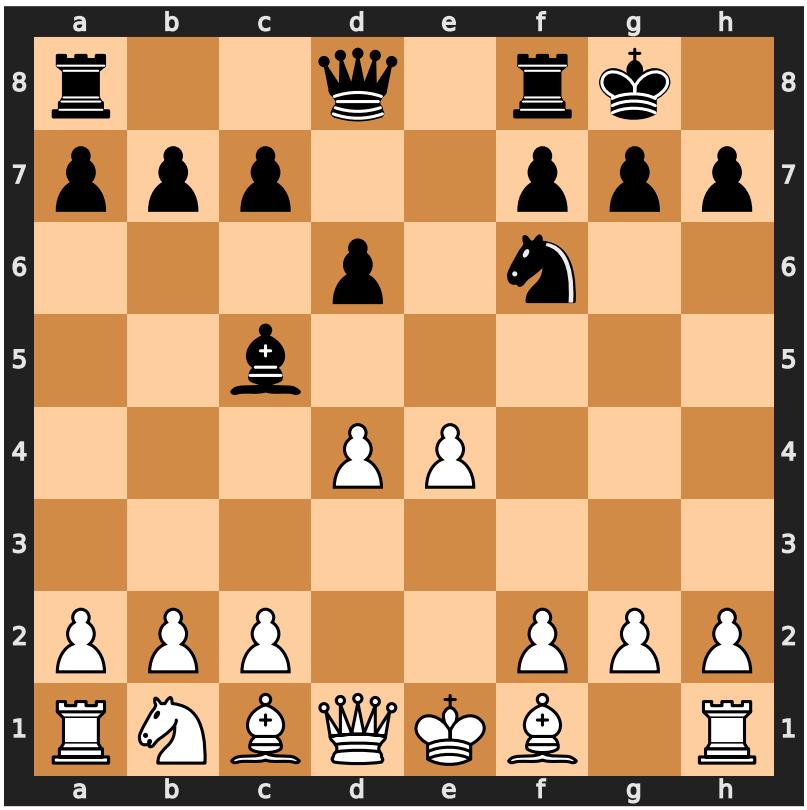

Figure 14.54: Chess Position

Task: Black plays …Bxd4, capturing White's d4 pawn with the bishop. Evaluate this move. **Hint 1:** After Bxd4, Black's bishop captures a pawn (1 point). But the bishop is now on d4, in the center. Can White capture it? **Hint 2:** White can play Qxd4, and then Black has traded B(3) for P(1). Net: Black lost 2 points. That is terrible. **Hint 3:** After Bxd4 Qxd4, Black can play Nxe4, attacking the queen while also winning a pawn. The queen must move, and Black has captured two center pawns (d4 and e4) for a bishop. That is roughly even: B(3) for 2P(2), with a knight attacking from e4. **Solution: This is a normal tactical sequence, not a sacrifice or blunder.** After Bxd4 Qxd4 Nxe4, Black has traded a bishop for two central pawns (B=3, two pawns=2). Black is down 1 point in material, but the open center and lead in development may compensate. This is a common positional pawn grab. It is not a brilliant sacrifice, and it is not

a blunder. It is a calculated trade with positional compensation. **Why this works:** Not every material decision is clearly "sacrifice" or "blunder." Some trades give up material for positional compensation. Recognizing these "gray area" decisions is part of getting stronger at chess.

All 50 exercises complete! Outstanding work. That is a serious accomplishment. You have practiced counting material, evaluating trades, comparing piece values, finding winning trades, and identifying sacrifices. Take a long break. You earned it.

14.10 Key Takeaways

1. **The point system (P=1, N=3, B=3, R=5, Q=9, K=infinite) is your starting guide for every trade.** It is not perfect, but it is right most of the time.
2. **The bishop pair is worth about 0.5 extra points.** Two bishops together control all 64 squares and are especially strong in open positions.
3. **Piece values change with position.** Knights love closed positions, bishops love open positions, rooks need open files, and a rook on the seventh rank is worth an extra pawn.
4. **When ahead in material, trade pieces (not pawns).** When behind, avoid trades and keep it complicated. This is the single most important trading rule.
5. **Trade your bad pieces for your opponent's good pieces, and never the other way around.** Remove their star player, keep yours.
6. **Counting material fast is about cancellation, not addition.** Match pieces one-to-one, and only count the leftovers.
7. **Sacrifices are NOT blunders when they come with a plan.** A sacrifice for checkmate, a strong attack, or a winning position is the highest art in chess.

14.11 Practice Assignment

Complete these tasks with a real board, on a chess website, or with a chess app:

1. **Material counting speed drill.** Go to Lichess.org or Chess.com and watch three games in the "Live" section. Pause at random points and count the material in less than 10 seconds. Practice the cancellation method until it feels automatic.
2. **Bishop pair challenge.** Play three games (against a computer on an easy setting) where you try to keep your bishop pair for as long as possible. Notice how the two bishops work together in open positions.
3. **Trading practice.** Play five games where you focus on the trading rules. Before every trade, ask yourself the six questions from the Trading Checklist. After each game, review: did you trade at the right moments?

4. **Find the sacrifice.** Play through 10 games on a database (Lichess game explorer or the Chessgames.com archives). In each game, look for a moment where one player sacrificed material. Was it a real sacrifice or a blunder? What did the sacrificing player get in return?

14.12 Progress Check

Answer these questions honestly:

- ☐ Can you list the point value of every piece from memory?
- ☐ Can you explain why the bishop pair is worth extra and when it is NOT an advantage?
- ☐ Can you give an example of when a knight is better than a bishop, and vice versa?
- ☐ Can you explain the difference between "winning the exchange" and "losing the exchange"?
- ☐ Do you know when to trade (ahead in material) and when to avoid trading (behind in material)?
- ☐ Can you count the material in a position within 10 seconds using the cancellation method?
- ☐ Can you explain the difference between a sacrifice and a blunder?

If you checked five or more boxes, you are ready for Chapter 5. If not, go back and review the sections that feel weak. Spend extra time on the exercises that challenged you. There is no penalty for reviewing. Every grandmaster has read the same material dozens of times.

End of Chapter 4. You now understand how much each piece is worth, when to trade, and when giving up material on purpose can be the best move in chess. That is a huge step forward. Take a break. Go for a walk. Let the ideas sink in. When you are ready, Chapter 5 will teach you how to deliver checkmate with just a king and queen, a king and rook, and more. The real endgame begins.

Chapter 15

Chapter 5: Basic Checkmates: K+Q, K+R, K+2B, K+B+N

Volume I: Foundations | Rating Range: Beginner (300–700)

> *"The hardest game to win is a won game."* – Emanuel Lasker, Second World Chess Champion

---

15.1 What You'll Learn

- How to checkmate with King and Queen against a lone King
- How to checkmate with King and Rook against a lone King
- How to checkmate with King and Two Bishops against a lone King
- How to checkmate with King, Bishop, and Knight against a lone King
- How to avoid accidental stalemate when you have an overwhelming advantage
- The step-by-step technique for each checkmate, practiced until it becomes automatic

---

15.2 Why Learn Basic Checkmates?

You can win all the material in the world, but if you cannot deliver checkmate, the game is a draw.

That sentence is worth reading twice. Imagine playing a brilliant game. You sacrifice pieces, find clever tactics, and win your opponent's queen. You are up a full queen with nothing but kings left on the board. The game should be over. But then you spend thirty moves chasing the enemy king around the board, never quite trapping it. The clock runs out. Or worse, you accidentally stalemate your opponent and the game is drawn. All that beautiful play, wasted.

This happens. It happens to beginners every single day. And it is completely preventable.

Basic checkmates are the finishing moves of chess. Think of them like a martial artist's takedowns. You can know every punch, every kick, every block in the book. But if you cannot finish the fight

when you have your opponent pinned, none of it matters. These techniques are the chess equivalent of learning to finish what you started.

There are four basic checkmates that every chess player must learn:

1. **King + Queen vs. King** (the easiest)
2. **King + Rook vs. King** (a bit harder)
3. **King + Two Bishops vs. King** (requires coordination)
4. **King + Bishop + Knight vs. King** (the hardest)

With practice, each one becomes automatic. You will not need to calculate during a game. Your hands will know what to do, just like tying your shoes. But you have to put in the practice first.

If you need to practice each technique 100 times before it clicks, that is completely normal. Every grandmaster alive today sat down and drilled these patterns until they could execute them without thinking. You are building the same foundation they built. Take your time. Be patient with yourself.

Let us begin with the easiest one.

15.3 Part 1: King + Queen vs. King

15.3.1 The Easiest Basic Checkmate

The queen is the most powerful piece on the board. She moves in any direction, as far as she wants, combining the power of a rook and a bishop in one piece. With that much firepower, checkmating a lone king should be straightforward. And it is, as long as you follow the technique and watch out for one dangerous trap: stalemate.

Here is the goal: push the enemy king to the edge of the board and then deliver checkmate on that edge. The queen alone cannot do it. You need your own king to help. The queen restricts the enemy king's movement, and your king walks over to assist with the final blow.

15.3.2 The Box Method

The best way to think about this checkmate is the "box method." Imagine drawing a box around the enemy king on the board. The queen creates the walls of this box. Each move, you shrink the box. The enemy king has less and less room to move. Eventually the box is so small that the king is trapped on the edge, and you deliver checkmate.

Here is the step-by-step technique:

Step 1: Use the queen to restrict the enemy king to a smaller area. Place your queen in the center of the board. From the center, the queen controls more squares than from anywhere else. The enemy king is now trapped in a smaller section of the board.

Step 2: Shrink the box. Move your queen to push the enemy king toward an edge. Each queen move should reduce the number of squares available to the king. Do not chase the king wildly. Instead, cut off its escape routes calmly and methodically.

Step 3: Bring your own king closer. Once the enemy king is restricted to a small area, start marching your king toward it. Your king needs to support the queen for the final checkmate.

Step 4: Push the enemy king to the edge. Use your queen and king together to force the enemy king all the way to the edge of the board. Any edge will do: rank 1, rank 8, the a-file, or the h-file.

Step 5: Deliver checkmate on the edge. With the enemy king on the edge and your king nearby, your queen delivers the final blow.

15.3.3 STALEMATE WARNING

This is the number one mistake beginners make with King + Queen vs. King. You get so focused on chasing the enemy king that you accidentally leave it with **no legal moves** while it is **not in check.** That is stalemate, and stalemate is a draw. You just threw away a winning game.

The rule to remember: **always leave the enemy king at least one escape square until you are ready to deliver checkmate.** Do not suffocate the king with your queen unless you are delivering checkmate on that exact move.

A common stalemate trap:

Set up your board: White King on f6, White Queen on f7, Black King on h8.

```
8  . . . . . . . k
7  . . . . . Q . .
6  . . . . . K . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

It is Black's turn. The Black king on h8 has three adjacent squares: g8, g7, and h7. Every single one is controlled: - **g8:** controlled by the queen (diagonal f7-g8) - **h7:** controlled by the queen (along rank 7, f7-g7-h7) - **g7:** controlled by the queen (rank 7) and the king (adjacent f6-g7)

The king has no legal moves. But it is not in check. That is **stalemate.** The game is drawn.

To avoid this, White should have placed the queen somewhere that leaves the king at least one square to step to, and THEN set up the final checkmate.

15.3.4 Complete Walkthrough

Set up your board: White King on e1, White Queen on d1, Black King on e8.

1. Qd5 – The queen centralizes. From d5, she controls the d-file, the 5th rank, and two long diagonals. The Black king cannot cross below rank 5.

1...Kf8 – The king retreats toward the kingside.

2. Kd2 – White brings the king forward. No rush. The queen has the restriction handled.

2...Ke8 – Black returns to e8.

3. Kd3 – The king continues its march.

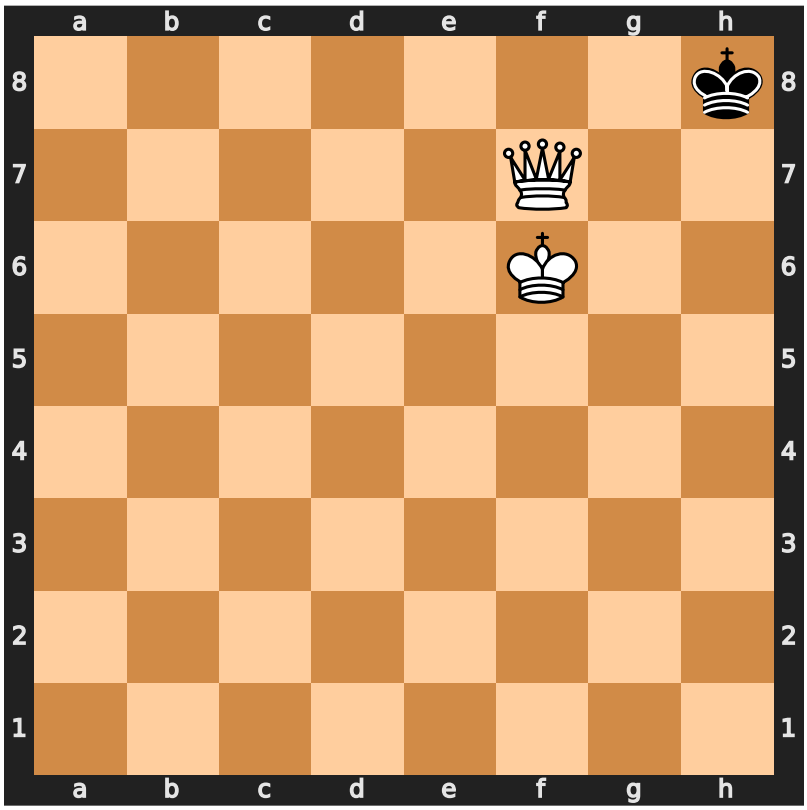

Figure 15.1: Chess Position

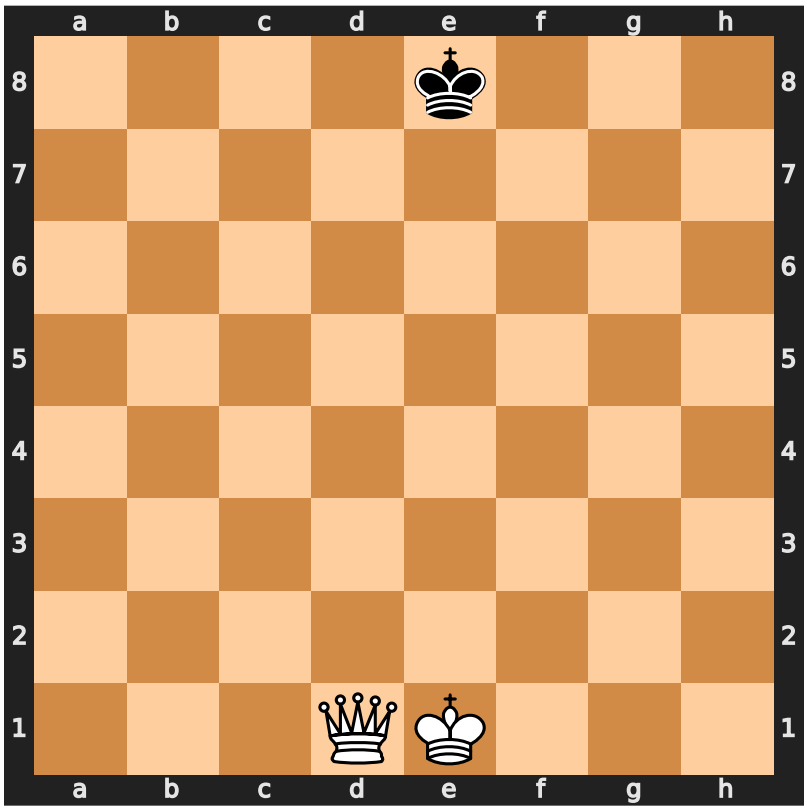

Figure 15.2: Chess Position

3...Kf8 – Black shuffles.

4. Ke4 – The king reaches the 4th rank.

4...Ke8 – Black shuffles again.

5. Ke5 – The king arrives on the 5th rank, working alongside the queen.

5...Kf8 – Black goes to f8.

6. Qd7 – The queen seizes the 7th rank. The Black king is now trapped on the 8th rank alone. The box is one rank tall.

6...Kg8 – The only option. f7, e7, and e8 are all controlled by the queen.

7. Ke6 – The king advances to e6, closing in.

7...Kf8 – If 7…Kh8, then 8. Kf6 followed by 9. Qg7 checkmate.

8. Qe7 – A patient, careful move. The queen controls e8 and f8, while leaving g8 open so there is no stalemate.

8...Kg8 – Forced. The only legal square.

9. Kf6 – Everything is in place.

9...Kh8 – The only legal move. g8 is controlled by the queen (diagonal), g7 and h7 are controlled by the queen (rank 7) and the king (adjacent).

10. Qg7 checkmate

```
8  . . . . . . . k
7  . . . . . . Q .
6  . . . . . K . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

Checkmate! The queen checks the king diagonally (g7-h8). g8 is controlled by the queen along the g-file. h7 is controlled by the queen along rank 7. The king cannot capture the queen because she is protected by the king on f6. Game over in ten moves.

15.3.5 Key Points for K+Q vs. K

- **Centralize your queen first.** The center gives maximum control.
- **Do not chase the king.** Restrict it. Cut off escape routes.
- **Bring your king forward.** The queen needs the king's help.
- **Watch for stalemate.** Always leave at least one legal move until you deliver the finishing blow.
- **Practice this 20 times.** Then practice it 20 more times.

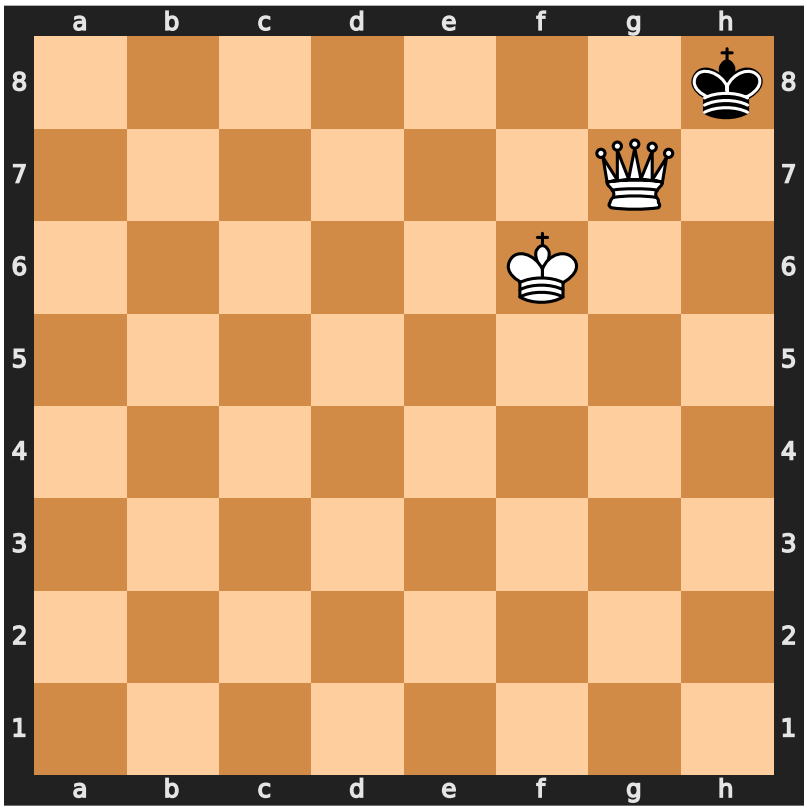

Figure 15.3: Chess Position

Good stopping point. You have learned the easiest basic checkmate. Practice it on your board several times before moving on. Come back fresh when you are ready for the rook.

15.4 Part 2: King + Rook vs. King

15.4.1 A Step Up in Difficulty

The rook is a powerful piece, but it is not a queen. It controls ranks and files but cannot move diagonally. That single limitation makes this checkmate harder than K+Q vs. K. You need more patience, more precision, and a slightly different technique.

The good news: stalemate is much harder to achieve accidentally with a rook, so you can focus on the technique.

The goal is the same: push the enemy king to the edge and deliver checkmate there.

15.4.2 The Staircase Technique

The best method is called the "staircase" or "ladder." Your rook cuts off the enemy king along a rank. Then you use your king to gain "opposition." Once you have opposition, the enemy king is forced to retreat. Then your rook cuts off the next rank. Step by step, like walking down a staircase, the king is pushed to the edge.

Step 1: Cut off the enemy king along a rank or file using the rook.

Step 2: Bring your own king toward the enemy king and get opposition (kings on the same file, one empty square between them).

Step 3: When you have opposition and it is the enemy king's turn, it must step sideways.

Step 4: After the king steps sideways, use the rook to check and cut off the next rank. This is one "step" of the staircase.

Step 5: Repeat until the king is on the edge.

Step 6: Deliver checkmate on the edge with the rook while your king covers the escape squares.

15.4.3 Understanding Opposition

Two kings are "in opposition" when they stand on the same file with exactly one empty square between them. The side that must move first is at a disadvantage, because they must step sideways and give up the file.

Set up your board: White King on e4, Black King on e6.

The kings face each other on the e-file with e5 between them. Neither can advance. Whoever moves first must step sideways.

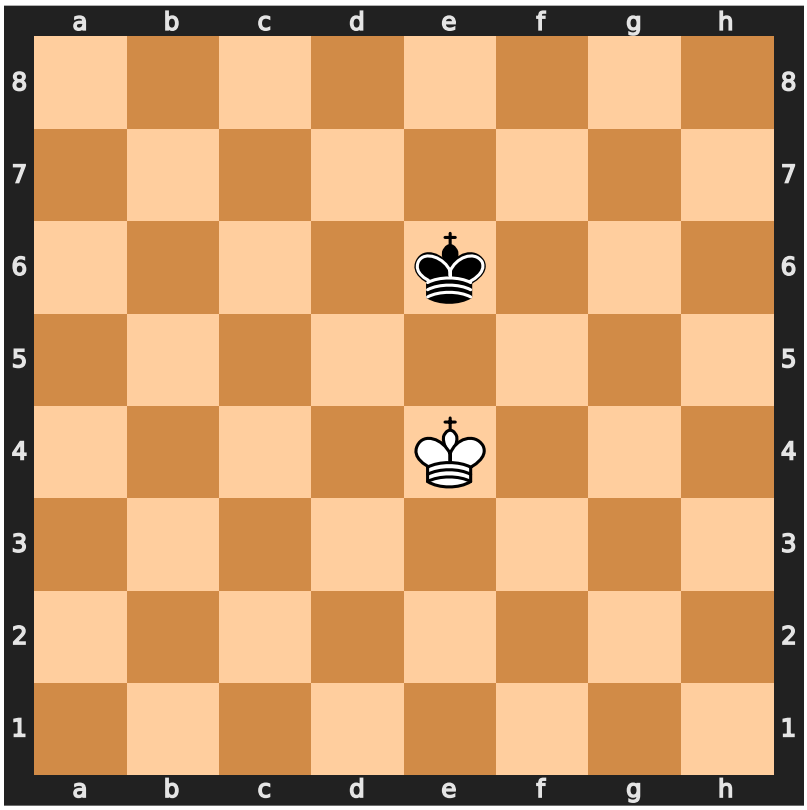

Figure 15.4: Chess Position

In K+R vs. K, you want opposition when it is the enemy king's turn to move. That forces the king sideways, and then your rook seals off the next rank.

15.4.4 Complete Walkthrough

Set up your board: White King on d5, White Rook on a1, Black King on d7.

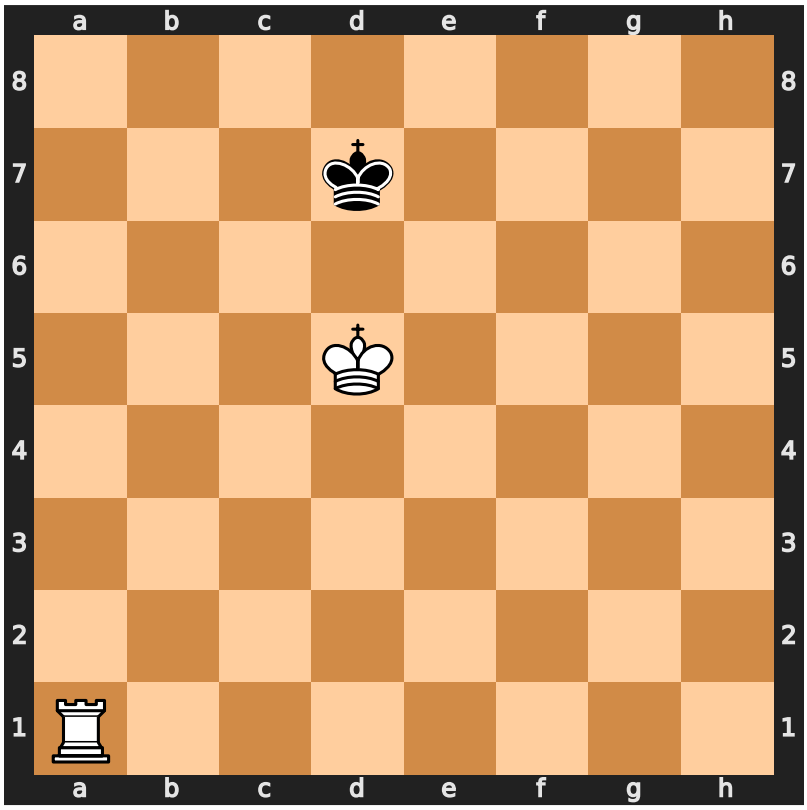

Figure 15.5: Chess Position

The kings are in opposition on the d-file. Time for the staircase.

1. Ra7+ – The rook checks along the 7th rank. The king must leave rank 7.

1...Ke8 – Retreats to rank 8. The rook now prevents the king from crossing below rank 7.

2. Kd6 – The king follows.

2...Kf8 – Steps sideways on the back rank.

3. Ke6 – The king advances, controlling d7, e7, and f7.

3...Kg8 – The only free square. f7 and g7 are blocked.

4. Kf6 – Following the king. Controls e7, f7, g7.

4...Kh8 – Pushed to the corner. The only free square.

5. Kg6 – Controls f7, g7, and h7.

5...Kg8 – The only legal move (h7 and g7 are controlled by the king).

6. Ra8 checkmate

```
8  R . . . . . k .
7  . . . . . . . .
6  . . . . . . K .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

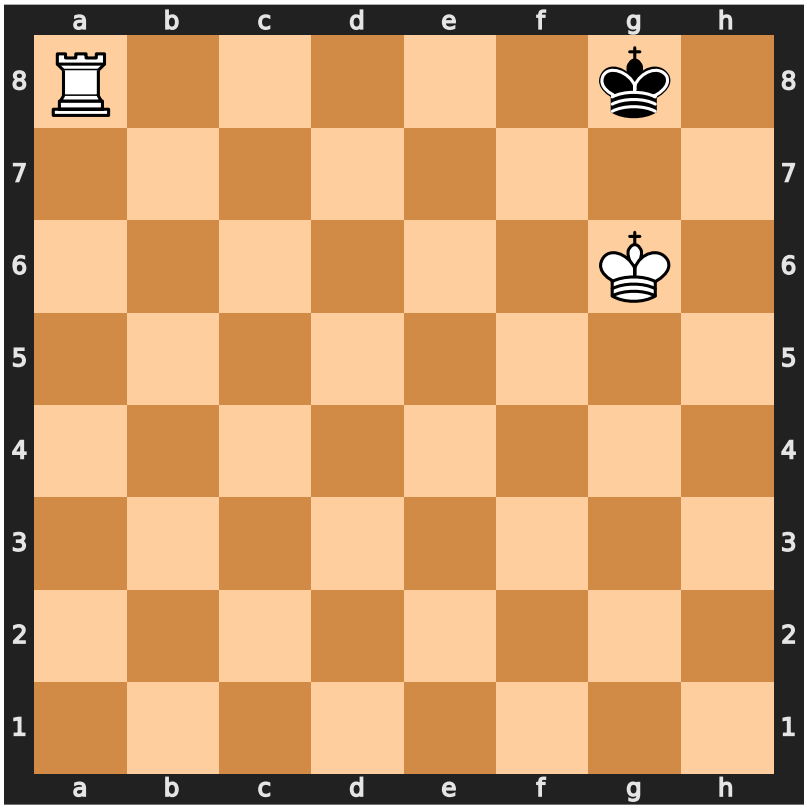

Figure 15.6: Chess Position

Checkmate! The rook checks along the 8th rank. f8 and h8 are covered by the rook. f7, g7, and h7 are covered by the king on g6. Every escape is sealed.

15.4.5 Starting from Scratch

From the full starting position (Ke1, Ra1, Ke8), the process takes roughly 15 to 20 moves. The outline:

1. Move your rook to a central rank to cut off the enemy king.
2. March your king toward the center and toward the enemy king.
3. Whenever the enemy king steps onto the same rank as your rook, check it and push it back.
4. Re-establish opposition, then use the rook to cut off the next rank.

5. Repeat until the king is on the 8th rank.
6. Deliver checkmate on the edge.

Tip: When the enemy king approaches your rook to attack it, slide the rook to the other side of the board. It still controls the same rank from over there.

15.4.6 Common Mistakes

Mistake 1: Chasing the king with the rook. The rook creates walls. The king does the pushing.

Mistake 2: Forgetting to bring the king forward. You cannot checkmate with a rook and a distant king.

Mistake 3: Panicking when the king approaches the rook. Just slide the rook to the other side.

Mistake 4: Losing patience. This checkmate takes more moves than K+Q. That is normal.

The King + Rook checkmate is a real achievement. If you can do it consistently, you are ahead of many casual players. Rest here.

15.5 Part 3: King + Two Bishops vs. King

15.5.1 Coordination Is the Key

This checkmate requires your two bishops to work as a team. Each bishop controls only one color of squares. One lives on light squares forever. The other lives on dark squares forever. Neither can cover the whole board alone.

But together, they form a wall. The two bishops working in tandem control both colors, creating a diagonal barrier the enemy king cannot cross.

15.5.2 Why Two Bishops Can Checkmate

A single bishop can never cover squares of the other color. The enemy king can simply stand on a square the bishop cannot reach. But with two bishops on opposite colors, every square is threatened. They form a complete diagonal barrier.

The key insight: **the two bishops create a diagonal "wall" that pushes the enemy king toward a corner.** Your king helps seal off the escape, and checkmate is delivered in the corner.

15.5.3 Step-by-Step Technique

Step 1: Centralize both bishops. Place them on adjacent diagonals near the center. Together they create a barrier that cuts the board in half.

Step 2: Use the bishops to drive the king toward a corner. Advance the barrier step by step. The king tries to stay central, but the wall forces it back.

Step 3: Bring your king into the attack. Your king helps seal off squares the bishops cannot reach from their current positions.

Step 4: Deliver checkmate in the corner. One bishop gives check on the long diagonal. The other bishop and the king control the remaining escape squares.

15.5.4 The Diagonal Barrier

The strongest formation for the two bishops is side by side on adjacent diagonals: for example, bishops on d4 and e4, or c5 and d5. In this formation, they create overlapping zones of control that the enemy king cannot penetrate. Think of them as a pair of scissors closing in.

When you advance one bishop, advance the other to maintain the formation. Keep them working as a pair.

15.5.5 The Checkmate Position

Set up your board: White King on b6, White Bishop on c6 (light squares), White Bishop on d6 (dark squares), Black King on a8.

```
8  k . . . . . . .
7  . . . . . . . .
6  . K B B . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . . . . . . . .
2  . . . . . . . .
1  . . . . . . . .
   a b c d e f g h
```

Checkmate! The light-squared bishop on c6 checks along the diagonal (c6-b7-a8). The escape squares: - **a7:** controlled by the king on b6 (adjacent) - **b7:** controlled by the bishop on c6 (diagonal) and the king (adjacent) - **b8:** controlled by the bishop on d6 (diagonal d6-c7-b8)

The king cannot capture the checking bishop on c6 because it is two squares away. Every escape is sealed.

Notice how each piece contributes: the light-squared bishop delivers the check, the dark-squared bishop covers the dark-squared escape (b8), and the king covers a7 and b7. Beautiful coordination.

15.5.6 How You Get There

The full K+2B vs. K checkmate takes about 18 to 20 moves from a random position. There are three phases:

Phase 1: Centralize. Move both bishops toward the center and bring your king forward.

Phase 2: Push the king to the edge. Advance the diagonal wall step by step.

Phase 3: Push the king to the corner and checkmate. The final checkmate always happens in the corner.

Practice this on your board. Set up random positions and try to push the king to the corner using the diagonal barrier. It takes patience, but the technique will click with repetition.

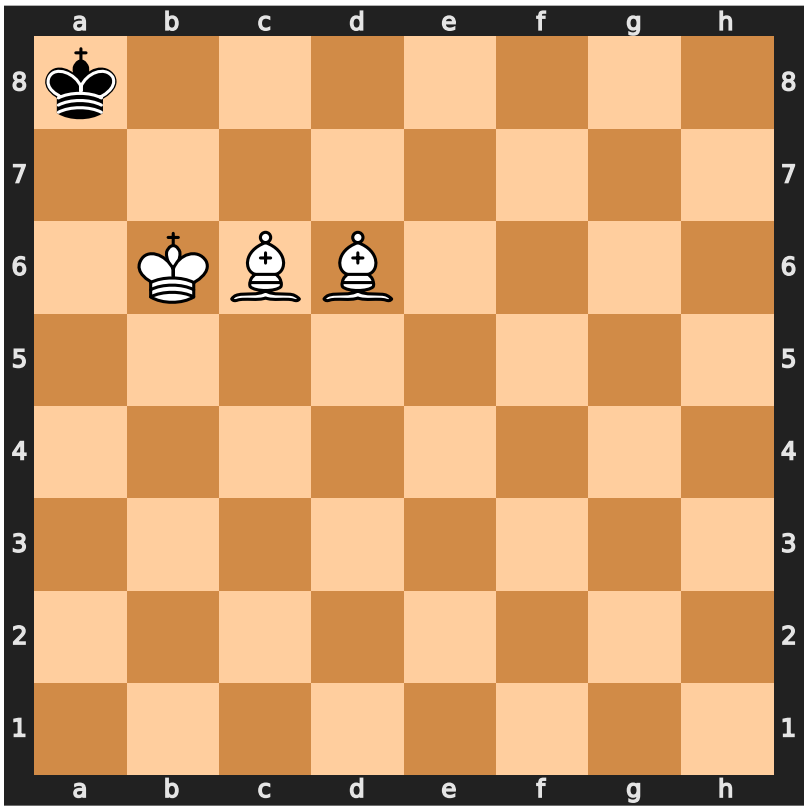

Figure 15.7: Chess Position

You have learned the concept behind the two-bishop checkmate. This is harder than the queen or rook checkmates and requires dedicated practice. Come back for the bishop and knight when you feel ready.

15.6 Part 4: King + Bishop + Knight vs. King

15.6.1 The Hardest Basic Checkmate

This is the most difficult checkmate in this chapter, and one of the hardest techniques in all of chess. Do not panic if it takes you a long time to learn. Even experienced tournament players struggle with this one.

But here is the truth: if you learn this, you have achieved something genuinely impressive. This checkmate is a badge of honor.

15.6.2 Why Is It So Hard?

The bishop and knight are fundamentally different pieces. The bishop glides along diagonals, covering long distances but stuck on one color forever. The knight hops in an L-shape, changing colors with every move but covering only a small area. Getting these two very different pieces to cooperate requires careful planning and precise execution.

And there is one more complication: **you can only deliver checkmate in a corner that matches your bishop's color.**

Read that again. If you have a light-squared bishop, you can only checkmate the enemy king in a light-squared corner (a1 or h8). If you have a dark-squared bishop, you can only checkmate in a dark-squared corner (a8 or h1).

15.6.3 The Corner Problem

The defending king will naturally try to run to the "wrong" corner (the corner that does NOT match your bishop's color). If it gets there, you cannot checkmate. You must redirect it to the correct corner using a technique called the "W maneuver," where the knight zigzags to control key squares and prevent the king from retreating.

15.6.4 The Checkmate Position

Set up your board: White King on b3, White Knight on c3, White Bishop on b2, Black King on a1.

```
8  . . . . . . . .
7  . . . . . . . .
6  . . . . . . . .
5  . . . . . . . .
4  . . . . . . . .
3  . K N . . . . .
2  . B . . . . . .
1  k . . . . . . .
```

```
a b c d e f g h
```

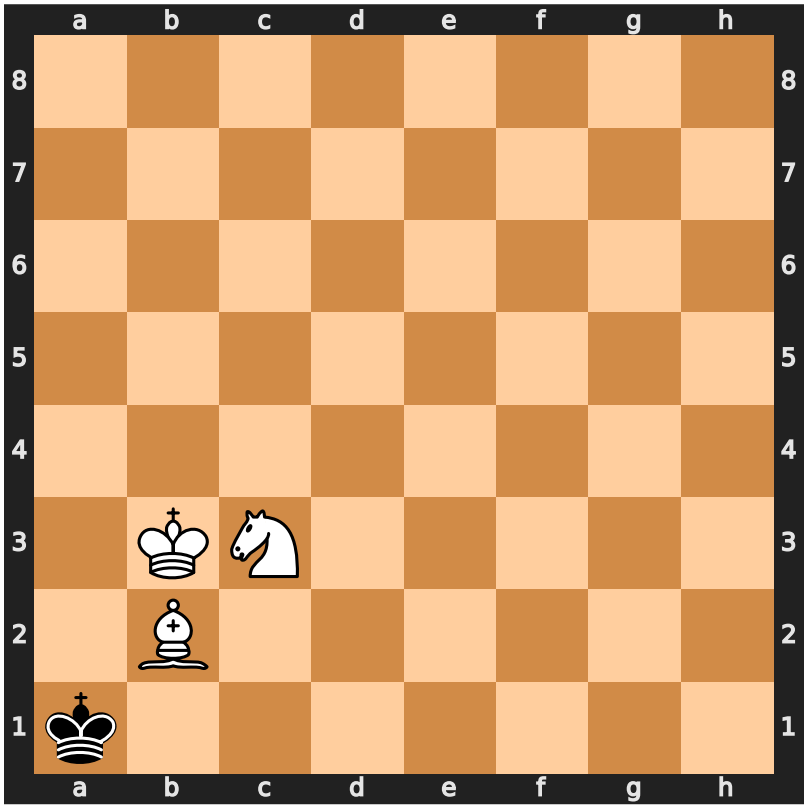

Figure 15.8: Chess Position

Checkmate! The bishop on b2 gives check along the diagonal (b2 to a1). The escape squares: - **a2:** controlled by the knight on c3 (knight attacks a2) - **b1:** controlled by the knight on c3 (knight attacks b1) - **b2:** the bishop is there, protected by the king on b3 (adjacent)

Every piece contributes: the bishop checks, the knight covers both escape squares, and the king protects the bishop.

15.6.5 Key Facts about K+B+N

- Checkmate is only possible in a corner matching the bishop's color
- Light-squared bishop: checkmate at a1 or h8
- Dark-squared bishop: checkmate at a8 or h1
- The full technique takes about 33 moves
- The 50-move rule applies: you must deliver checkmate within 50 moves of the last capture or pawn move, or the game is drawn
- This is an advanced beginner skill. Many players do not learn it until rating 1000+. That is perfectly fine.

15.6.6 A Realistic Note

If you are between 300 and 700 right now, here is what matters: **know that K+B+N can checkmate, know that it only works in the bishop's corner, and know that it takes**

about 33 moves. You can practice the full technique when you are ready.

There are excellent online trainers for this endgame. Search for "bishop and knight checkmate trainer" to find interactive practice tools.

You have now seen all four basic checkmates. That is a tremendous amount of material. Take a real break. Come back for the demonstrations and exercises when you are refreshed.

15.7 Annotated Demonstration 1: King + Queen vs. King

Set up your board: White King on g1, White Queen on a4, Black King on d5.

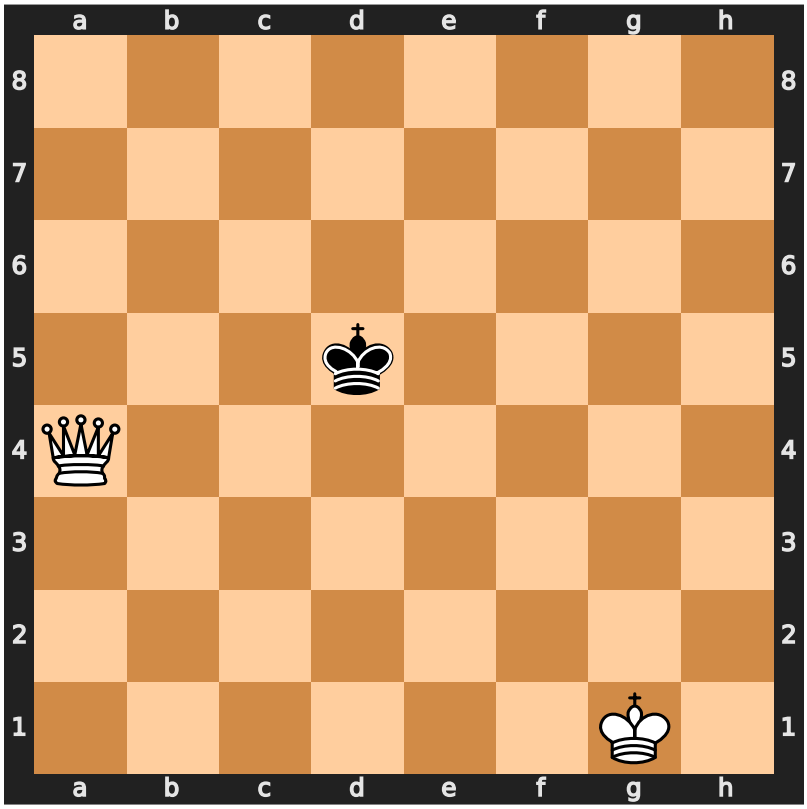

Figure 15.9: Chess Position

1. Qd4+ – The queen moves next to the king, giving check. The king must move.

1...Ke6 – Steps away from the queen.

2. Qe4+ – Another check. The queen follows.

2...Kf7 – Retreats further.

3. Qe5 – The queen centralizes on e5, cutting off the king's access to most of the board.

3...Kg6 – The king tries to stay away from the edges.

4. Kf2 – White brings the king forward. The queen has the restriction covered.

4...Kf7 – Retreats.

5. Kf3 – Continuing forward.

5...Kg6 – Holds the center.

6. Kf4 – The White king is now on the 4th rank.

6...Kf7 – Retreats again.

7. Kf5 – Both pieces are working together now.

7...Kg8 – The king retreats toward the corner.

8. Qe7 – The queen seizes the 7th rank. The king is trapped on rank 8.

8...Kh8 – The only square. g8 is controlled by the queen (diagonal), g7 and h7 by the queen (rank 7).

9. Kf6 – The king advances.

9...Kg8 – Forced back.

10. Qg7 checkmate – The queen checks diagonally. g8 is sealed by the g-file, h7 by rank 7, and the king on f6 protects the queen. Ten moves, start to finish.

15.8 Annotated Demonstration 2: King + Rook vs. King – The Staircase

Set up your board: White King on d5, White Rook on a1, Black King on d7.

1. Ra7+ – The rook checks along rank 7. The king must leave.

1...Ke8 – Retreats to rank 8. The rook prevents crossing below rank 7.

2. Kd6 – The king follows.

2...Kf8 – Steps sideways.

3. Ke6 – White advances, controlling d7, e7, f7.

3...Kg8 – The only free square.

4. Kf6 – Following. Controls e7, f7, g7.

4...Kh8 – Pushed to the corner.

5. Kg6 – Controls f7, g7, h7.

5...Kg8 – Forced. The only legal move.

6. Ra8 checkmate – The rook checks along the 8th rank. f8 and h8 are covered by the rook. f7, g7, h7 are covered by the king. Six moves of pure staircase technique.

FEN (final): `R5k1/8/6K1/8/8/8/8/8 b - - 0 1`

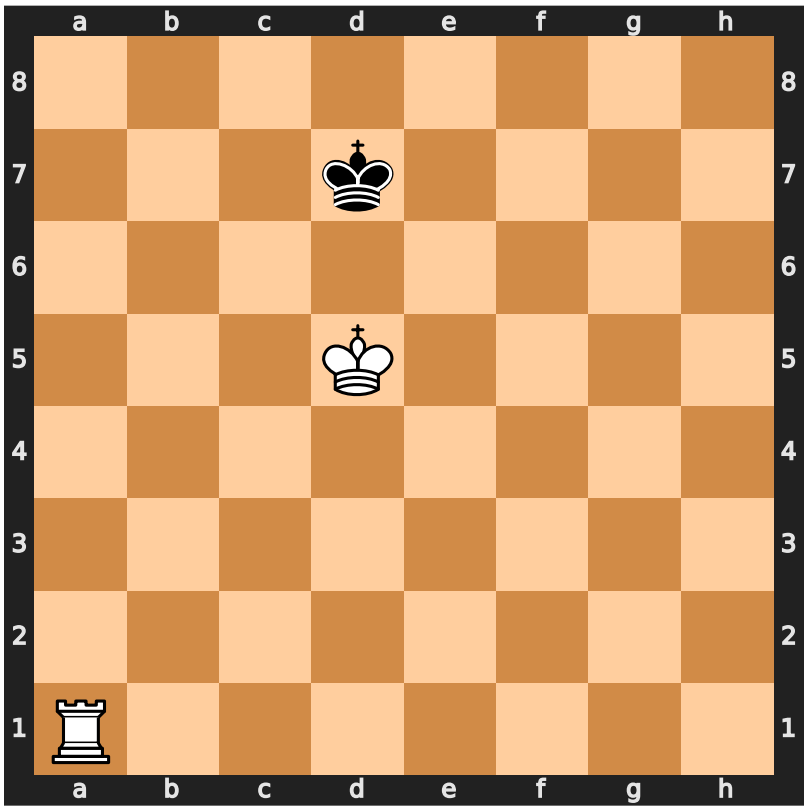

Figure 15.10: Chess Position

15.9 Annotated Demonstration 3: King + Two Bishops vs. King – The Diagonal Wall

Set up your board: White King on c4, White Bishop on d4 (dark squares), White Bishop on e4 (light squares), Black King on c6.

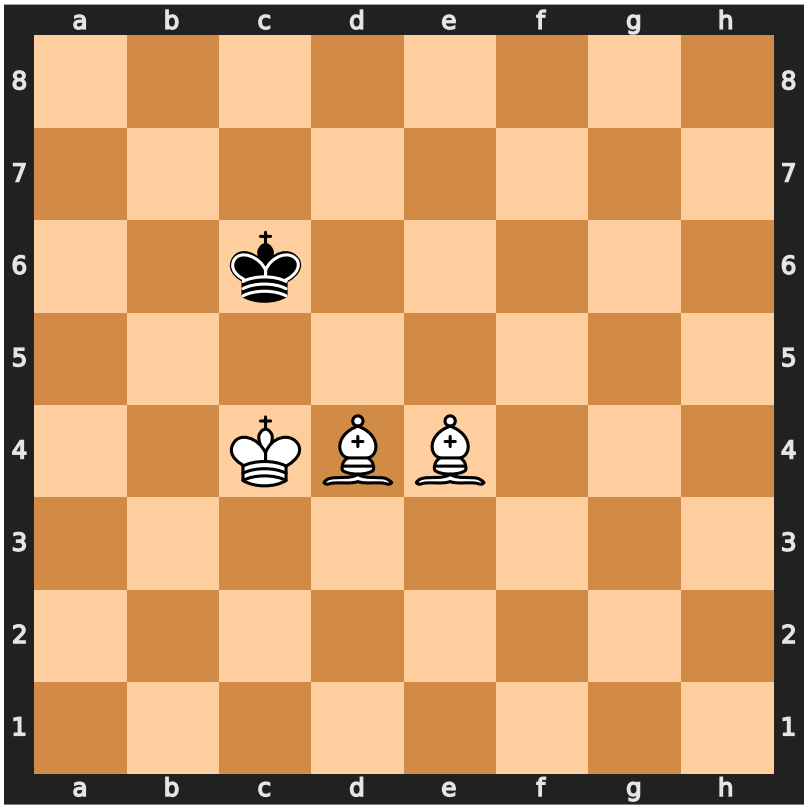

Figure 15.11: Chess Position

This demonstration shows the final phase, where the bishops drive the king into the corner.

1. Bc5 – The dark-squared bishop advances, controlling b6 and d6. The king cannot go forward.

1...Kb7 – The king retreats.

2. Bd5+ – The light-squared bishop checks along the diagonal (d5-c6-b7). The king must move toward the corner.

2...Ka8 – Forced toward the a8 corner.

3. Kb6 – The king advances, covering a7, b7, and c7.

From here the technique continues: the bishops tighten the diagonal wall while the king supports, driving the defending king into the corner. The final checkmate position looks like this:

Set up your board (final position): White King on b6, White Bishop on c6 (light), White Bishop on d6 (dark). Black King on a8.

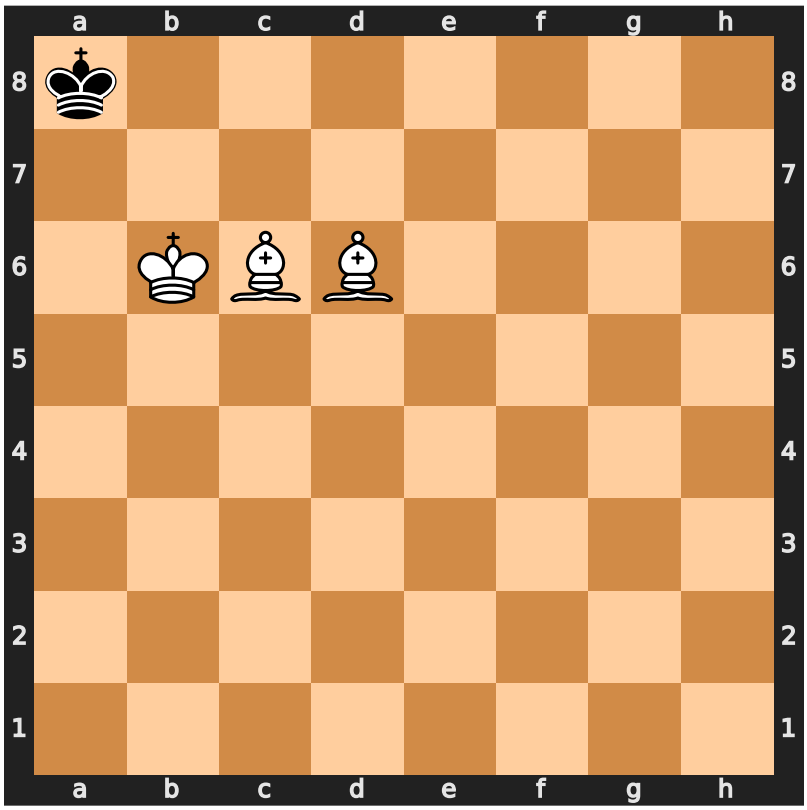

Figure 15.12: Chess Position

This is checkmate. The bishop on c6 checks along the diagonal c6-b7-a8. Escapes: a7 is covered by the king, b7 is covered by the bishop on c6 and the king, b8 is covered by the bishop on d6 along the c7-b8 diagonal. All sealed.

The full process takes about 18 moves from a central position.

Three demonstrations complete. Take a break before the exercises.

Exercises

Work through these exercises on your board or on a screen. Set up each position, find the solution, and then check your answer. If you get stuck, use the hints. There is no shame in using hints. That is what they are for.

15.9.1 Section A: King + Queen vs. King (Exercises 5.1 – 5.20)

Exercise 5.1 **Position:** White: Kg6, Qf5. Black: Kh8.

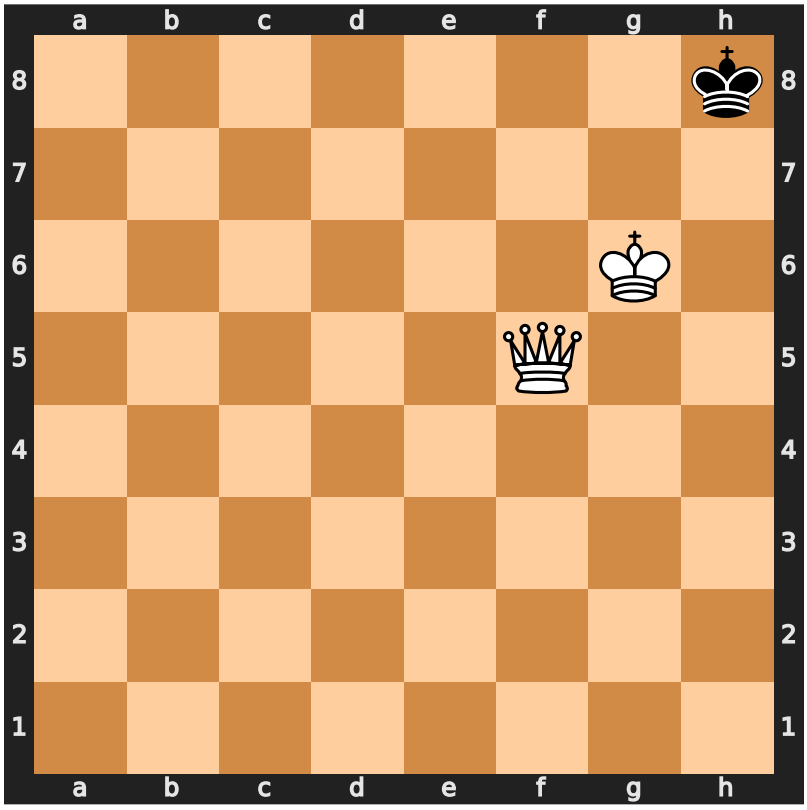

Figure 15.13: Chess Position

Task: Checkmate in 1 move. **Hint 1:** The queen needs to reach a square that checks the king and covers g8. **Hint 2:** The king on g6 already covers g7 and h7. **Hint 3:** Move the queen to the 8th rank along the f-file. **Solution: 1. Qf8#** – The queen checks along rank 8. g8 is covered by the queen. g7 and h7 are covered by the king. Why this works: the queen seals the back rank while the king blocks rank 7.

Exercise 5.2 **Position:** White: Ka6, Qe7. Black: Ka8.

Task: Checkmate in 1 move. **Hint 1:** The queen can reach a7 along rank 7. **Hint 2:** On a7, the queen gives check along the a-file. **Hint 3:** The king on a6 protects the queen on a7. **Solution: 1. Qa7#** – The queen checks along the a-file. b8 is covered on the diagonal, b7 along rank 7. The king protects the queen.

Exercise 5.3 **Position:** White: Kb6, Qa5. Black: Ka8.

Task: Checkmate in 1 move. **Hint 1:** Same mating square as Exercise 5.2. **Hint 2:** The queen moves from a5 to a7 along the a-file. **Hint 3:** Qa7#. **Solution: 1. Qa7#** – Same pattern. The queen checks on the a-file. b8 covered by the diagonal, b7 by rank 7 and the king.

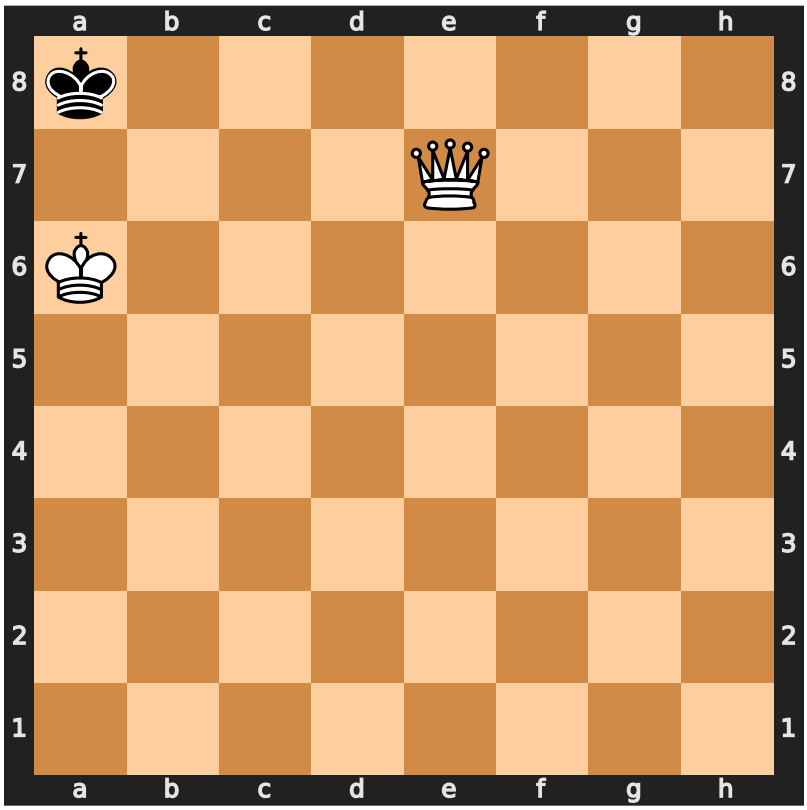

Figure 15.14: Chess Position

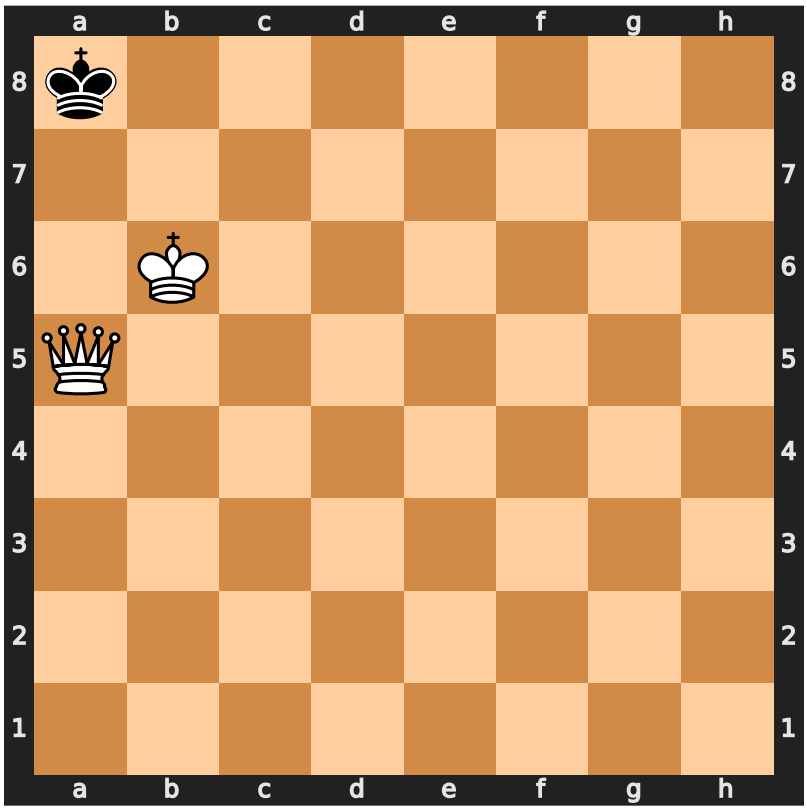

Figure 15.15: Chess Position

Exercise 5.4 **Position:** White: Kf7, Qg5. Black: Kh8.

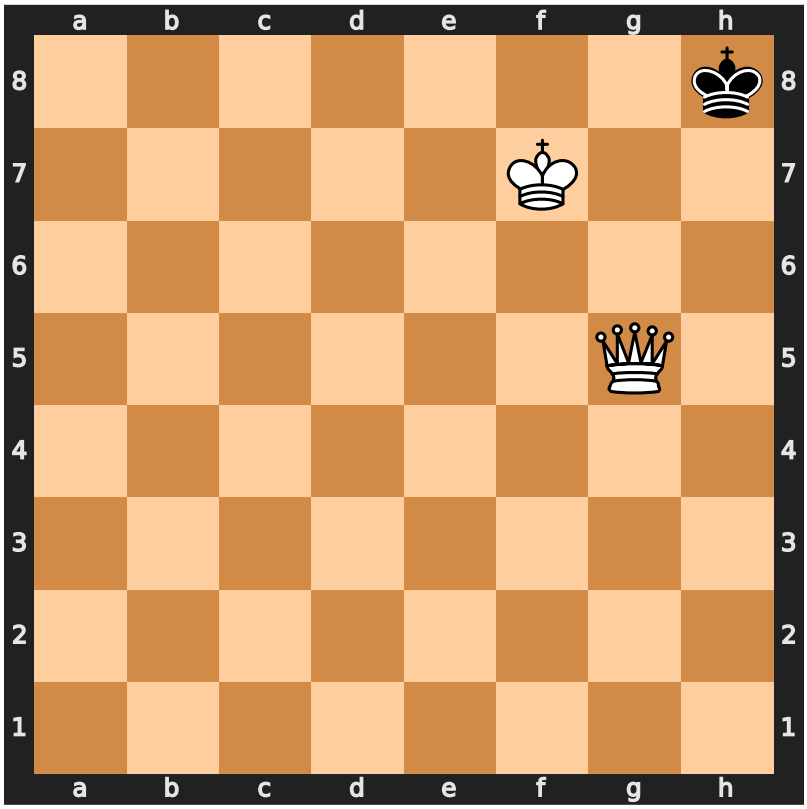

Figure 15.16: Chess Position

Task: Checkmate in 1 move. **Hint 1:** The queen can reach g7. **Hint 2:** On g7, the queen checks h8 diagonally. **Hint 3:** The king on f7 protects g7 and covers g8. **Solution: 1. Qg7#** – The queen checks diagonally. g8 is covered by the queen (g-file) and the king (f7-g8 adjacent). h7 is covered by the queen (rank 7).

Exercise 5.5 **Position:** White: Kc2, Qd3. Black: Ka1.

Task: Checkmate in 1 move. **Hint 1:** Move the queen to b1. **Hint 2:** On b1, the queen checks along rank 1. **Hint 3:** a2 is covered by the diagonal. b2 is covered by the king. **Solution: 1. Qb1#** – The queen checks along rank 1. a2 covered on the diagonal b1-a2. b2 covered by the king and the queen (b-file). The king protects the queen.

Exercise 5.6 **Position:** White: Kg2, Qf3. Black: Kh1.

Task: Checkmate in 1 move. **Hint 1:** The king covers g1 and h2. **Hint 2:** The queen needs to check h1 along rank 1. **Hint 3:** Qf1#. **Solution: 1. Qf1#** – The queen checks along rank 1. g1 covered by the queen (rank 1) and the king (adjacent). h2 covered by the king (adjacent).

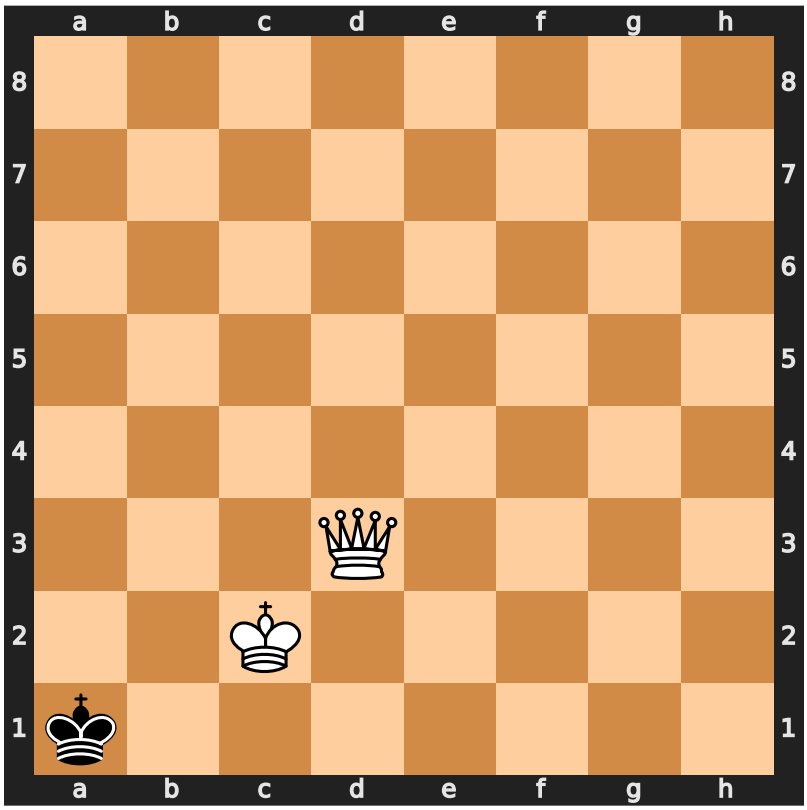

Figure 15.17: Chess Position

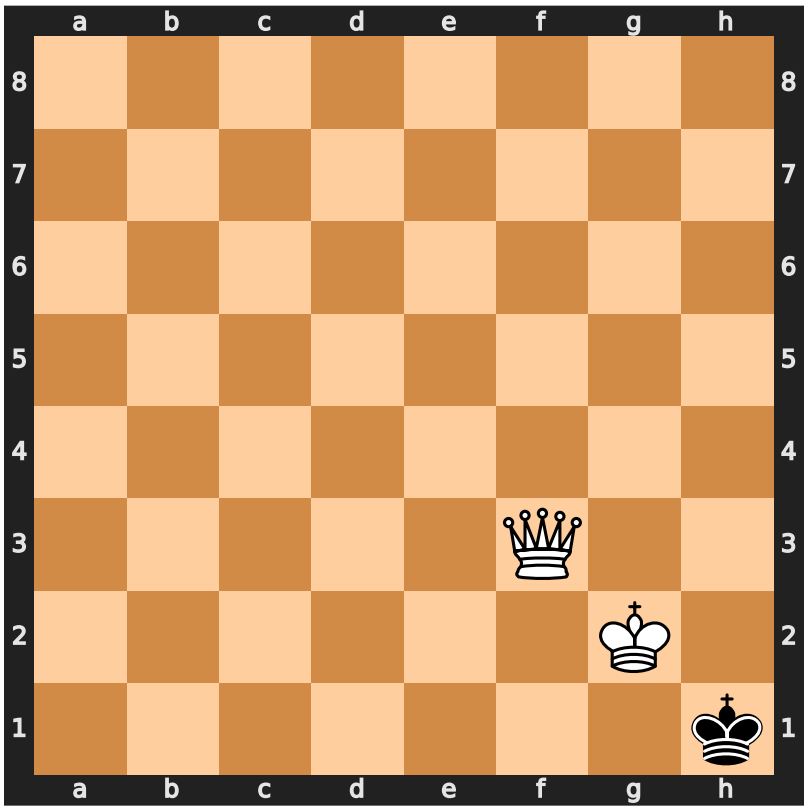

Figure 15.18: Chess Position

Exercise 5.7 **Position:** White: Kf3, Qe4. Black: Kh1.

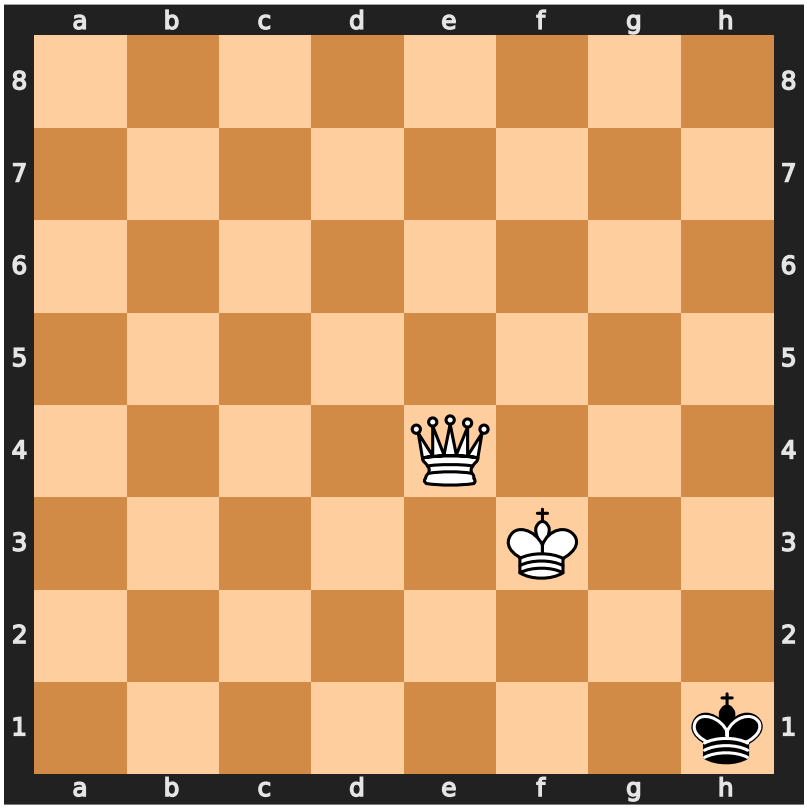

Figure 15.19: Chess Position

Task: Checkmate in 1 move. **Hint 1:** The queen can reach g2 on the diagonal. **Hint 2:** On g2, the queen checks h1 diagonally. **Hint 3:** The king on f3 protects g2. **Solution: 1. Qg2#** – The queen checks diagonally (g2-h1). h2 covered along rank 2. g1 covered on the g-file. The king protects the queen.

Exercise 5.8 **Position:** White: Kf2, Qe3. Black: Kh1.

Task: Checkmate in 1 move. **Hint 1:** Move the queen to g1. **Hint 2:** The queen checks along rank 1. **Hint 3:** h2 covered by the queen (diagonal g1-h2). g2 covered by the queen and king. **Solution: 1. Qg1#** – The queen checks along rank 1. h2 covered on the diagonal. g2 covered on the g-file and by the king (adjacent). The king protects the queen (f2-g1 adjacent).

Exercise 5.9 **Position:** White: Kg6, Qh5. Black: Kh8.

Task: Checkmate in 1 move. **Hint 1:** The queen is one square from delivering a devastating check. **Hint 2:** Qh7 checks along the h-file. **Hint 3:** g8 is covered on the diagonal, g7 by the king. **Solution: 1. Qh7#** – The queen checks along the h-file. g8 covered by the diagonal h7-g8. g7 covered by the king (adjacent). The king protects the queen (g6-h7 adjacent).

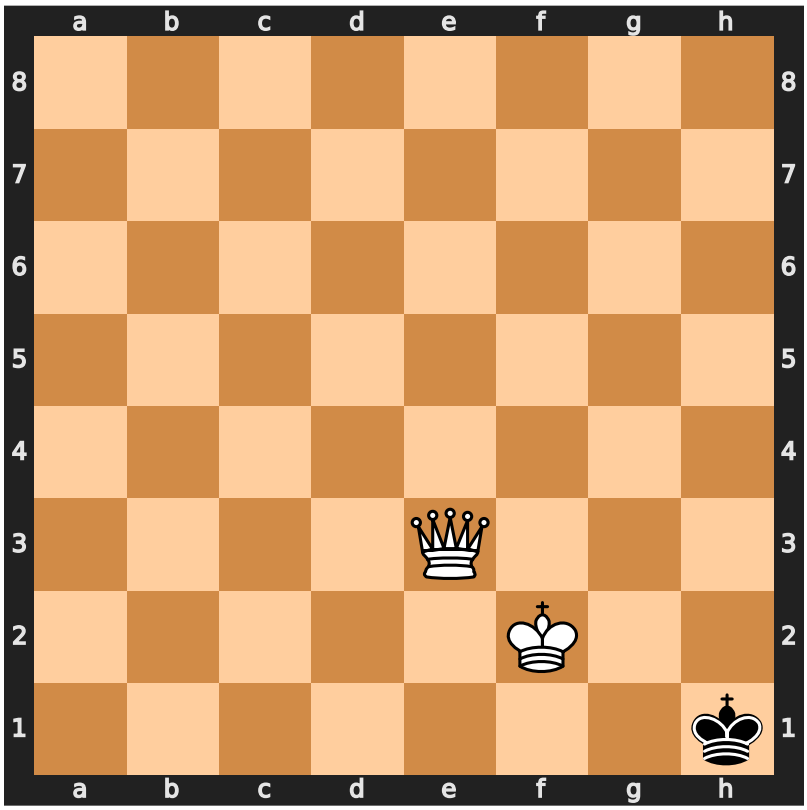

Figure 15.20: Chess Position

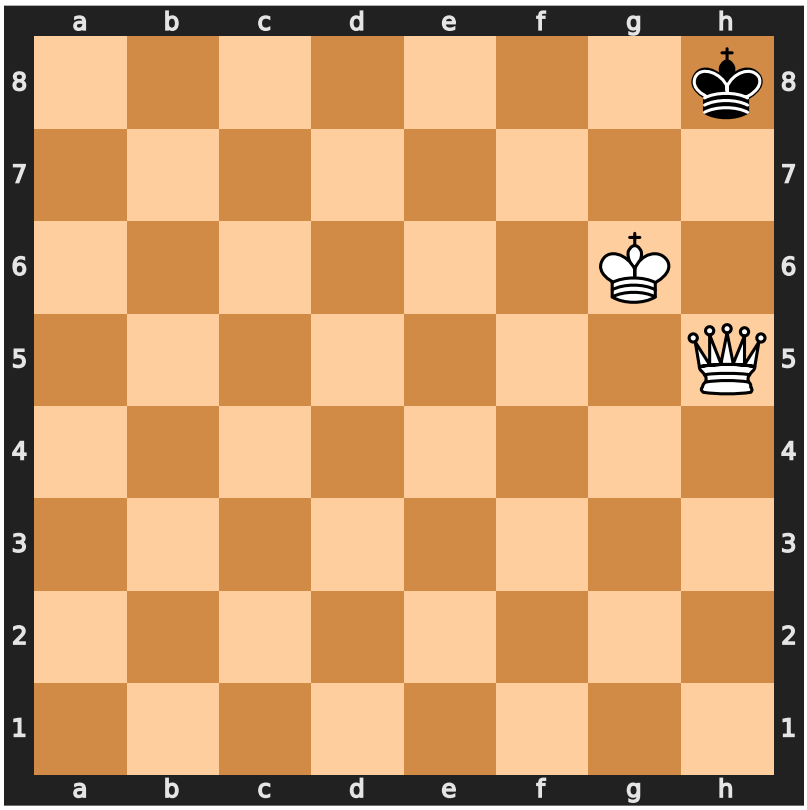

Figure 15.21: Chess Position

Exercise 5.10 **Position:** White: Kb3, Qa4. Black: Ka1.

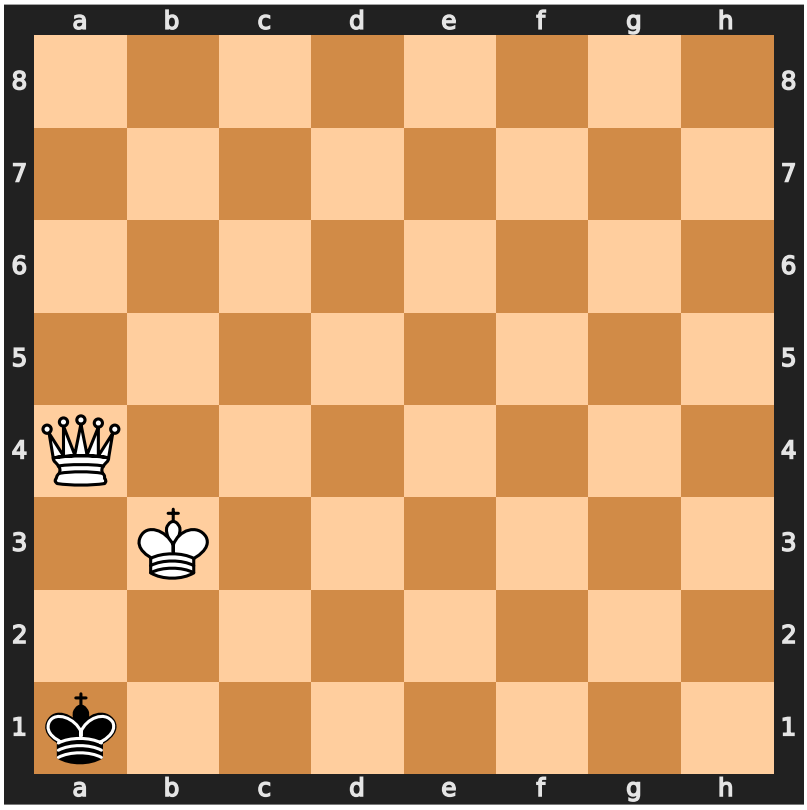

Figure 15.22: Chess Position

Task: Checkmate in 1 move. **Hint 1:** The queen moves to a2. **Hint 2:** Check along the a-file. **Hint 3:** b1 covered by the diagonal, b2 by the king and rank 2. **Solution: 1. Qa2#** – The queen checks along the a-file. b1 covered on the diagonal a2-b1. b2 covered along rank 2 and by the king. The king protects the queen (b3-a2 adjacent).

Exercise 5.11 **Position:** White: Ke6, Qd5. Black: Ke8.

Task: Checkmate in 2 moves. **Hint 1:** Check the king on d7 first. **Hint 2:** After 1. Qd7+ Kf8, the king is in the corner area. **Hint 3:** 2. Qf7#. **Solution: 1. Qd7+ Kf8** (the only legal move: d8, e7, f7 all controlled) **2. Qf7#** – g8 covered on the diagonal, e8 on the diagonal, g7 and e7 on rank 7 and by the king.

Exercise 5.12 **Position:** White: Kf6, Qe5. Black: Kh8.

Task: Checkmate in 2 moves. **Hint 1:** Restrict the king to one square first. **Hint 2:** 1. Qe7 leaves only Kg8 as a legal move. **Hint 3:** 2. Qg7#. **Solution: 1. Qe7** (g7, h7, and f8 all controlled; only Kg8 is legal) **1...Kg8 2. Qg7#** – checks along the g-file. f8 and h8 on the diagonal. f7 and h7 on rank 7.

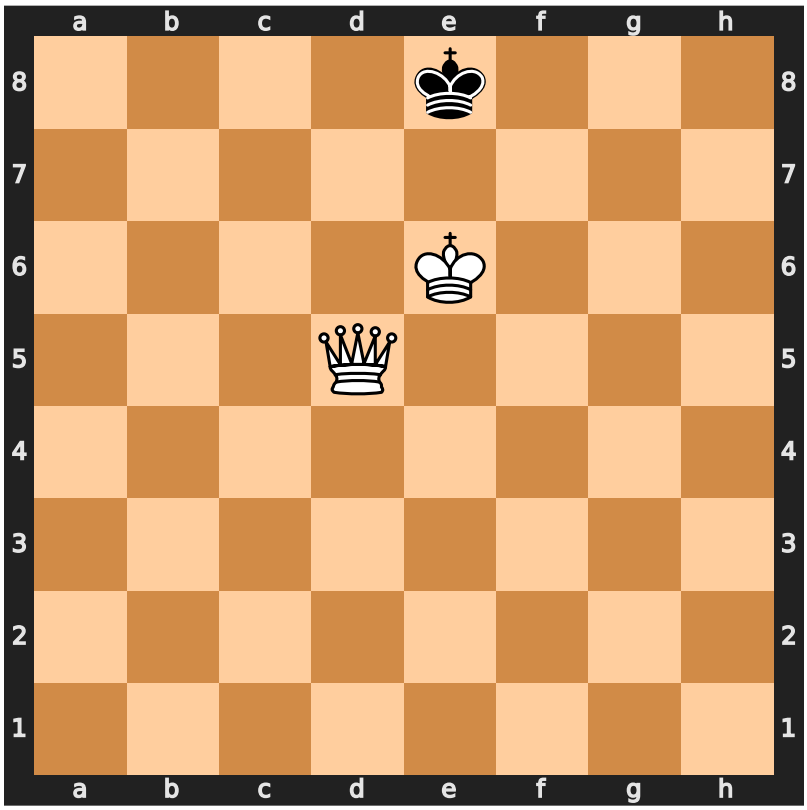

Figure 15.23: Chess Position

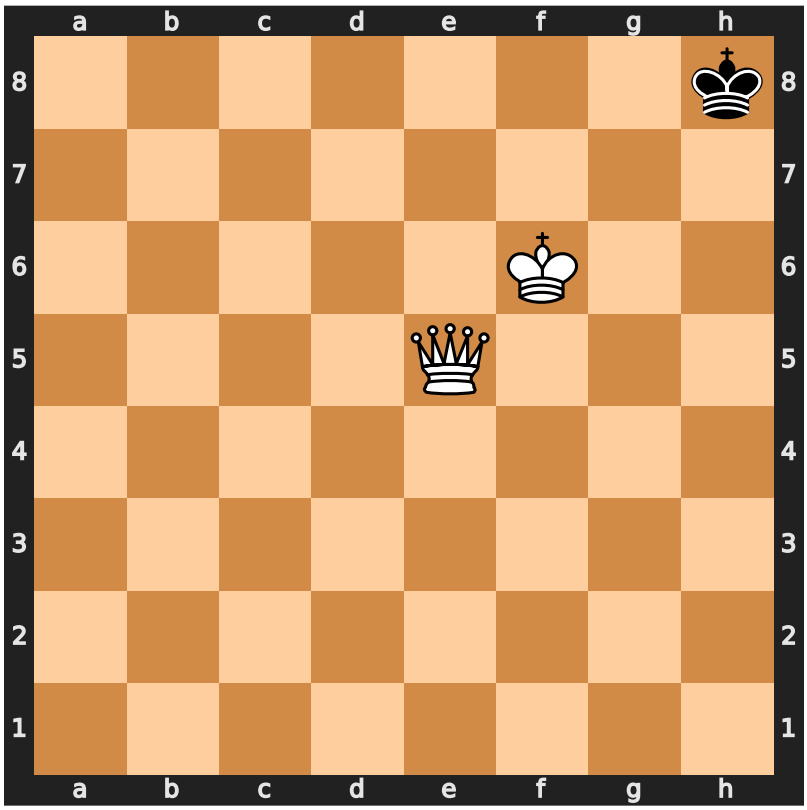

Figure 15.24: Chess Position

Exercise 5.13 **Position:** White: Kc7, Qd5. Black: Ka8.

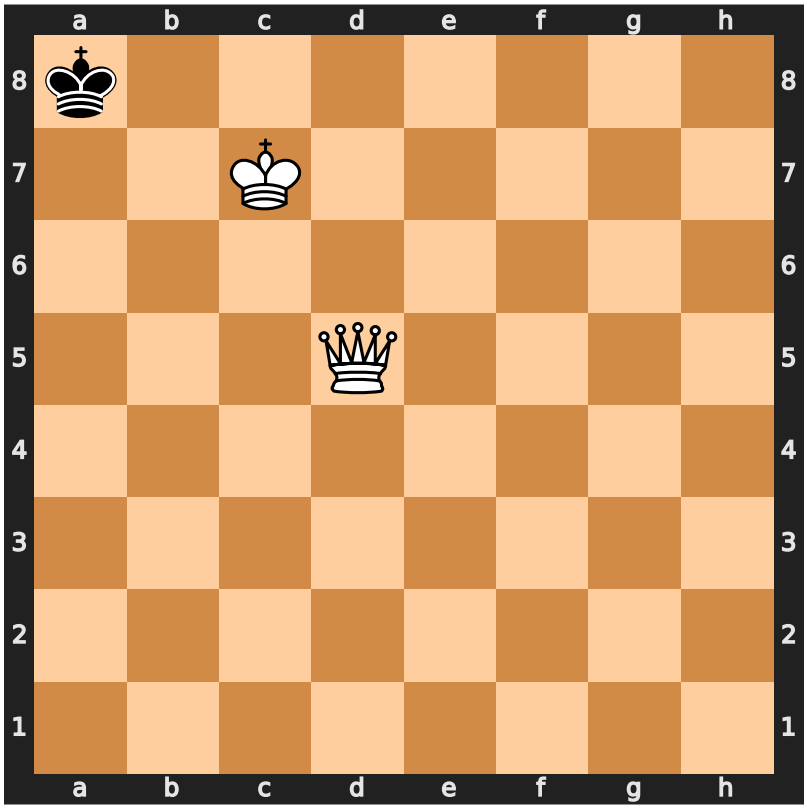

Figure 15.25: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** Check on the back rank first. **Hint 2:** 1. Qd8+ Ka7 (b8, b7 controlled by Kc7). **Hint 3:** 2. Qa5# (checks along the a-file; a6, a8 on the file; b6, b7, b8 by king/queen). **Solution: 1. Qd8+ Ka7 2. Qa5#** – The queen checks along the a-file from a5. a6 and a8 covered on the file. b6 covered on the diagonal. b7 and b8 covered by the king.

Exercise 5.14 **Position:** White: Kd6, Qc5. Black: Kd8.

Task: Checkmate in 2 moves. **Hint 1:** 1. Qc7 restricts the king to e8. **Hint 2:** After 1...Ke8, all rank-7 squares are covered. **Hint 3:** 2. Qe7#. **Solution: 1. Qc7 Ke8 2. Qe7#** – d8 covered on the diagonal and by the king. f8 on the diagonal. d7 on rank 7 and by the king. f7 on rank 7.

Exercise 5.15 **Position:** White: Kg6, Qf4. Black: Kh8.

Task: Checkmate in 2 moves. **Hint 1:** Check on the diagonal first. **Hint 2:** 1. Qf6+ Kg8 (only legal move). **Hint 3:** 2. Qf8#. **Solution: 1. Qf6+ Kg8** (g7 is covered by the king on g6; g8 is the only legal move) **2. Qf8#** – The queen checks along rank 8. h7 covered by king. g7 covered by king. Checkmate.

Exercise 5.16 **Position:** White: Kb3, Qc4. Black: Ka1.

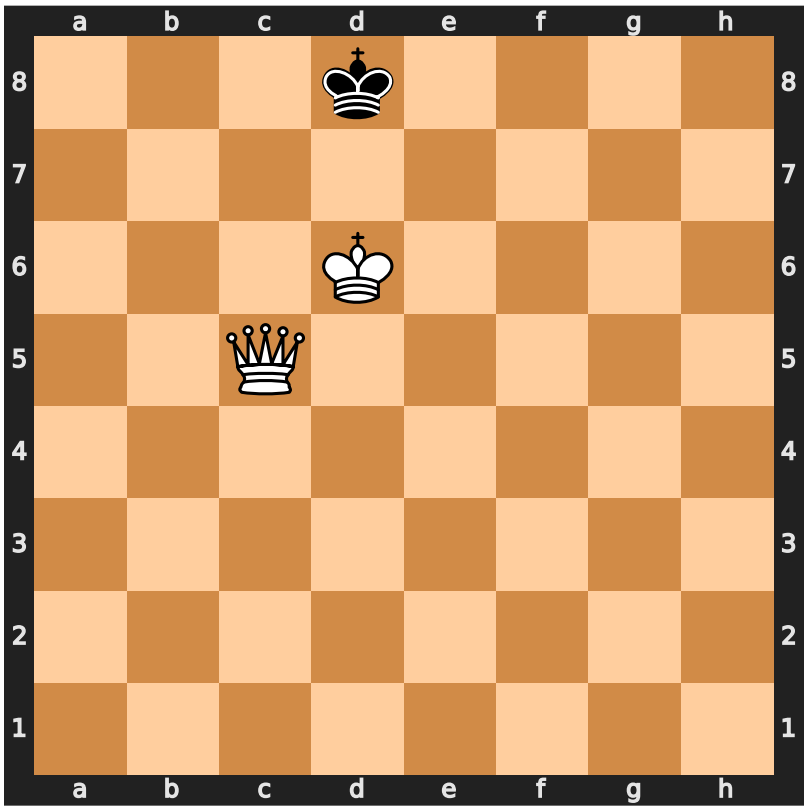

Figure 15.26: Chess Position

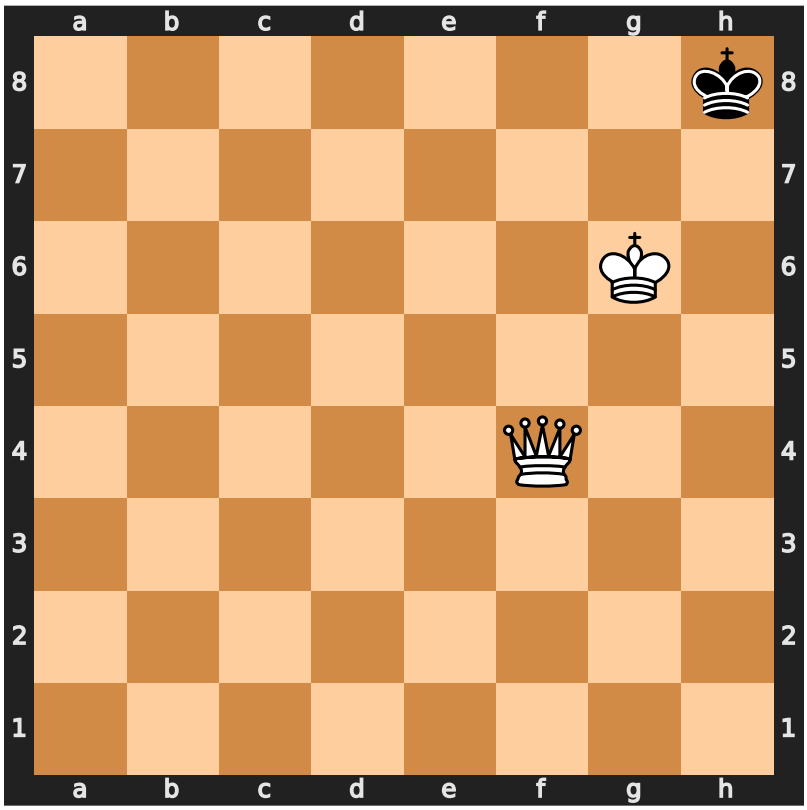

Figure 15.27: Chess Position

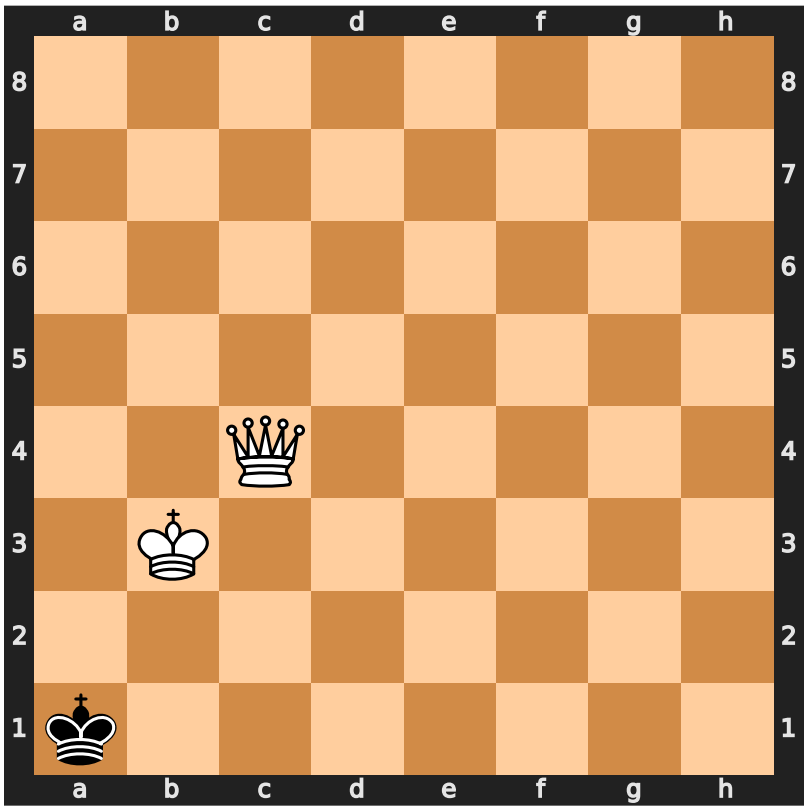

Figure 15.28: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** Check along rank 1 first. **Hint 2:** 1. Qc1+ Ka2 (b1 and b2 covered by king and queen). **Hint 3:** 2. Qb2#. **Solution: 1. Qc1+ Ka2 2. Qb2#** – checks along rank 2 (b2-a2). a1 covered on the diagonal. a3 covered on the diagonal and by the king. b1 covered on the b-file.

Exercise 5.17 **Position:** White: Kf6, Qg5. Black: Kf8.

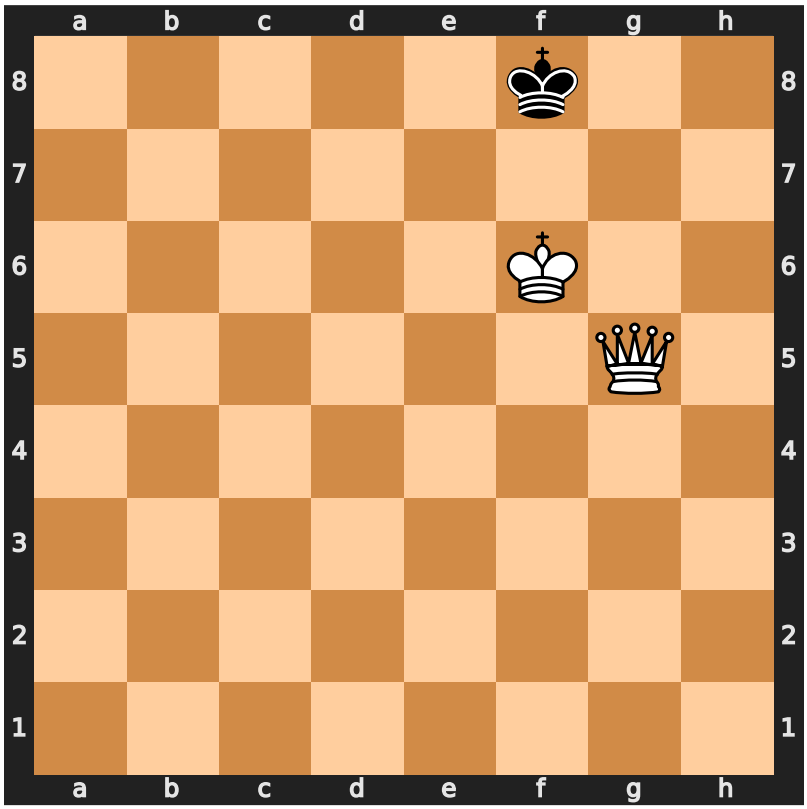

Figure 15.29: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** Restrict the king with a quiet queen move. **Hint 2:** 1. Qe7 forces Kg8. **Hint 3:** 2. Qg7#. **Solution: 1. Qe7 Kg8 2. Qg7#** – same pattern as Exercise 5.12. The queen seals rank 7 and the g-file.

Exercise 5.18 **Position:** White: Kg2, Qf4. Black: Kh1.

Task: Checkmate in 2 moves. **Hint 1:** Check on rank 1 first. **Hint 2:** 1. Qf1+ Kh2 (g1 covered by queen and king). **Hint 3:** 2. Qg1#. **Solution: 1. Qf1+ Kh2 2. Qg1#** – checks diagonally (g1-h2). h1 covered on rank 1. h3 covered by the king. g2 is the king's square. g3 covered by the king.

Exercise 5.19 **Position:** White: Kb6, Qc4. Black: Ka8.

Task: Checkmate in 2 moves. **Hint 1:** Check on the back rank. **Hint 2:** 1. Qc8+ Ka7 (b8, b7

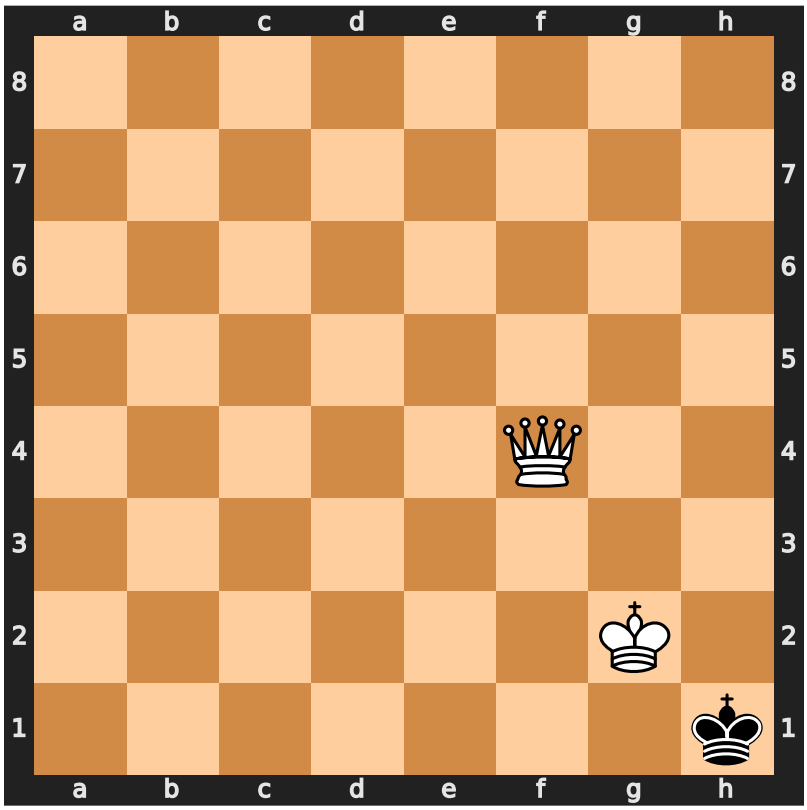

Figure 15.30: Chess Position

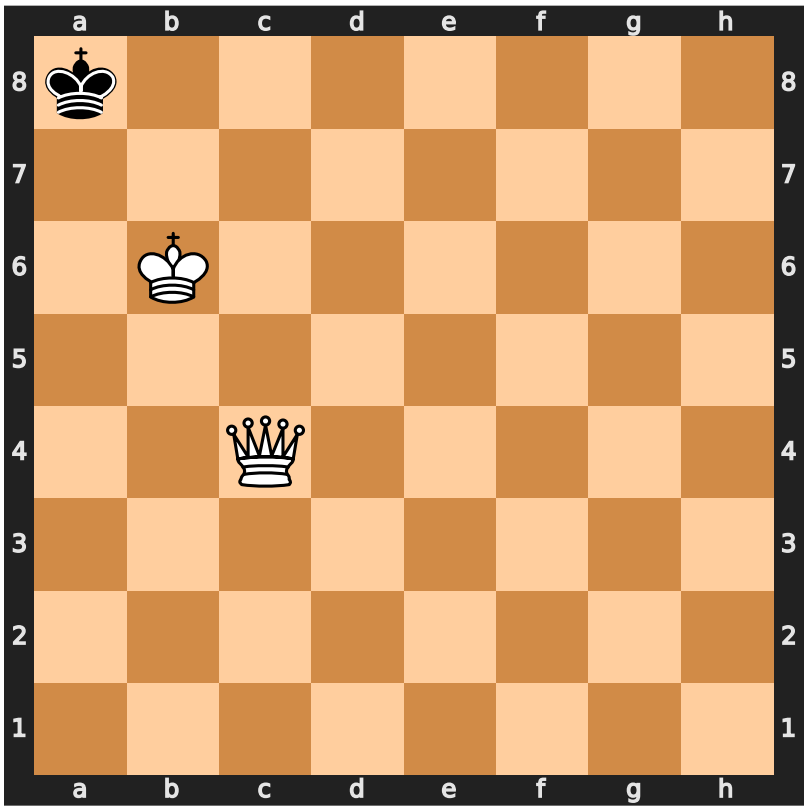

Figure 15.31: Chess Position

covered by king). **Hint 3:** 2. Qb7#. **Solution: 1. Qc8+ Ka7 2. Qb7#** – checks along rank 7 (b7-a7). a8 covered on the diagonal. a6 covered on the diagonal. b8 on the b-file. The king protects the queen.

Exercise 5.20 **Position:** White: Kd6, Qe5. Black: Kd8.

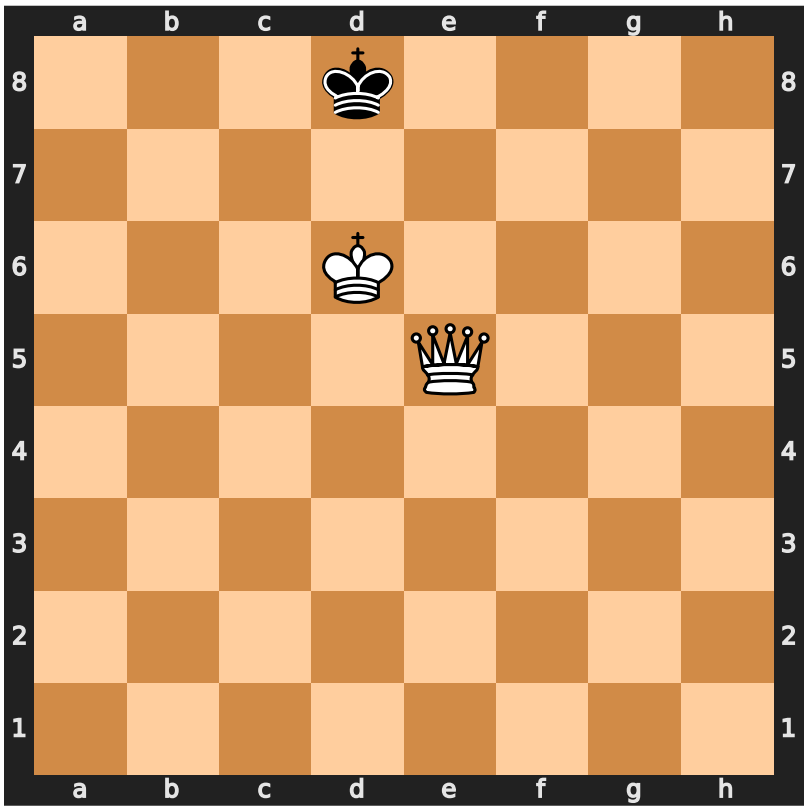

Figure 15.32: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** Restrict with 1. Qc7. **Hint 2:** After 1…Ke8, the king is trapped. **Hint 3:** 2. Qe7#. **Solution: 1. Qc7 Ke8 2. Qe7#** – same pattern as Exercise 5.14.

15.9.2 Section B: King + Rook vs. King (Exercises 5.21 – 5.40)

Exercise 5.21 **Position:** White: Kb6, Rh1. Black: Ka8.

Task: Checkmate in 1 move. **Hint 1:** The rook needs to reach the 8th rank. **Hint 2:** Rh8 checks along the entire 8th rank. **Hint 3:** The king on b6 covers a7 and b7. **Solution: 1. Rh8#** – The rook checks along rank 8. a7 covered by king (adjacent). b7 covered by king (adjacent). b8 covered by rook (rank 8).

Exercise 5.22 **Position:** White: Kg6, Ra1. Black: Kg8.

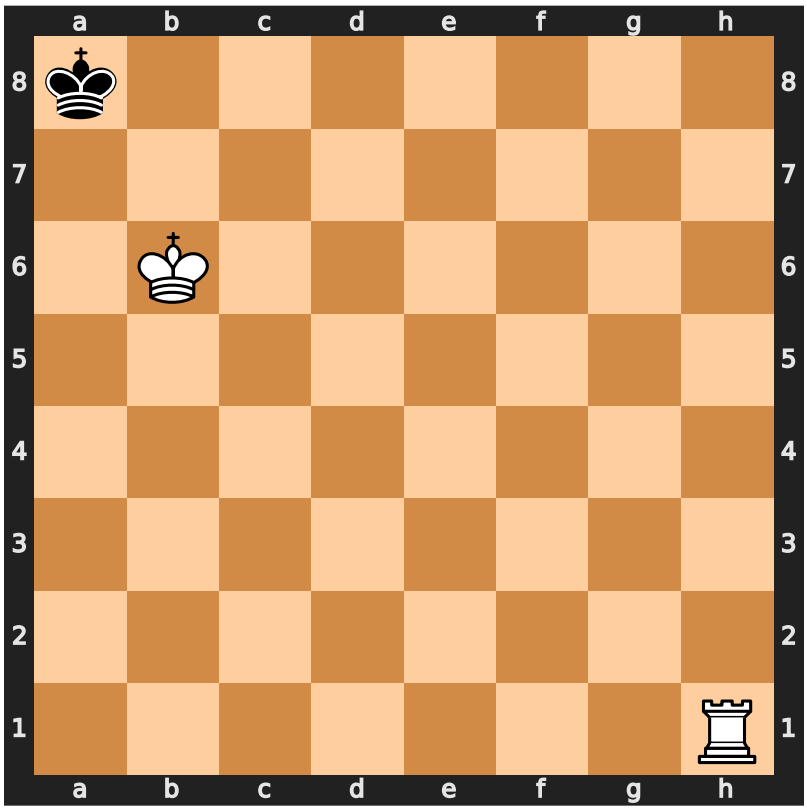

Figure 15.33: Chess Position

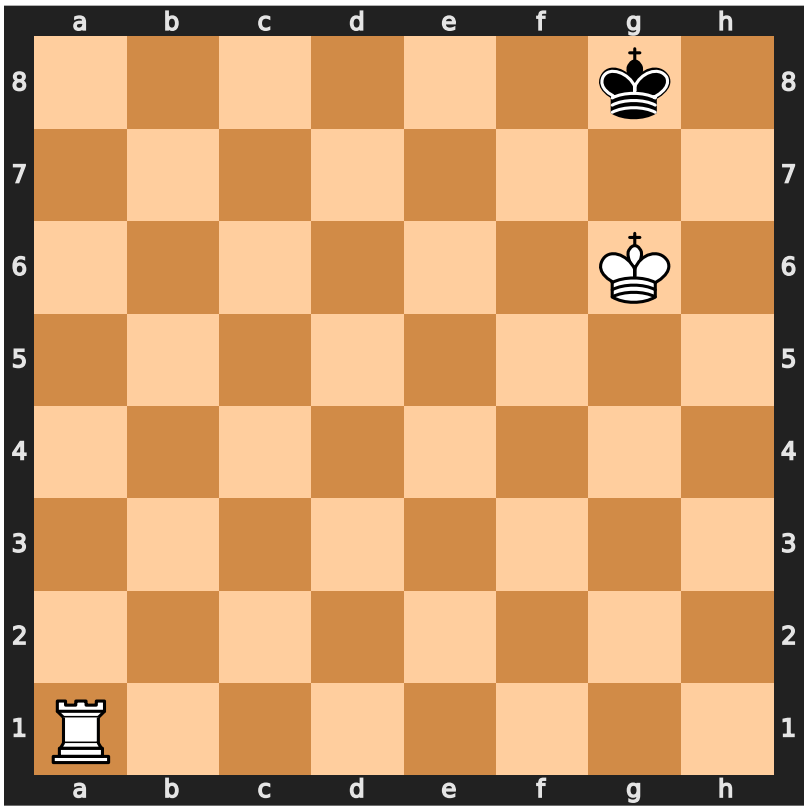

Figure 15.34: Chess Position

Task: Checkmate in 1 move. **Hint 1:** Ra8# seals the 8th rank. **Hint 2:** The king covers f7, g7, and h7. **Solution: 1. Ra8#** – Rook checks along rank 8. f7, g7, h7 covered by king. f8, h8 covered by rook.

Exercise 5.23 **Position:** White: Kc2, Rh3. Black: Ka1.

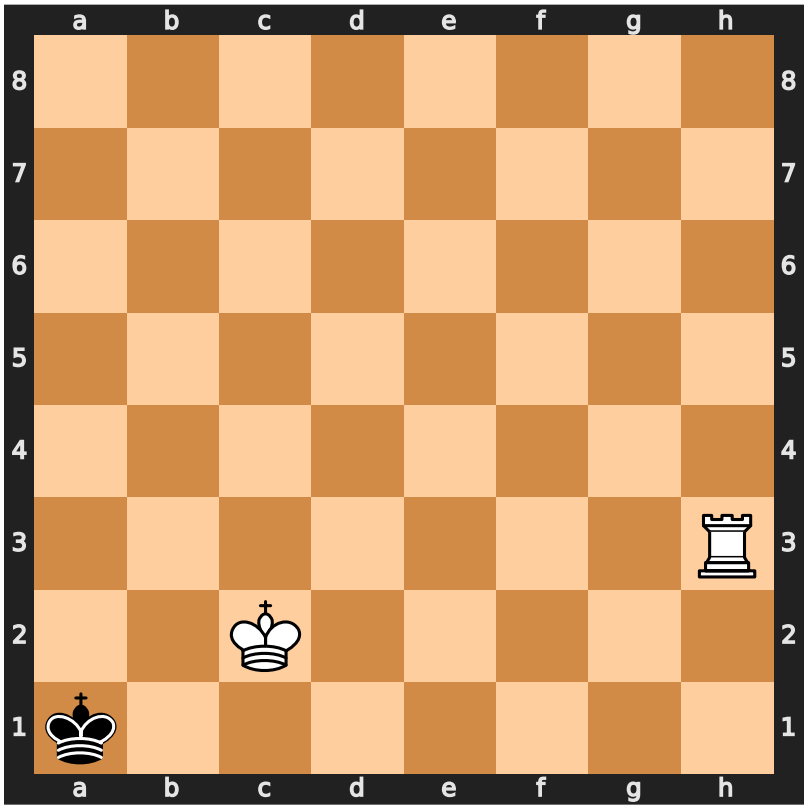

Figure 15.35: Chess Position

Task: Checkmate in 1 move. **Hint 1:** The rook can reach the a-file from h3. **Hint 2:** Ra3 checks along the a-file. **Hint 3:** The king covers b1 and b2. **Solution: 1. Ra3#** – The rook checks along the a-file. a2 covered by rook (a-file). b1 covered by king (adjacent c2-b1). b2 covered by king (adjacent).

Exercise 5.24 **Position:** White: Kf6, Rd1. Black: Kf8.

Task: Checkmate in 1 move. **Hint 1:** The rook goes to the 8th rank. **Hint 2:** Rd8# seals everything. **Solution: 1. Rd8#** – Rook checks along rank 8. e7, f7, g7 covered by king. e8, g8 covered by rook.

Exercise 5.25 **Position:** White: Ke6, Rh1. Black: Ke8.

Task: Checkmate in 1 move. **Hint 1:** Rh8# seals the 8th rank. **Hint 2:** The king covers d7, e7, and f7. **Solution: 1. Rh8#** – Rook checks along rank 8. d7, e7, f7 covered by king. d8, f8

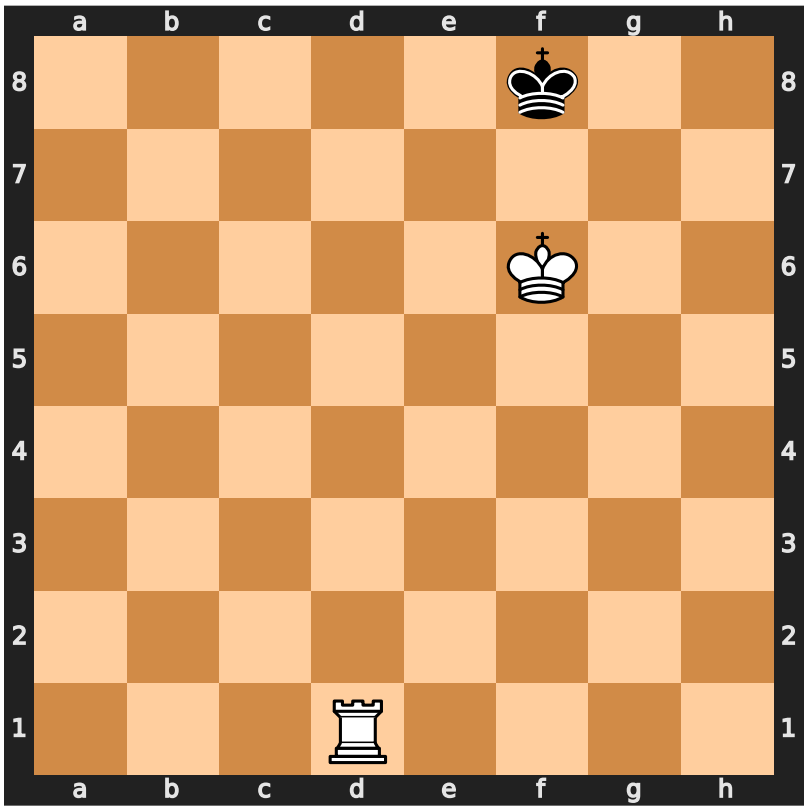

Figure 15.36: Chess Position

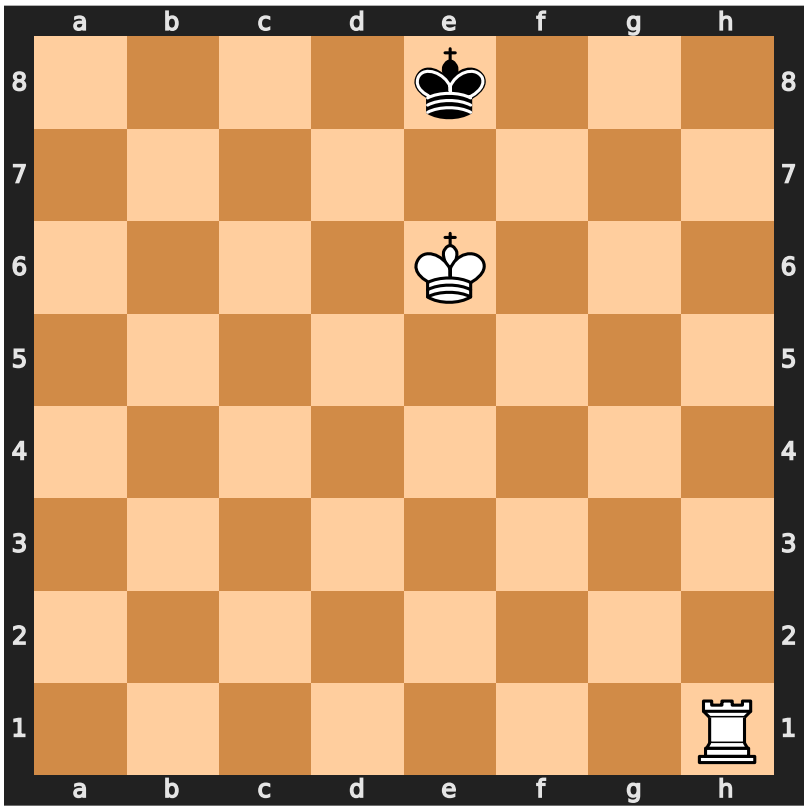

Figure 15.37: Chess Position

covered by rook.

Exercise 5.26 **Position:** White: Kb6, Rd1. Black: Ka8.

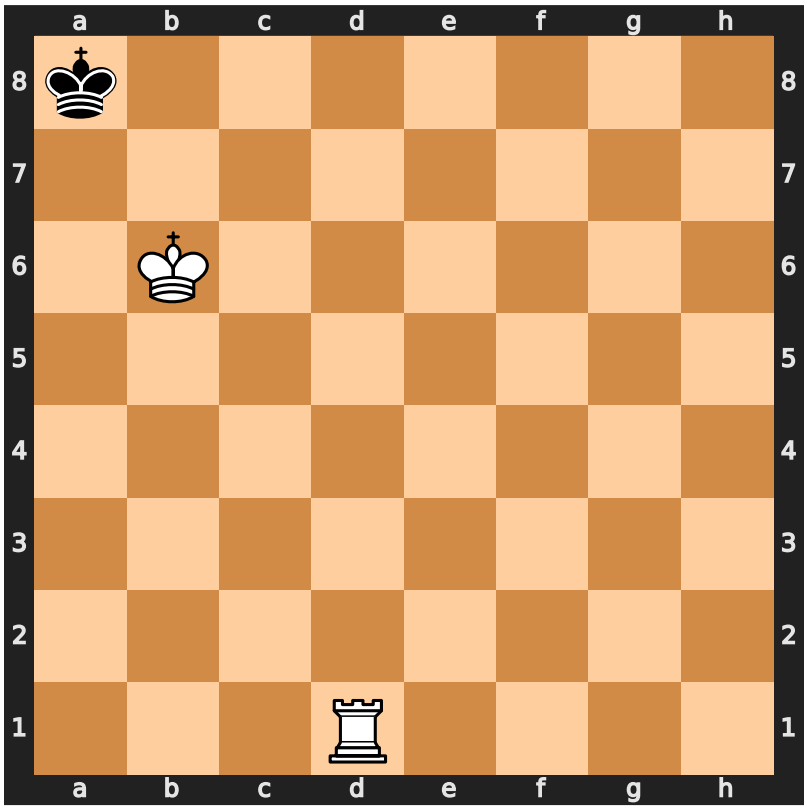

Figure 15.38: Chess Position

Task: Checkmate in 1 move. **Hint 1:** Same pattern: rook to the 8th rank. **Hint 2:** Rd8# checks along the rank. **Solution: 1. Rd8#** – Rook checks along rank 8. b8 covered by rook. a7, b7 covered by king.

Exercise 5.27 **Position:** White: Kg6, Rd1. Black: Kh8.

Task: Checkmate in 1 move. **Hint 1:** Rd8# seals the 8th rank. **Hint 2:** g7 and h7 covered by king. g8 covered by rook. **Solution: 1. Rd8#** – Rook checks along rank 8. g8 covered by rook. g7, h7 covered by king.

Exercise 5.28 **Position:** White: Kd6, Ra1. Black: Kd8.

Task: Checkmate in 1 move. **Hint 1:** Perfect opposition on the d-file. The rook finishes. **Hint 2:** Ra8# seals the rank. **Solution: 1. Ra8#** – Rook checks along rank 8. c7, d7, e7 covered by king. c8, e8 covered by rook.

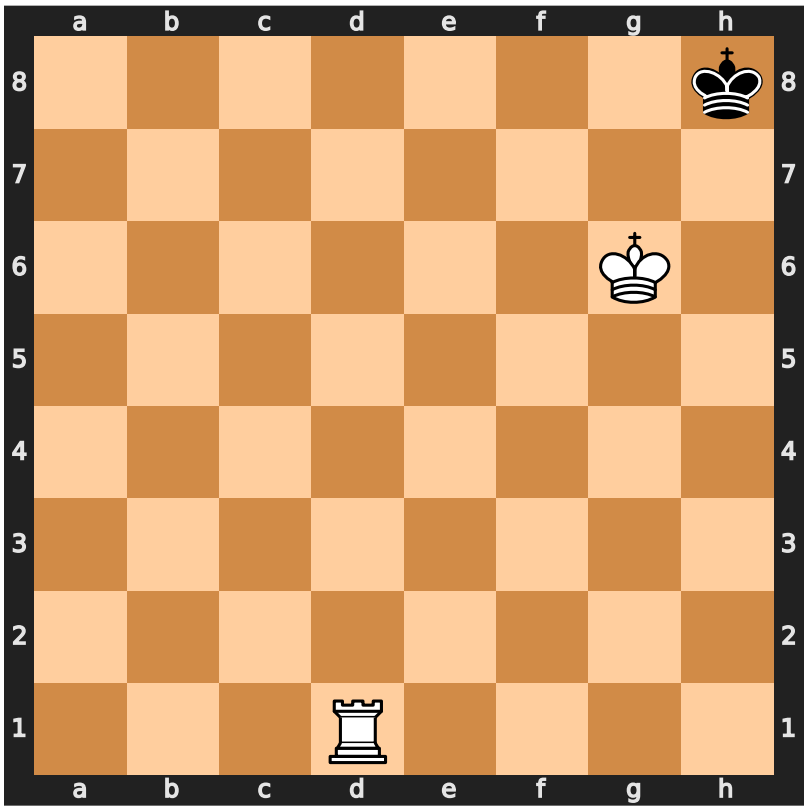

Figure 15.39: Chess Position

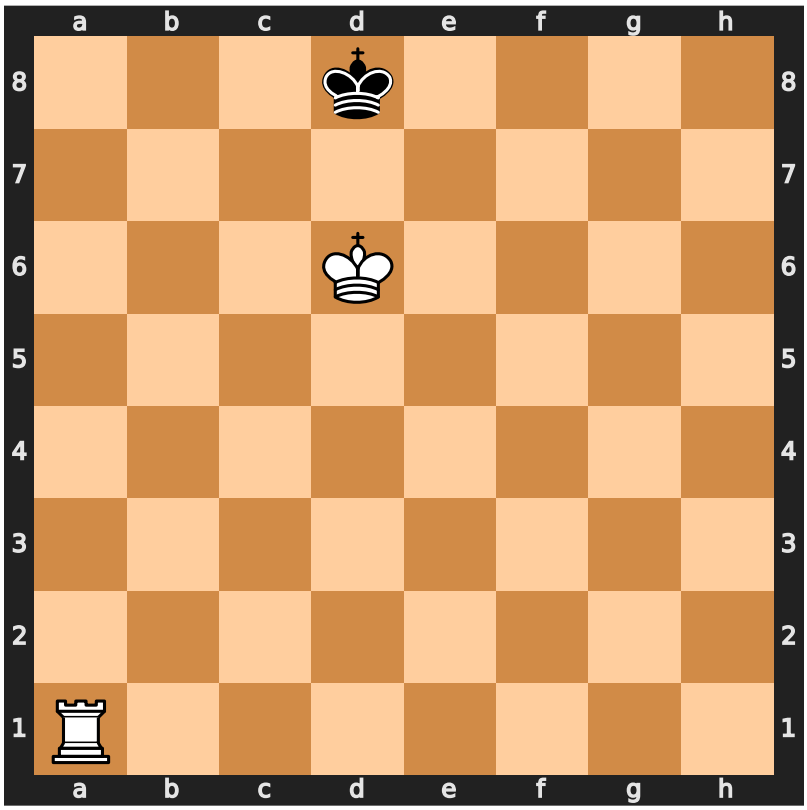

Figure 15.40: Chess Position

Exercise 5.29 **Position:** White: Kb6, Re1. Black: Kb8.

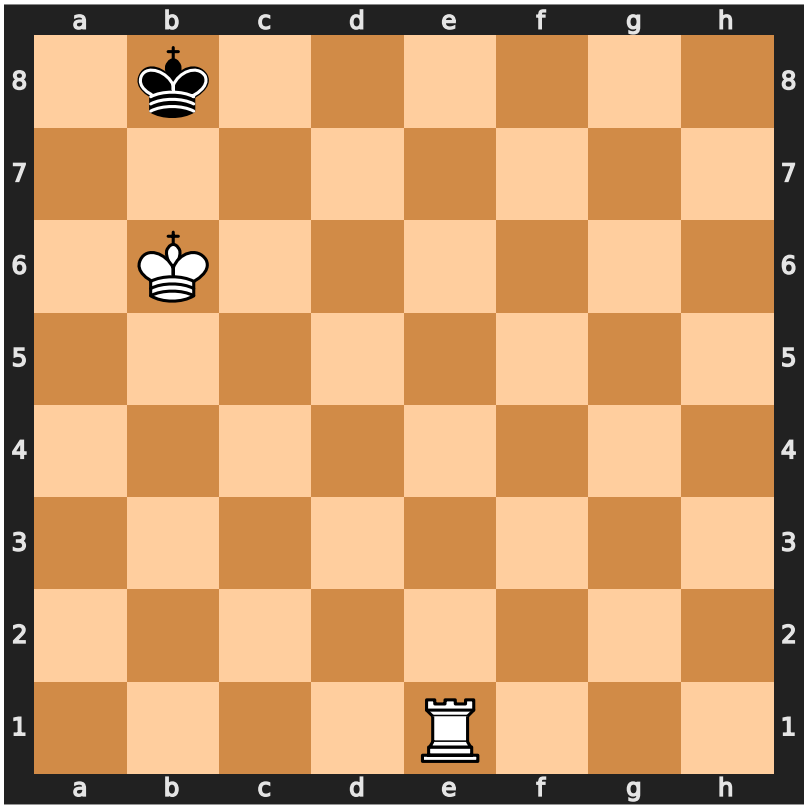

Figure 15.41: Chess Position

Task: Checkmate in 1 move. **Hint 1:** Opposition on the b-file. Rook seals it. **Hint 2:** Re8# checks along rank 8. **Solution: 1. Re8#** – Rook checks along rank 8. a8, c8 covered by rook. a7, b7, c7 covered by king.

Exercise 5.30 **Position:** White: Kh6, Ra1. Black: Kh8.

Task: Checkmate in 1 move. **Hint 1:** Ra8# seals rank 8. King covers g7 and h7. **Solution: 1. Ra8#** – Rook checks along rank 8. g8 covered by rook. g7, h7 covered by king.

Exercise 5.31 **Position:** White: Kf5, Ra7. Black: Kh8.

Task: Checkmate in 2 moves. **Hint 1:** The king needs to step closer to cover h7 and g7. **Hint 2:** 1. Kg6 (covers g7, h7, f7). Black has only Kg8 (h7 controlled by king, g7 controlled by king). **Hint 3:** 2. Ra8#. **Solution: 1. Kg6 Kg8 2. Ra8#** – After Kg6, the king on h8 can only go to g8. Then the rook seals rank 8 with the king covering f7, g7, h7.

Exercise 5.32 **Position:** White: Kg6, Ra1. Black: Kh8.

Task: Checkmate in 2 moves. **Hint 1:** The king on h8 has only one legal move: Kg8 (g7, h7 controlled by king). **Hint 2:** A "waiting move" with the rook does the trick. 1. Rb1 (or Rc1,

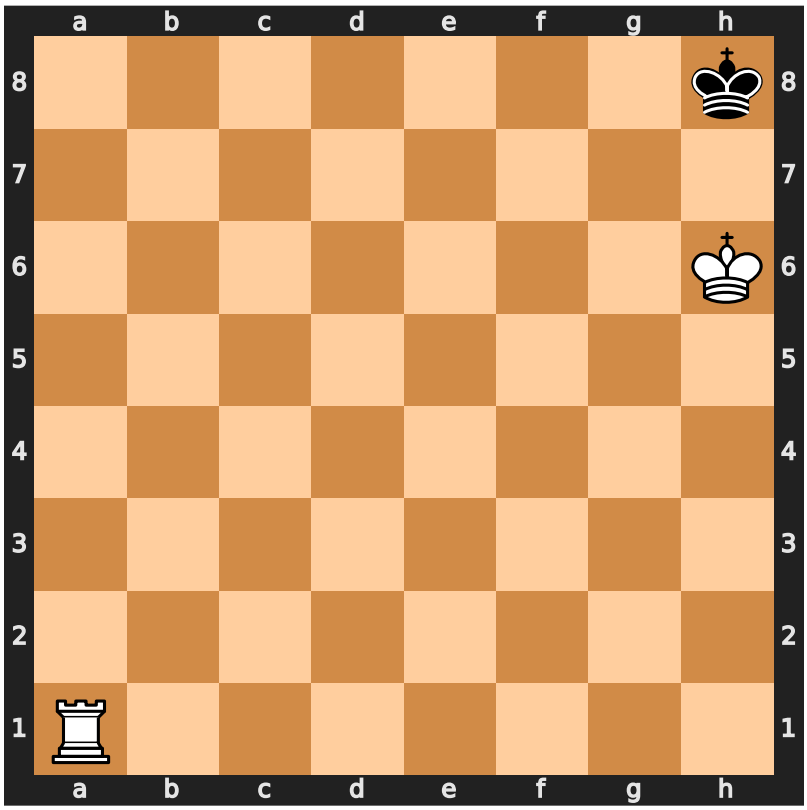

Figure 15.42: Chess Position

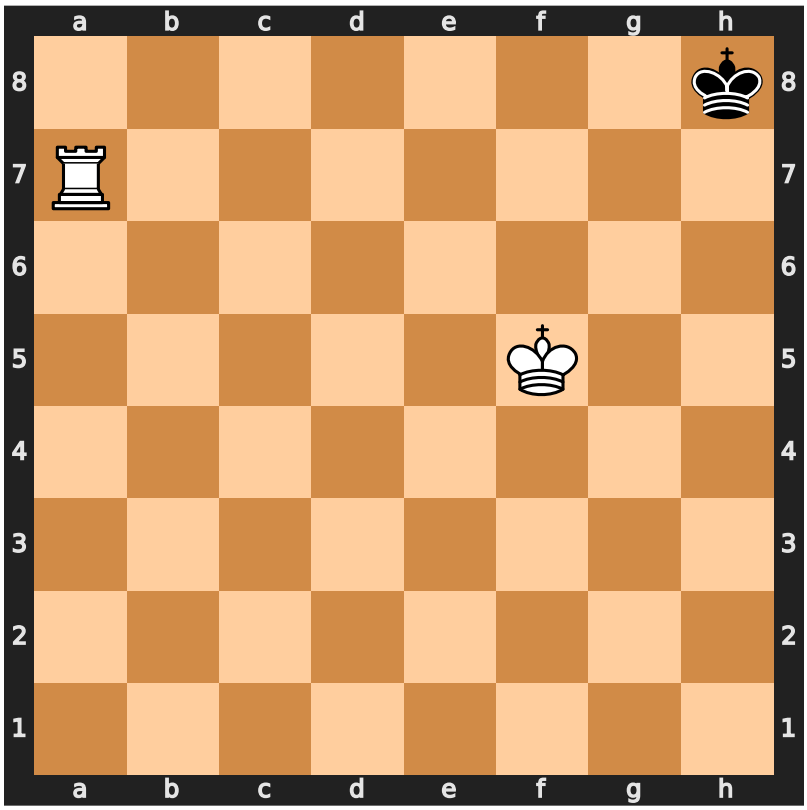

Figure 15.43: Chess Position

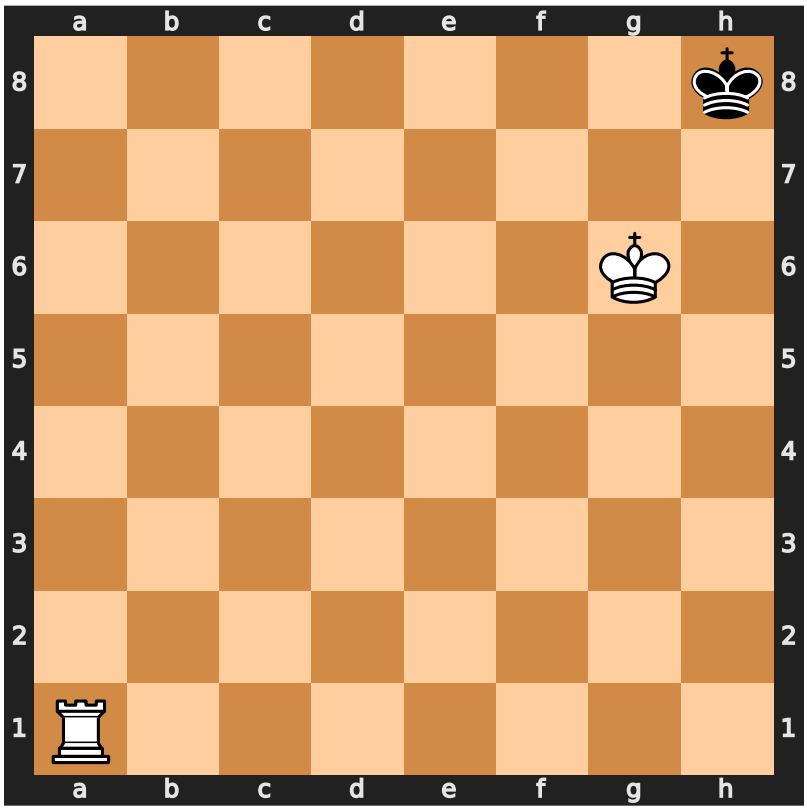

Figure 15.44: Chess Position

Rd1, etc.) Kg8. **Hint 3:** 2. Rb8# (or whichever file). **Solution: 1. Rb1 Kg8 2. Rb8#** – The waiting move forces Black to play Kg8 (the only legal move). Then the rook delivers the back-rank checkmate.

Exercise 5.33 **Position:** White: Ke5, Ra7. Black: Ke8.

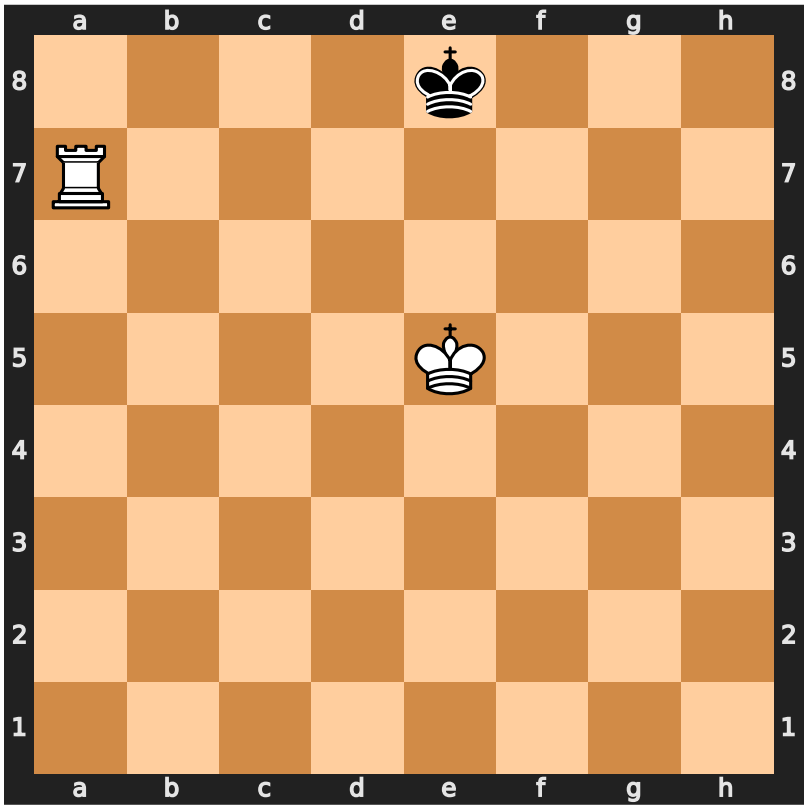

Figure 15.45: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** Advance the king to establish opposition. **Hint 2:** 1. Ke6 (opposition). Black must go to d8 or f8. **Hint 3:** After 1…Kd8 2. Ra8# (c7, d7, e7 covered by king). After 1…Kf8 the king escapes to g8. So only 1…Kd8 allows mate in 2. **Solution: 1. Ke6 Kd8 2. Ra8#** – If Black plays 1…Kf8 instead, White continues with 2. Kf6 and mates next move. Against 1…Kd8, the rook seals rank 8 immediately.

Exercise 5.34 **Position:** White: Kd5, Ra1. Black: Kd7.

Task: Checkmate in 3 moves. **Hint 1:** Use the staircase: check along rank 7 first. **Hint 2:** 1. Ra7+ Ke8 (forced to rank 8). Then bring the king forward. **Hint 3:** 2. Kd6 Kf8 3. Ke6 and the staircase continues. **Solution: 1. Ra7+ Ke8 2. Kd6 Kf8 3. Ke6** and the technique continues until the rook delivers back-rank checkmate. This exercise illustrates the full staircase process from Demonstration 2.

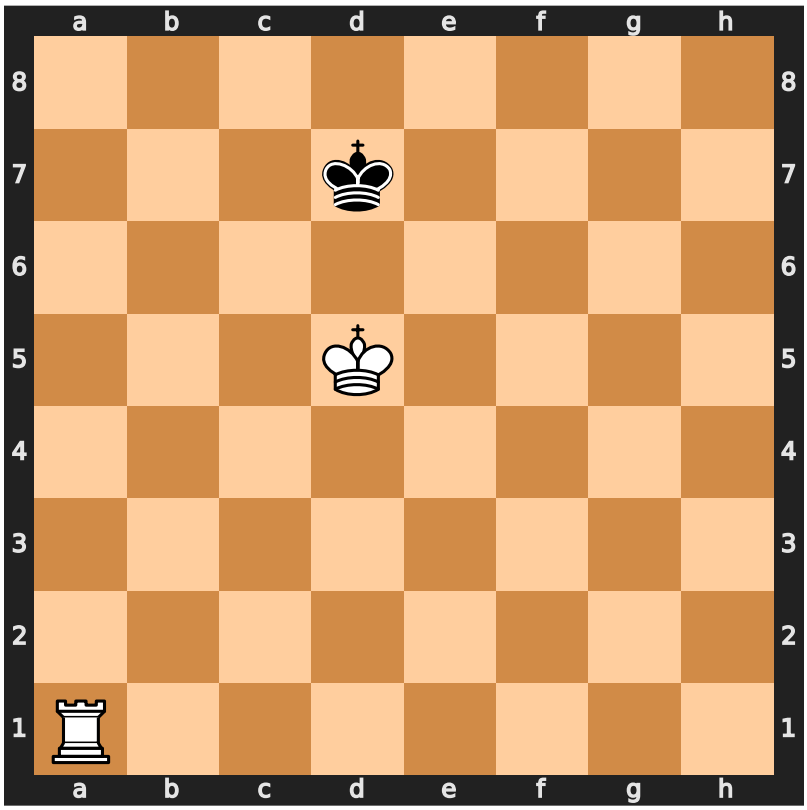

Figure 15.46: Chess Position

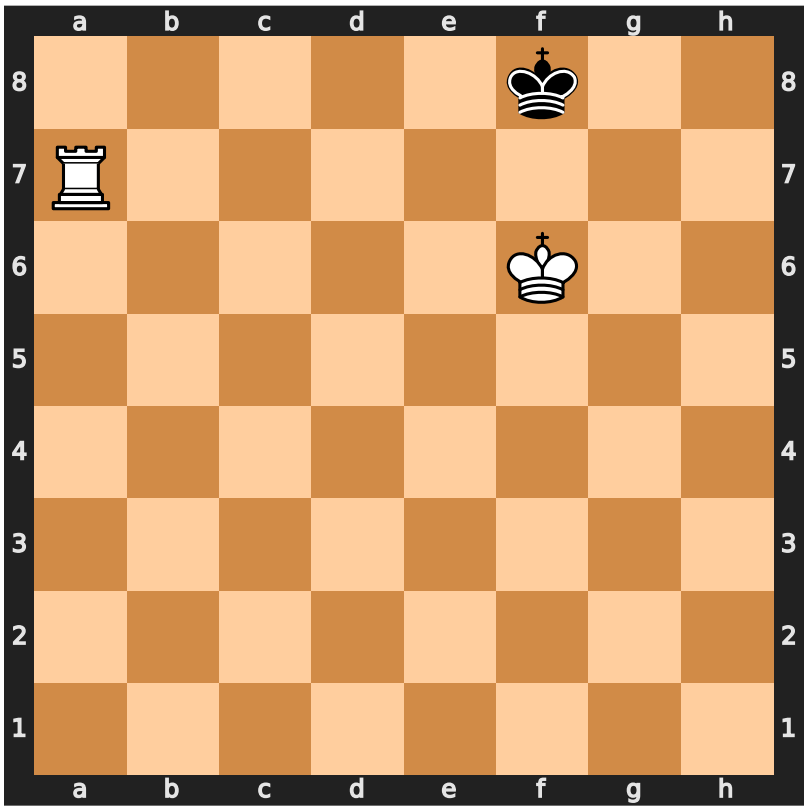

Figure 15.47: Chess Position

Exercise 5.35 **Position:** White: Kf6, Ra7. Black: Kf8.

Task: Checkmate in 3 moves. **Hint 1:** The king is on the back rank but not in a corner. Push it there. **Hint 2:** 1. Ke6 threatens to establish opposition. **Hint 3:** If 1…Ke8, play 2. Ra8# immediately. If 1…Kg8, continue with 2. Kf6 and checkmate follows shortly. **Solution: 1. Ke6** and the technique continues. If 1…Ke8, then 2. Ra8# is immediate checkmate. If 1…Kg8, the king chases with 2. Kf6 Kh8 3. Kg6 and Ra8# next move.

Exercise 5.36 **Position:** White: Kb6, Rg7. Black: Ka8.

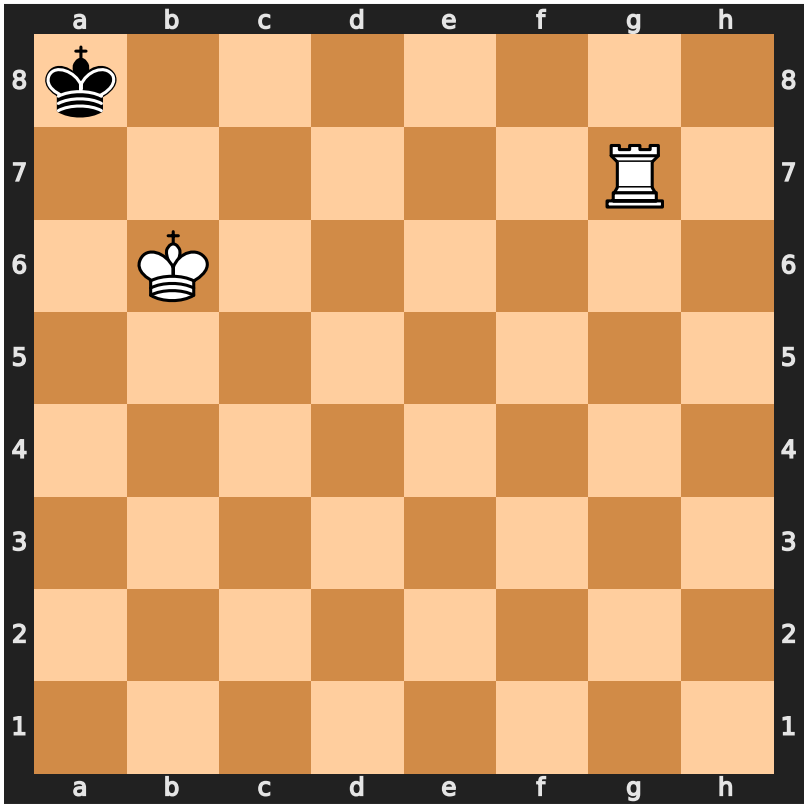

Figure 15.48: Chess Position

Task: Checkmate in 2 moves. **Hint 1:** The rook needs to reach rank 8, but the king is on a8. Use a waiting move along rank 7. **Hint 2:** 1. Rc7 covers the c-file and rank 7. From a8, only Kb8 is legal (a7 controlled by the king). **Hint 3:** After 1…Kb8, play 2. Rc8#. **Solution: 1. Rc7 Kb8 2. Rc8#** – The rook checks along rank 8. a8 covered by rook. a7 and b7 covered by king. c7 covered by king (b6 is adjacent to c7). Checkmate.

Exercise 5.37 **Position:** White: Ke6, Ra1. Black: Ke8.

Task: Checkmate in 1 move. **Hint 1:** Perfect opposition. Rook to the 8th rank. **Solution: 1. Ra8#** – Identical to Exercise 5.25 but with the rook on a1 instead of h1. Rook seals rank 8. King covers d7, e7, f7.

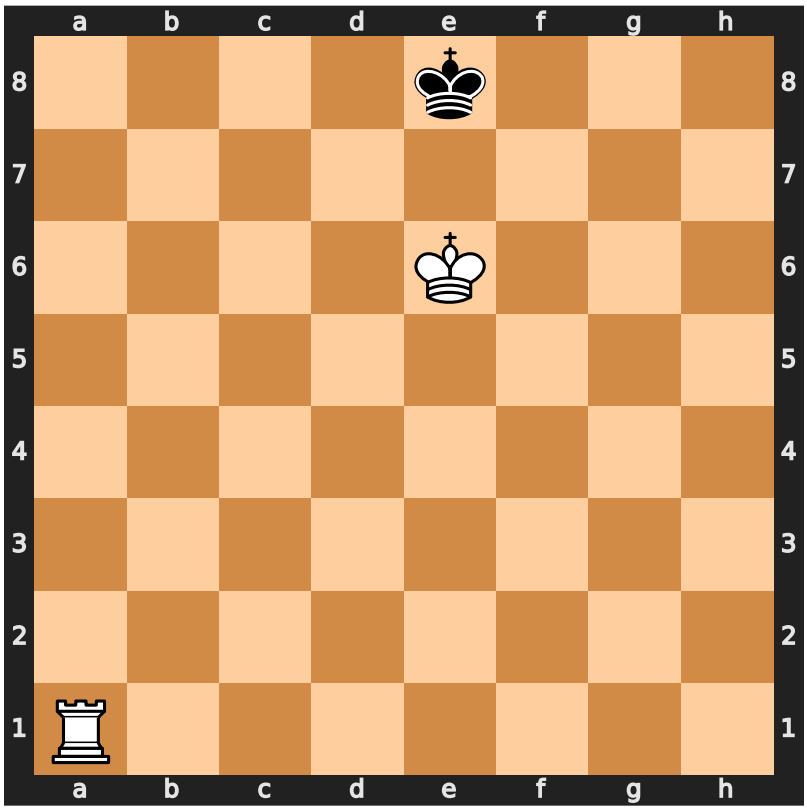

Figure 15.49: Chess Position

Exercise 5.38 **Position:** White: Kc6, Rh1. Black: Kc8.

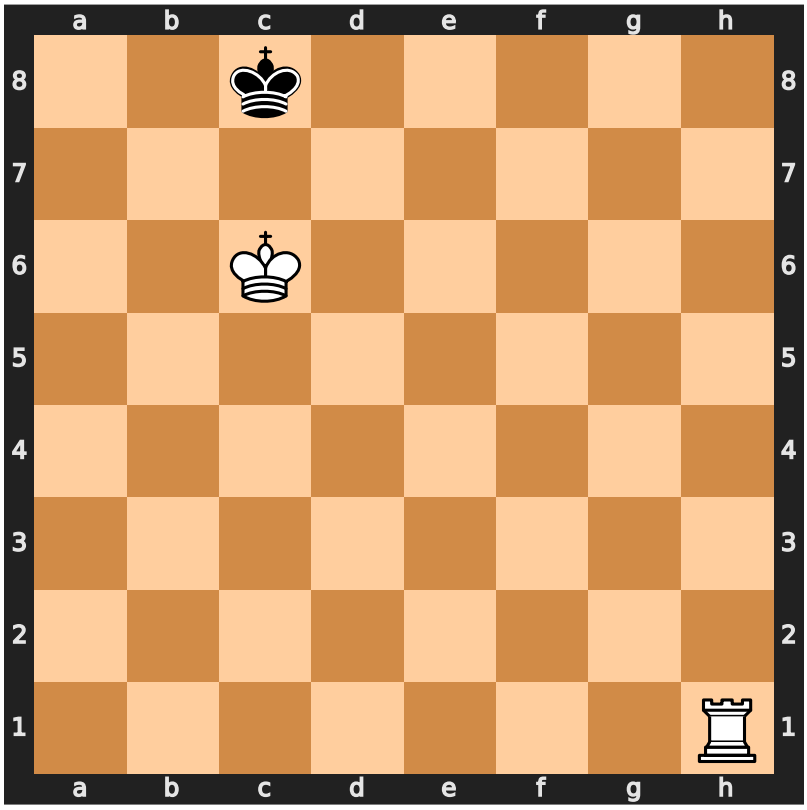

Figure 15.50: Chess Position

Task: Checkmate in 1 move. **Hint 1:** Opposition on c-file. Rook seals rank 8. **Solution: 1. Rh8#** – Rook checks along rank 8. b7, c7, d7 covered by king. b8, d8 covered by rook.

Exercise 5.39 **Position:** White: Kg5, Ra7. Black: Kg8.

Task: Checkmate in 2 moves. **Hint 1:** 1. Kg6 establishes control. **Hint 2:** After Kg6, Black plays Kf8 or Kh8. **Hint 3:** If Kh8: 2. Ra8#. If Kf8: White continues with 2. Kf6 and mates shortly. **Solution: 1. Kg6 Kh8 2. Ra8#** – The king move forces Black to the corner, then the rook finishes. If 1…Kf8, the technique requires one or two more moves.

Exercise 5.40 **Position:** White: Kf6, Ra7. Black: Kg8.

Task: Checkmate in 2 moves. **Hint 1:** 1. Kg6 forces Black's king to h8 or f8. **Hint 2:** If 1…Kh8: 2. Ra8# is immediate checkmate. **Hint 3:** If 1…Kf8 instead, the technique continues with 2. Kf6 and eventually Ra8#. **Solution: 1. Kg6 Kh8 2. Ra8#** – The king steps forward, forces the defending king to the corner, and the rook delivers the final blow. If 1…Kf8 instead, the technique continues with 2. Kf6.

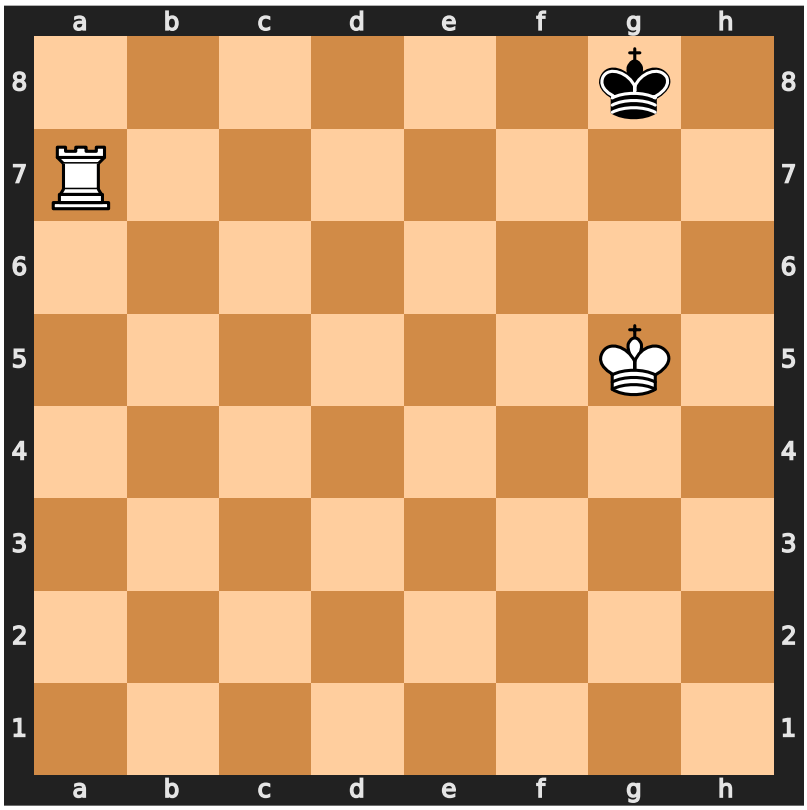

Figure 15.51: Chess Position

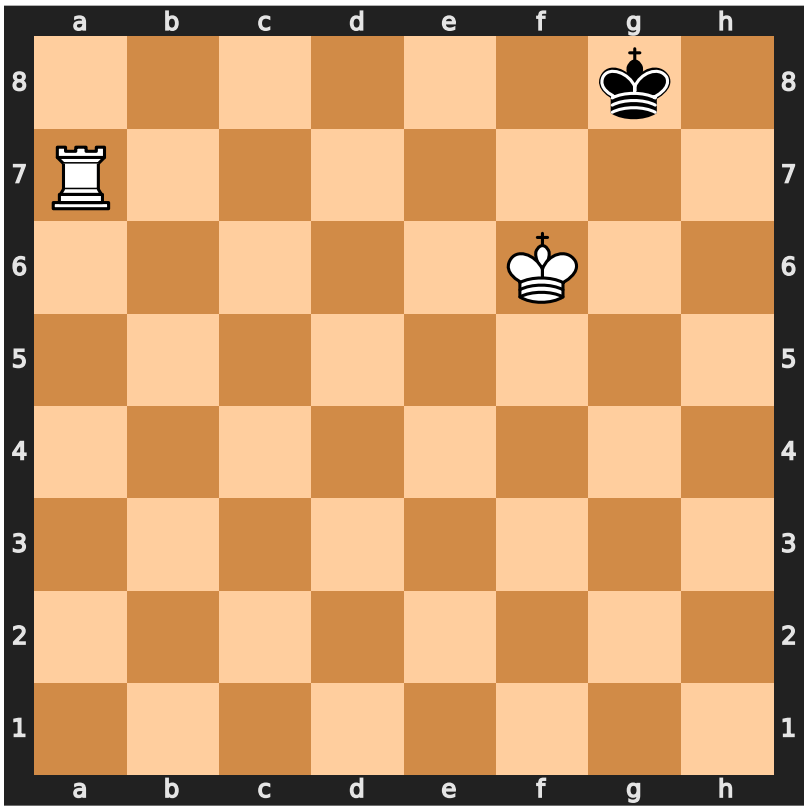

Figure 15.52: Chess Position

15.9.3 Section C: King + Two Bishops vs. King (Exercises 5.41 – 5.55)

These exercises focus on recognizing the checkmate pattern and understanding how the bishops cooperate. The two-bishop checkmate always ends in the corner.

Exercise 5.41 **Position:** White: Kb6, Bc6, Bd6. Black: Ka8.

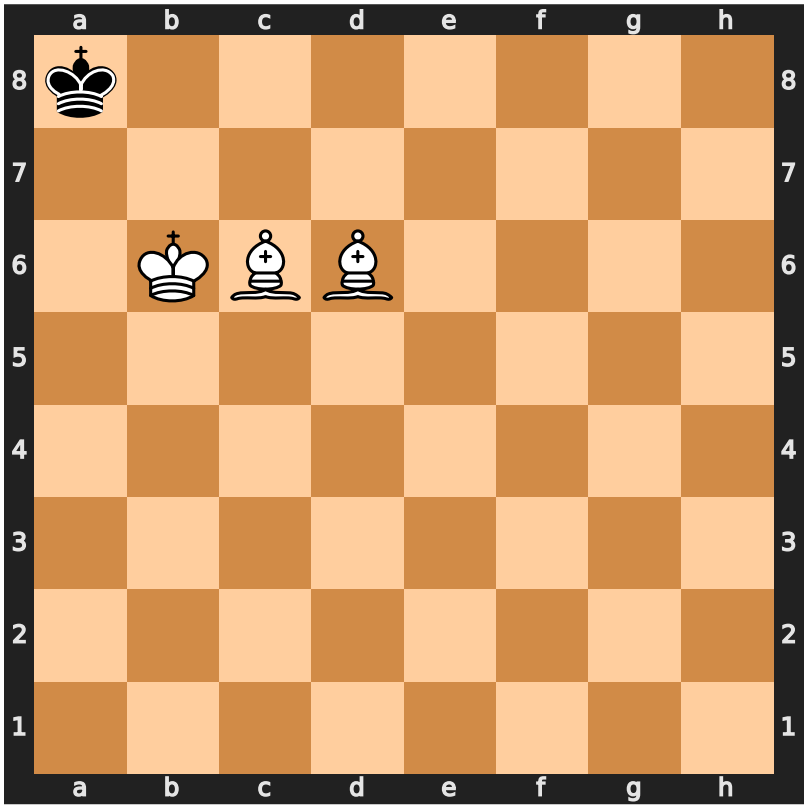

Figure 15.53: Chess Position

Task: Verify this is checkmate. Name the checking piece and the piece covering b8. **Solution:** Bc6 checks a8 (diagonal c6-b7-a8). Bd6 covers b8 (diagonal d6-c7-b8). King covers a7 and b7. Checkmate.

Exercise 5.42 **Position:** White: Kg6, Bf7, Bg7. Black: Kh8.

Task: Verify this is checkmate. Name the checking piece and the piece covering g8. **Solution:** Bg7 checks h8 (diagonal g7-h8). Bf7 covers g8 (diagonal f7-g8). King covers h7. Checkmate.

Exercise 5.43 **Position:** White: Kb6, Bc7, Bd5. Black: Ka8.

Task: Verify this is checkmate. **Solution:** Bd5 checks a8 (diagonal d5-c6-b7-a8). Bc7 covers b8 (diagonal c7-b8). King covers a7 and b7. Checkmate.

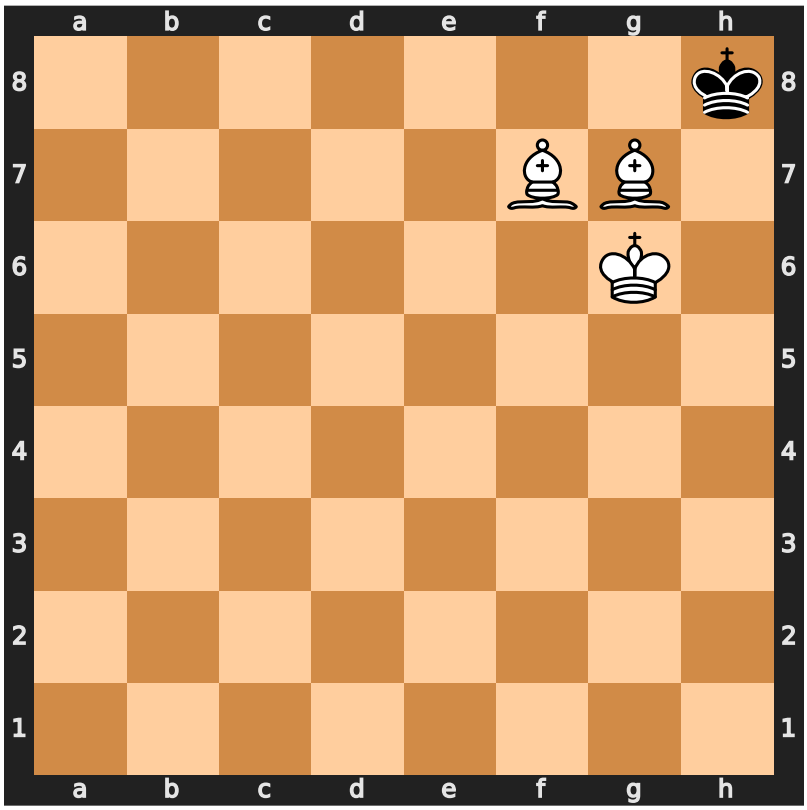

Figure 15.54: Chess Position

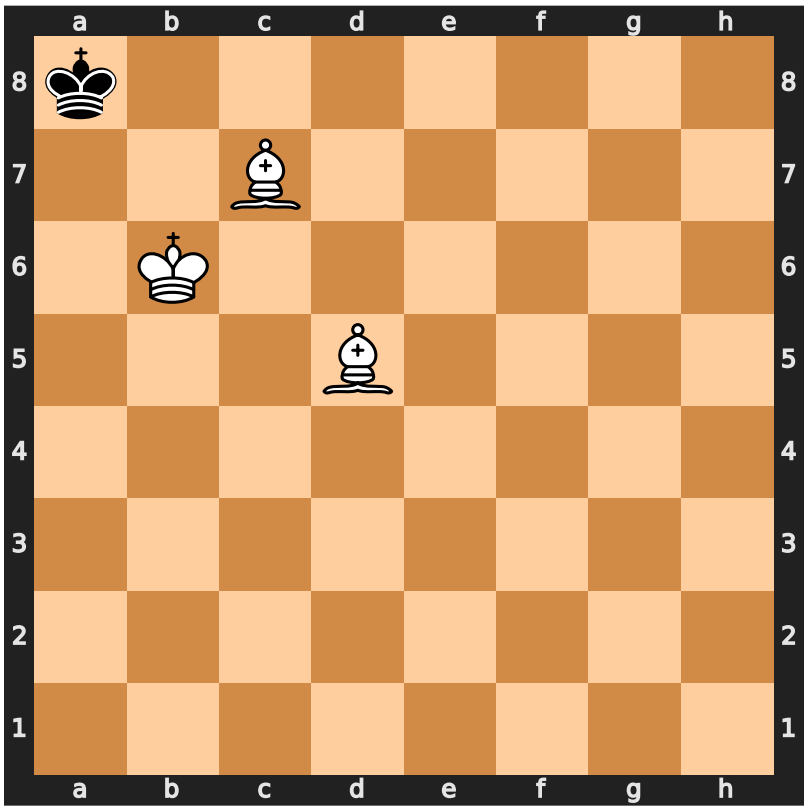

Figure 15.55: Chess Position

Exercise 5.44 **Position:** White: Kg6, Bg7, Bh5. Black: Kh8.

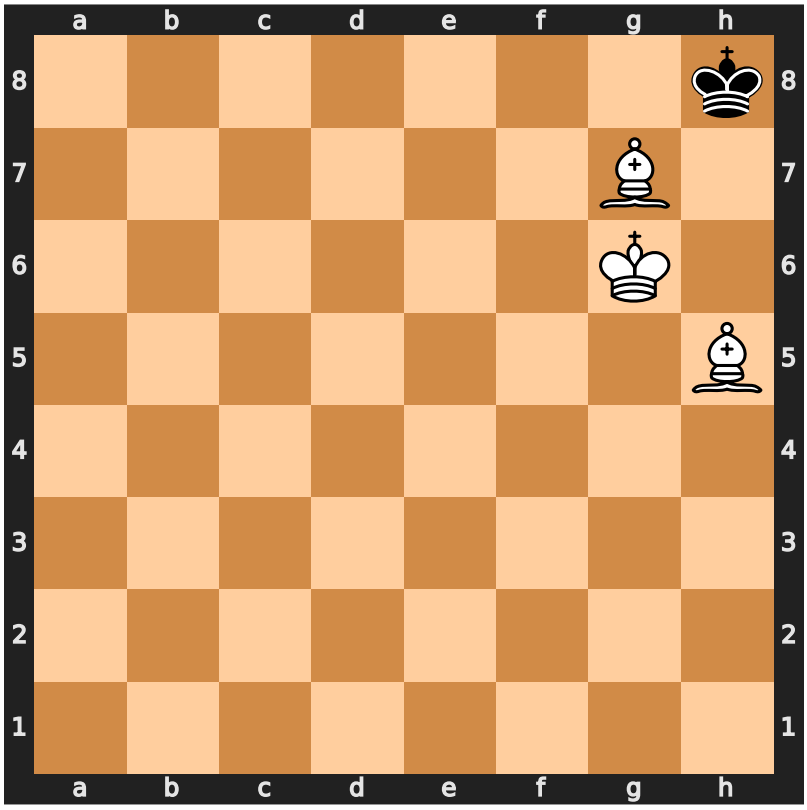

Figure 15.56: Chess Position

Task: Is this checkmate? **Hint:** Which piece attacks h8? **Solution:** Bg7 attacks h8 on the diagonal. Check! However, g8 is not covered: Bh5 does not control g8 (its diagonals go to g6 and g4), and Kg6 is not adjacent to g8. **g8 is free. Not checkmate!** Black escapes to g8.

Exercise 5.45 **Position:** White: Kg6, Bf6, Bf7. Black: Kh8.

Task: White to play and checkmate in 1 move. **Solution: 1. Bg7#** (Bf6 to g7). Checks h8 on the diagonal. g8 covered by Bf7 (f7-g8). h7 covered by king (g6-h7). Bg7 protected by king. Checkmate!

Exercise 5.46 **Position:** White: Kb6, Bd5, Bc5. Black: Ka8.

Task: White to play and checkmate in 1 move. **Hint:** Move the dark-squared bishop to create a discovered check from the light-squared bishop. **Solution: 1. Bd6#** (Bc5 to d6). Discovered check from Bd5 along the diagonal d5-c6-b7-a8. b8 covered by Bd6 (d6-c7-b8). a7 covered by king. b7 covered by Bd5. Checkmate!

Exercise 5.47 **Position:** White: Kg6, Bg5, Bf7. Black: Kh8.

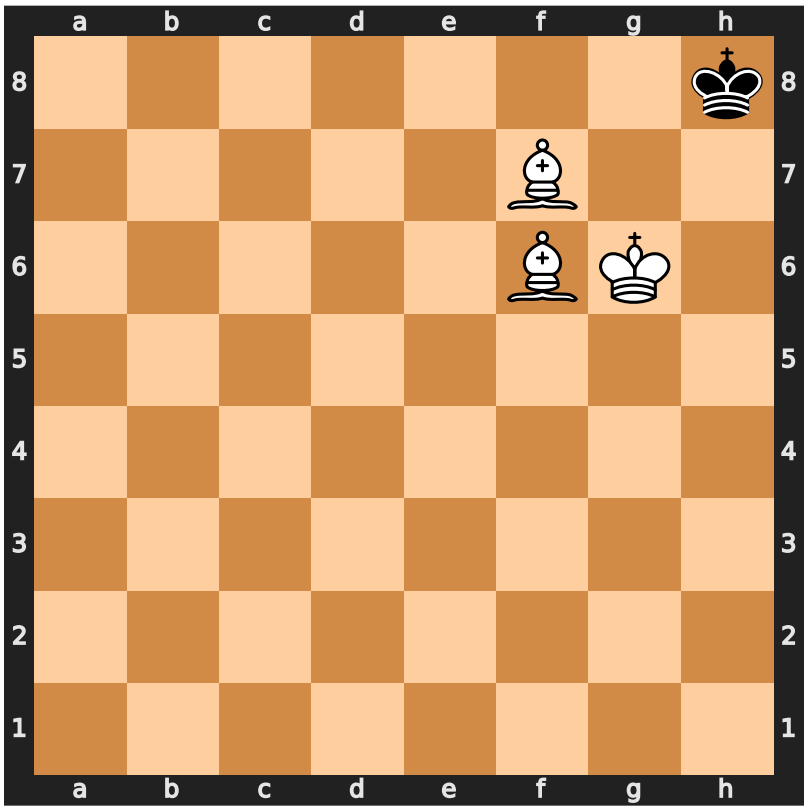

Figure 15.57: Chess Position

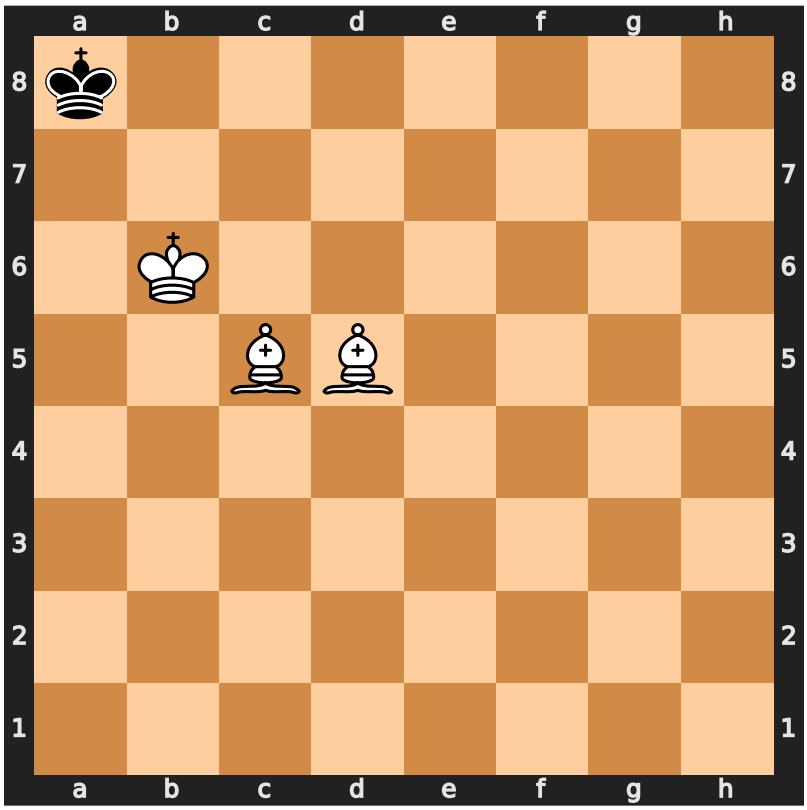

Figure 15.58: Chess Position

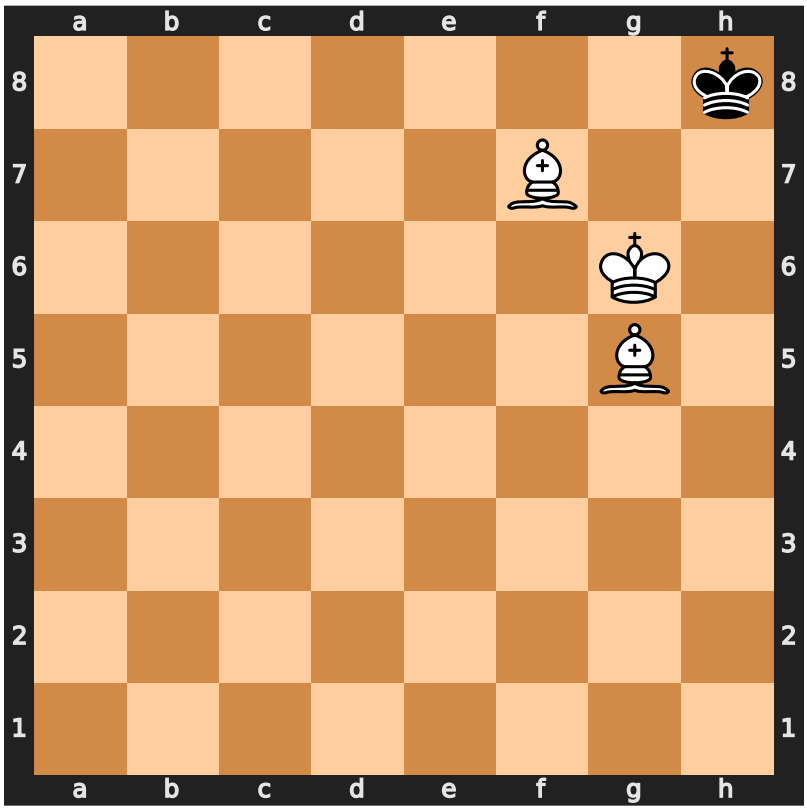

Figure 15.59: Chess Position

Task: White to play and checkmate in 1 move. **Hint:** Move the dark-squared bishop to f6 or g7. **Solution: 1. Bf6#** (Bg5 to f6). Checks h8 on the diagonal (f6-g7-h8). g8 covered by Bf7 (f7-g8). g7 covered by king (g6-g7). h7 covered by king (g6-h7). Checkmate!

Exercise 5.48 **Position:** White: Kb6, Bc6, Be5. Black: Ka8.

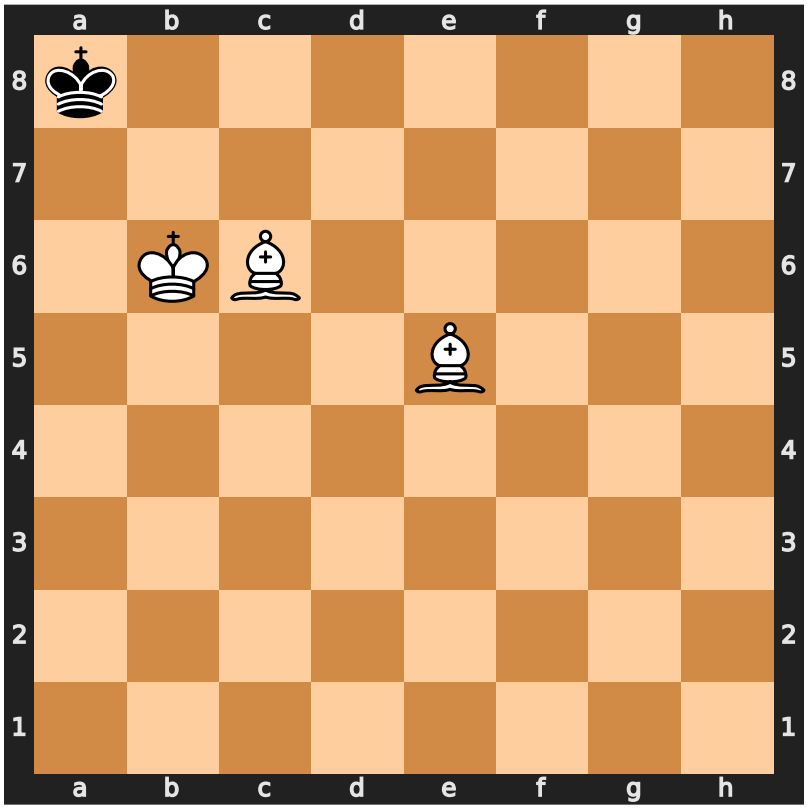

Figure 15.60: Chess Position

Task: Is this checkmate? **Solution:** Bc6 checks a8 (c6-b7-a8 diagonal). a7: covered by king. b7: covered by Bc6 and king. b8: Be5 covers b8 along the e5-d6-c7-b8 diagonal. **Checkmate confirmed.**

Exercise 5.49 **Position:** White: Kh6, Bf7, Bf6. Black: Kh8.

Task: White to play and checkmate in 1 move. **Solution: 1. Bg7#** (Bf6 to g7). Checks h8 on the diagonal. g8 covered by Bf7 (f7-g8 diagonal). h7 covered by king (h6-h7 adjacent). Checkmate!

Exercise 5.50 **Position:** White: Ka3, Bb3, Bb2. Black: Ka1.

Task: Is this checkmate? **Solution:** Bb2 checks a1 on the b2-a1 diagonal. Check! a2: covered by Bb3 (b3-a2 diagonal) and Ka3. But b1 is not covered by any piece – Bb2's diagonals go to a1 and c1 (not b1), Bb3's diagonals go to a2 and c2 (not b1), and Ka3 is not adjacent to b1. **b1 is free. Not checkmate!**

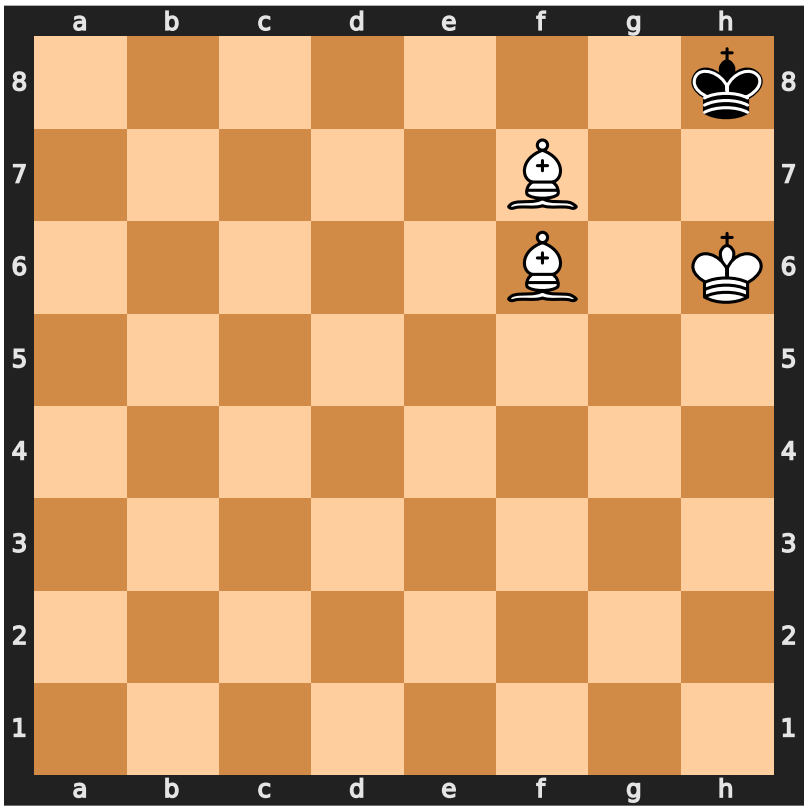

Figure 15.61: Chess Position

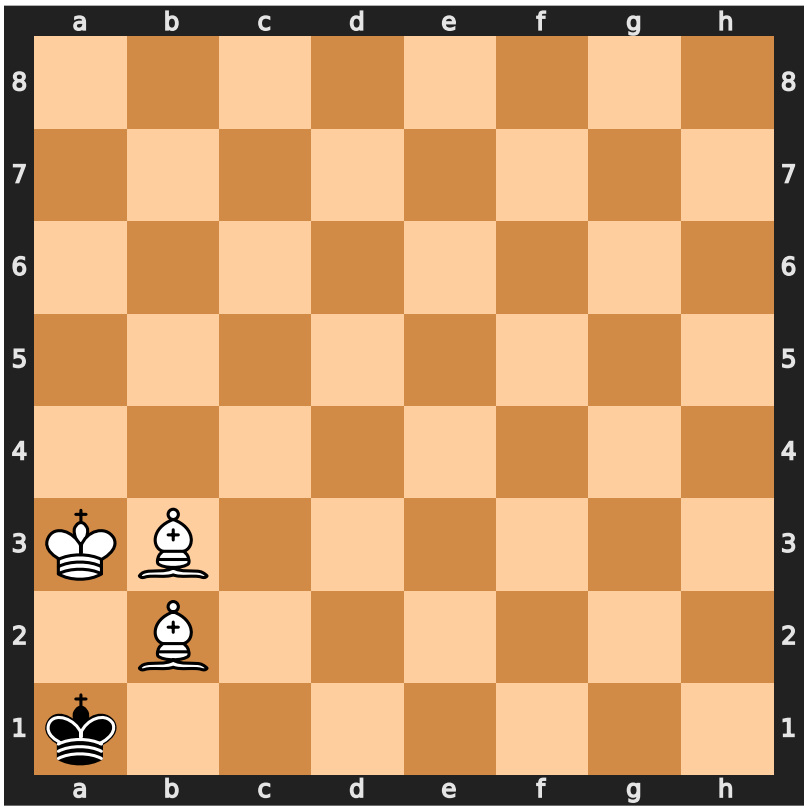

Figure 15.62: Chess Position

Exercise 5.51 **Position:** White: Ka3, Bc3, Bb3. Black: Ka1.

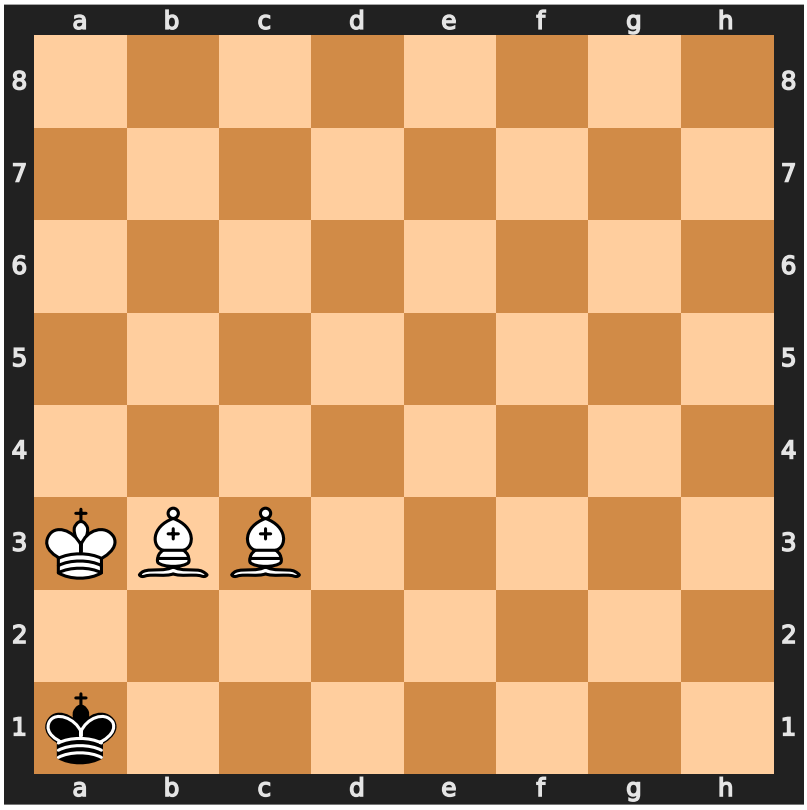

Figure 15.63: Chess Position

Task: Is this checkmate? **Solution:** Neither bishop gives check: Bc3's diagonals (b2, d2, b4, d4) do not include a1, and Bb3's diagonals (a2, c2, a4, c4) do not include a1. **Not checkmate** – there is no check at all. The king can move to b1 (not controlled by any piece). This is not even stalemate.

Exercise 5.52 **Position:** White: Ka6, Ba7, Bb7. Black: Ka8.

Task: Is this checkmate or stalemate? **Solution:** Bb7 checks a8 on the b7-a8 diagonal. Check! Escapes: a7 is occupied by Ba7 (protected by Ka6), and b8 is covered by Ba7 on the a7-b8 diagonal. **Checkmate!**

Exercise 5.53 **Position:** White: Ka6, Bb5, Ba7. Black: Ka8.

Task: Is this checkmate? **Solution:** Neither bishop gives check: Bb5's diagonals (a6, c6, a4, c4) do not include a8, and Ba7 cannot check a8 because bishops do not move along files. No check means no checkmate. Can the king move? b8 is covered by Ba7 (a7-b8 diagonal). b7 is covered by Ka6 (adjacent). a7 is occupied by Ba7. No legal moves and no check. **Stalemate!** The game is a draw.

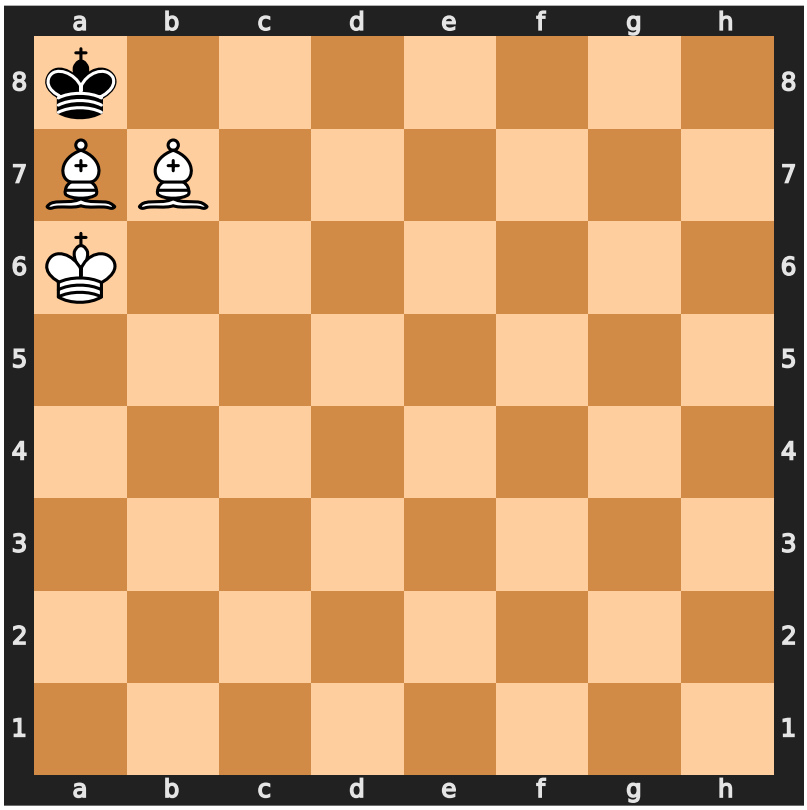

Figure 15.64: Chess Position

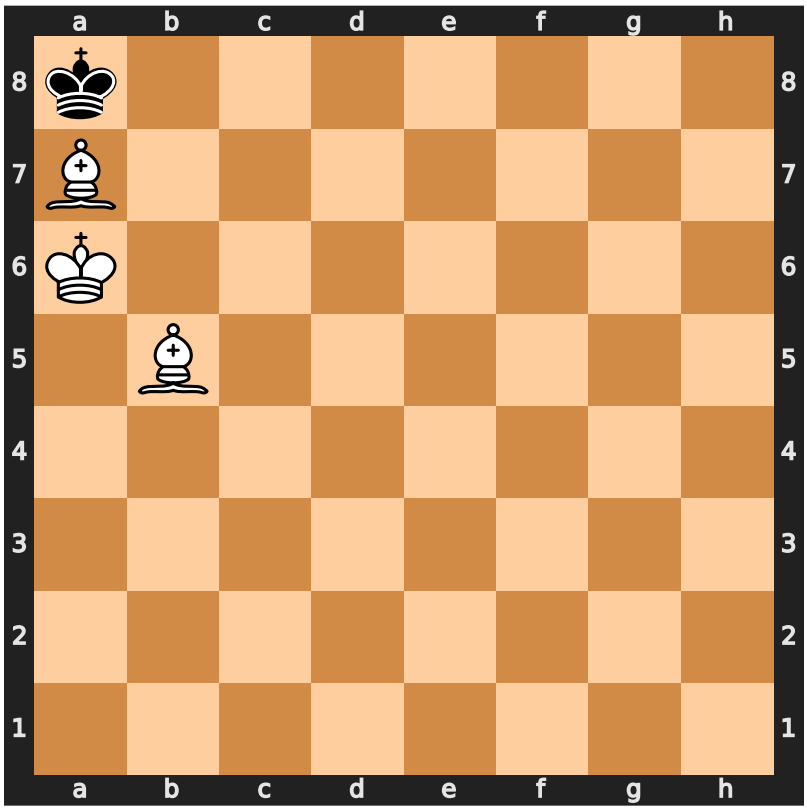

Figure 15.65: Chess Position

Exercise 5.54 **Position:** White: Kb6, Bd6, Bd5. Black: Ka8.

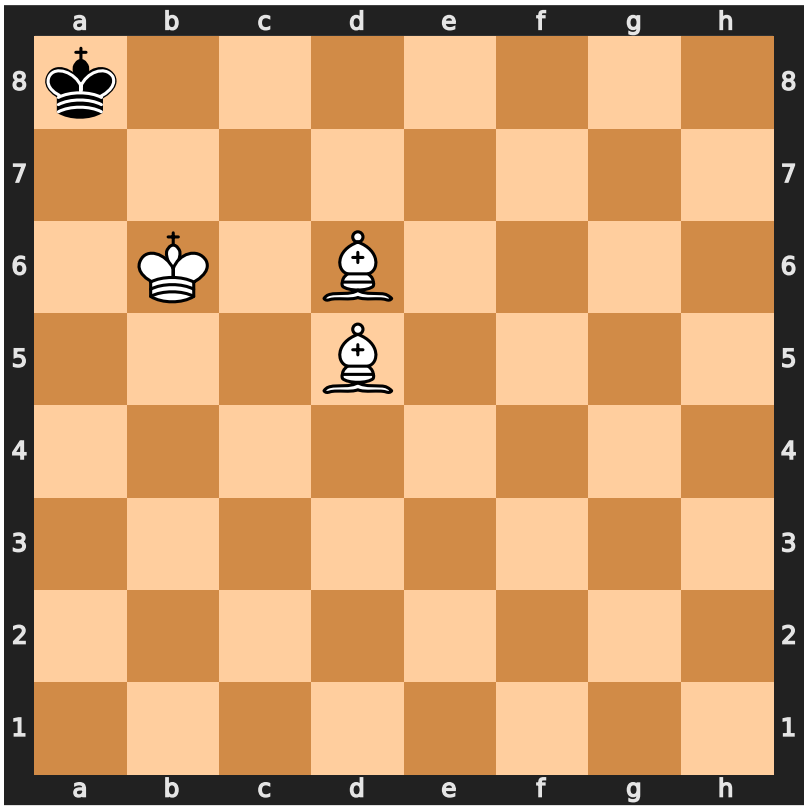

Figure 15.66: Chess Position

Task: Is this checkmate? **Solution:** Bd5 checks a8 along the d5-c6-b7-a8 diagonal. a7: covered by king (b6 adjacent). b7: covered by Bd5 and king. b8: covered by Bd6 along the d6-c7-b8 diagonal. **Checkmate!**

Exercise 5.55 **Position:** Set up White: Ke1, Bc1, Bf1, and Black: Ke8. **Task:** Practice driving the Black king to a corner and delivering checkmate using the diagonal barrier technique. This is an open-ended practice exercise with no single correct answer. The goal is to deliver checkmate in under 25 moves. **Solution:** The key steps: (1) centralize both bishops side by side to form a diagonal wall, (2) advance the diagonal wall toward a corner one step at a time, (3) bring your king up to support the bishops, (4) deliver checkmate in the corner using the pattern from Exercise 5.41 (Kb6, Bc6, Bd6 vs. Ka8).

15.9.4 Section D: King + Bishop + Knight vs. King (Exercises 5.56 – 5.65)

These exercises focus on recognizing the final checkmate pattern and understanding which corner is correct.

Exercise 5.56 **Position:** White: Kb3, Nc3, Bb2. Black: Ka1.

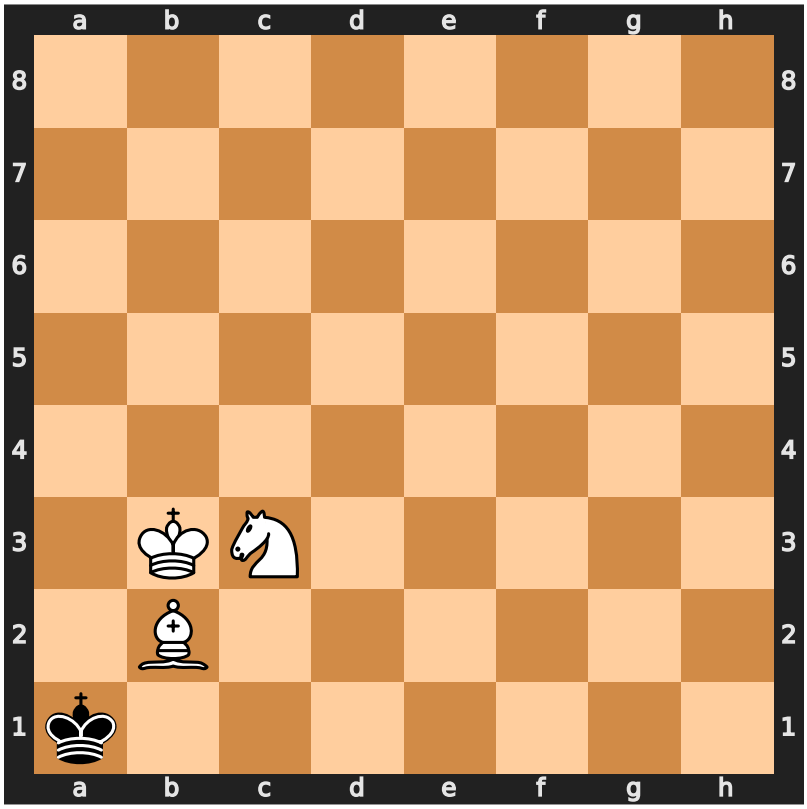

Figure 15.67: Chess Position

Task: Verify this is checkmate. **Solution:** Bb2 checks a1 (diagonal b2-a1). a2: Nc3 attacks a2 (knight on c3 reaches a2). b1: Nc3 attacks b1. b2: bishop there, protected by king (b3-b2 adjacent). **Checkmate confirmed.**

Exercise 5.57 **Position:** White: Kg3, Nf3, Bg2. Black: Kh1.

Task: Verify this is checkmate. **Solution:** Bg2 checks h1 on the g2-h1 diagonal. g1: covered by Nf3. h2: covered by Nf3 and Kg3. g2: Bg2 is there, protected by Kg3 (adjacent). **Checkmate confirmed.**

Exercise 5.58 **Position:** White: Ka3, Nc2, Bb1. Black: Ka1.

Task: Is this checkmate? **Solution:** Nc2 checks Ka1 (c2 to a1 is a valid knight move). Check! However, the bishop on b1 is unprotected – neither Ka3 nor Nc2 defends b1. The king escapes by capturing: **Kxb1** is legal. **Not checkmate.** This illustrates a common error: all pieces in the mating net must be protected or out of the king's reach.

Exercise 5.59 **Task:** In K+B+N vs. K, if you have a dark-squared bishop, which corners can you deliver checkmate in? **Solution:** A dark-squared bishop can deliver checkmate in **a1** (dark

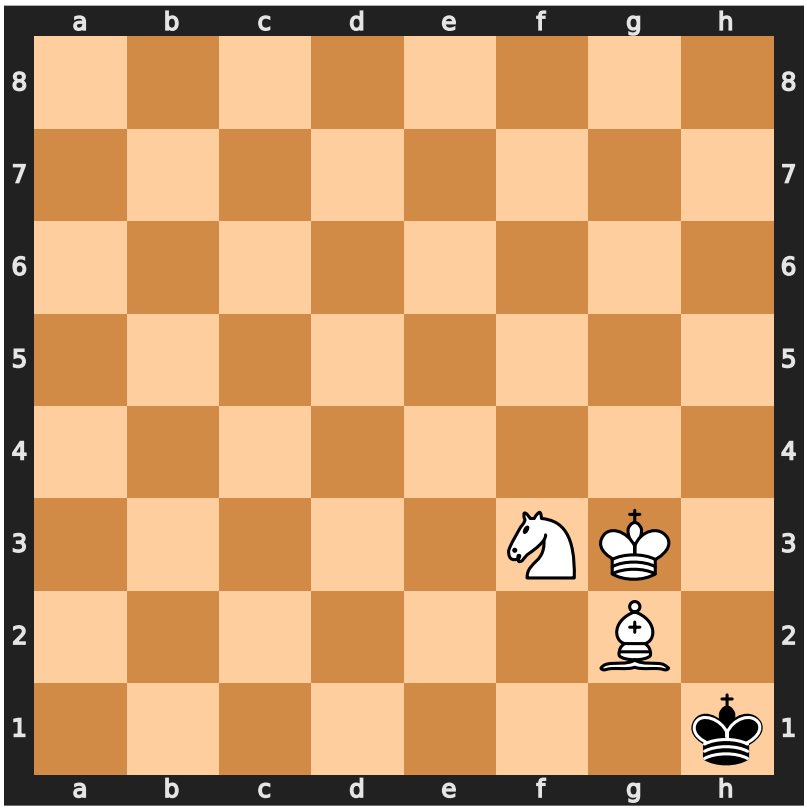

Figure 15.68: Chess Position

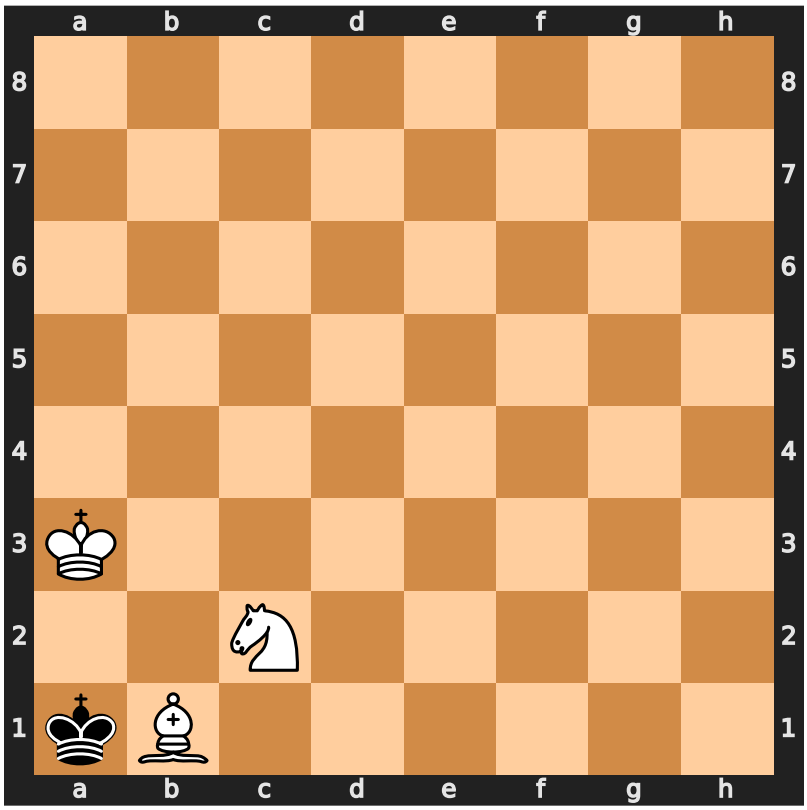

Figure 15.69: Chess Position

square) or **h8** (dark square). These are the dark-squared corners.

Exercise 5.60 **Task:** In K+B+N vs. K, if you have a light-squared bishop, which corners can you deliver checkmate in? **Solution:** A light-squared bishop can deliver checkmate in **a8** (light square) or **h1** (light square). These are the light-squared corners.

Exercise 5.61 **Position:** White: Kb6, Nc6, Bb7. Black: Ka8.

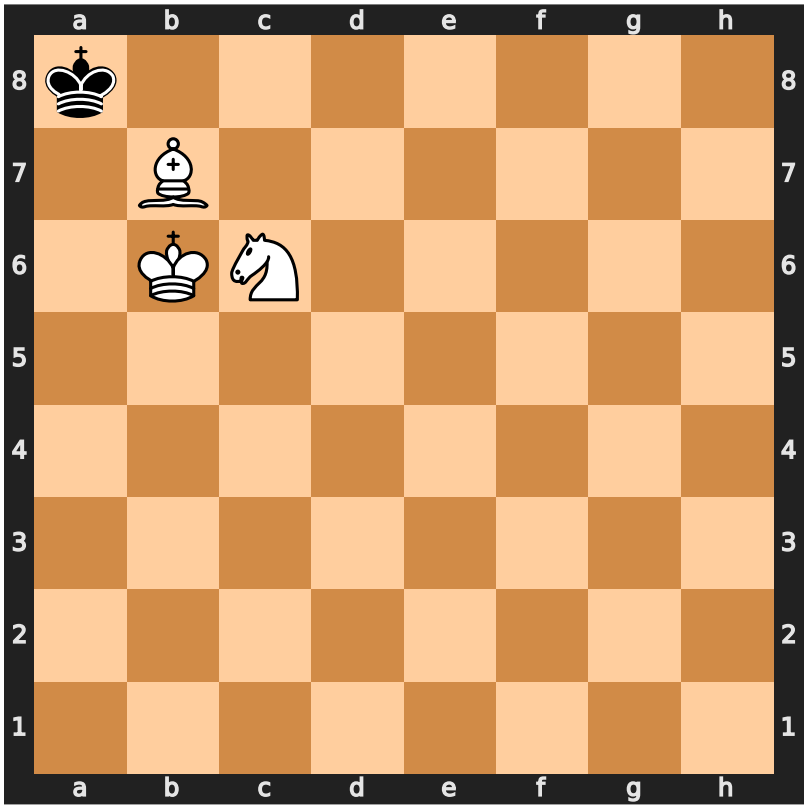

Figure 15.70: Chess Position

Task: Is this checkmate? **Solution:** Bb7 checks a8 on the b7-a8 diagonal. b8: covered by Nc6 (knight on c6 attacks b8). a7: covered by Kb6 (adjacent). b7: occupied by bishop, protected by Kb6 (adjacent). **Checkmate confirmed!**

Exercise 5.62 **Position:** White: Kg6, Nf6, Bg8. Black: Kh8.

Task: Is this checkmate? **Solution:** Bg8 does not check h8 – g8 and h8 are on the same rank, and bishops do not move along ranks. Nf6 does not check h8 either (f6 attacks d5, d7, e4, e8, g4, g8, h5, h7 – not h8). **No check. Not checkmate.**

Exercise 5.63 **Position:** White: Kf6, Nf7, Bg8. Black: Kh8.

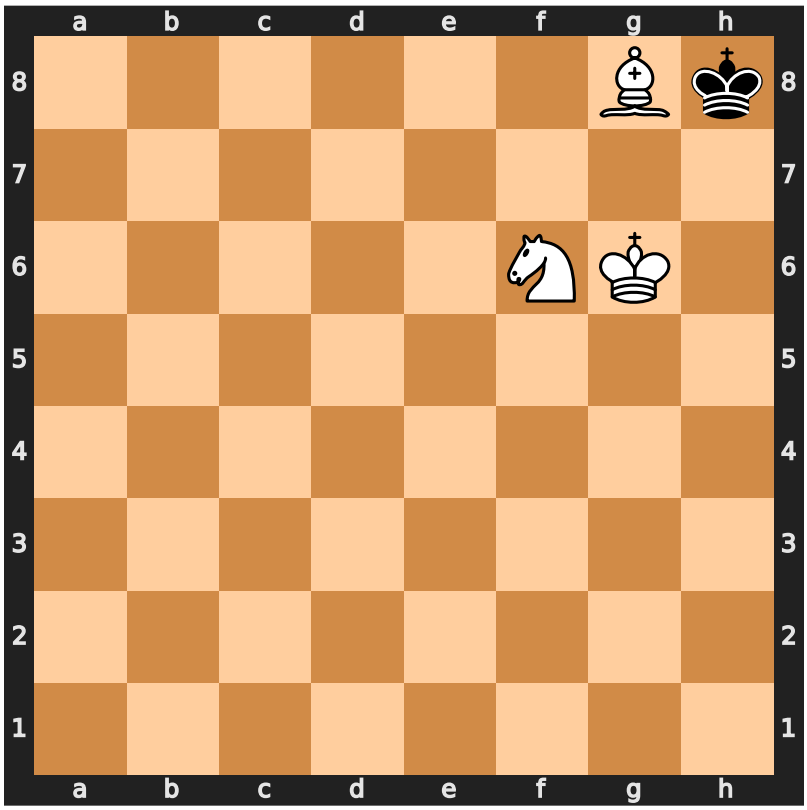

Figure 15.71: Chess Position

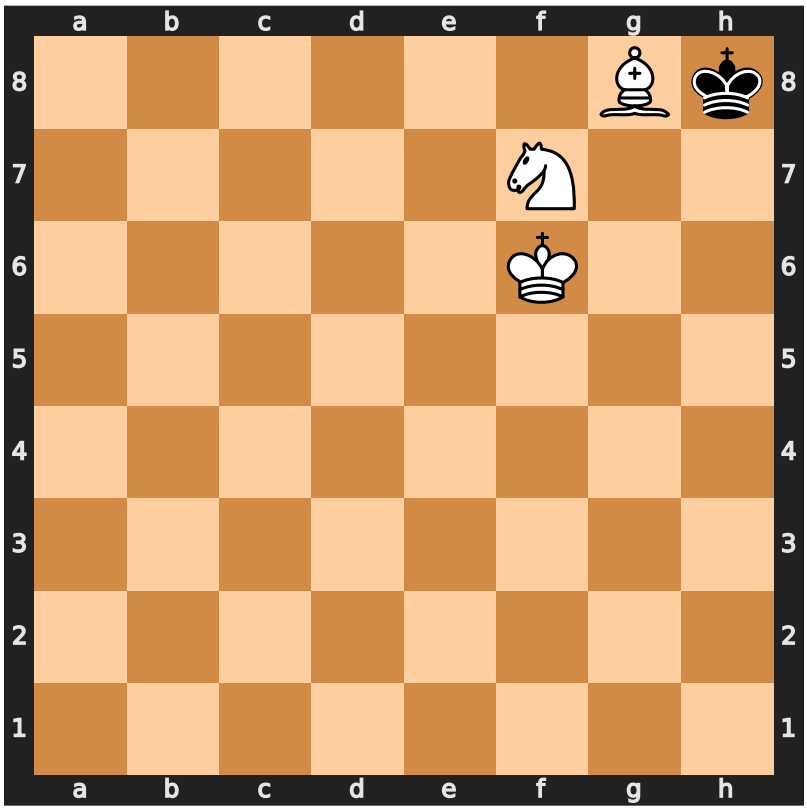

Figure 15.72: Chess Position

Task: Is this checkmate? **Solution:** Nf7 checks h8 (f7 attacks d6, d8, e5, g5, h6, h8). Check! However, the bishop on g8 is unprotected – Kf6 is not adjacent to g8, and Nf7 does not attack g8. The king escapes by capturing: **Kxg8** is legal. **Not checkmate.** The bishop must be protected for the mating net to hold.

Exercise 5.64 **Task:** The Black king has reached h1 (a light-squared corner). You have a light-squared bishop. Is this the correct corner to deliver checkmate? **Solution: Yes.** h1 is a light square. A light-squared bishop can deliver checkmate in the light-squared corners (a8 and h1). You are in the correct corner.

Exercise 5.65 **Task:** The Black king has reached h8 (a dark-squared corner). You have a light-squared bishop. Can you deliver checkmate here? **Solution: No.** h8 is a dark square. A light-squared bishop cannot check a king on a dark-squared corner. You must drive the king out of h8 and redirect it to a8 or h1 using the W maneuver. This is the hardest part of the K+B+N technique.

15.9.5 Section E: Find the Fastest Checkmate (Exercises 5.66 – 5.75)

These exercises use various material combinations. Find the fastest checkmate.

Exercise 5.66 **Position:** White: Kf6, Qe5. Black: Kf8.

Task: Find the fastest checkmate (mate in 2). **Solution: 1. Qe7 Kg8 2. Qg7#** – Queen restricts, then finishes on the g-file.

Exercise 5.67 **Position:** White: Kg6, Qd1. Black: Kh8.

Task: Find the fastest checkmate (mate in 1). **Solution: 1. Qd8#** – The queen checks along rank 8 (d8-e8-f8-g8-h8). g8 covered by the queen on rank 8. g7 and h7 covered by king. Checkmate!

Exercise 5.68 **Position:** White: Ke6, Rh1. Black: Ke8.

Task: Find the fastest checkmate (mate in 1). **Solution: 1. Rh8#** – Rook checks along rank 8. d7, e7, f7 covered by king. d8, f8 covered by rook.

Exercise 5.69 **Position:** White: Kb6, Bc6, Bd6. Black: Ka8.

Task: This is already checkmate if it were Black's turn. What should White play? **Hint:** Make a waiting move that maintains the checkmate threat. **Solution: 1. Be5** – The dark-squared bishop moves from d6 to e5. Bc6 still checks a8 along the c6-b7-a8 diagonal. Be5 covers b8 along the e5-d6-c7-b8 diagonal. a7: covered by king. b7: covered by Bc6. **Checkmate!**

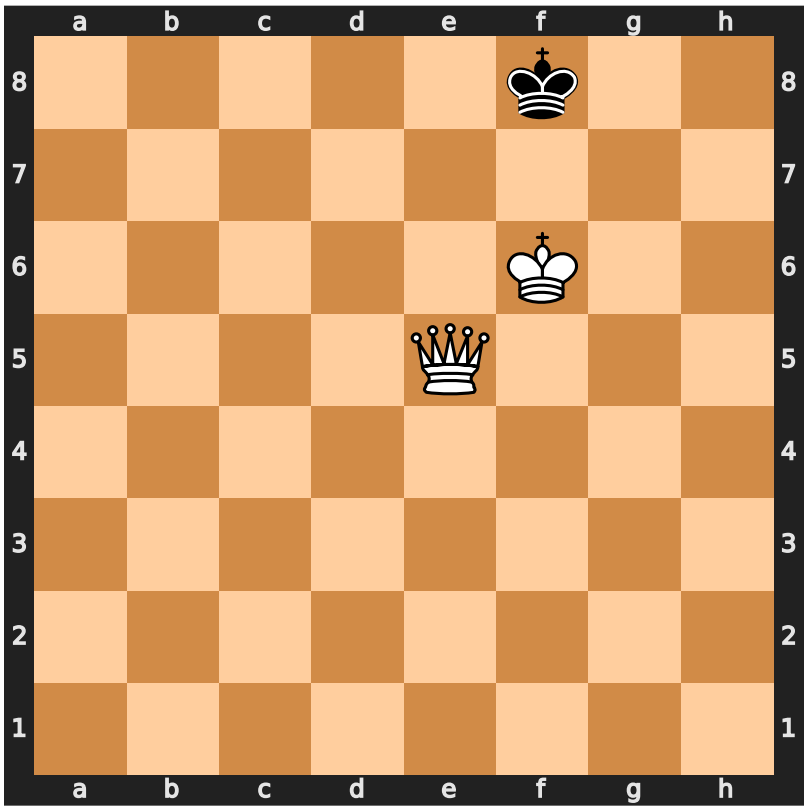

Figure 15.73: Chess Position

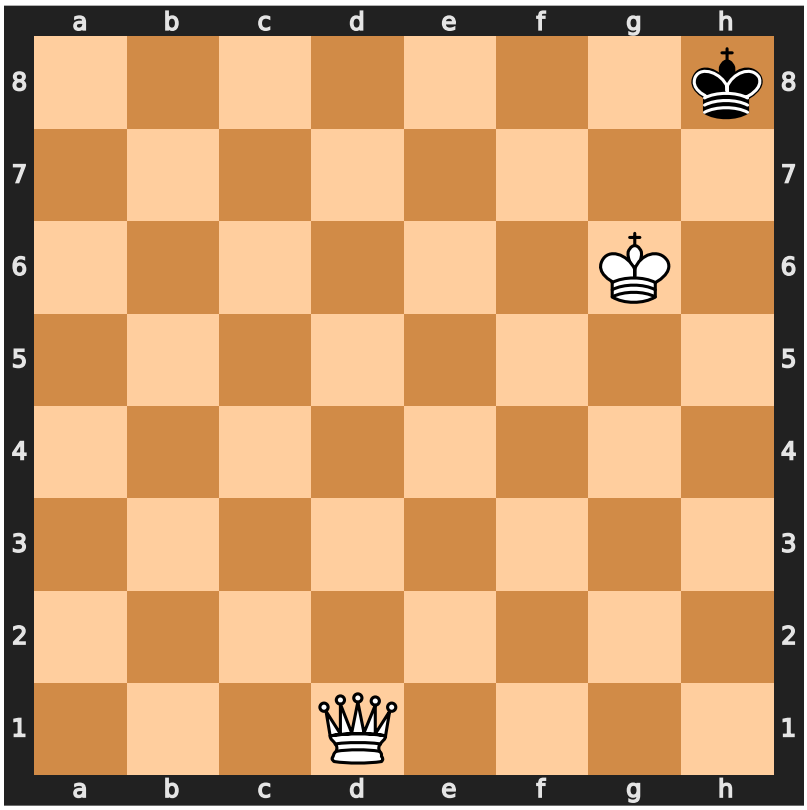

Figure 15.74: Chess Position

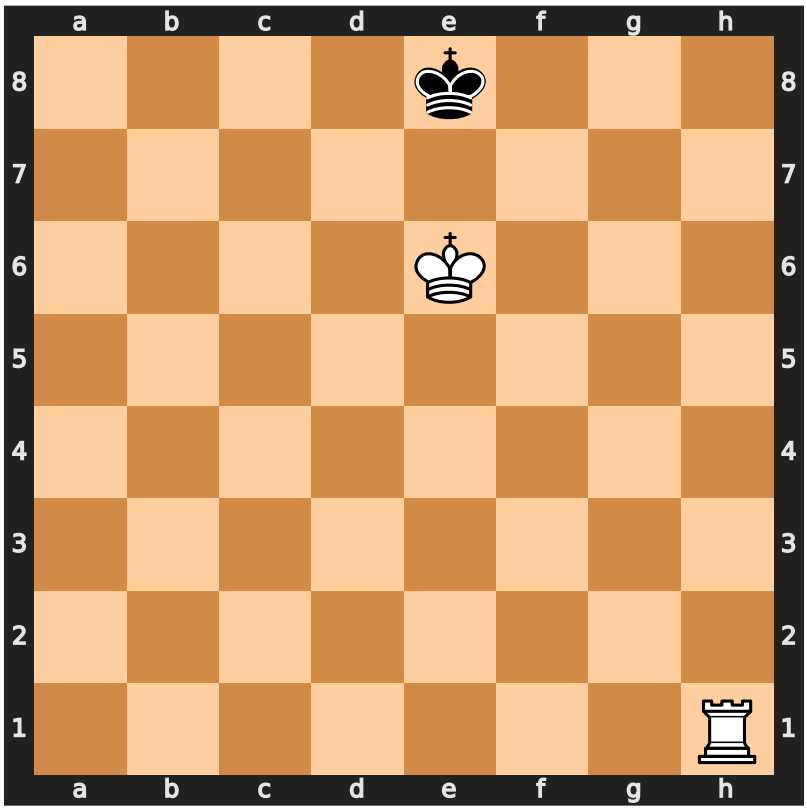

Figure 15.75: Chess Position

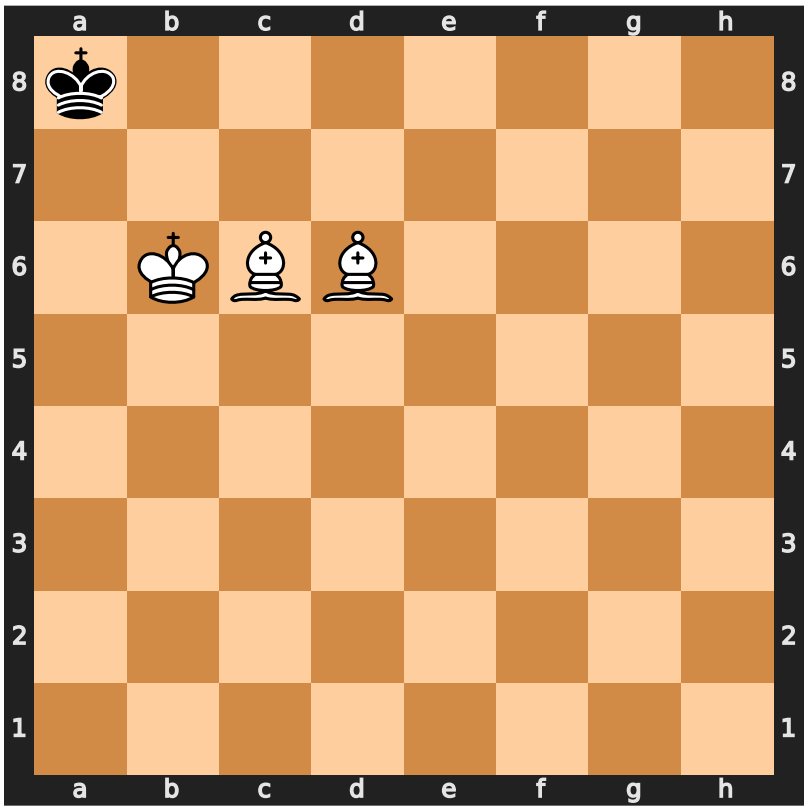

Figure 15.76: Chess Position

Exercise 5.70 **Position:** White: Kg6, Qa1. Black: Kh8.

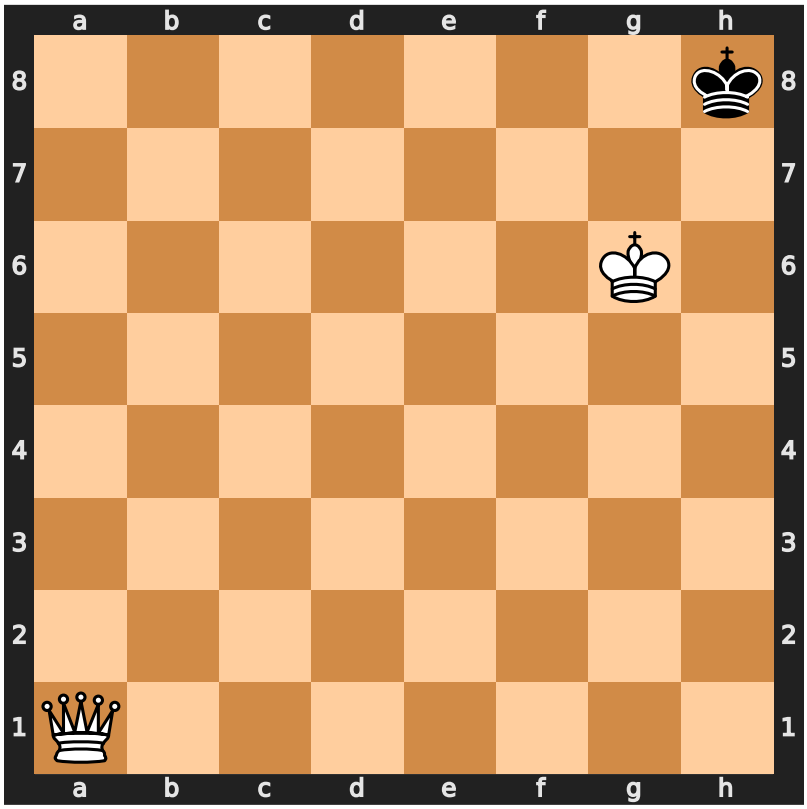

Figure 15.77: Chess Position

Task: Find the fastest checkmate. **Solution: 1. Qa8#** – The queen moves to a8 along the a-file, then checks h8 along rank 8. g8 covered by queen (rank 8). g7 and h7 covered by king. Checkmate!

Exercise 5.71 **Position:** White: Kf6, Rd1. Black: Kh8.

Task: Find the fastest checkmate. **Hint:** The king covers g7 but not h7. Can you still mate? **Solution:** 1. Rd8+ checks along rank 8, but h7 is not covered (Kf6 is not adjacent to h7 – two files apart). The king escapes to h7. **Not checkmate in 1.** The fastest mate requires **1. Kg6** first (covering h7 and g7), then **2. Rd8#**. **Mate in 2.**

Exercise 5.72 **Position:** White: Kb6, Qa7. Black: Kc8.

Task: Find the fastest checkmate. **Solution: 1. Qc7#** – The queen moves to c7, checking along the c-file. d8 and b8 covered on diagonals. d7 and b7 covered along rank 7. Checkmate!

Exercise 5.73 **Position:** White: Ke6, Qc5. Black: Ke8.

Task: Find the fastest checkmate. **Solution: 1. Qc8#** – The queen checks along rank 8. d8 and f8 covered by queen on rank 8. d7 and f7 covered by king (adjacent). e7 covered by king (adjacent). Checkmate in 1!

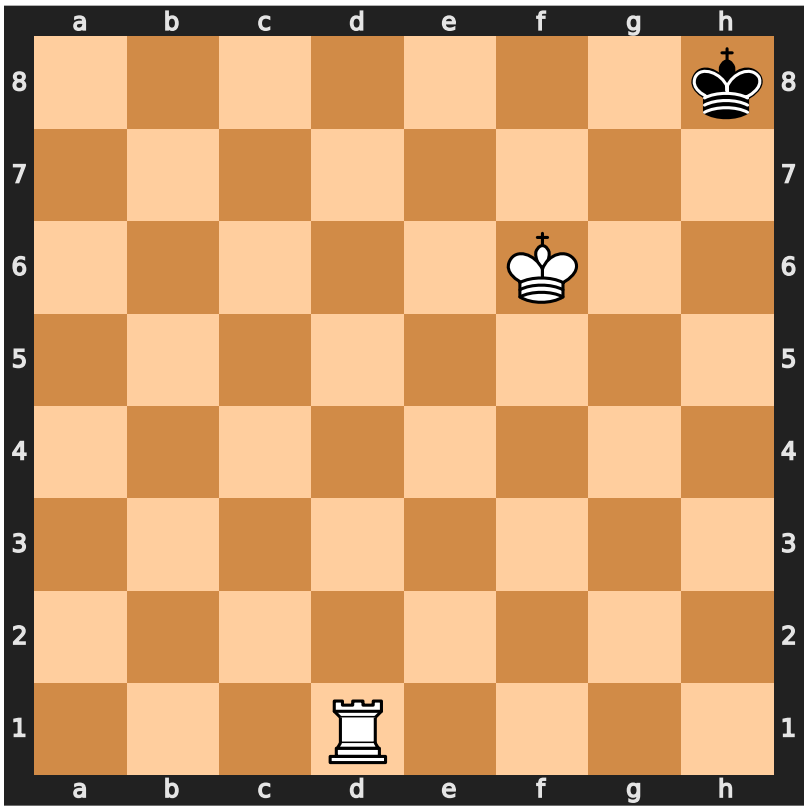

Figure 15.78: Chess Position

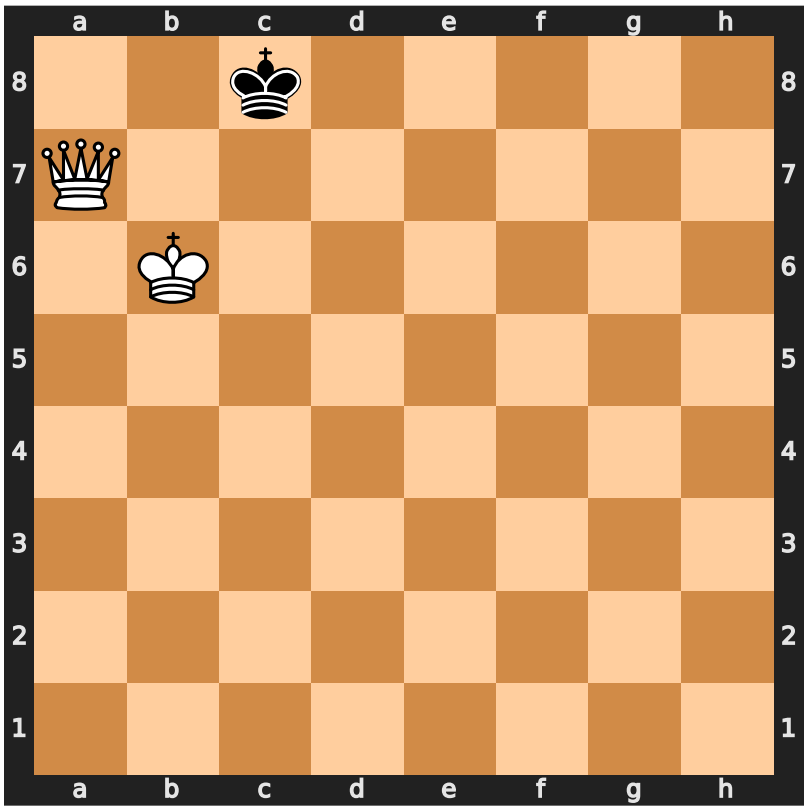

Figure 15.79: Chess Position

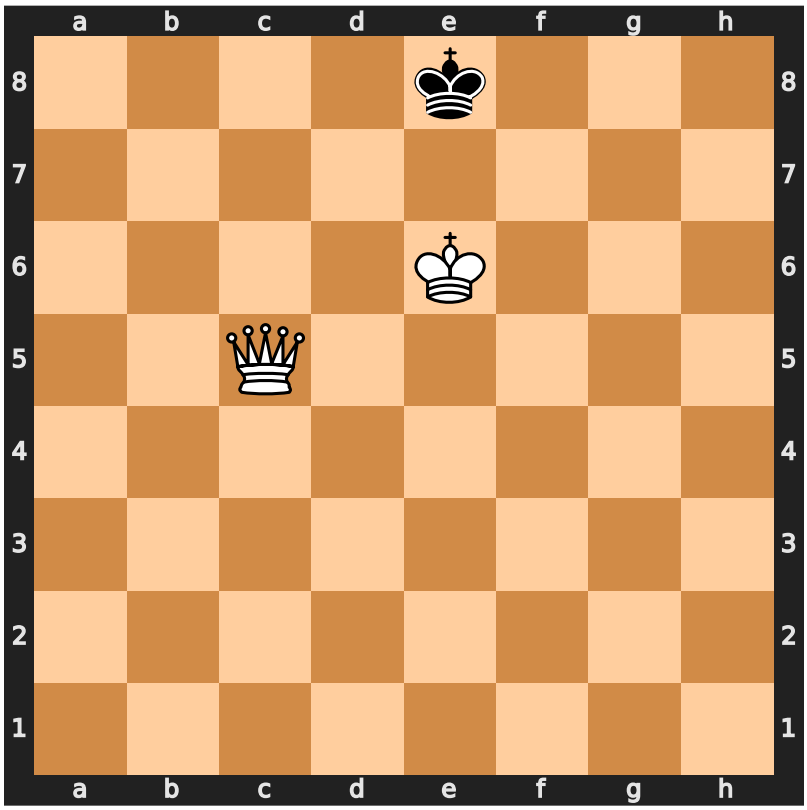

Figure 15.80: Chess Position

Exercise 5.74 **Position:** White: Kd6, Qa5. Black: Kd8.

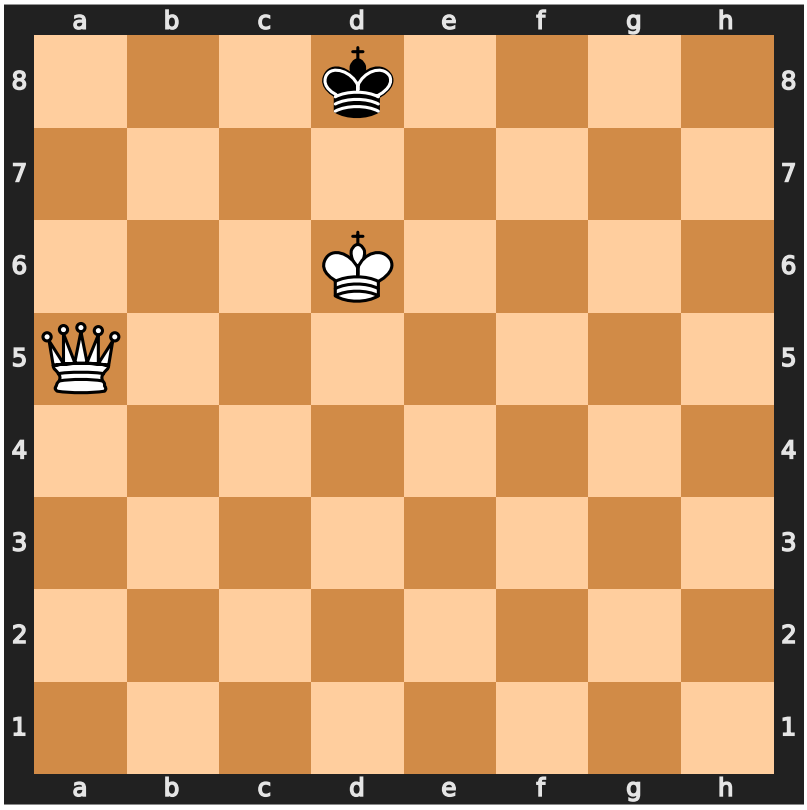

Figure 15.81: Chess Position

Task: Find the fastest checkmate. **Hint:** Can the queen reach a square that checks the king and covers all escapes? **Solution: 1. Qa8#** – The queen moves to a8 along the a-file, then checks along rank 8. c8 and e8 covered by queen on rank 8. c7, d7, e7 covered by king (adjacent). Checkmate!

Exercise 5.75 **Task:** From the checkmate position Kb3, Nc3, Bb2 vs. Ka1, trace backwards: what was White's last move to deliver this checkmate? **FEN (final position):** `8/8/8/8/8/1KN5/1B6/k7 b - - 0 1` **Solution:** White's last move was moving the bishop to b2 (for example, from a3, c1, or c3). The bishop move delivers check on the b2-a1 diagonal. Before the move, the knight on c3 was already covering a2 and b1, and the king on b3 was already protecting the bishop's destination square.

15.9.6 Section F: Avoid the Stalemate! (Exercises 5.76 – 5.80)

In each of these positions, White has an overwhelming advantage but must be careful not to stalemate the Black king. Find a winning move that is NOT stalemate.

Exercise 5.76 **Position:** White: Kf6, Qe5. Black: Kh8. **Black to move.**

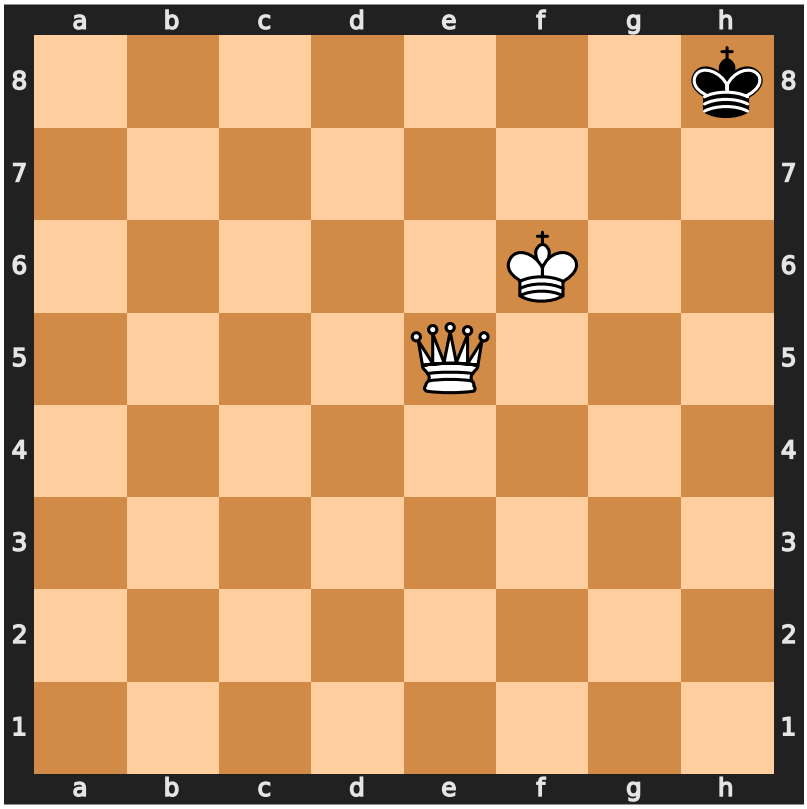

Figure 15.82: Chess Position

Task: It is Black's turn. Is this stalemate? **Hint:** Can the Black king go to g8? **Solution:** g8 is not controlled by the queen (Qe5 does not reach g8 on any diagonal, file, or rank) and Kf6 is not adjacent to g8. g8 is free. **Not stalemate.** Black plays Kg8.

Exercise 5.77 **Position:** White: Kf6, Qf7. Black: Kh8. **Black to move.**

Task: Is this stalemate? **Solution:** From h8: g8 (Qf7 diagonal f7-g8. Controlled!), g7 (Qf7 rank 7 and Kf6 adjacent. Controlled!), h7 (Qf7 rank 7. Controlled!). No legal moves and no check. **Stalemate! The game is a draw.**

Exercise 5.78 **Position:** White: Ke6, Qd6. Black: Ke8. **White to move.**

Task: White wants to checkmate, not stalemate. Find the right move. **Solution: 1. Qd7+** is safe – it gives check, so stalemate is impossible. After 1...Kf8, White plays 2. Qf7#. The key principle: **when in doubt, give check.** Check eliminates the possibility of stalemate.

Exercise 5.79 **Position:** White: Kg6, Qg5. Black: Kh8. **White to move.**

Task: Find the winning move. Avoid stalemate. **Hint:** Giving check is the safest way to avoid stalemate. **Solution: 1. Qf6+ Kg8 2. Qf8#** – The queen checks on the f6-g7-h8 diagonal. After

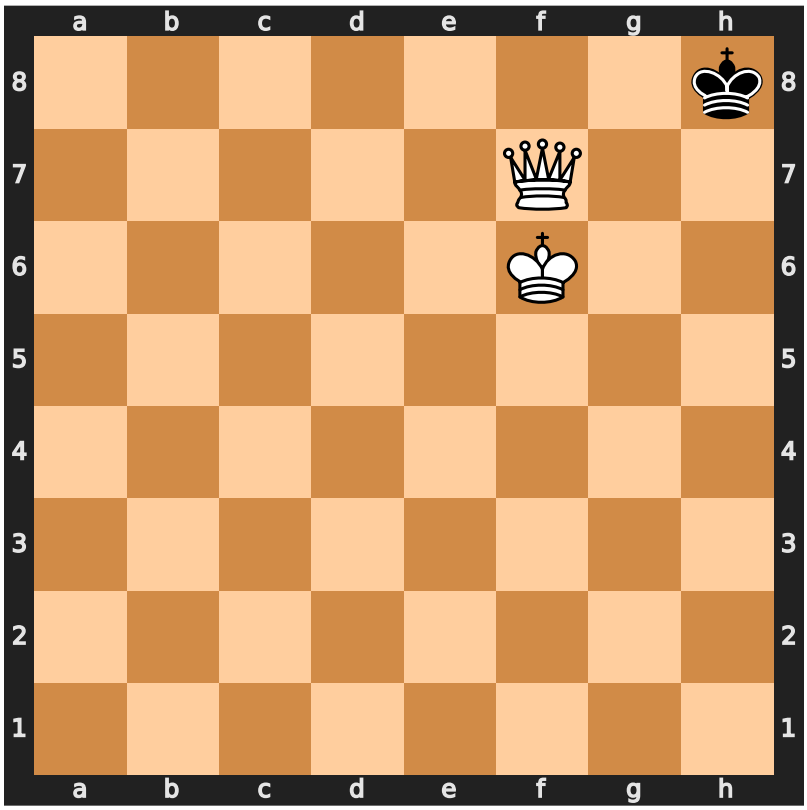

Figure 15.83: Chess Position

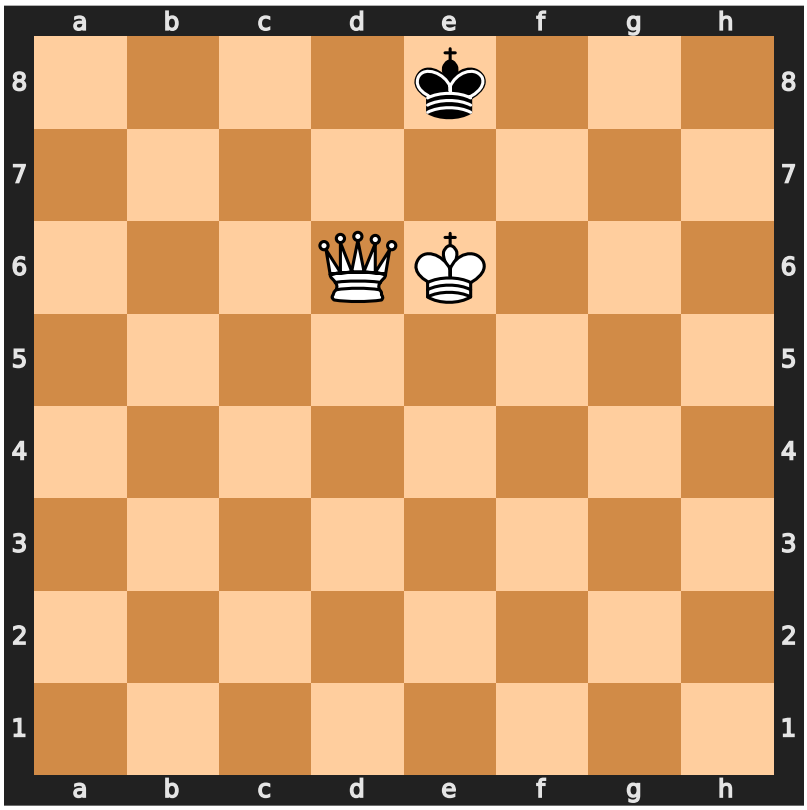

Figure 15.84: Chess Position

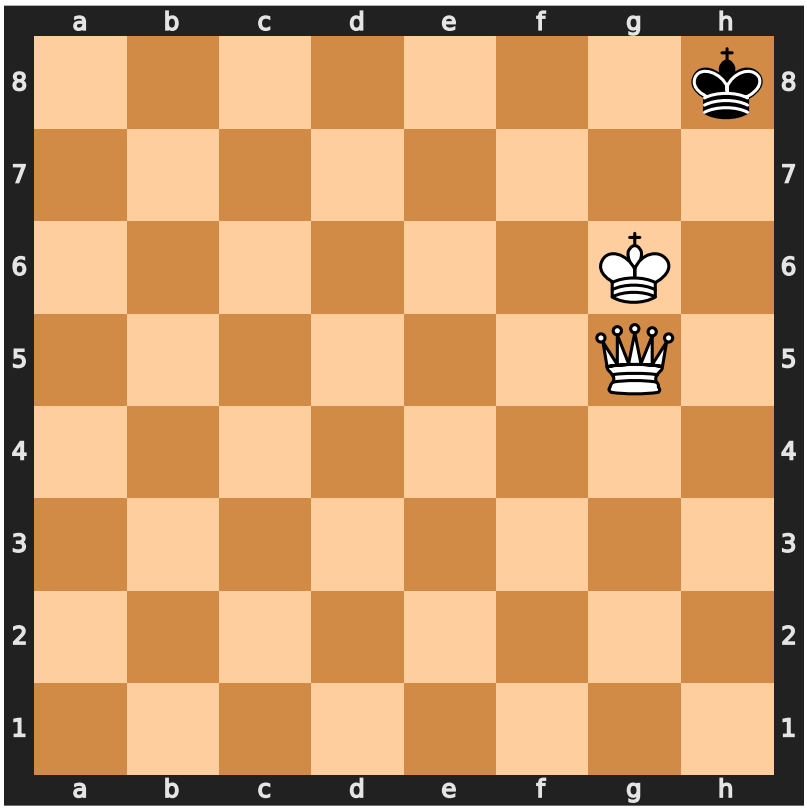

Figure 15.85: Chess Position

1…Kg8, the queen delivers checkmate on f8 (checks along rank 8, with h7 and g7 covered by the king). Clean and stalemate-free.

Exercise 5.80 **Position:** White: Ke6, Rg7. Black: Ke8. **White to move.**

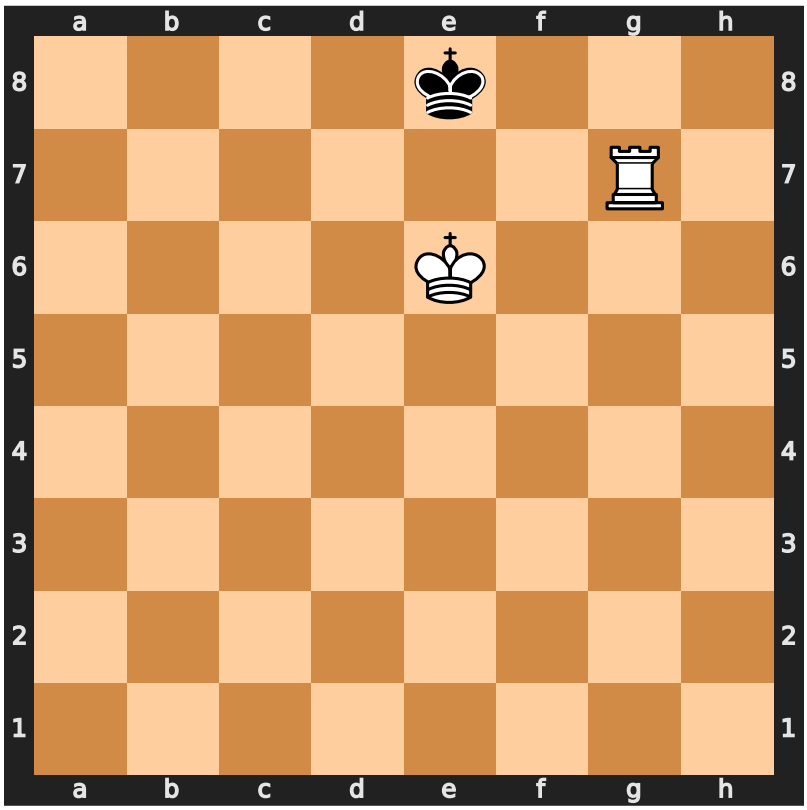

Figure 15.86: Chess Position

Task: Deliver checkmate without stalemate. **Hint:** The rook can reach the 8th rank in one move. **Solution: 1. Rg8#** – The rook checks along rank 8. d8 and f8 covered by rook. d7, e7, f7 covered by king. Clean back-rank checkmate. No stalemate risk here because the rook gives check.

15.10 Key Takeaways

1. **K+Q vs. K** is the easiest basic checkmate. Use the box method: centralize the queen, shrink the box, bring your king forward, deliver checkmate on the edge. Always watch for stalemate.

2. **K+R vs. K** uses the staircase technique. Cut off ranks with the rook, gain opposition with the king, push the enemy king back one rank at a time. The key position is your king covering three rank-7 squares while the rook seals rank 8.

3. **K+2B vs. K** requires the two bishops to work as a team. Place them side by side on adjacent diagonals to create a wall the enemy king cannot cross. Drive the king to a corner

and deliver checkmate with the standard pattern (one bishop checks, the other covers the remaining escape).

4. **K+B+N vs. K** is the hardest basic checkmate. Remember: you can only checkmate in a corner that matches your bishop's color. The technique takes about 33 moves. This is an advanced skill that many players learn later.

5. **Stalemate is the biggest danger** in all of these endgames. Always make sure the enemy king has at least one legal move until you are ready to deliver checkmate. When in doubt, give check.

15.11 Practice Assignment

Here is your practice plan for this chapter. Do as much as you can, and come back to the rest later.

Week 1: K+Q vs. K - Set up the starting position (Ke1, Qd1 vs. Ke8) and deliver checkmate. Do this 10 times. - Then set up random positions and practice. Goal: checkmate in 15 moves or fewer. - Play the K+Q vs. K endgame against a computer set to the easiest level.

Week 2: K+R vs. K - Set up the walkthrough position (Kd5, Ra1 vs. Kd7) and follow the staircase. - Then set up the full starting position (Ke1, Ra1 vs. Ke8) and practice. - Goal: checkmate in 25 moves or fewer.

Week 3: K+2B vs. K - Study the checkmate position (Kb6, Bc6, Bd6 vs. Ka8) until you can set it up from memory. - Practice driving the king to the corner from a central position. Use a computer if needed. - Goal: checkmate in 30 moves or fewer.

Week 4 (optional): K+B+N vs. K - Study the checkmate position (Kb3, Nc3, Bb2 vs. Ka1) until you can recognize it instantly. - Use an online K+B+N trainer to practice the full technique. - Goal: checkmate within the 50-move limit.

Ongoing: After each practice session, play one or two real games. You will be surprised how often these endings come up.

15.12 Progress Check

Answer these questions honestly. There is no grade, only self-awareness.

1. Can you deliver K+Q vs. K checkmate within 15 moves from any position? (Yes / Not yet)
2. Can you deliver K+R vs. K checkmate within 25 moves? (Yes / Not yet)
3. Can you explain the staircase technique in your own words? (Yes / Not yet)
4. Do you know what a stalemate trap looks like and how to avoid it? (Yes / Not yet)
5. Can you set up the K+2B checkmate position from memory? (Yes / Not yet)
6. Do you know which corners are correct for K+B+N? (Yes / Not yet)

If you answered "Yes" to questions 1, 2, and 4, you have a solid foundation in basic checkmates. The remaining techniques will come with time.

If you answered "Not yet" to most questions, that is completely fine. Go back to the sections you found hardest and practice again. Every expert was once a beginner who kept practicing.

Chapter complete. You have worked through one of the most important chapters in this entire book. These checkmate techniques are the foundation of everything that follows. Without them, no amount of opening knowledge or tactical brilliance matters. You can deliver the final blow. Be proud of that.

Rest here. You have earned it. Come back for Chapter 6 when you are ready.

Chapter 16

Chapter 6: Elementary Tactics — Forks, Pins, Skewers, Double Attacks

Rating Range: Beginner (400–800)

"Chess is 99% tactics." — Richard Teichmann

16.1 What You'll Learn

- How to attack two pieces at once with **forks** (knight forks, queen forks, pawn forks)
- How **pins** freeze a piece in place and how to exploit that frozen piece
- How **skewers** force a valuable piece to move, winning the piece behind it
- How **discovered attacks** let one piece move while another attacks from behind
- How **removing the defender** and **overloading** set up every other tactic
- How to spot these patterns in your own games and punish your opponent's mistakes

This is the most important chapter in Volume I. Tactics win games. All the opening theory and endgame knowledge in the world means nothing if you cannot spot a knight fork or a deadly pin. The patterns you learn here will win you material, save your pieces, and put your opponents in positions they cannot escape.

Take your time with this chapter. Practice each pattern on your board. Come back to it again and again. These seven tactical weapons will serve you for as long as you play chess.

16.2 Part 1: The Fork

A fork is one of the simplest and most powerful ideas in chess. One piece moves to a square where it attacks two or more enemy pieces at the same time. Your opponent can save one of them, but not both. You win material.

The fork is like being in two places at once. Your opponent has to choose which piece to save, and the other one is yours.

Every piece on the board can deliver a fork. But some pieces are better at it than others. Let's look at each one.

16.2.1 The Knight Fork

The knight is the ultimate forking piece. Because it moves in an L-shape and jumps over other pieces, it can reach squares that other pieces cannot. A knight on a single square can attack a king on one side and a queen on the other, and there is nothing in between to block it.

This is why the knight fork is the most common tactic in chess at the beginner level. Learn to spot it, and you will win dozens of games.

Set up your board: Place a White knight on e5, a Black king on d7, and a Black queen on f7. Look at the knight. It attacks both the king and the queen at the same time. Black must move the king out of check. After the king moves, the knight captures the queen. White wins a queen for free.

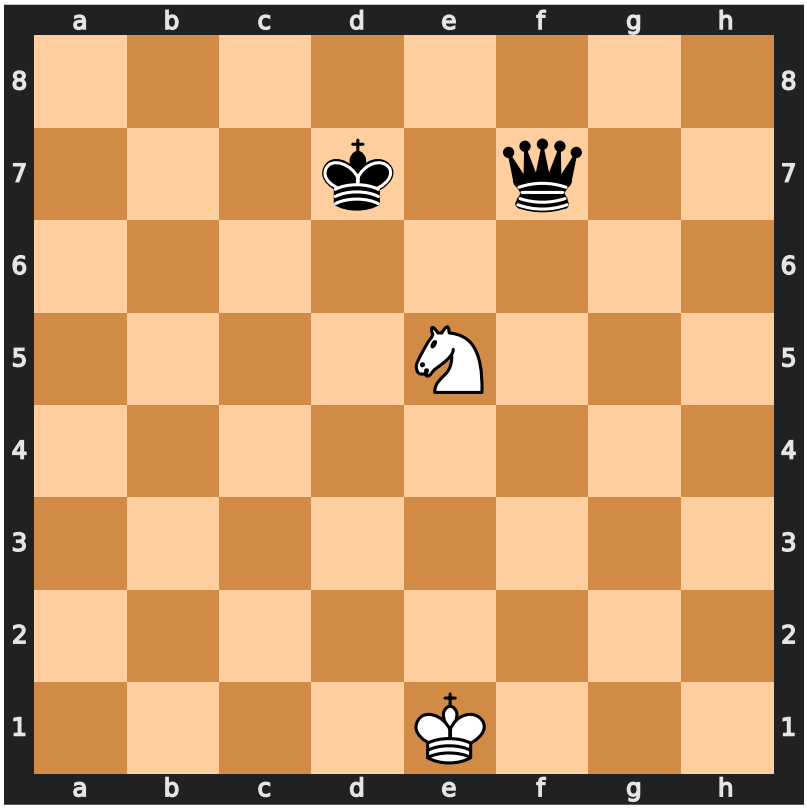

Figure 16.1: Chess Position

This is called a **royal fork** because it attacks the king and queen together. It is devastating. One simple knight move wins the most powerful piece on the board.

Now let's see how a knight fork appears in a real game situation.

Set up your board: Place White pieces: king on g1, queen on d1, rook on e1, knight on d4,

pawns on a2, b2, f2, g2, h2. Place Black pieces: king on e8, queen on a5, rook on a8, bishop on c8, pawns on a7, b7, c7, f7, g7, h7.

White plays **Nc6!** The knight lands on c6, attacking the Black queen on a5 AND the Black rook on a8. No matter what Black does, White wins one of them.

Why does this work? The knight's L-shaped movement lets it attack pieces that are far apart. A queen, bishop, or rook attacks in straight lines, so the targets need to line up. But a knight can hit pieces that have no connection to each other. That makes knight forks hard to see coming and almost impossible to block.

Key insight: Knights can fork pieces even when those pieces are nowhere near each other. Watch for squares where your knight attacks two targets at once.

16.2.2 Queen Forks

The queen is the most powerful piece on the board because it can move in all directions: along files, ranks, and diagonals. That means it can attack two pieces at once from many different angles.

Set up your board: Place a White queen on e4, a Black rook on a8, and a Black knight on h7. The queen attacks the rook along the diagonal and the knight along the rank. Black cannot save both.

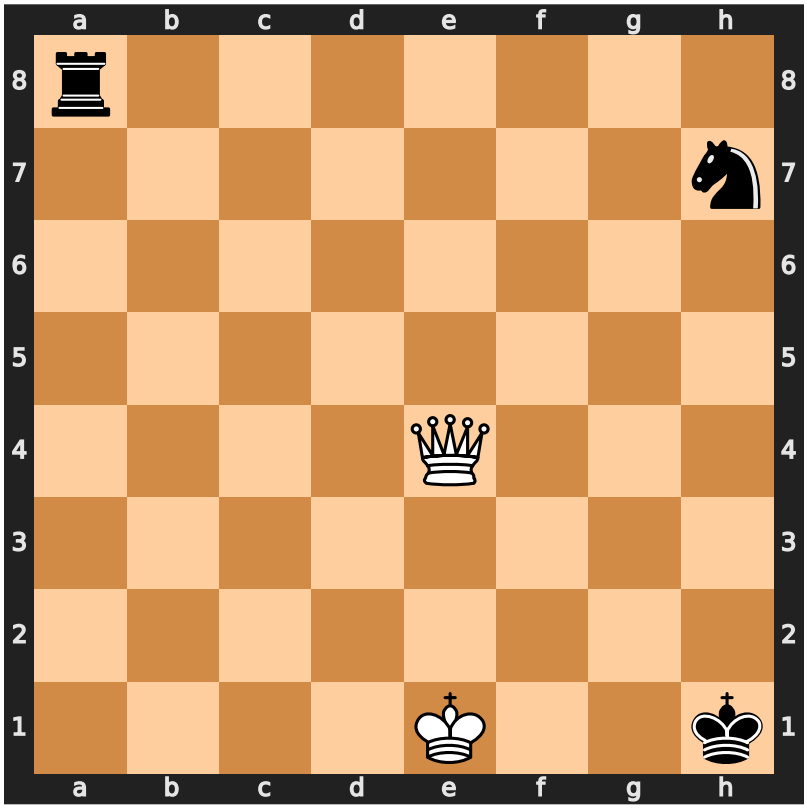

Figure 16.2: Chess Position

The queen fork is powerful, but there is a catch. Because the queen is so valuable, you must be careful not to fork two pieces only to have one of them capture your queen. Always check: is the

square safe for my queen?

Set up your board: Place a White queen on d1, a Black king on f8, a Black rook on a4, and a Black bishop on h5. White plays **Qd8+**, checking the king. After the king moves, the queen can capture the rook on a4 next turn. This is a queen fork that starts with check, which makes it even stronger because the opponent MUST deal with the check first.

Tip: Queen forks that include a check are the best kind. Your opponent has no choice but to answer the check, which gives you time to collect the second target.

16.2.3 Pawn Forks

Do not underestimate the humble pawn. A pawn captures diagonally, which means it can attack two pieces at once, one on each side. And because pawns are worth only one point, your opponent cannot trade for the pawn without losing material.

Set up your board: Place a White pawn on d4, a Black knight on c6, and a Black bishop on e6. White pushes **d5!** The pawn on d5 attacks both the knight on c6 and the bishop on e6. Black must move one, and White captures the other. A one-point pawn wins a three-point piece.

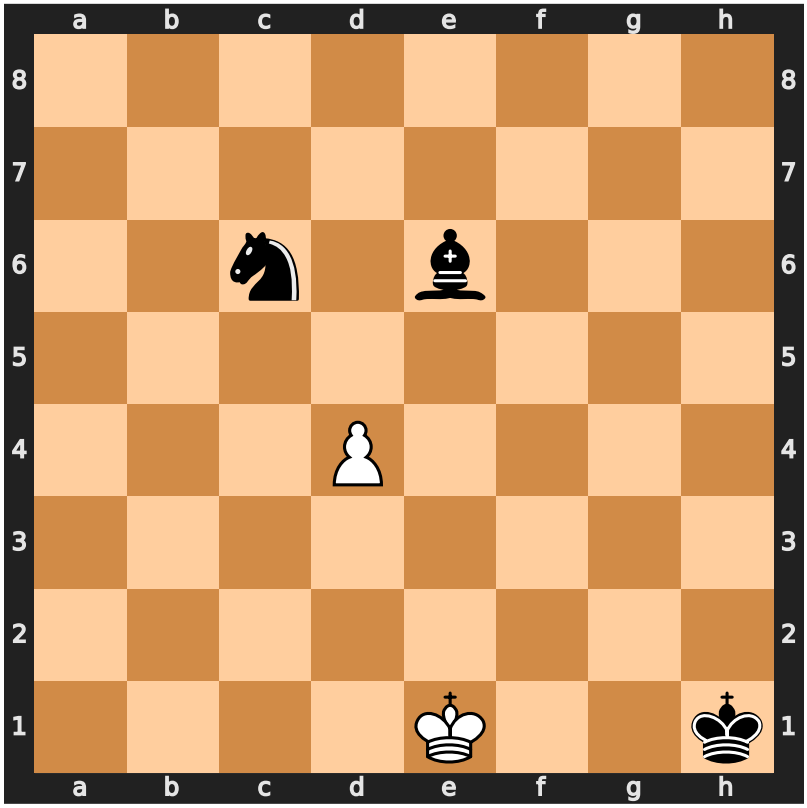

Figure 16.3: Chess Position

Pawn forks are easy to miss because we often ignore pawns. But a well-timed pawn push can win a piece and change the whole game.

16.2.4 Rook and Bishop Forks

Rooks and bishops can deliver forks too, though they are less common than knight, queen, or pawn forks.

A **rook fork** happens when a rook moves to a rank or file where it attacks two pieces at once. Since rooks move in straight lines, the two targets must be on the same rank or the same file.

Set up your board: Place a White rook on a1, a Black knight on a4, and a Black bishop on a7. The rook attacks both pieces along the a-file. Black can move one, but the other falls.

A **bishop fork** works along diagonals. Place a White bishop on d5. If a Black rook sits on a8 and a Black knight sits on g8, the bishop attacks both along the diagonals. However, bishop forks are rare because both targets must sit on the same color diagonal.

16.2.5 How to Set Up Forks

Forks do not appear out of nowhere. You create them. Here are three ways:

1. Look for the forking square. Before you move, scan the board for squares where your piece (especially a knight) would attack two targets. Then figure out how to get your piece there.

2. Use threats to drive pieces to the right squares. Sometimes your opponent's pieces are not on the right squares for a fork yet. You can use checks, captures, or threats to force them to the squares you need. A check forces the king to a specific square. A capture forces a recapture to a specific square. Use these forcing moves to set up your fork.

3. Watch for back-rank patterns. After castling, the king is usually on g1 or g8. Knights on f3 or c3 are common. Look at where a knight could land to fork the king, queen, and rooks.

Memory aid: When your opponent's king and queen are on the same rank, file, or close together, look for a knight fork. This is especially common after the opponent castles and brings the queen to the wrong square.

> **Milestone:** You have learned 1 of 7 tactical patterns. Forks alone will win you many games. But there is much more to come.

This is a natural stopping point. Practice finding knight forks on your board for 10 minutes. Set up random positions and look for forking squares. When you are ready, keep going.

16.3 Part 2: The Pin

A pin is a tactic where one piece attacks an enemy piece, and that enemy piece cannot move (or should not move) because a more valuable piece sits behind it on the same line.

Think of it this way: your bishop stares down a diagonal. In its path, there is an enemy knight. Behind the knight, there is the enemy king. The knight is "pinned" in place. If the knight moves, the king would be in check, which is illegal. So the knight is stuck.

Pins come in two types, and understanding the difference matters.

16.3.1 Absolute Pins

An **absolute pin** is a pin against the king. The pinned piece literally cannot move because doing so would expose the king to check, which is illegal in chess.

Set up your board: Place a White bishop on g5, a Black knight on f6, and a Black king on e7. The bishop pins the knight to the king. The knight cannot move at all. It is frozen in place.

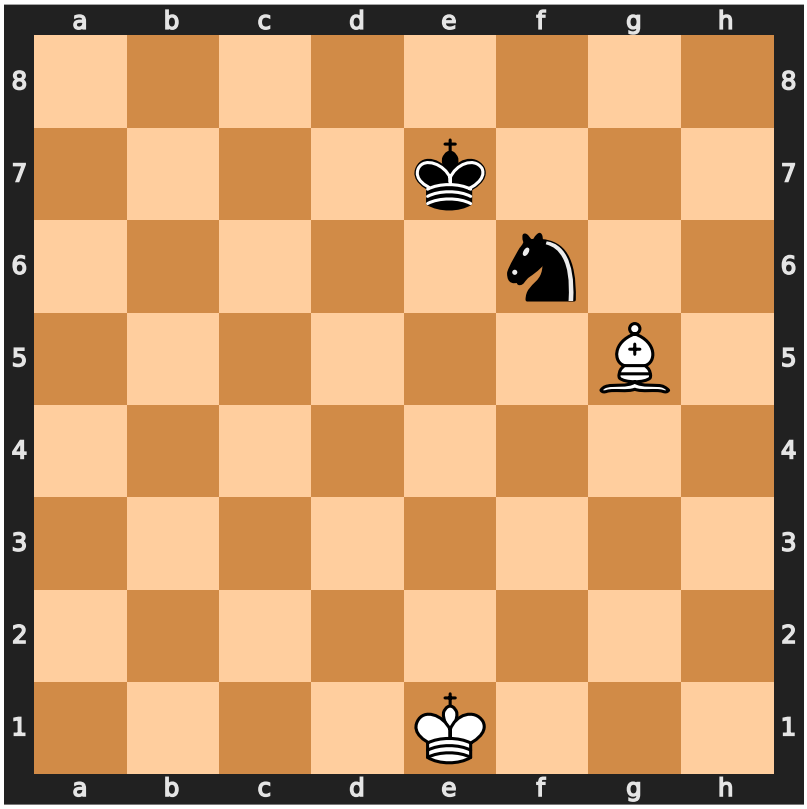

Figure 16.4: Chess Position

This is the strongest type of pin. The pinned piece is a sitting target. You can pile up attackers on it, and your opponent cannot simply move it out of the way.

Why absolute pins are so strong: The pinned piece does not really defend anything. Imagine the knight on f6 is "defending" the pawn on d5. Since the knight cannot move, can it really capture on d5? No, it cannot. So any piece the knight appears to defend is actually undefended. This is an essential concept.

16.3.2 Relative Pins

A **relative pin** pins a piece against the queen, a rook, or another valuable piece (not the king). The pinned piece CAN legally move, but doing so would lose the more valuable piece behind it.

Set up your board: Place a White bishop on b5, a Black knight on c6, and a Black queen on d7. The bishop pins the knight to the queen. The knight CAN legally move, but if it does, the bishop captures the queen. So the knight "should not" move.

Relative pins are slightly weaker than absolute pins because the opponent might choose to move

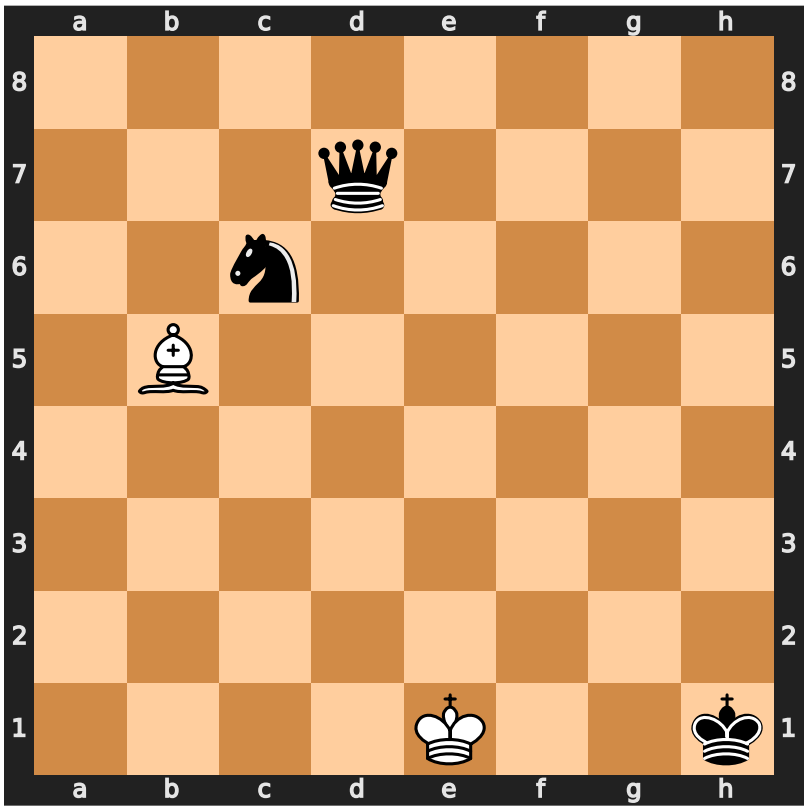

Figure 16.5: Chess Position

the pinned piece anyway if they see a strong enough reason. For example, if the knight on c6 could deliver checkmate by moving, the player might sacrifice the queen and move it anyway. But in most cases, a relative pin keeps the piece frozen just as effectively.

16.3.3 Who Can Pin?

Only pieces that attack in straight lines can create pins. That means:

- **Bishops** (pin along diagonals)
- **Rooks** (pin along files and ranks)
- **Queens** (pin along files, ranks, and diagonals)

Knights and pawns cannot create pins because they do not attack in straight lines.

Bishops are the most common pinning piece because they often pin knights early in the game. The classic example: White plays Bg5, pinning the Black knight on f6 to the queen on d8. This happens in countless openings.

16.3.4 How to Exploit a Pin

Creating a pin is only the first step. The real power comes from exploiting it. Here is how:

1. Pile up on the pinned piece. Once a piece is pinned, it cannot run away. So bring more attackers to target it. If you have a bishop pinning a knight, bring a pawn up to attack the knight too. Bring another piece. Eventually, the pinned piece will fall because the defender cannot add enough protection.

Set up your board: Place a White bishop on g5, a White pawn on f2, a Black knight on f6, and a Black king on g8, with Black pawns on f7, g7, h7. White plays **h4**, then **h5**, then eventually attacks the pinned knight with the pawn. The knight cannot escape. White wins it.

2. Use the pin to win connected material. Sometimes the pinned piece is protecting something else. Since it cannot actually move, whatever it was protecting is now undefended.

3. Pin and win the exchange. If you pin a knight to a rook, and the knight is worth 3 points while the rook is worth 5, you might be able to capture the knight and then also threaten the rook.

16.3.5 How to Break a Pin

If your piece gets pinned, you need to know how to escape. Here are the main methods:

1. Block the line. Place a piece between the pinning piece and the valuable piece behind. This breaks the pin because the intermediate piece now blocks the attack.

Set up your board: Place a White bishop on g5 pinning a Black knight on f6 to the Black queen on d8. Black plays **Be7**, placing the bishop between the queen on d8 and the pinned knight. Now the knight is free to move because the bishop blocks the pin.

2. Move the piece behind. If a knight is pinned to the queen, move the queen to a safe square. The knight is no longer pinned because there is nothing valuable behind it.

3. Attack the pinning piece. If a bishop pins your knight, advance a pawn to chase the bishop away. For example, if the bishop sits on g5 pinning your knight on f6, play **h6** to attack the bishop. It must retreat, and the pin is broken.

4. Counterattack. Sometimes the best response to a pin is to ignore it and create a bigger threat. If your opponent wastes time exploiting the pin, you might find a tactic of your own.

16.3.6 Classic Pin Examples

The Opening Pin: After 1.e4 e5 2.Nf3 Nc6 3.Bb5, White pins the knight on c6 to the king on e8 (in spirit, since the bishop actually threatens to capture on c6 and damage Black's pawn structure). This is the Ruy Lopez, one of the oldest openings in chess.

The Bg5 Pin: After 1.d4 d5 2.c4 e6 3.Nc3 Nf6 4.Bg5, White pins the knight on f6 to the queen on d8. This is one of the most common pins in all of chess. Black must decide how to deal with it.

The Back-Rank Pin: A rook on e1 can pin an enemy piece on e7 to the king on e8. Rook pins along files are powerful in the middlegame and endgame.

> **Milestone:** You have learned 2 of 7 tactical patterns. Forks and pins together will transform your game. Most games between beginners are decided by one of these two patterns.

Good stopping point. You have covered forks and pins. Take a break, play a game online, and try to spot these patterns. Then come back for skewers.

16.4 Part 3: The Skewer

A skewer is the reverse of a pin. In a pin, the less valuable piece is in front and cannot move. In a skewer, the MORE valuable piece is in front and is forced to move, exposing the less valuable piece behind it for capture.

Think of a skewer like a shish kebab. The important piece is on the front of the stick and has to jump off, leaving the piece behind it to get eaten.

16.4.1 How Skewers Work

Set up your board: Place a White bishop on a1, a Black king on d4, and a Black rook on f6. The bishop on a1 checks the king through the diagonal a1-d4-f6. The king MUST move out of check. After the king moves, the bishop captures the rook on f6. White wins a whole rook.

The key difference between a pin and a skewer: - **Pin:** Less valuable piece in front, more valuable piece behind. The front piece is stuck. - **Skewer:** More valuable piece in front, less valuable piece behind. The front piece must move.

16.4.2 Bishop Skewers

Bishops are excellent skewering pieces because they control long diagonals. A bishop on one corner of the board can skewer pieces all the way on the opposite corner.

Set up your board: Place a White bishop on b1, a Black queen on d3, and a Black rook on f5. White plays **Ba2** (or the bishop is already aiming at d3-f5). The bishop attacks the queen. The queen must move. The bishop then captures the rook. White trades a threat for a rook.

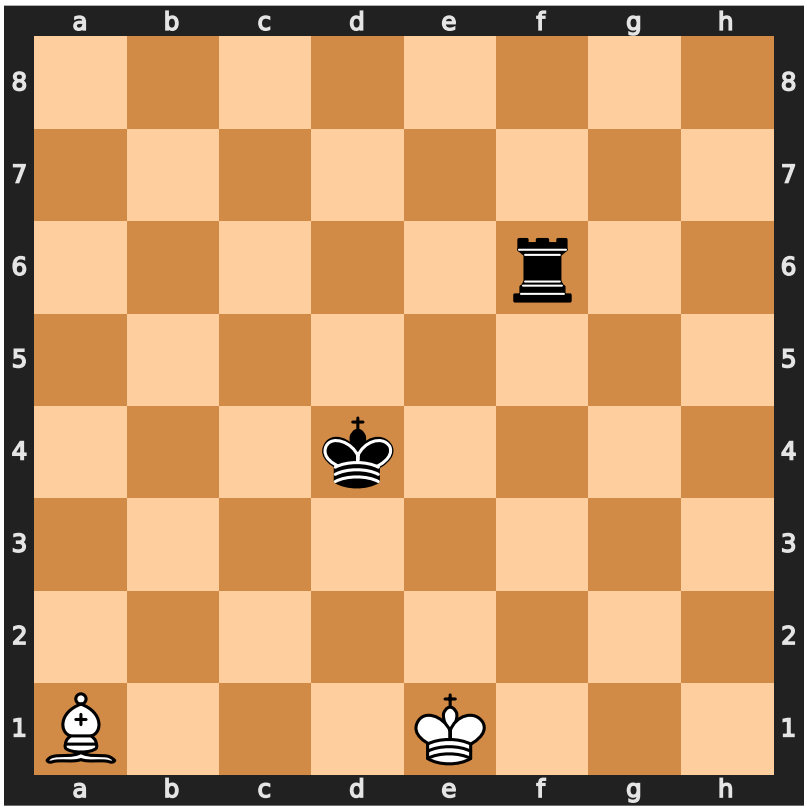

Figure 16.6: Chess Position

The most common bishop skewer targets the king and a piece behind it. After the king steps out of check, the bishop gobbles up whatever was behind.

16.4.3 Rook Skewers

Rooks skewer along files and ranks. The most common rook skewer happens on the back rank.

Set up your board: Place a White rook on a1, a Black king on a5, and a Black rook on a8. White plays **Ra1+** (or the rook is already on the first rank). Check to the king on a5. The king moves. The White rook captures the Black rook on a8.

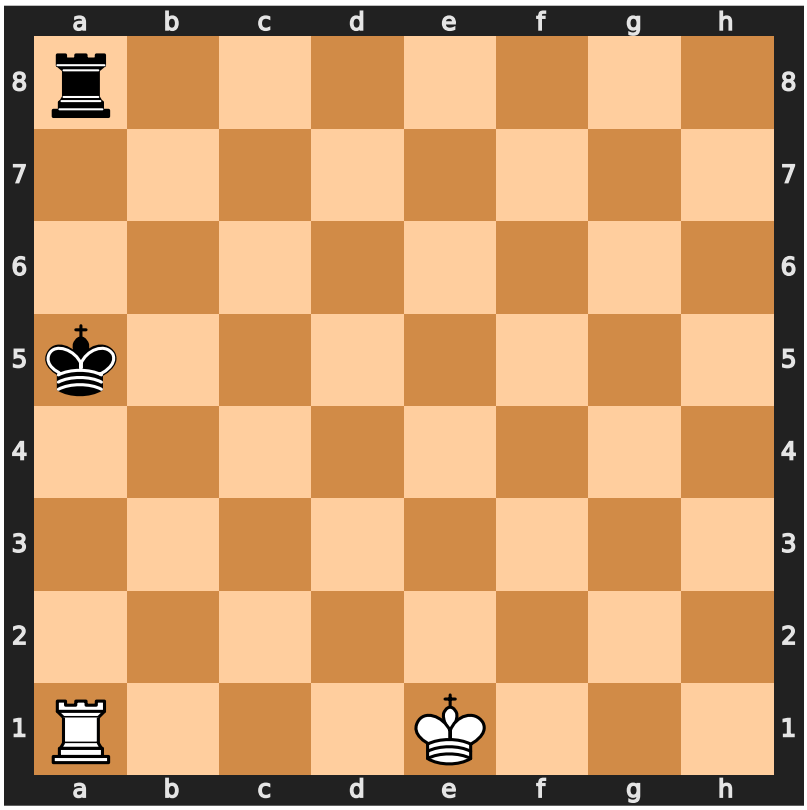

Figure 16.7: Chess Position

Rook skewers along ranks are also common. Place a White rook on h4, a Black queen on e4, and a Black bishop on b4. The rook attacks the queen along the 4th rank. The queen moves. The rook takes the bishop.

16.4.4 Queen Skewers

The queen can skewer along files, ranks, and diagonals. But because the queen is so valuable, queen skewers usually target the king (giving check) and then capture the piece behind.

Set up your board: Place a White queen on a1, a Black king on d4, and a Black rook on g7. White plays **Qa1+** (the queen checks the king along the diagonal, and after the king moves, the queen captures the rook on g7). Actually, let's place the queen so this works on a clean diagonal.

Place a White queen on h1, a Black king on e4, and a Black rook on b7. The queen checks the king from h1 along the h1-e4 diagonal. After the king moves, the queen goes to b7 and takes the rook.

16.4.5 When to Look for Skewers

Watch for these conditions:

1. **Two enemy pieces on the same line** (file, rank, or diagonal), with the more valuable one closer to your attacking piece.
2. **After a trade.** When pieces get traded, the board opens up. Open lines mean skewer opportunities.
3. **When the king is exposed.** An exposed king is a skewer target. Check the king, and whatever sits behind it on that line is yours.
4. **In the endgame.** With fewer pieces on the board, it is easier for bishops and rooks to find long, clear lines for skewers.

   Milestone: You have learned 3 of 7 tactical patterns. Already more than most casual players know. Forks, pins, and skewers are the "big three" of chess tactics.

Take a break here if you need one. Three major patterns down, four to go. You are doing great.

16.5 Part 4: Discovered Attacks

A discovered attack is one of the most dangerous weapons in chess. The idea is simple: you move one piece out of the way, and the piece BEHIND it reveals an attack that was hidden.

The discovered attack is like a magic trick. Your opponent watches your moving piece while the real threat comes from behind. By the time they see it, it is too late.

16.5.1 How Discovered Attacks Work

Set up your board: Place a White rook on e1, a White knight on e4, and a Black queen on e7. Right now, the knight on e4 blocks the rook's view of the Black queen. But if the knight moves (say, to d6, c5, f6, or any other square), the rook on e1 suddenly attacks the queen on e7. The queen is under attack from the rook, and the knight has moved to a completely different square where it might be creating a second threat.

That is the beauty of discovered attacks. The moving piece and the revealed piece create TWO threats at the same time. Your opponent can only deal with one.

16.5.2 Discovered Check

When the revealed attack is a CHECK, it becomes a discovered check. This is brutal because checks must be answered immediately. The opponent has no time to deal with whatever the moving piece is doing.

Set up your board: Place a White bishop on c1, a White knight on d2, a Black king on h6, and a Black queen on a5. If the knight moves from d2, it reveals the bishop's diagonal from c1 toward h6, giving check. So the knight can move ANYWHERE and the bishop gives check. Suppose the

knight jumps to **f3**, attacking the Black queen on a5. Black must answer the check from the bishop. Meanwhile, the queen on a5 is attacked by the knight. After Black deals with the check, White captures the queen.

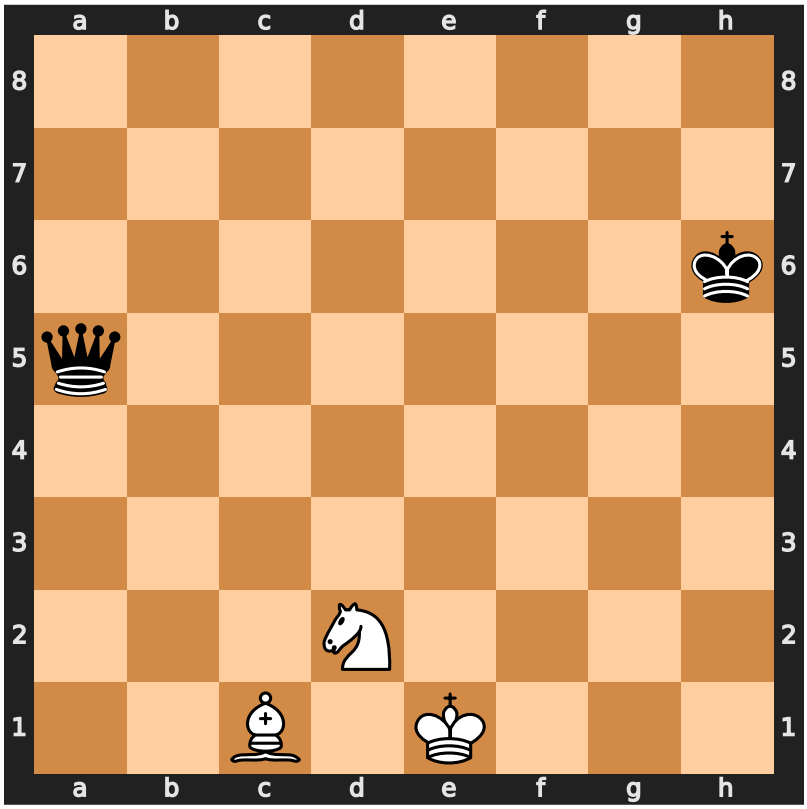

Figure 16.8: Chess Position

The moving piece gets a "free move" during a discovered check. It can capture a piece, give a second threat, or park itself on the best square available, all while the opponent is forced to deal with the check.

16.5.3 Double Check

Double check is the most powerful form of discovered attack. Both the moving piece AND the revealed piece give check at the same time. The king is attacked from two directions simultaneously.

Here is what makes double check so devastating: you cannot block two checks at once, and you cannot capture two checking pieces at once. The ONLY way to escape a double check is to move the king. That means double check bypasses all normal defenses.

Set up your board: Place a White rook on e1, a White knight on e5, a Black king on e8, and various Black pieces around. The knight on e5 blocks the rook's attack on the king. If the knight moves to **f7** or **d7** or **g6** (giving check with the knight), the rook also gives check along the e-file. Both pieces check the king at the same time. Double check. The king must move.

If White plays **Nd7+**, the knight checks from d7 and the rook checks along the e-file. Double check. Black's king must move. It cannot block both checks. It cannot capture both checking pieces.

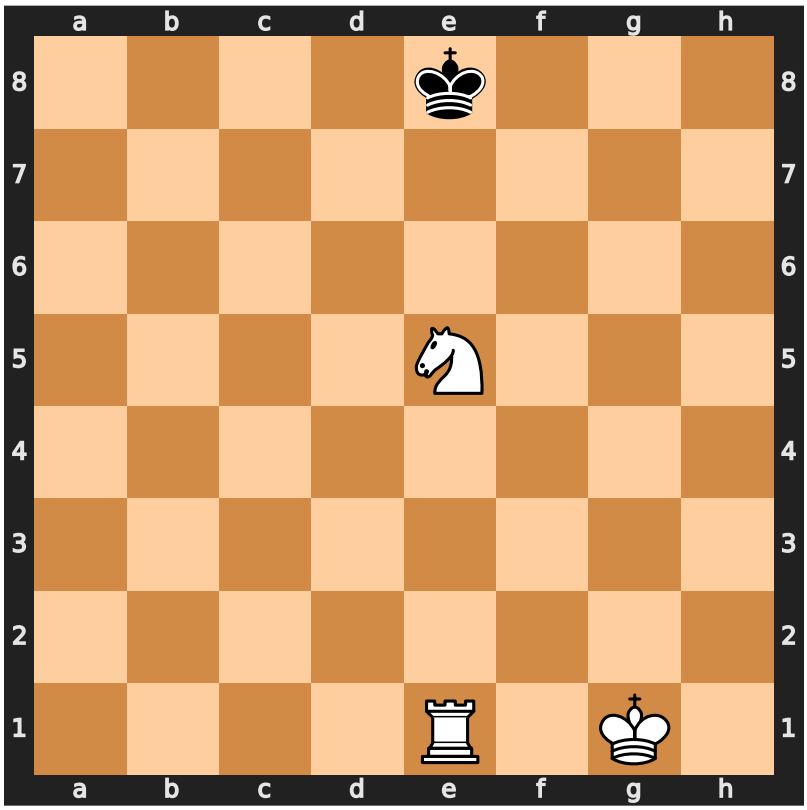

Figure 16.9: Chess Position

Double check often leads to checkmate because the king is forced to specific squares where it may have no escape.

16.5.4 How to Set Up Discovered Attacks

Look for these elements:

1. **A piece with a blocked line of attack.** Your rook, bishop, or queen is aimed at something valuable, but one of YOUR OWN pieces is in the way.
2. **A useful place for the blocking piece to go.** The piece that is blocking must have a good square to move to. Ideally, it creates its own threat (capture, check, or attack).
3. **A target for the revealed attack.** The piece behind must be attacking something valuable once the line opens.

The battery setup: A rook behind a knight on the same file, or a bishop behind a knight on the same diagonal, is a "battery." When the knight moves, the piece behind fires. Place your pieces in battery positions, and discovered attacks will appear naturally.

16.5.5 The Power of the Discovered Attack

In practical play, discovered attacks win more games than almost any other tactic at the beginner level. Here is why:

1. They create two threats at once (the moving piece and the revealed piece).
2. When the revealed attack is check, the opponent has no time to save the other piece.
3. They are hard to see coming because the threat is hidden behind another piece.

Train yourself to look for discovered attacks by asking: "If I move THIS piece, does the piece behind it attack anything?" Make this a habit, and you will find discovered attacks your opponents never see coming.

> **Milestone:** You have learned 4 of 7 tactical patterns. Discovered attacks are what separate beginners from improving players. If you can spot these, you are growing fast.

Discovered attacks take time to internalize. Stop here, solve a few puzzles with discovered checks online (Lichess has a great tactics trainer), and come back refreshed.

16.6 Part 5: Double Attacks

We have already seen specific types of double attacks: forks, skewers, and discovered attacks are all forms of creating two threats at once. But the principle deserves its own section because it is the foundation of ALL tactics.

The core principle: Create more threats than your opponent can handle. If you make one threat, your opponent deals with it. If you make two threats, they can deal with one but not both. You win.

Every tactic in chess boils down to this idea. A fork attacks two pieces with one move. A discovered check creates a check AND an attack on another piece. A skewer forces one piece to move, exposing another.

16.6.1 How to Think About Double Attacks

When you are looking for tactics, do not search for specific pattern names. Instead, ask yourself:

1. **"Can I make a move that creates two threats?"**
2. **"Can I give check while also attacking another piece?"**
3. **"Can I capture a piece while also threatening something else?"**

If the answer to any of these questions is yes, you may have found a winning tactic. The name of the pattern (fork, pin, skewer, discovered attack) does not matter in the heat of the game. What matters is: does this move create more problems than my opponent can solve?

16.6.2 Combining Double Attacks

Strong tactical players often combine multiple patterns in a single sequence. For example:

- **Pin + Fork:** Pin a piece to the king, then fork the pinned piece and another target.
- **Discovered attack + Skewer:** Move a piece to reveal an attack, and the revealed attack is a skewer.
- **Remove the defender + Fork:** Capture a defending piece, and now a fork is possible.

You will see these combinations in the annotated games later in this chapter. For now, remember the principle: tactics work together. One pattern sets up another.

16.7 Part 6: Removing the Defender

Every well-placed piece has a job. A knight might defend a bishop. A pawn might protect a rook. A queen might guard a mating square. When you remove a defending piece, whatever it was protecting becomes vulnerable.

Removing the defender is often the "setup move" before a fork, pin, or checkmate. It is not flashy on its own, but it unlocks everything else.

16.7.1 How It Works

Set up your board: Place a White queen on d1, a White bishop on c4, a Black pawn on f7, and a Black king on g8 (with Black pawns on f7, g7, h7 and a Black rook on f8). The pawn on f7 defends the square g6 and supports the rook. The rook on f8 defends f7. Everything is connected.

Now imagine White captures: **Bxf7+!** The bishop takes the f7 pawn. This removes a key defender. Suddenly, the king is exposed, the rook on f8 lost its support, and tactical opportunities appear everywhere.

16.7.2 Common Patterns

1. Capture the defender. The most direct method. Take the piece that is doing the defending, and the thing it was protecting falls.

2. Lure the defender away. Attack the defending piece from another direction, forcing it to move to a square where it can no longer protect what it was guarding.

3. Block the defender. Place a piece in the path between the defender and what it protects. The defender is still on the board but can no longer do its job.

16.7.3 How to Spot It

Ask yourself: "What is holding my opponent's position together?" Find the piece that is doing the most work, and target it. Remove it, and the rest of the position collapses.

In many beginner games, a single pawn or knight holds the entire defense together. Capture that piece, and you win material or deliver checkmate.

16.8 Part 7: Overloaded Pieces

An overloaded piece is a piece trying to do two jobs at once. It is protecting one thing AND defending another, or guarding a square AND blocking an attack. When you attack an overloaded piece, it must abandon one of its duties to handle the other. Something falls.

16.8.1 How It Works

Set up your board: Place a White rook on e1, a White queen on d3, a Black queen on d8, a Black king on g8, a Black rook on e8, and Black pawns on f7, g7, h7. The Black rook on e8 is doing two jobs: it defends the back rank (if it leaves, White plays Re8# checkmate) AND it sits on the e-file opposing the White rook.

Now, if White finds a way to force the rook to leave the e-file (say, by attacking it from another direction), the back rank becomes weak. The rook is overloaded.

16.8.2 Recognizing Overloaded Pieces

Look for pieces that are: - Defending two separate pieces at once - Guarding against checkmate AND defending material - Blocking a file AND protecting a pawn

When you see a piece doing double duty, find a way to attack it. Force it to choose one job, and the other job goes undone.

Example: A knight on f6 is defending the pawn on d5 AND protecting the h7 square from a queen invasion. If you capture the pawn on d5 with a piece the knight must recapture, the knight leaves f6. Now h7 is unprotected, and your queen invades.

Tip: Overloaded pieces are everywhere in chess. Start looking for them in your own games. Ask: "Is my opponent's piece doing two things at once? Can I force it to pick one?"

> **Milestone:** You have learned all 7 tactical patterns! Forks, pins, skewers, discovered attacks, double attacks, removing the defender, and overloaded pieces. You now have every tactical tool a beginner needs. The rest is practice.

You have just finished the theory section for all seven tactical patterns. This is a major accomplishment. Take a real break. Go for a walk, get some water, stretch. When you come back, we will look at five brilliant games where grandmasters used these exact tactics to create masterpieces.

16.9 Annotated Master Games

Now let's watch grandmasters use the tactics you just learned. These five games feature forks, pins, skewers, discovered attacks, and combinations that changed chess history. Set up your board for each game and play through every move. At key moments, I will ask you to pause and find the tactic before I reveal it.

16.9.1 Game 1 of 5: Legal vs Saint Brie (Paris, 1750)

"Legal's Mate"

This game is over 270 years old, and it is still taught today. It shows how a pin can be BROKEN by a spectacular sacrifice, leading to checkmate.

Opening: Philidor Defense (C41) **Result:** 1-0

Set up your board with the starting position. White pieces on their normal squares, Black pieces on their normal squares. Follow each move carefully.

1.e4 e5

Both sides push their king's pawn two squares. Standard opening play.

2.Nf3 d6

Black plays the Philidor Defense, supporting the e5 pawn with the d-pawn. A solid but passive choice.

3.Bc4 Bg4

White develops the bishop to an aggressive diagonal aiming at f7. Black develops the bishop to g4, pinning the White knight on f3 to the White queen on d1. This looks like a good move for Black. The knight cannot move without exposing the queen, right?

4.Nc3 g6?

Black plays casually. This is a mistake. Black should have been more careful about the pin.

Pause and look: White has a bishop on c4 aiming at f7, a knight on f3 that is pinned, and a knight on c3. Black has a bishop on g4 that is pinning the knight. What if White ignores the pin entirely?

5.Nxe5!!

White moves the pinned knight! "But the queen is hanging!" you say. Yes, it is. The Black bishop on g4 can capture the White queen. But watch what happens.

5...Bxd1

Black takes the queen. A queen for a knight! Surely Black is winning? Not even close.

6.Bxf7+ Ke7

White's bishop captures on f7 with check. The king must move. It goes to e7 (the only legal square after …Ke7, since d8 is blocked by the queen and f8 is blocked by the bishop).

7.Nd5# Checkmate!

FEN (final position): `rnbq1bnr/ppp1kB2/3p2p1/3NN3/4P3/8/PPPP1PPP/R1B1K2R b - - 0 7`

After 1.e4 e5 2.Nf3 d6 3.Bc4 Bg4 4.Nc3 g6 5.Nxe5 Bxd1 6.Bxf7+ Ke7 7.Nd5#, the knight on d5 delivers check and the king has no escape: d8, e8, f8, and f6 are all covered.

Tactical patterns in this game: - **Pin** (Black's Bg4 pins the knight to the queen) - **Pin break** (White ignores the pin with Nxe5!!) - **Discovered attack** (the knight moves from f3, but the real threat comes from the bishop on c4) - **Sacrifice** (giving up the queen for a forced checkmate)

Why this works: Black's pin looked strong, but White found something more important than the queen: checkmate. Legal's combination teaches us that pins can be broken when there is a bigger threat. Never assume a pin is permanent.

What to remember: Before you feel comfortable about a pin you have created, always ask: "Can my opponent sacrifice the pinned piece and find something better?"

16.9.2 Game 2 of 5: Reti vs Tartakower (Vienna, 1910)

"The Most Elegant Three-Move Finish"

This game features one of the most famous queen sacrifices in history, using a discovered attack and back-rank weakness.

Opening: Caro-Kann Defense (B15) **Result:** 1-0

Set up your board.

1.e4 c6 2.d4 d5 3.Nc3 dxe4 4.Nxe4 Nf6

Standard Caro-Kann. Black develops naturally.

5.Qd3!?

An unusual queen move. White places the queen on d3 where it eyes the kingside.

5...e5

Black strikes at the center.

6.dxe5 Qa5+

Black checks, picking up the e5 pawn next.

7.Bd2 Qxe5 8.O-O-O

White castles queenside. The pieces are developing quickly.

8...Nxe4??

Black captures the knight on e4. This looks like a free piece! But it is a terrible blunder.

Pause and look: The Black king is on e8. The White queen is on d3. If the queen moves to d8, it would be check. And what is on d8? The Black queen is gone (it is on e5). There is nothing protecting d8 except the king itself. Look at the back rank. Is it weak?

9.Qd8+!!

White SACRIFICES the queen! Qd8 check. The king must capture.

9...Kxd8

The king takes the queen. Black is up a queen! But…

10.Bg5+

The bishop comes to g5 with check. This is a discovered attack: the bishop gives check, and the rook on d1 is now aiming at the king too. But more importantly, look at what happens next. If the king goes to c7 or e8…

10...Kc7 (or 10…Ke8)

11.Bd8# Checkmate!

FEN (final position after 10...Ke8 11.Bd8#): `3Bk3/pp3ppp/2p5/4q1B1/4n3/8/PPP2PPP/2KR3R b - - 0 11`

After 8…Nxe4 9.Qd8+! Kxd8 10.Bg5+: - If 10…Kc7, 11.Bd8# (the bishop checkmates from d8, covering c7 and e7, with the rook supporting) - If 10…Ke8, 11.Rd8# (the rook delivers back-rank mate)

Tactical patterns in this game: - **Back-rank weakness** (Black's king has no escape squares) - **Queen sacrifice** (Qd8+!! forces the king to a terrible square) - **Discovered check** (Bg5+ reveals threats) - **Checkmate pattern** (the combination is forced in only 3 moves)

Why this works: Black's back rank was completely undefended. The queen sacrifice forced the king into the open, and the discovered check finished the job. This game teaches a vital lesson: always keep an eye on back-rank weakness, especially when your king has not castled.

16.9.3 Game 3 of 5: Lasker vs Thomas (London, 1912)

"The King Hunt"

This is one of the most spectacular games ever played. World Champion Emanuel Lasker sacrifices his queen and then hunts Black's king across the entire board, from h7 all the way to d1, delivering checkmate in the center.

Opening: Dutch Defense (A83) **Result:** 1-0

Set up your board.

1.d4 e6 2.Nf3 f5

Black plays the Dutch Defense, controlling e4 with the f-pawn. But this weakens the king's position.

3.Nc3 Nf6 4.Bg5 Be7 5.Bxf6 Bxf6

White trades the bishop for the knight. Now the dark-squared bishop is gone, and the a1-h8 diagonal is weakened for Black.

6.e4 fxe4 7.Nxe4 b6

White opens the center. Black develops slowly.

8.Ne5 O-O

Black castles, putting the king on g8. The kingside is about to come under heavy fire.

9.Bd3 Bb7 10.Qh5!

White places the queen aggressively on h5, aiming at h7.

Pause and look: The queen on h5 threatens Qxh7#. The only defender of h7 is the king itself (and the f6 bishop indirectly). What can Black do?

10...Qe7

Black tries to defend. But the storm is coming.

11.Qxh7+!!

White SACRIFICES the queen! Takes the pawn on h7 with check. The king must capture.

11...Kxh7

12.Nxf6+ Kh6

The knight comes to f6 with check (double check from the knight and the discovered check from… actually, it is just the knight check here). The king goes to h6, running from the check.

13.Neg4+ Kg5

Another check from the knight on g4. The king runs to g5. The king is now in the middle of the board, completely exposed.

14.h4+ Kf4

White pushes the h-pawn with check. The king flees to f4. Incredible.

15.g3+ Kf3

Another pawn check. The king goes to f3. It has crossed the entire board.

16.Be2+ Kg2

The bishop checks from e2. The king goes to g2, right next to White's own rook on h1.

17.Rh2+ Kg1

The rook checks from h2. The king goes to g1.

18.Kd2# (or O-O-O#)

White plays king to d2, and it is checkmate! The king has moved to d2, and the Black king on g1 has no escape. The rook on h2 controls the second rank, the bishop on e2 covers f1, and the knight on f6 covers other squares.

Actually, the historical record shows 18.Kd2# as checkmate, with some sources recording it as 18.O-O-O# (queenside castling as the final move, which would be legal since neither the king nor the a1 rook has moved). Both deliver the same checkmate.

Tactical patterns in this game: - **Queen sacrifice** (Qxh7+!! to strip away the king's pawn cover) - **Discovered check** (Nxf6+ reveals the queen's line, though the queen has been sacrificed) - **Double attacks** (every check forces the king forward while threatening more) - **King hunt** (the king is chased from h7 to g1, covering nearly the entire board)

Why this works: Black's king had weak pawn cover (the f5 pawn was traded early, weakening the kingside). Lasker exploited this with a queen sacrifice that ripped open the king's shelter. Once the king was exposed, a series of checks drove it across the board to its doom.

What to remember: When your opponent's king is weakened (missing pawns in front of it, no defenders nearby), look for sacrifices that tear it open. A queen sacrifice sounds scary, but if it leads to checkmate, it is the best move on the board.

16.9.4 Game 4 of 5: Paulsen vs Morphy (New York, 1857)

"The Queen Sacrifice That Launched a Legend"

Paul Morphy was the greatest player of his era, and this game shows why. His queen sacrifice (Qxf3!!) is one of the most celebrated moves in chess history. The combination that follows demonstrates how rapid development and open lines create unstoppable attacks.

Opening: Four Knights Game (C48) **Result:** 0-1 (Morphy wins with Black)

Set up your board.

1.e4 e5 2.Nf3 Nc6 3.Nc3 Nf6 4.Bb5 Bc5 5.O-O O-O

Both sides develop quickly. A normal Four Knights opening.

6.Nxe5 Re8

White takes the e5 pawn with the knight. Black immediately plays Re8, pinning the knight to the king along the e-file and threatening to win it back.

7.Nxc6 dxc6 8.Bc4 b5 9.Be2 Nxe4 10.Nxe4 Rxe4

A series of exchanges. Black now has a rook actively placed on e4.

11.Bf3 Re6 12.c3 Qd3!

Black's queen comes to d3, a powerful centralized position. Morphy is building pressure.

13.b4 Bb6 14.a4 bxa4 15.Qxa4 Bd7 16.Ra2 Rae8

Both of Black's rooks are on the e-file. All of Black's pieces are developed and active. White's pieces are passive and tangled.

Pause and look: Compare the two positions. How many of White's pieces are actively placed? How many of Black's? Count them. Black has the queen on d3, both rooks on the e-file, bishops on b6 and d7. White has the queen on a4 (far from the action), the rook on a2 (doing nothing), and the bishop on f3 (passive). This development advantage is what Morphy will convert.

17.Qa6

White tries to generate counterplay.

17...Qxf3!!

Morphy sacrifices the queen! Black takes the bishop on f3 with the queen. White must capture.

18.gxf3 Rg6+

The rook comes to g6 with check. The king is exposed now (the g-pawn just moved to capture the queen, opening the g-file).

19.Kh1 Bh3

Black's bishop comes to h3, threatening Bg2# checkmate. The attack flows naturally.

20.Rd1 Bg2+ 21.Kg1 Bxf3+

The bishop gives a discovered check by moving to f3. The king must deal with it.

22.Kf1 Bg2+ 23.Kg1 Bh3+ 24.Kh1 Bxf2

Morphy is methodically dismantling White's position while keeping the king under constant pressure.

25.Qf1 Bxf1 26.Rxf1 Re2 27.Ra1 Rh6 28.d4 Be3 0-1

White resigns. The position is hopeless. Black's pieces dominate every part of the board.

Tactical patterns in this game: - **Pin** (Re8 pins the knight to the king in the opening) - **Queen sacrifice** (Qxf3!! opens the g-file for the rook) - **Discovered check** (Bxf3+ reveals the rook's attack) - **Development advantage** (Morphy's rapid development created the conditions for every tactic)

Why this works: Morphy understood that having all your pieces active and coordinated is worth more than any single piece, even a queen. His queen sacrifice opened lines that his rooks and bishops used to create an unstoppable attack. The lesson: develop ALL your pieces before you attack, and when the attack comes, even a queen sacrifice can be correct.

16.9.5 Game 5 of 5: Byrne vs Fischer (New York, 1956)

"The Game of the Century"

A 13-year-old Bobby Fischer played this game against Donald Byrne, one of America's strongest players. Fischer's queen sacrifice on move 17 stunned the chess world and earned the game its legendary nickname. It remains one of the greatest games ever played.

Opening: Gruenfeld Defense (D92) **Result:** 0-1 (Fischer wins with Black)

Set up your board.

1.Nf3 Nf6 2.c4 g6 3.Nc3 Bg7 4.d4 O-O 5.Bf4 d5

Fischer plays the Gruenfeld, challenging the center immediately.

6.Qb3 dxc4 7.Qxc4 c6 8.e4 Nbd7 9.Rd1 Nb6 10.Qc5 Bg4

Fischer develops with purpose. The bishop on g4 pins the knight on f3 to… well, it puts pressure on the knight and aims at the d1 rook behind it.

11.Bg5?!

White pins the Black knight on f6 to the queen on d8. Pins everywhere!

11...Na4! 12.Qa3 Nxc3 13.bxc3 Nxe4!

Fischer sacrifices a knight to destroy White's center. Bold play from a 13-year-old.

14.Bxe7 Qb6!

White captures the bishop on e7, but Fischer's queen comes to b6 with a powerful position.

15.Bc4 Nxc3!

Another piece enters the attack. Fischer is tearing White's position apart.

16.Bc5 Rfe8+ 17.Kf1

White's king cannot castle anymore. It sits on f1, awkwardly placed.

Pause and look: Fischer is about to play one of the most famous moves in chess history. Black has a knight on c3, a queen on b6, a rook on e8, and a bishop on g4. White's king is on f1, exposed. What would you play?

17...Be6!!

Fischer offers his QUEEN. The bishop moves to e6, and the queen on b6 is attacked by the bishop on c5. Fischer does not care. If White takes the queen with Bxb6, then …Bxc4+ wins the bishop and forks the king and rook, and Black's attack continues with overwhelming force.

18.Bxb6 Bxc4+ 19.Kg1 Ne2+ 20.Kf1 Nxd4+

A beautiful sequence. Knight forks, discovered checks, and devastating tactics flow from every direction.

21.Kg1 Ne2+ 22.Kf1 Nc3+ 23.Kg1 axb6 24.Qb4 Ra4 25.Qxb6 Nxd1

Fischer has won massive material. The rest is technique.

26.h3 Rxa2 27.Kh2 Nxf2 28.Re1 Rxe1 29.Qd8+ Bf8 30.Nxe1 Bd5 31.Nf3 Ne4 32.Qb8 b5 33.h4 h5 34.Ne5 Kg7 35.Kg1 Bc5+ 36.Kf1 Ng3+ 37.Ke1 Bb4+ 38.Kd1 Bb3+ 39.Kc1 Ne2+ 40.Kb1 Nc3+ 41.Kc1 Rc2# Checkmate.

FEN (final position): `1Q6/5pk1/6p1/1b2N2p/1b5P/1nB5/2r5/2K5 w - - 0 42`

After 41…Rc2#, the king is on c1, the rook gives check from c2, and the knight on c3 and bishop on b4 cover the escape squares. Checkmate.

Tactical patterns in this game: - **Pin** (Bg4 pins the knight, Bg5 pins the other knight) - **Queen sacrifice** (Be6!! allows the queen to be captured) - **Knight forks** (Ne2+, Nxd4+, and others throughout the combination) - **Discovered checks** (multiple in the final sequence) - **Overloaded pieces** (White cannot defend everything at once)

Why this works: Fischer saw further than his opponent at every turn. The queen sacrifice was not a wild gamble. It was a precise calculation. After Bxb6, Fischer had a sequence of checks and

forks that won back more material than the queen was worth. The game teaches us that sacrifices must be backed by concrete calculation, not hope.

What to remember: A 13-year-old played this game. He did not have a computer. He did not have a coach sitting next to him. He had pattern recognition, calculation, and the courage to sacrifice his queen when he saw it was correct. You can develop these same skills. It starts with learning the patterns in this chapter.

You have now studied five masterpieces of tactical chess. Take a real break before the exercise section. The next 140 problems will test everything you have learned. Come back with fresh eyes and a clear mind.

16.10 Exercises

140 exercises organized by tactical pattern. Set up each position on your board or load the FEN into a chess program. Try to solve before reading hints.

Difficulty: = straightforward | = requires planning | = deep combination

---

16.10.1 Section A: Fork Exercises (6.1–6.35)

Exercise 6.1 **Position:** White: Ke1, Ne5. Black pieces on f8 and b8.

Task: White to move. Find the knight fork. **Hint 1:** The knight on e5 can jump to d7. **Hint 2:** Check what squares d7 attacks. **Hint 3:** It hits f8 (king) and b8 (queen). **Solution: 1.Nd7+** Forks king on f8 and queen on b8. After the king moves, the knight captures.

Exercise 6.2 **Position:** White: Ke1, Nb3. Black pieces on d7 and a6.

Task: White to move. Find the knight fork. **Hint 1:** The knight on b3 can jump to c5. **Hint 2:** Check what squares c5 attacks. **Hint 3:** It hits d7 (king) and a6 (queen). **Solution: 1.Nc5+** Forks king on d7 and queen on a6. After the king moves, the knight captures.

Exercise 6.3 **Position:** White: Ke2, Nb5. Black pieces on e8 and a8.

Task: White to move. Find the knight fork. **Hint 1:** The knight on b5 can jump to c7. **Hint 2:** Check what squares c7 attacks. **Hint 3:** It hits e8 (king) and a8 (rook). **Solution: 1.Nc7+** Forks king on e8 and rook on a8. After the king moves, the knight captures.

Exercise 6.4 **Position:** White: Ke1, Ne5. Black pieces on d8 and h8.

Task: White to move. Find the knight fork. **Hint 1:** The knight on e5 can jump to f7. **Hint 2:** Check what squares f7 attacks. **Hint 3:** It hits d8 (king) and h8 (rook). **Solution: 1.Nf7+** Forks king on d8 and rook on h8. After the king moves, the knight captures.

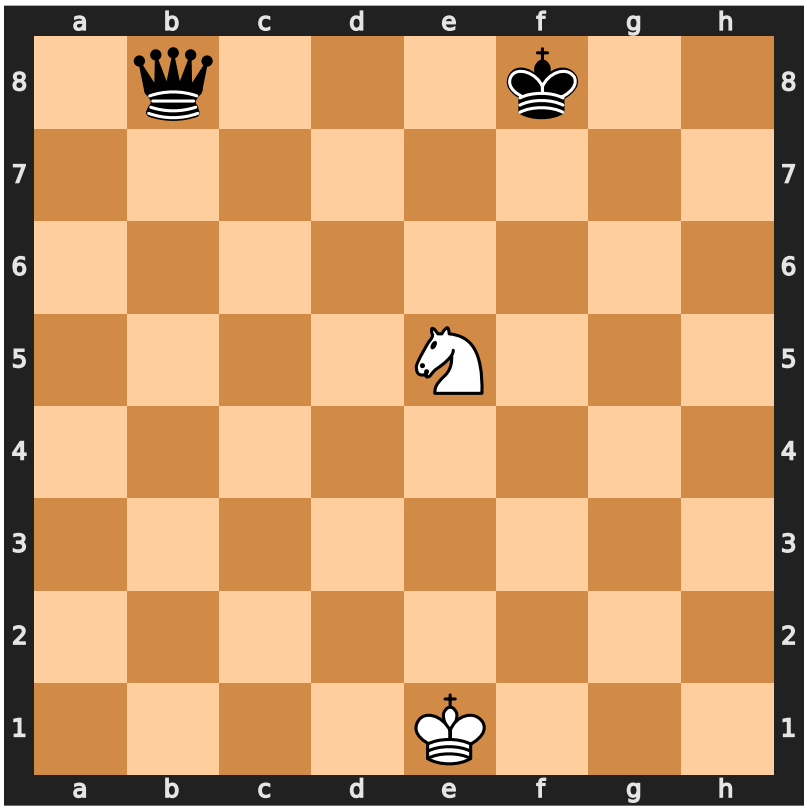

Figure 16.10: Chess Position

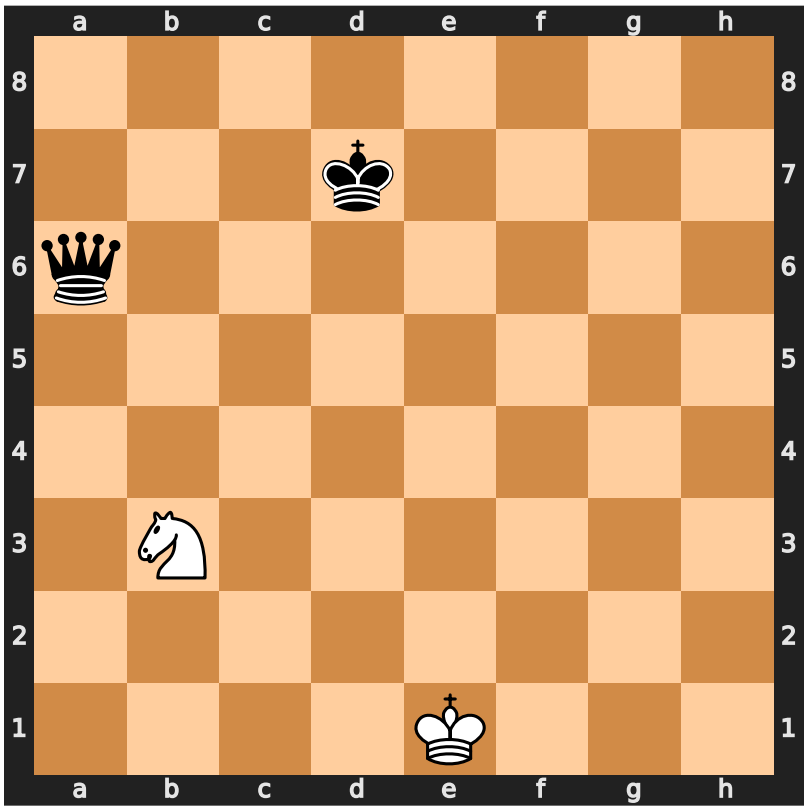

Figure 16.11: Chess Position

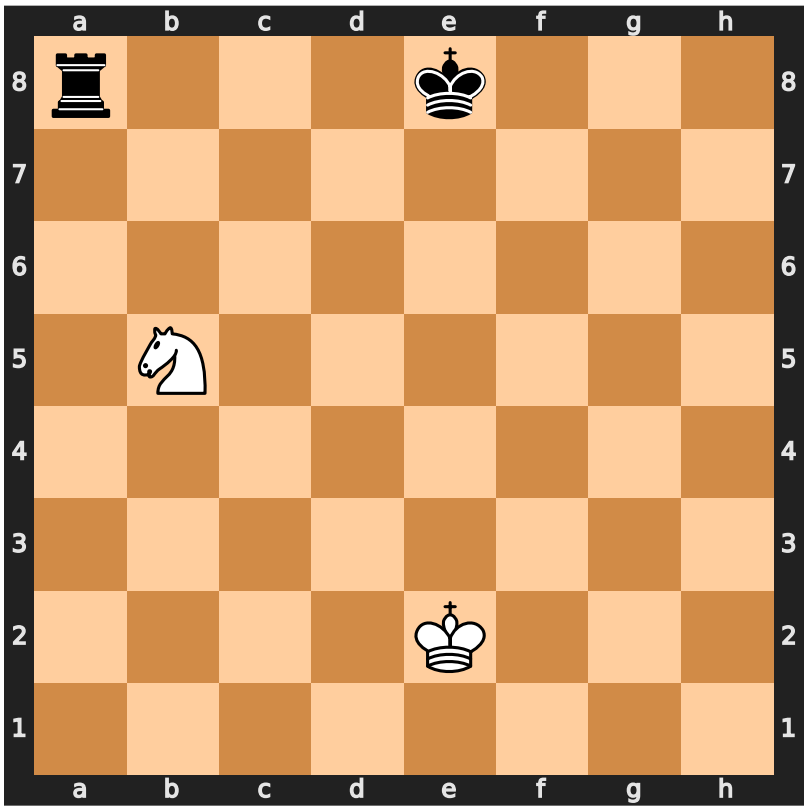

Figure 16.12: Chess Position

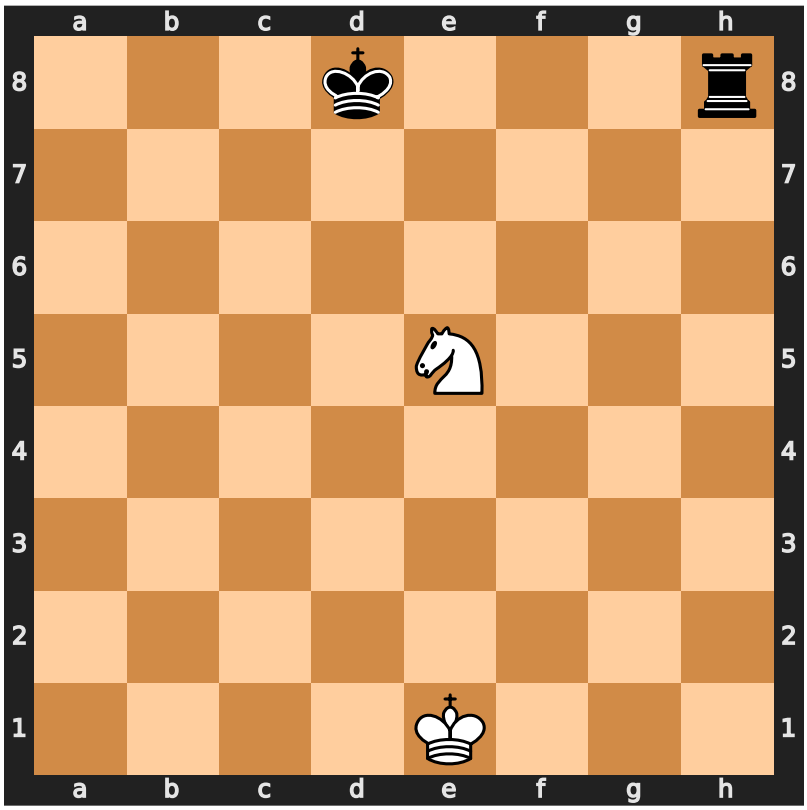

Figure 16.13: Chess Position

Exercise 6.5 **Position:** White: Ke2, Nf3. Black pieces on e6 and h7.

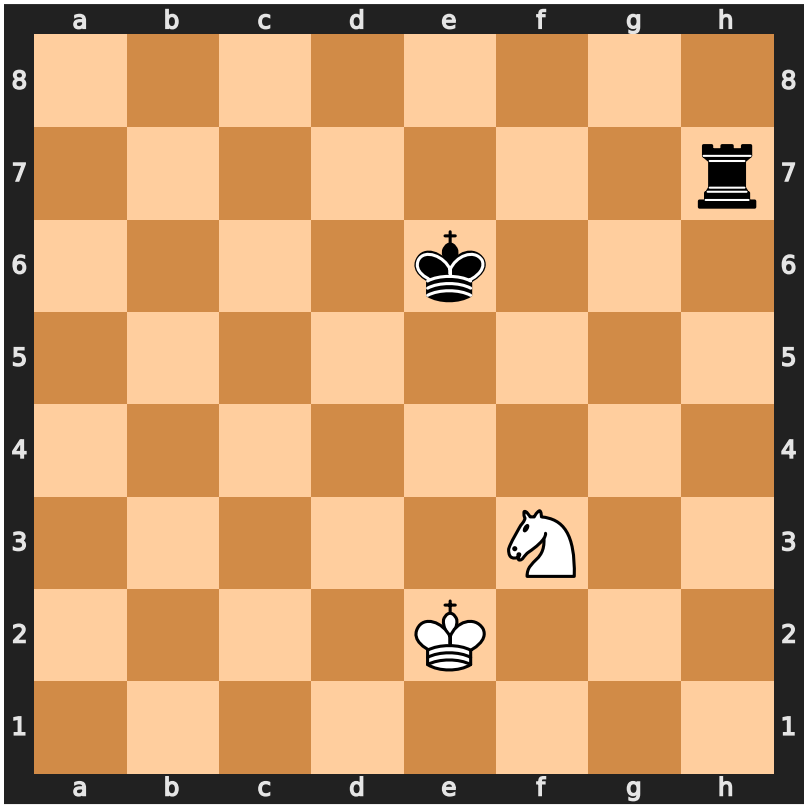

Figure 16.14: Chess Position

Task: White to move. Find the knight fork. **Hint 1:** The knight on f3 can jump to g5. **Hint 2:** Check what squares g5 attacks. **Hint 3:** It hits e6 (king) and h7 (rook). **Solution: 1.Ng5+** Forks king on e6 and rook on h7. After the king moves, the knight captures.

Exercise 6.6 **Position:** White: Ke1, Ng3. Black pieces on e7 and h6.

Task: White to move. Find the knight fork. **Hint 1:** The knight on g3 can jump to f5. **Hint 2:** Check what squares f5 attacks. **Hint 3:** It hits e7 (king) and h6 (bishop). **Solution: 1.Nf5+** Forks king on e7 and bishop on h6. After the king moves, the knight captures.

Exercise 6.7 **Position:** White: Ke1, Ne4. Black pieces on a6 and d7.

Task: White to move. Find the knight fork. **Hint 1:** The knight on e4 can jump to c5. **Hint 2:** Check what squares c5 attacks. **Hint 3:** It hits a6 (rook) and d7 (rook). **Solution: 1.Nc5** Forks rook on a6 and rook on d7. Black saves one, White takes the other.

Exercise 6.8 **Position:** White: Ke1, Nd3. Black pieces on d7 and f7.

Task: White to move. Find the knight fork. **Hint 1:** The knight on d3 can jump to e5. **Hint**

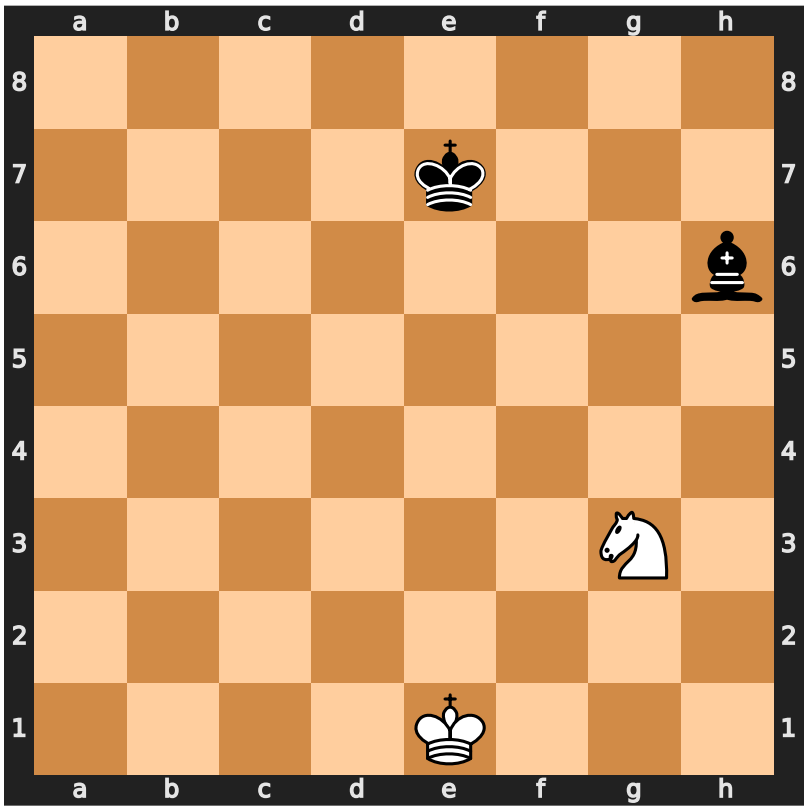

Figure 16.15: Chess Position

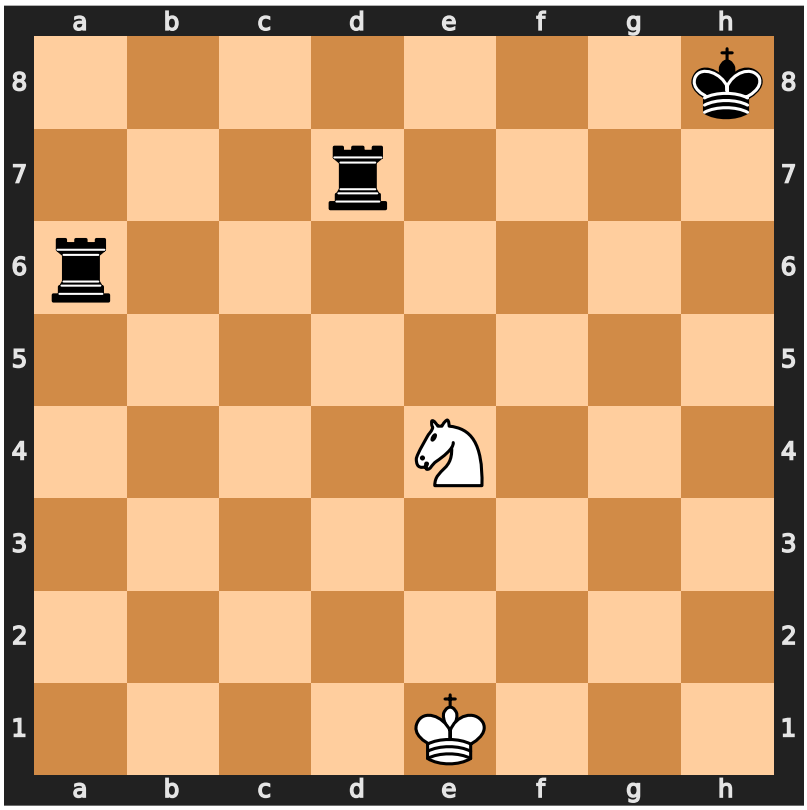

Figure 16.16: Chess Position

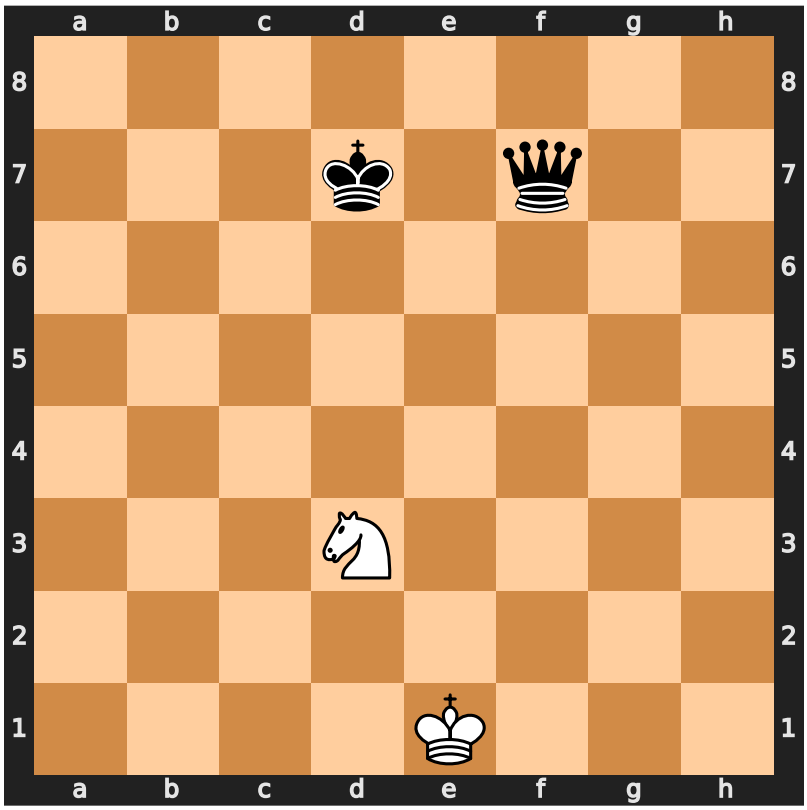

Figure 16.17: Chess Position

2: Check what squares e5 attacks. **Hint 3:** It hits d7 (king) and f7 (queen). **Solution: 1.Ne5+** Forks king on d7 and queen on f7. After the king moves, the knight captures.

Exercise 6.9 **Position:** White: Ke1, Ng4. Black pieces on f7 and g8.

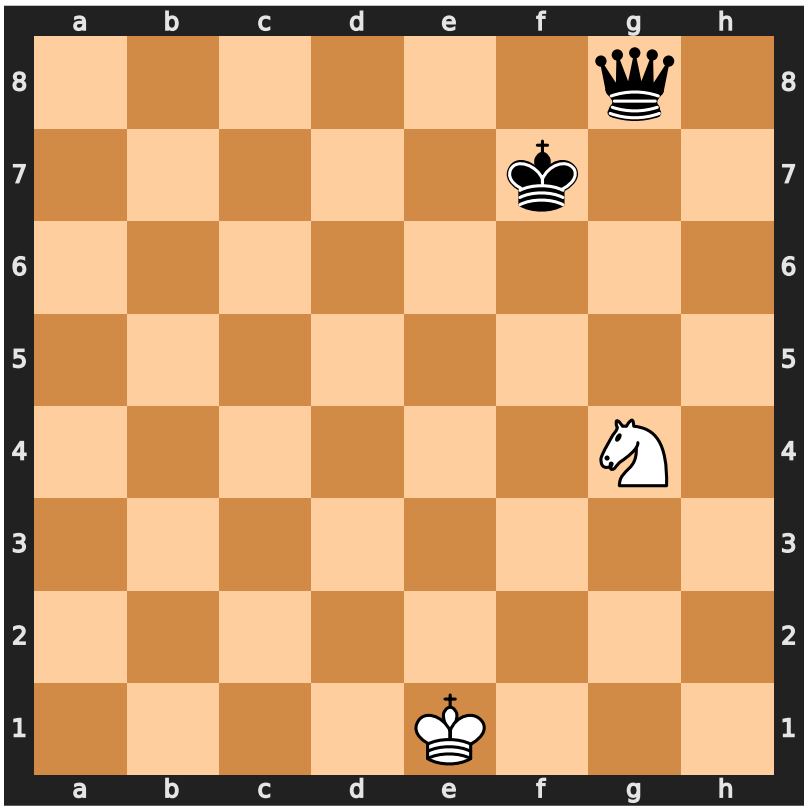

Figure 16.18: Chess Position

Task: White to move. Find the knight fork. **Hint 1:** The knight on g4 can jump to h6. **Hint 2:** Check what squares h6 attacks. **Hint 3:** It hits f7 (king) and g8 (queen). **Solution: 1.Nh6+** Forks king on f7 and queen on g8. After the king moves, the knight captures.

Exercise 6.10 **Position:** White: Ke2, Nc4. Black pieces on d7 and a8.

Task: White to move. Find the knight fork. **Hint 1:** The knight on c4 can jump to b6. **Hint 2:** Check what squares b6 attacks. **Hint 3:** It hits d7 (king) and a8 (rook). **Solution: 1.Nb6+** Forks king on d7 and rook on a8. After the king moves, the knight captures.

Exercise 6.11 **Position:** White: Ke1, Nc4. Black pieces on c8 and e8.

Task: White to move. Find the knight fork. **Hint 1:** The knight on c4 can jump to d6. **Hint 2:** Check what squares d6 attacks. **Hint 3:** It hits c8 (rook) and e8 (queen). **Solution: 1.Nd6** Forks rook on c8 and queen on e8. Black saves one, White takes the other.

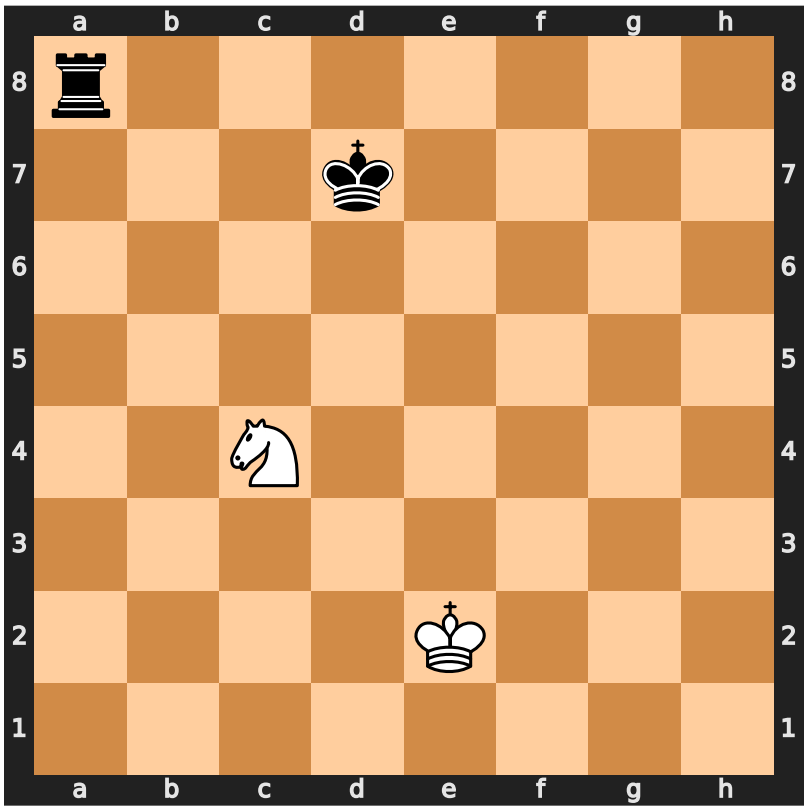

Figure 16.19: Chess Position

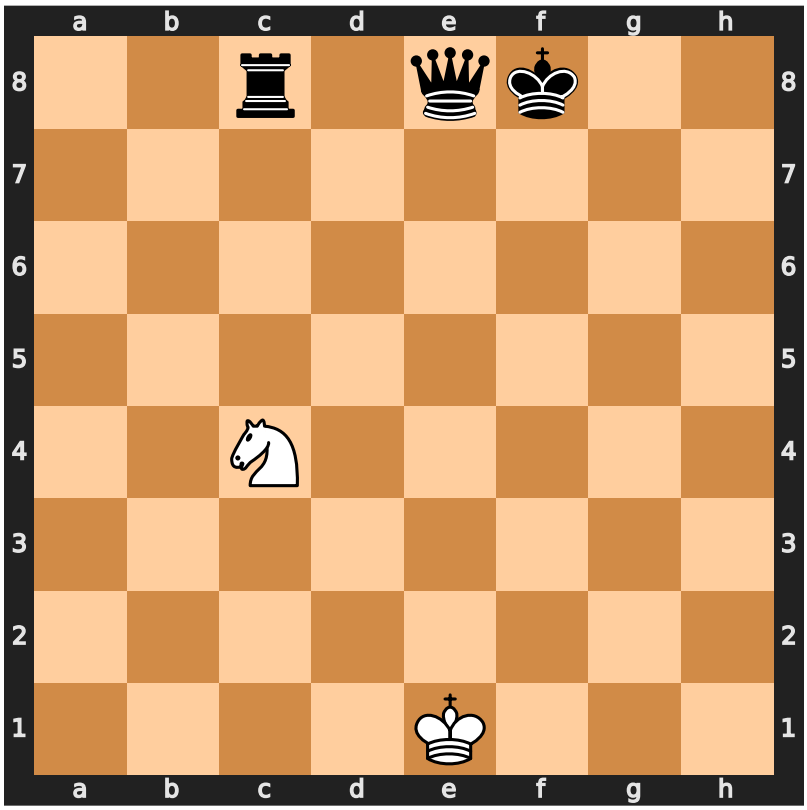

Figure 16.20: Chess Position

Exercise 6.12 **Position:** White: Ke1, Nd4. Black pieces on d8 and a7.

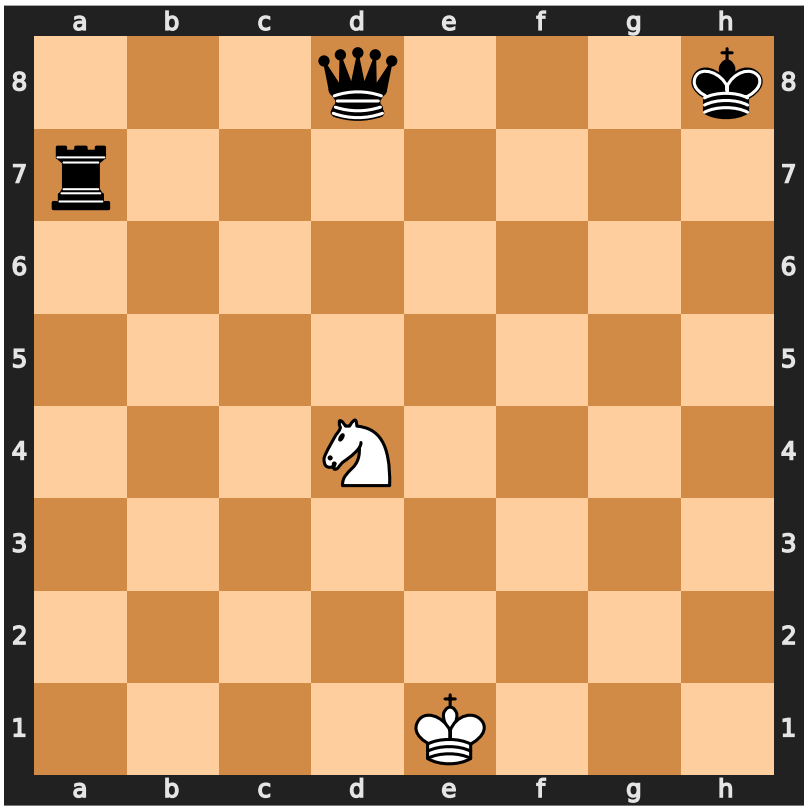

Figure 16.21: Chess Position

Task: White to move. Find the knight fork. **Hint 1:** The knight on d4 can jump to c6. **Hint 2:** Check what squares c6 attacks. **Hint 3:** It hits d8 (queen) and a7 (rook). **Solution: 1.Nc6** Forks queen on d8 and rook on a7. Black saves one, White takes the other.

Exercise 6.13 **Position:** Qd1, Ka8, Rh5

Task: Queen fork with check. **Hint 1:** Qd5+ checks on the a8 diagonal and attacks h5 on the rank. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qd5+** Check on the diagonal, rook falls on the rank.

Exercise 6.14 **Position:** Qb1, Kf5, Rb8

Task: Fork king and rook. **Hint 1:** Qb5+ checks on the rank, rook on b8 via b-file. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qb5+** Check, then Qxb8.

Exercise 6.15 **Position:** Qh1, Kd5, Rh8

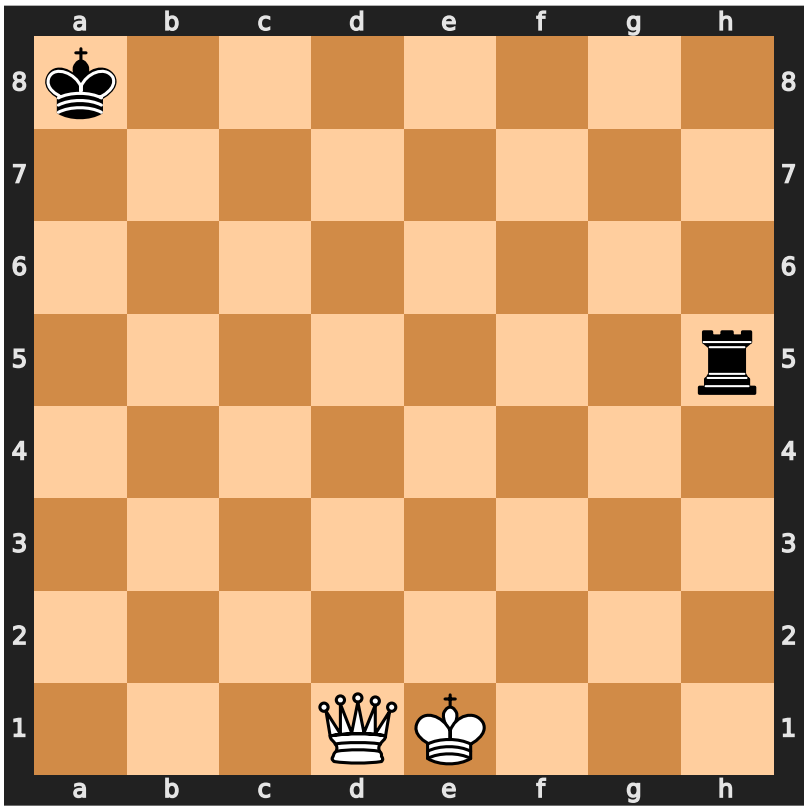

Figure 16.22: Chess Position

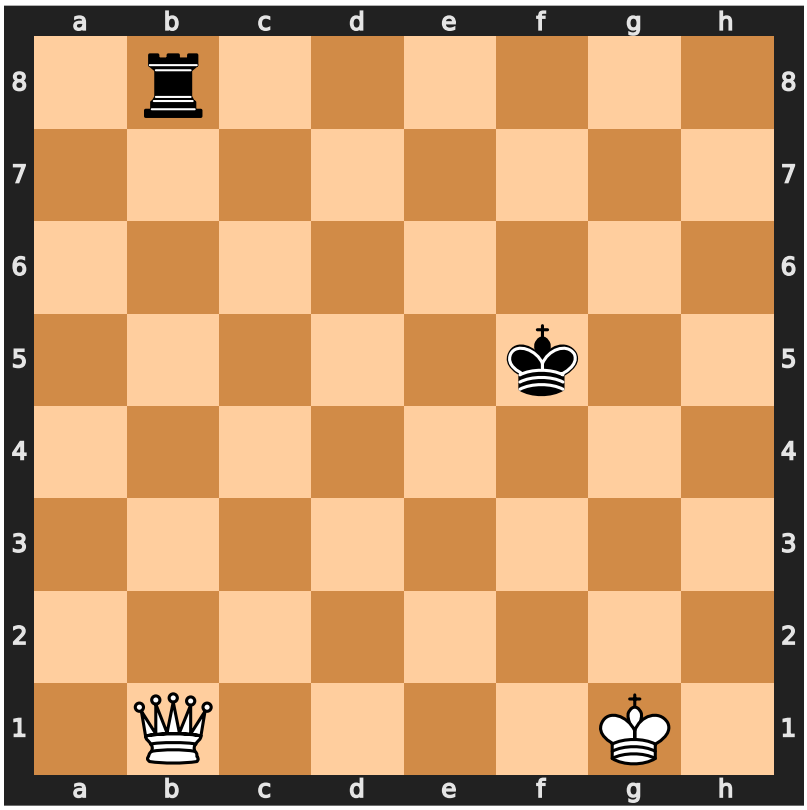

Figure 16.23: Chess Position

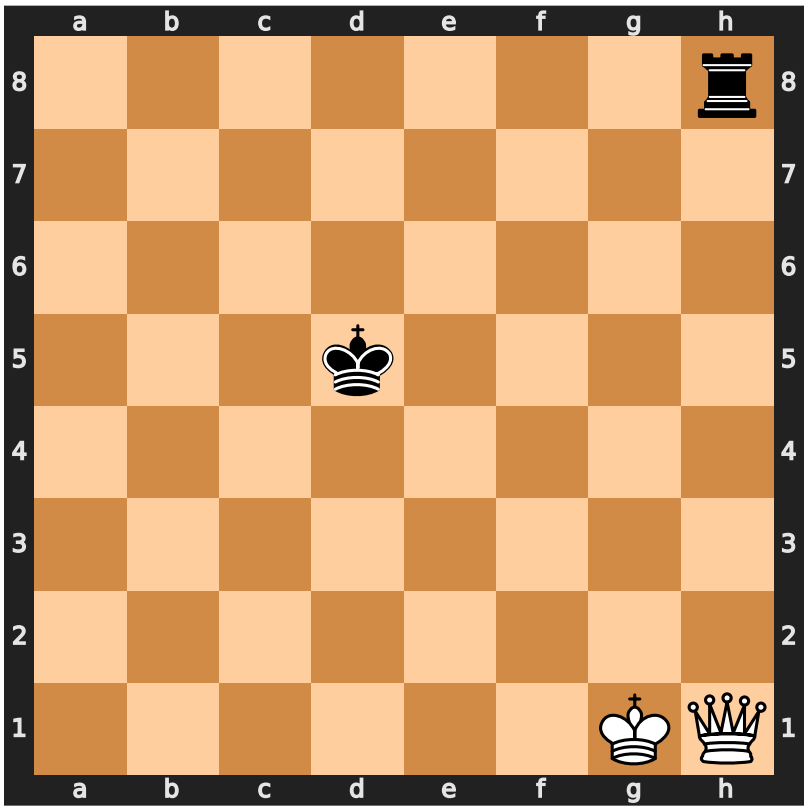

Figure 16.24: Chess Position

Task: Check and win the rook. **Hint 1:** Qh5+ checks on the rank, rook on h8 via h-file. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qh5+** Check on the rank, Qxh8 follows.

Exercise 6.16 **Position:** Qe1, Kd4, Ra8

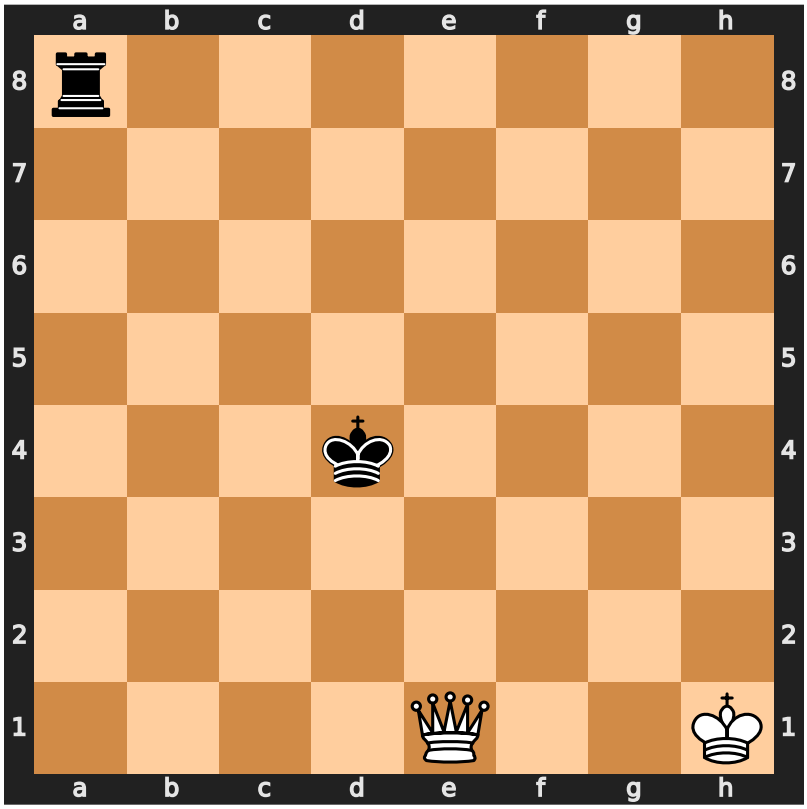

Figure 16.25: Chess Position

Task: Queen fork on the diagonal. **Hint 1:** Qa1+ checks on the a1-d4 diagonal, rook on a8 via a-file. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qa1+** Check on the diagonal, Qxa8 follows.

Exercise 6.17 **Position:** Qf3, Kc6, Rf8

Task: Check and win the rook. **Hint 1:** Qf6+ checks on the rank, rook on f8 via f-file. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qf6+** Check, then Qxf8.

Exercise 6.18 **Position:** Qa1, Kd7, Rh7

Task: Queen fork on the 7th rank. **Hint 1:** Qa7+ checks on the rank, rook on h7 attacked. **Hint 2:** The queen attacks along ranks, files, and diagonals. **Hint 3:** After the king moves, capture the loose piece. **Solution: 1.Qa7+** Check on the 7th rank, Qxh7 follows.

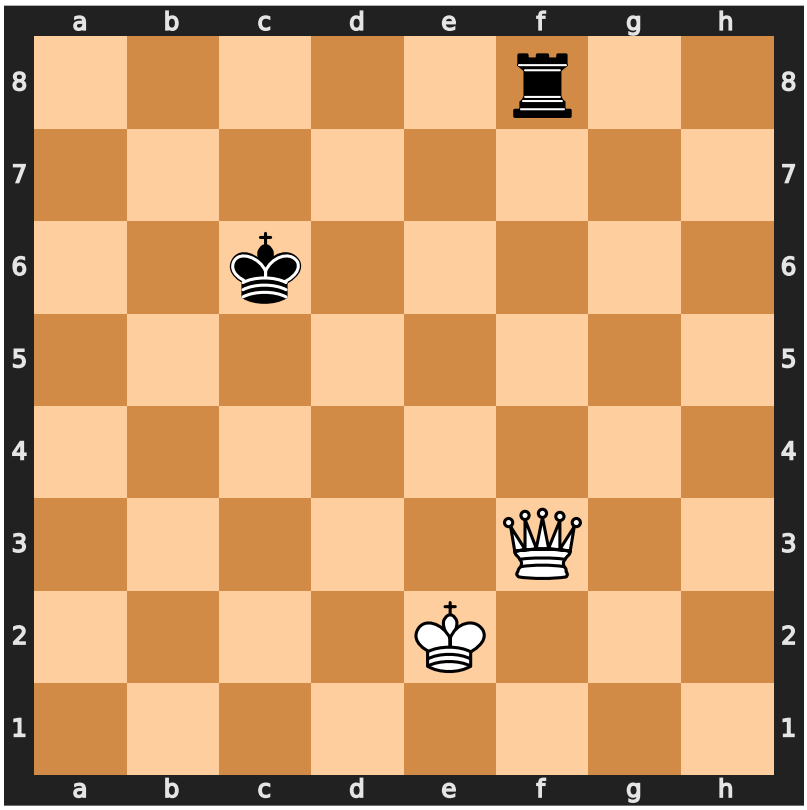

Figure 16.26: Chess Position

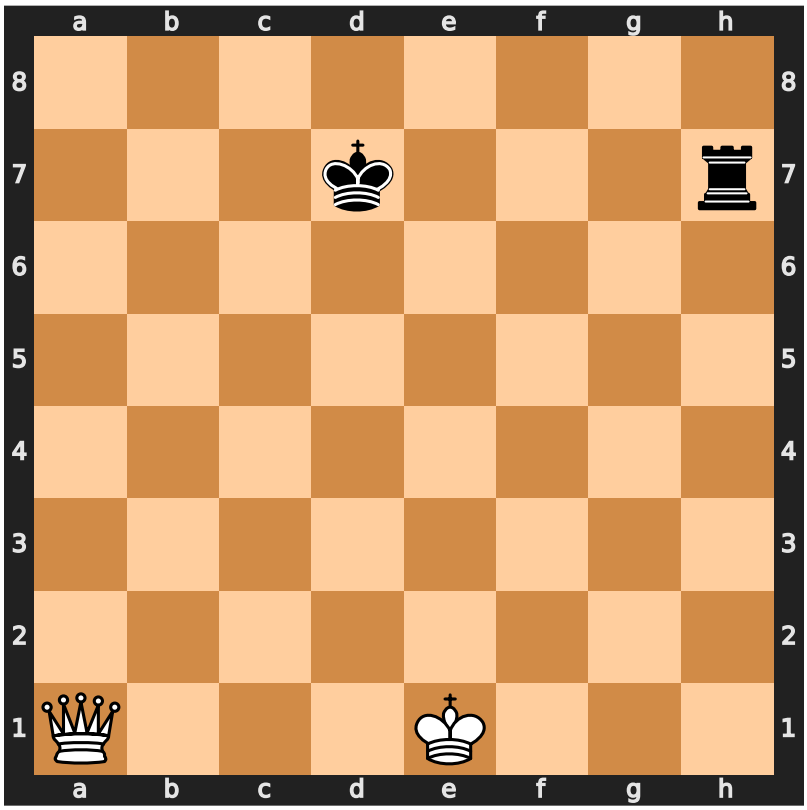

Figure 16.27: Chess Position

Exercise 6.19 **Position:** White pawn on d4. Black pieces on c5 and e5.

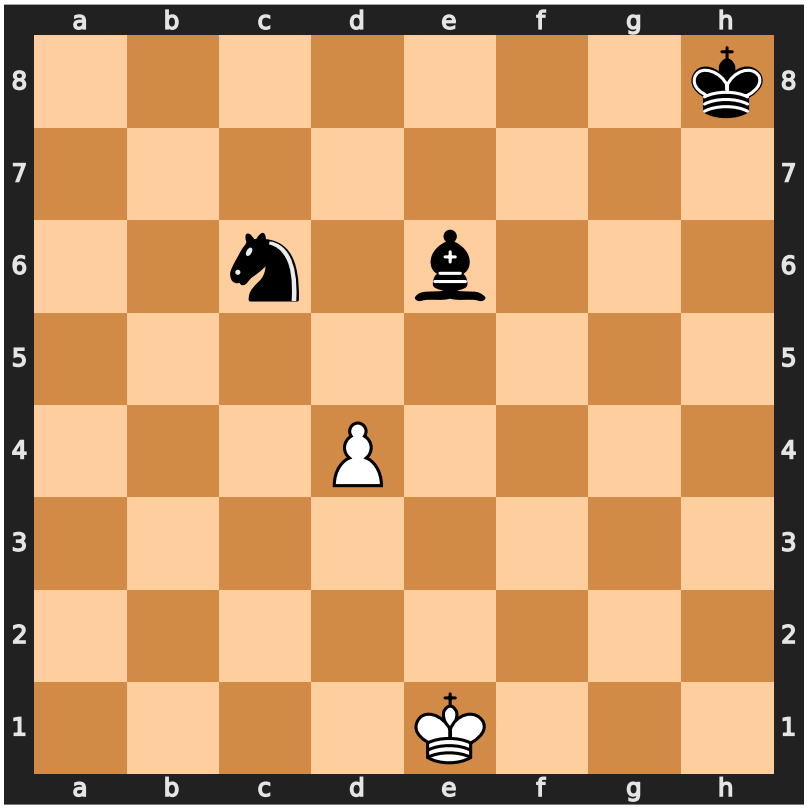

Figure 16.28: Chess Position

Task: White to move. Find the pawn fork. **Hint 1:** The pawn on d4 advances to d5. **Hint 2:** A pawn on d5 attacks c5 and e5. **Hint 3:** Both squares have Black pieces. **Solution: 1.d5!** Pawn forks the pieces on c5 and e5.

Exercise 6.20 **Position:** White pawn on e4. Black pieces on d5 and f5.

Task: White to move. Find the pawn fork. **Hint 1:** The pawn on e4 advances to e5. **Hint 2:** A pawn on e5 attacks d5 and f5. **Hint 3:** Both squares have Black pieces. **Solution: 1.e5!** Pawn forks the pieces on d5 and f5.

Exercise 6.21 **Position:** White pawn on c4. Black pieces on b5 and d5.

Task: White to move. Find the pawn fork. **Hint 1:** The pawn on c4 advances to c5. **Hint 2:** A pawn on c5 attacks b5 and d5. **Hint 3:** Both squares have Black pieces. **Solution: 1.c5!** Pawn forks the pieces on b5 and d5.

Exercise 6.22 **Position:** White pawn on b4. Black pieces on a5 and c5.

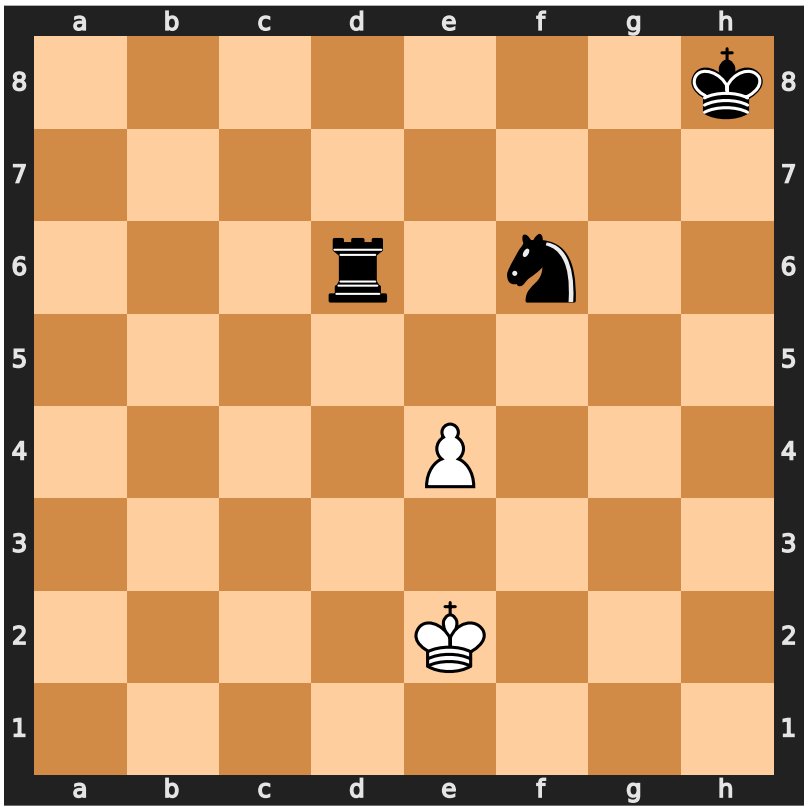

Figure 16.29: Chess Position

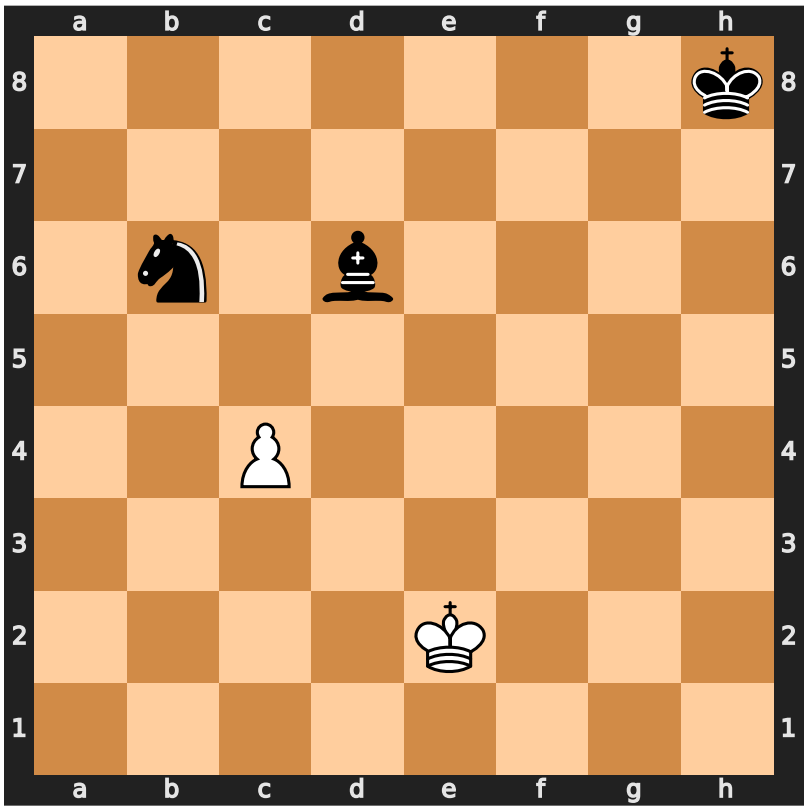

Figure 16.30: Chess Position

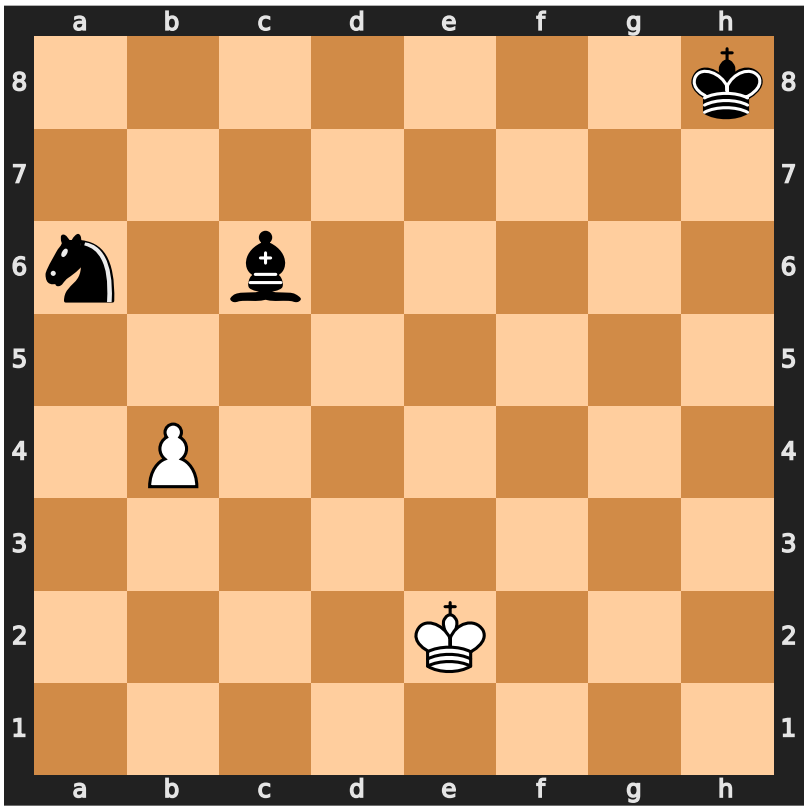

Figure 16.31: Chess Position

Task: White to move. Find the pawn fork. **Hint 1:** The pawn on b4 advances to b5. **Hint 2:** A pawn on b5 attacks a5 and c5. **Hint 3:** Both squares have Black pieces. **Solution: 1.b5!** Pawn forks the pieces on a5 and c5.

Exercise 6.23 **Position:** White: Kg1, Nd3. Black pieces include king and queen.

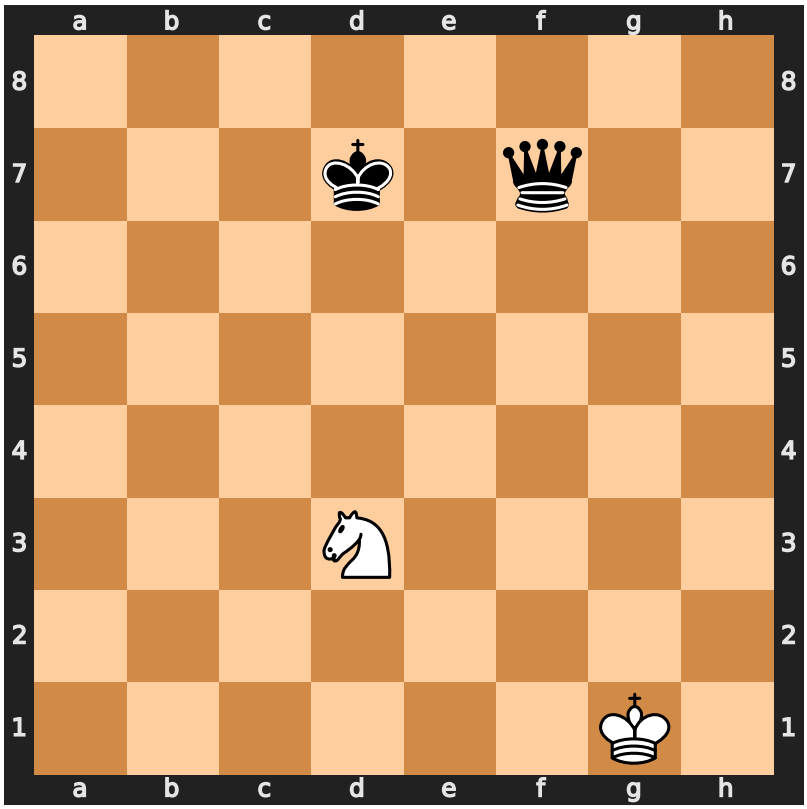

Figure 16.32: Chess Position

Task: White to move. Find the knight fork. **Hint 1:** Ne5+ is the key move. **Hint 2:** It attacks d7 and f7. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Ne5+** Knight forks the king on d7 and queen on f7.

Exercise 6.24 **Position:** White: Kg1, Ne2. Black pieces include king and queen.

Task: White to move. Find the knight fork. **Hint 1:** Nc3+ is the key move. **Hint 2:** It attacks b5 and d1. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Nc3+** Knight forks the king on b5 and queen on d1.

Exercise 6.25 **Position:** White: Ke1, Ng5. Black pieces include king and queen.

Task: White to move. Find the knight fork. **Hint 1:** Ne6+ is the key move. **Hint 2:** It attacks f8 and d8. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Ne6+** Knight forks the king on f8 and queen on d8.

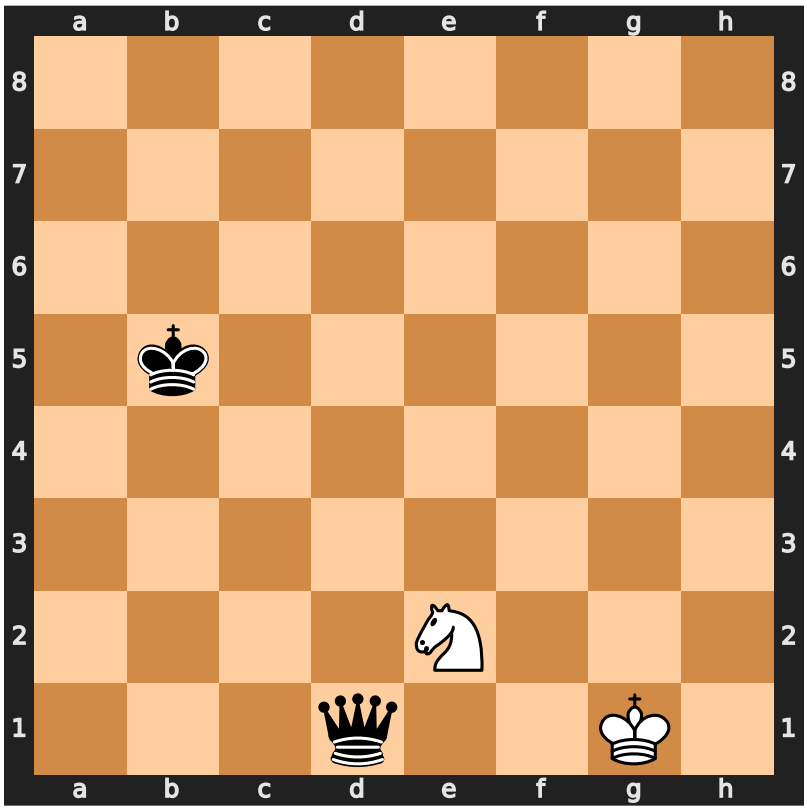

Figure 16.33: Chess Position

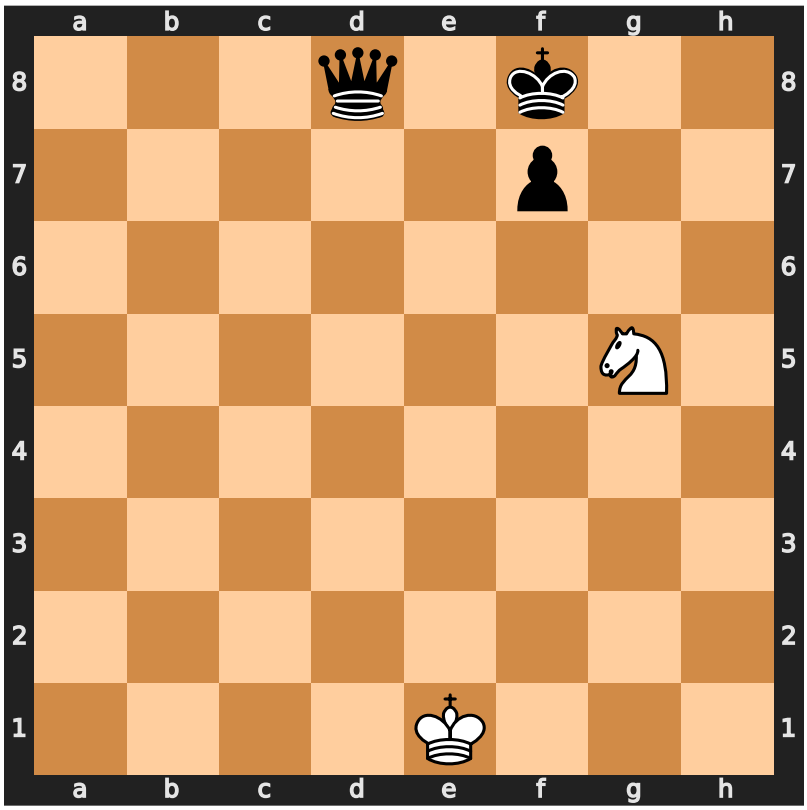

Figure 16.34: Chess Position

Exercise 6.26 **Position:** White: Ka1, Ng4. Black pieces include king and queen.

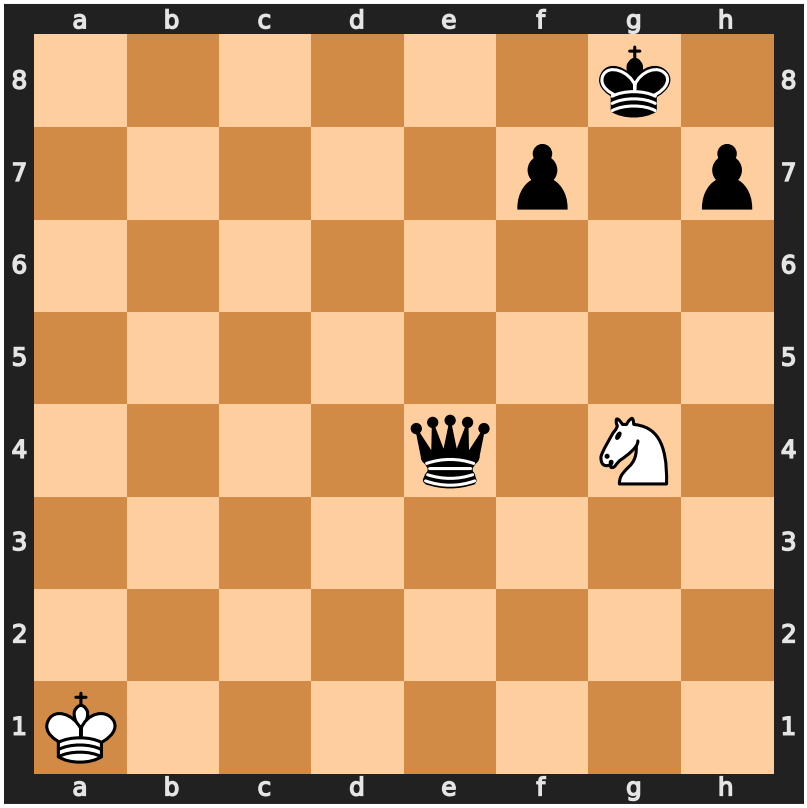

Figure 16.35: Chess Position

Task: White to move. Find the knight fork. **Hint 1:** Nf6+ is the key move. **Hint 2:** It attacks g8 and e4. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Nf6+** Knight forks the king on g8 and queen on e4.

Exercise 6.27 **Position:** White: Ke1, Ne5. Black pieces include rook and rook.

Task: White to move. Find the knight fork. **Hint 1:** Nd7 is the key move. **Hint 2:** It attacks b8 and f8. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Nd7** Knight forks the rook on b8 and rook on f8.

Exercise 6.28 **Position:** White: Ke1, Nh4. Black pieces include king and queen.

Task: White to move. Find the knight fork. **Hint 1:** Ng6+ is the key move. **Hint 2:** It attacks h8 and e7. **Hint 3:** Calculate what each side wins and loses. **Solution: 1.Ng6+** Knight forks the king on h8 and queen on e7.

Exercise 6.29 **Position:** White: Kg1, Nd3. Black: Kd7, Qf7, Rc4.

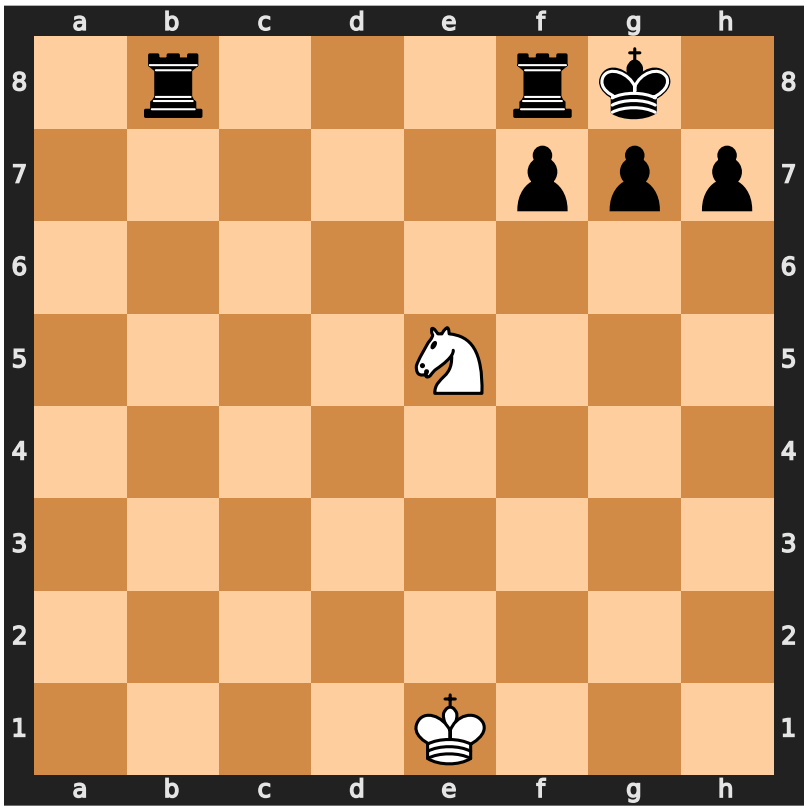

Figure 16.36: Chess Position

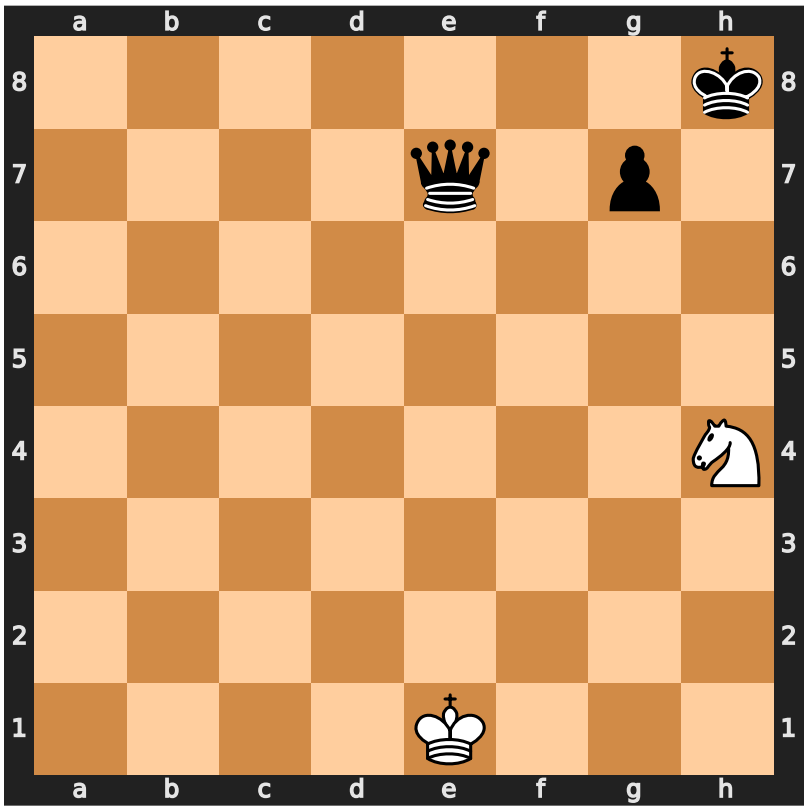

Figure 16.37: Chess Position

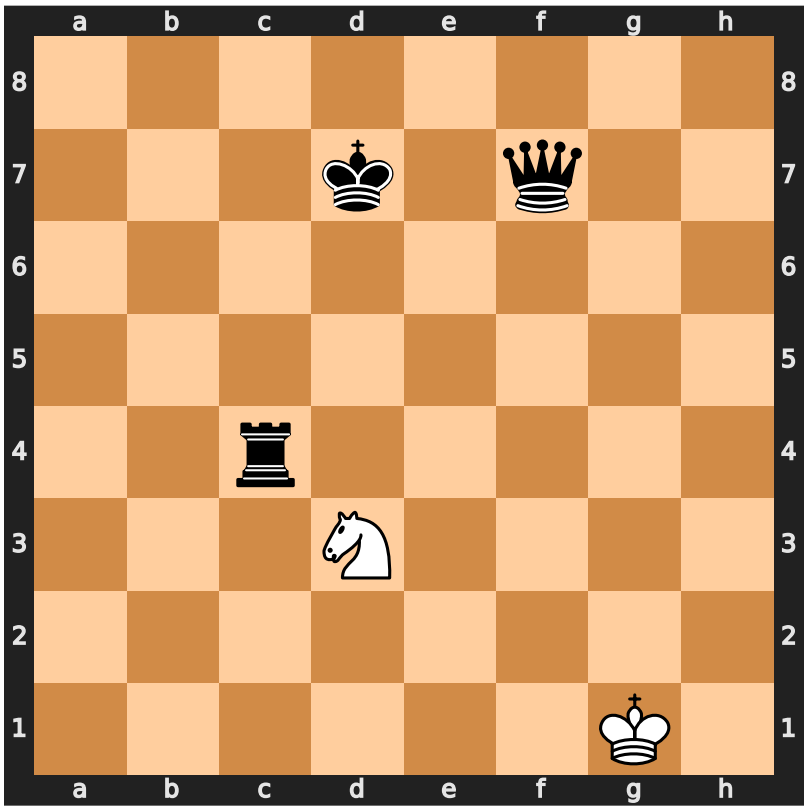

Figure 16.38: Chess Position

Task: TRIPLE fork! **Hint 1:** Ne5+ checks the king. **Hint 2:** e5 also attacks f7 and c4. **Hint 3:** Three pieces at once! **Solution: 1.Ne5+** Triple fork! King on d7, queen on f7, rook on c4 all attacked. After king moves, Nxf7.

Exercise 6.30 **Position:** White: Ke1, Ne4. Black: Kf7, Rc8, Qe8.

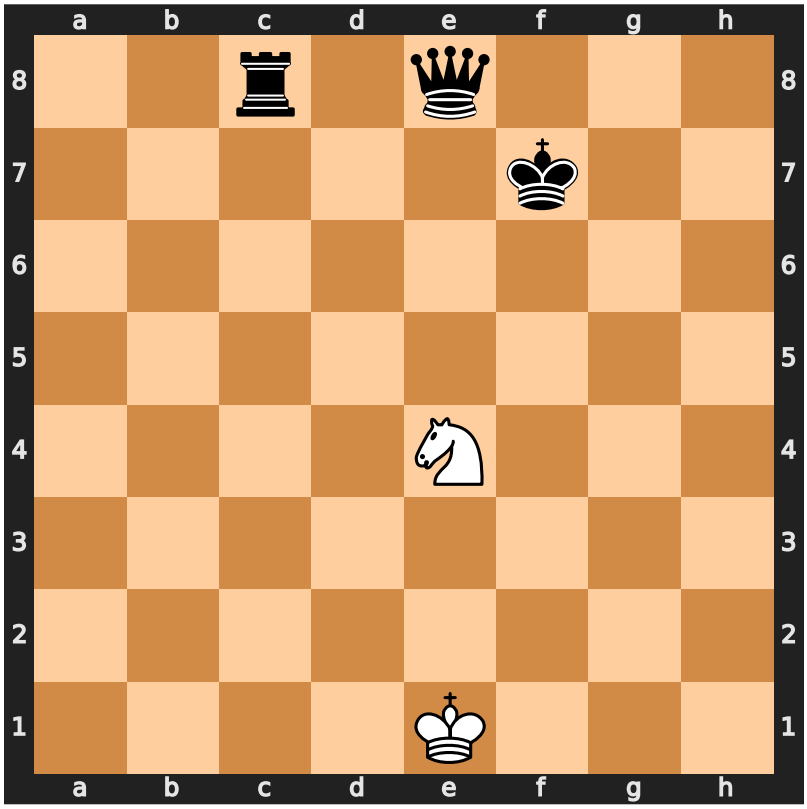

Figure 16.39: Chess Position

Task: Triple fork with check. **Hint 1:** Nd6+ checks king on f7. **Hint 2:** d6 attacks c8 and e8. **Hint 3:** Three targets! **Solution: 1.Nd6+** King, rook, and queen all forked!

Exercise 6.31 **Position:** White: Ke1, Na4. Black: Kd7, Qc8.

Task: Knight fork from the queenside. **Hint 1:** Nb6+ checks. **Hint 2:** b6 attacks c8. **Hint 3:** Royal fork! **Solution: 1.Nb6+** Forks king and queen.

Exercise 6.32 **Position:** White: Ke1, Nc4. Black: Kd8, Rc8, Qe8.

Task: Fork two major pieces. **Hint 1:** Nd6 attacks c8 and e8. **Hint 2:** Rook and queen forked. **Hint 3:** Black loses a major piece. **Solution: 1.Nd6!** Forks rook on c8 and queen on e8.

Exercise 6.33 **Position:** White: Ke2, Pf4. Black: Kh8, Re6, Ng6.

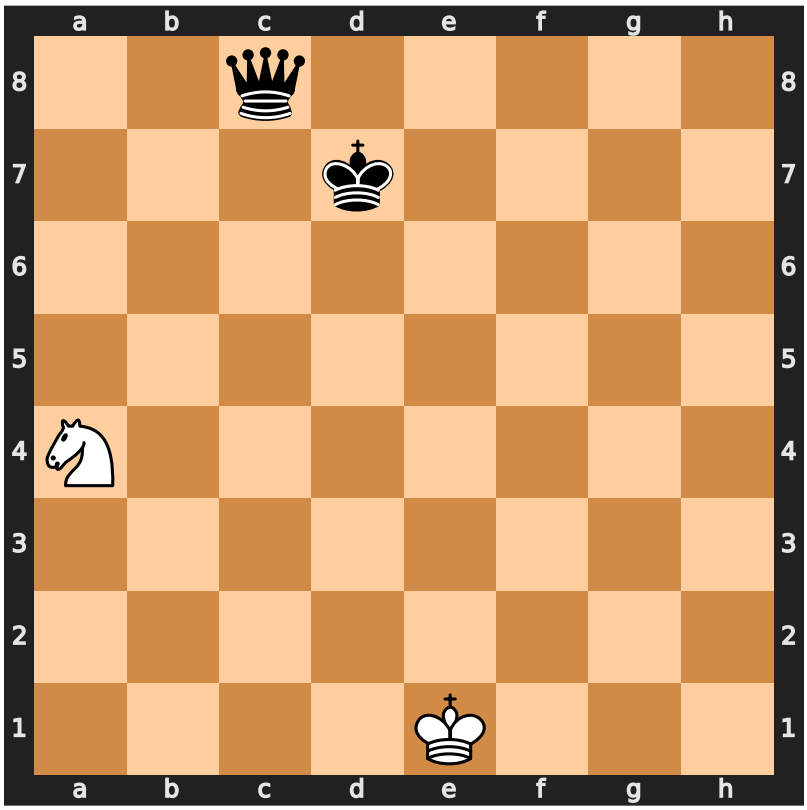

Figure 16.40: Chess Position

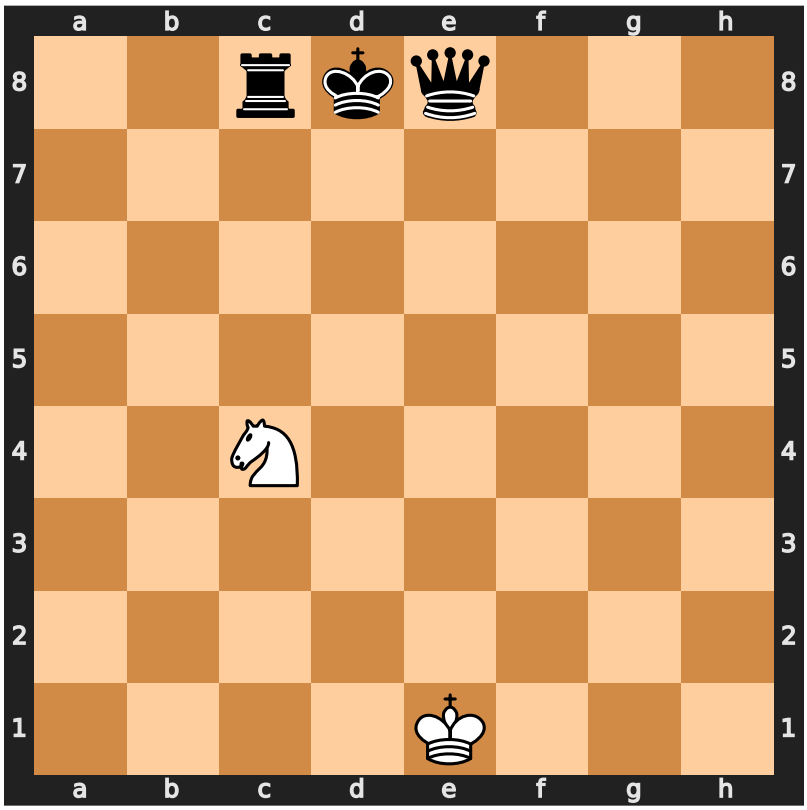

Figure 16.41: Chess Position

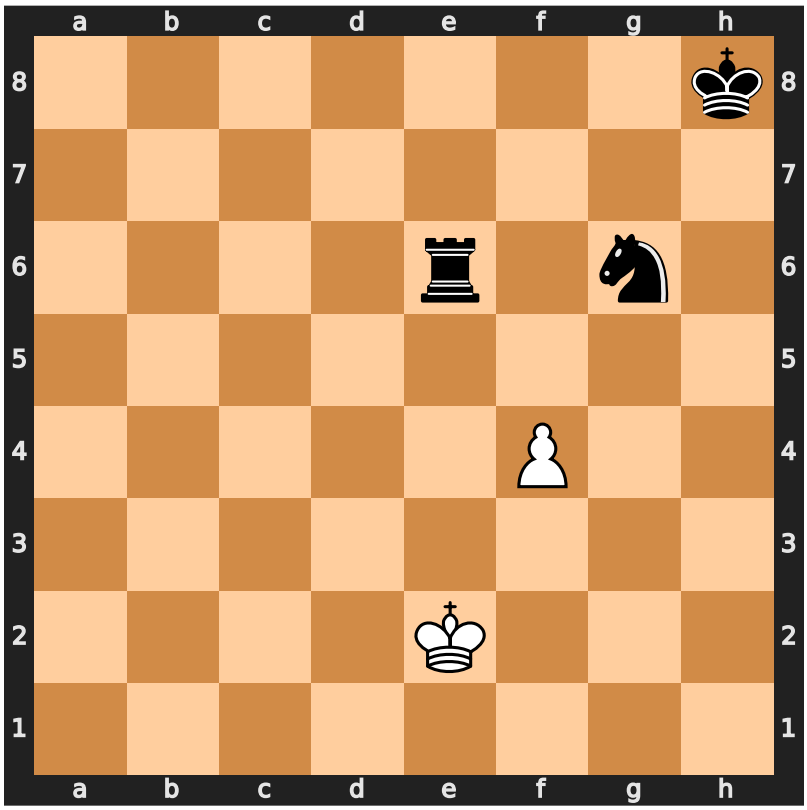

Figure 16.42: Chess Position

Task: Pawn fork. **Hint 1:** f5 attacks e6 and g6. **Hint 2:** Rook and knight forked. **Hint 3:** One piece falls. **Solution: 1.f5!** Pawn forks rook and knight.

Exercise 6.34 **Position:** White: Ke2, Nc4. Black: Ka4, Ra8, Qc8.

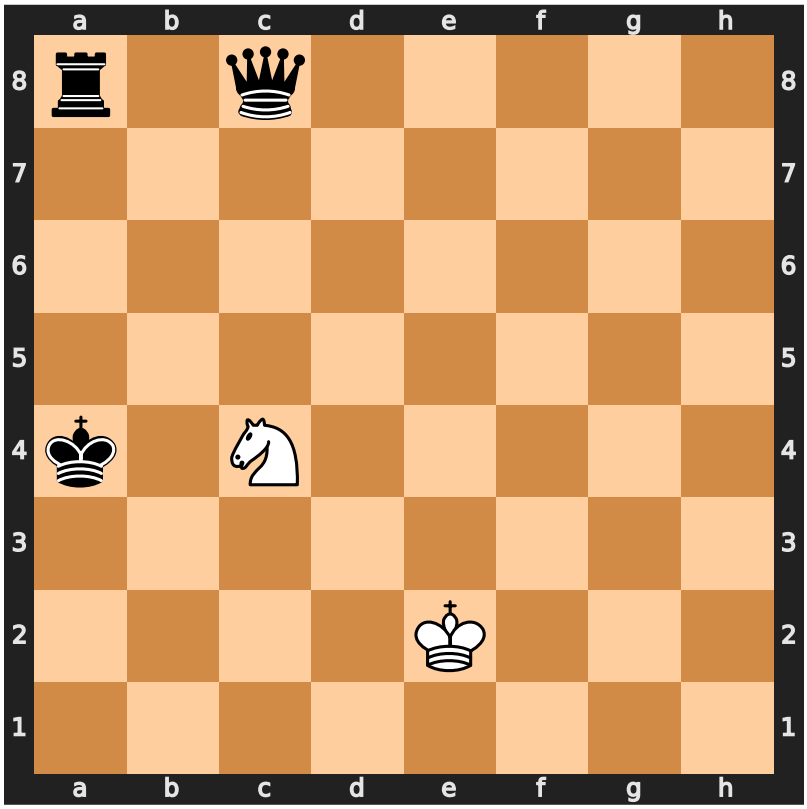

Figure 16.43: Chess Position

Task: TRIPLE fork! **Hint 1:** Nb6+ checks king on a4. **Hint 2:** b6 attacks a8 and c8. **Hint 3:** King, rook, AND queen! **Solution: 1.Nb6+** Triple fork! King, rook, and queen attacked. After king moves, Nxc8.

Exercise 6.35 **Position:** White: Ke1, Ng5. Black: Kf6, Qc3.

Task: Fork king and queen. **Hint 1:** Ne4+ checks f6. **Hint 2:** e4 attacks c3. **Hint 3:** Royal fork! **Solution: 1.Ne4+** Forks king on f6 and queen on c3.

---

35 fork exercises complete. Take a break before pins.

16.10.2 Section B: Pin Exercises (6.36–6.65)

Exercise 6.36 **Position:** See hint for piece placement.

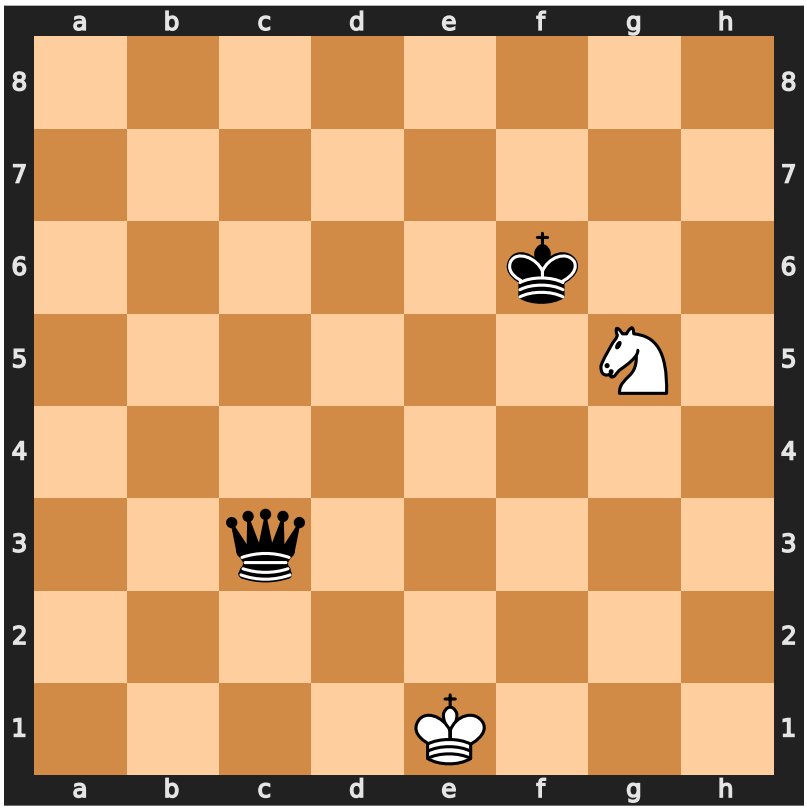

Figure 16.44: Chess Position

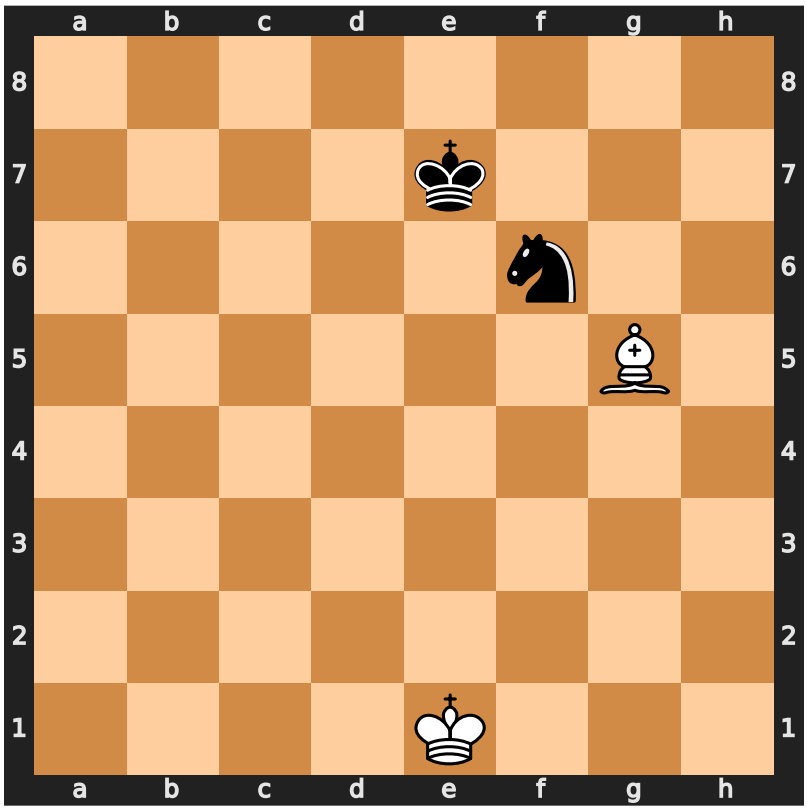

Figure 16.45: Chess Position

Task: Capture the pinned piece. **Hint 1:** Bg5 pins Nf6 to Ke7. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Bxf6+** Captures the pinned piece.

Exercise 6.37 **Position:** See hint for piece placement.

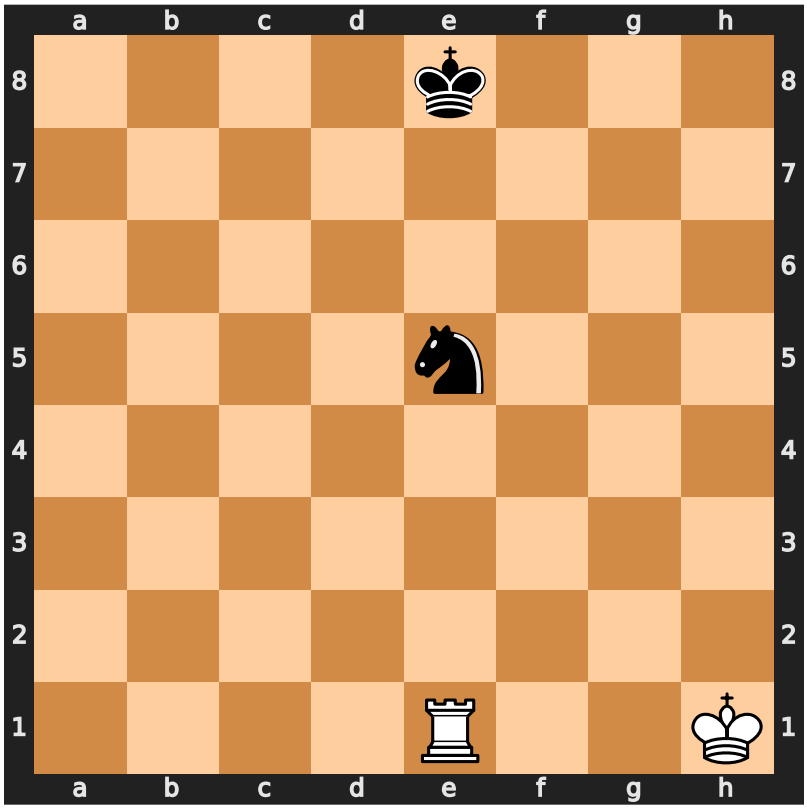

Figure 16.46: Chess Position

Task: Capture the pinned piece. **Hint 1:** Re1 pins Ne5 to Ke8. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Rxe5** Captures the pinned piece.

Exercise 6.38 **Position:** See hint for piece placement.

Task: Capture the pinned piece. **Hint 1:** Ra1 pins Ba5 to Ka8. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Rxa5** Captures the pinned piece.

Exercise 6.39 **Position:** See hint for piece placement.

Task: Capture the pinned piece. **Hint 1:** Qa1 pins Bd4 to Kg7. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Qxd4+** Captures the pinned piece.

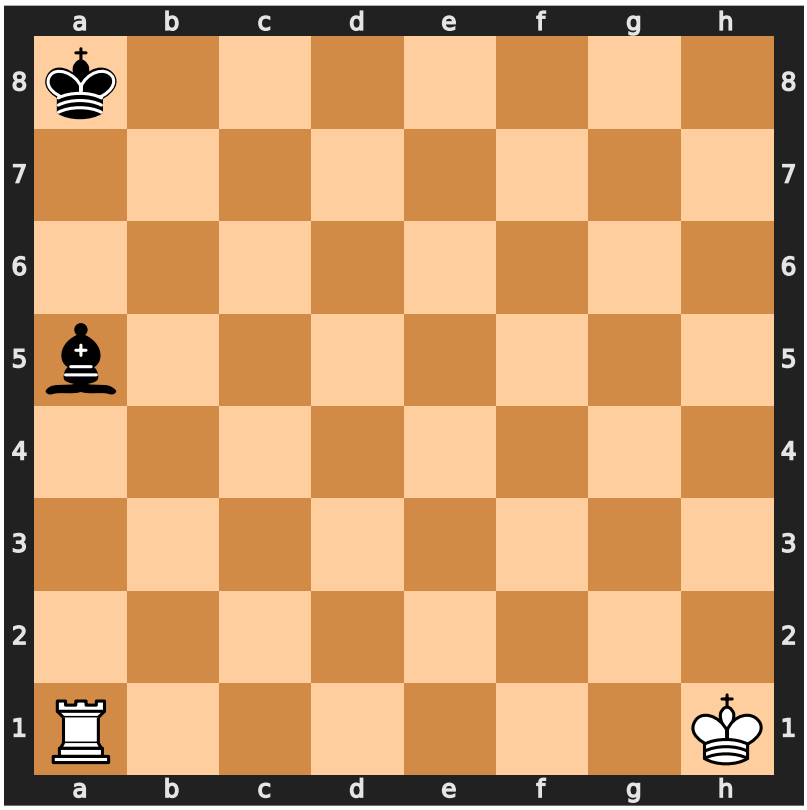

Figure 16.47: Chess Position

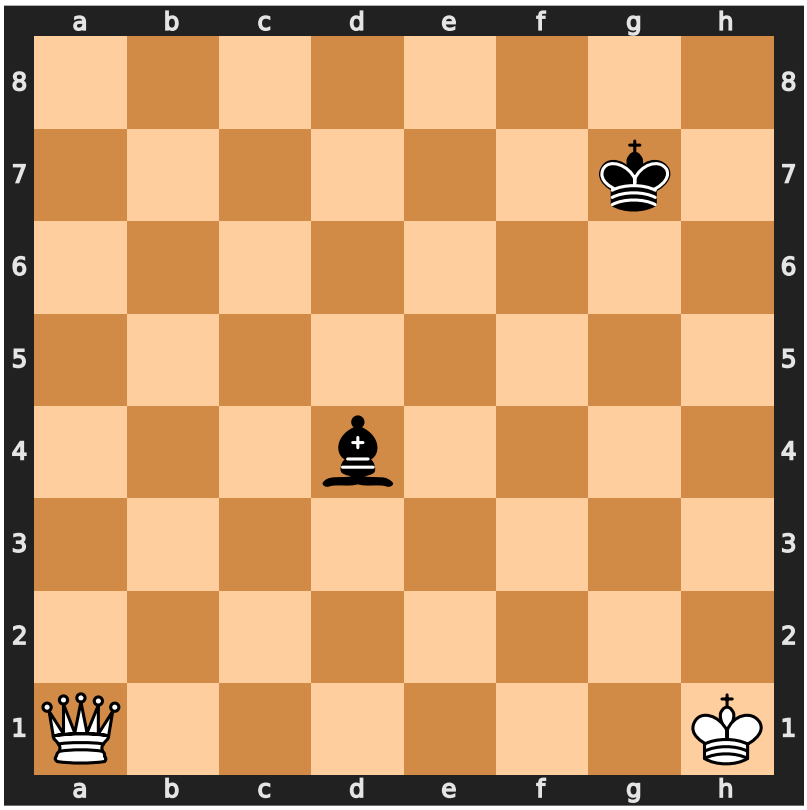

Figure 16.48: Chess Position

Exercise 6.40 **Position:** See hint for piece placement.

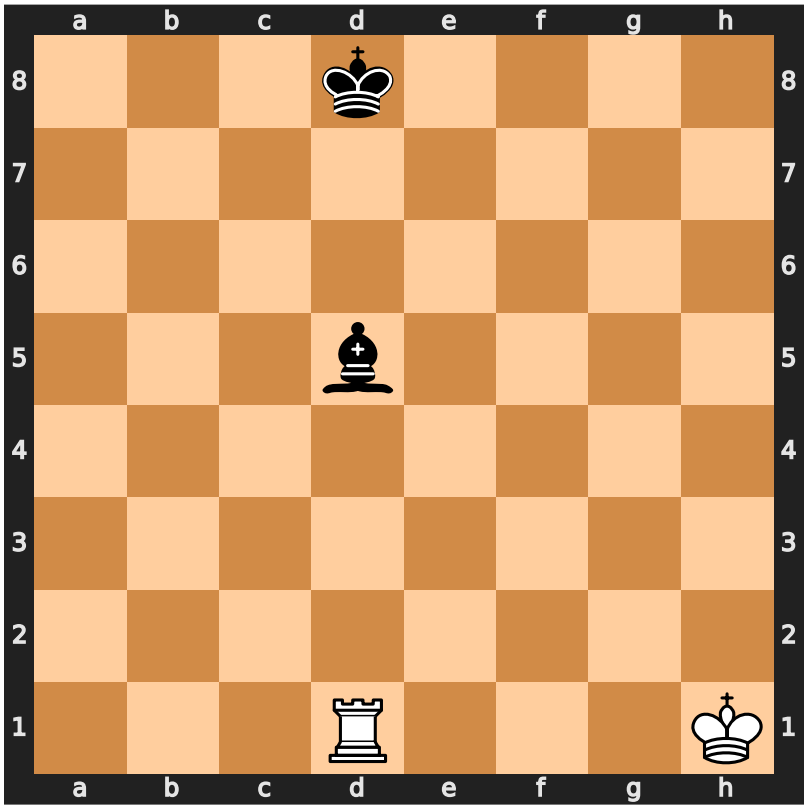

Figure 16.49: Chess Position

Task: Capture the pinned piece. **Hint 1:** Rd1 pins Bd5 to Kd8. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Rxd5+** Captures the pinned piece.

Exercise 6.41 **Position:** See hint for piece placement.

Task: Capture the pinned piece. **Hint 1:** Bc1 pins Re3 to Kg5. Win the exchange. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Bxe3** Captures the pinned piece.

Exercise 6.42 **Position:** See hint for piece placement.

Task: Capture the pinned piece. **Hint 1:** Rh1 pins Nh5 to Kh8. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Rxh5+** Captures the pinned piece.

Exercise 6.43 **Position:** See hint for piece placement.

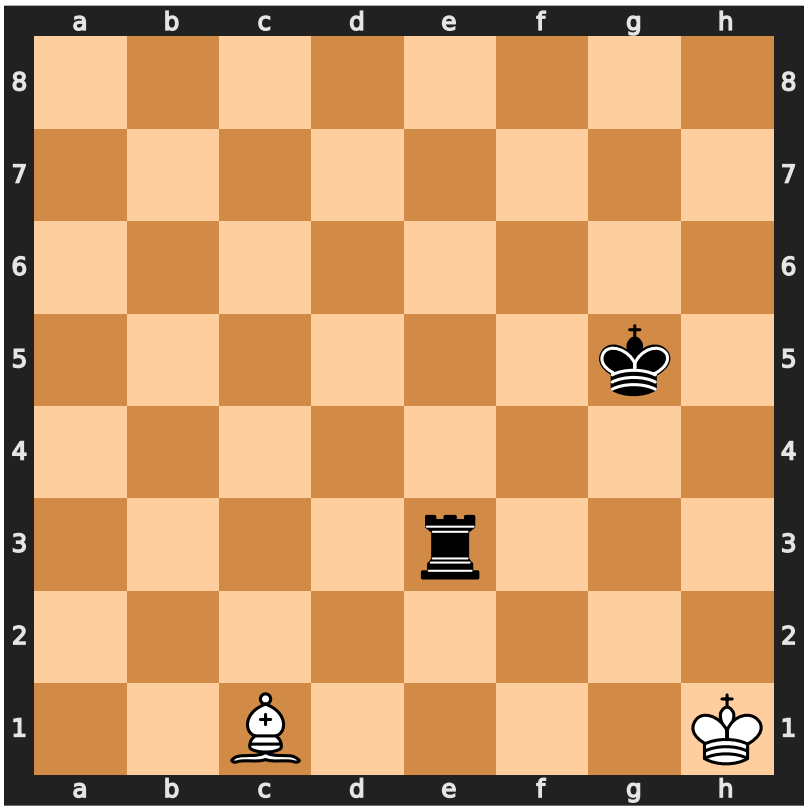

Figure 16.50: Chess Position

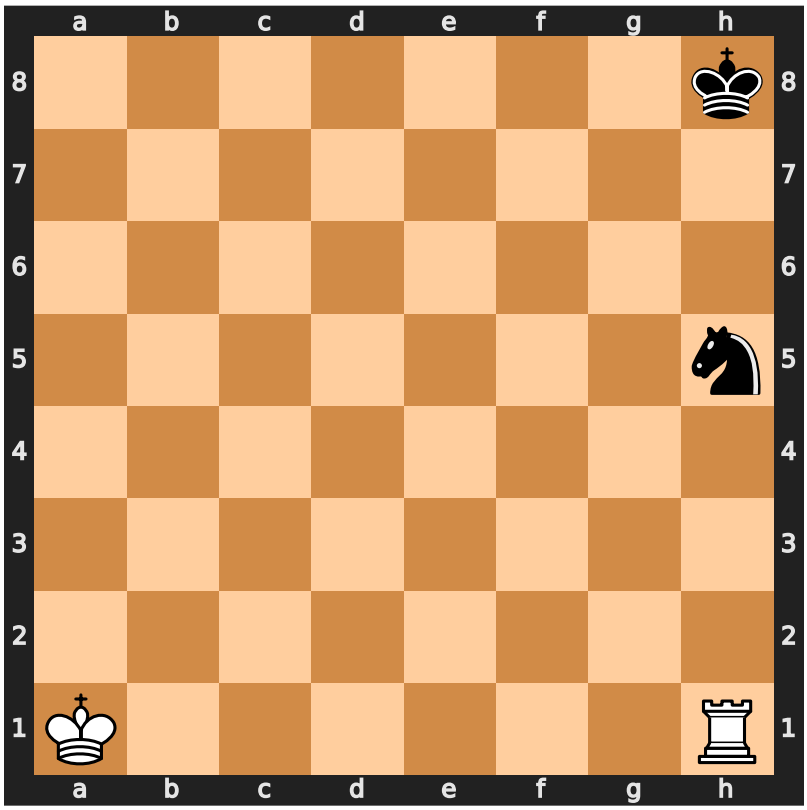

Figure 16.51: Chess Position

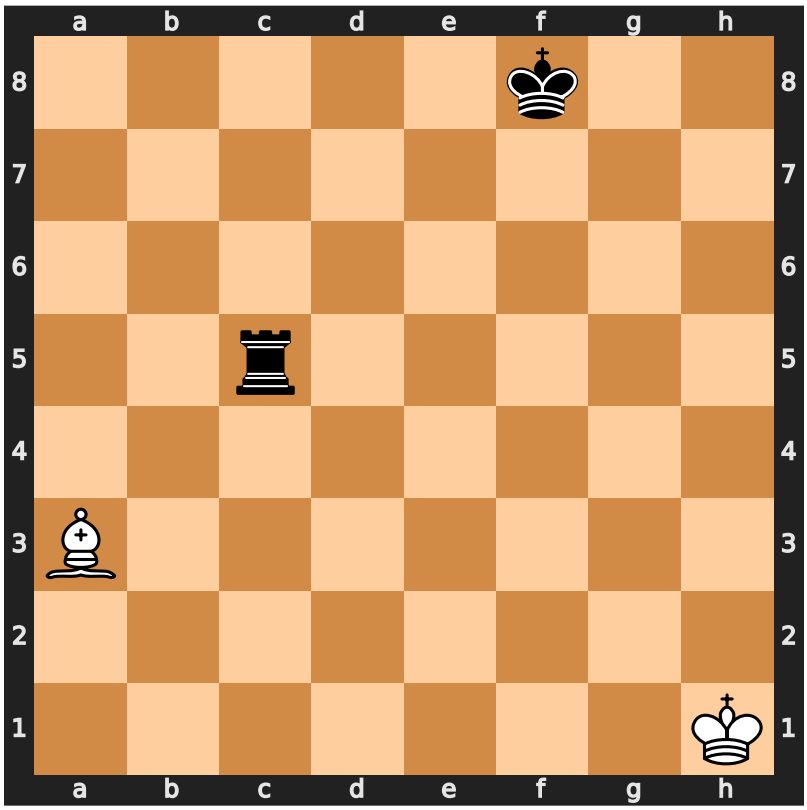

Figure 16.52: Chess Position

Task: Capture the pinned piece. **Hint 1:** Ba3 pins Rc5 to Kf8. Win the exchange. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Bxc5+** Captures the pinned piece.

Exercise 6.44 **Position:** See hint for piece placement.

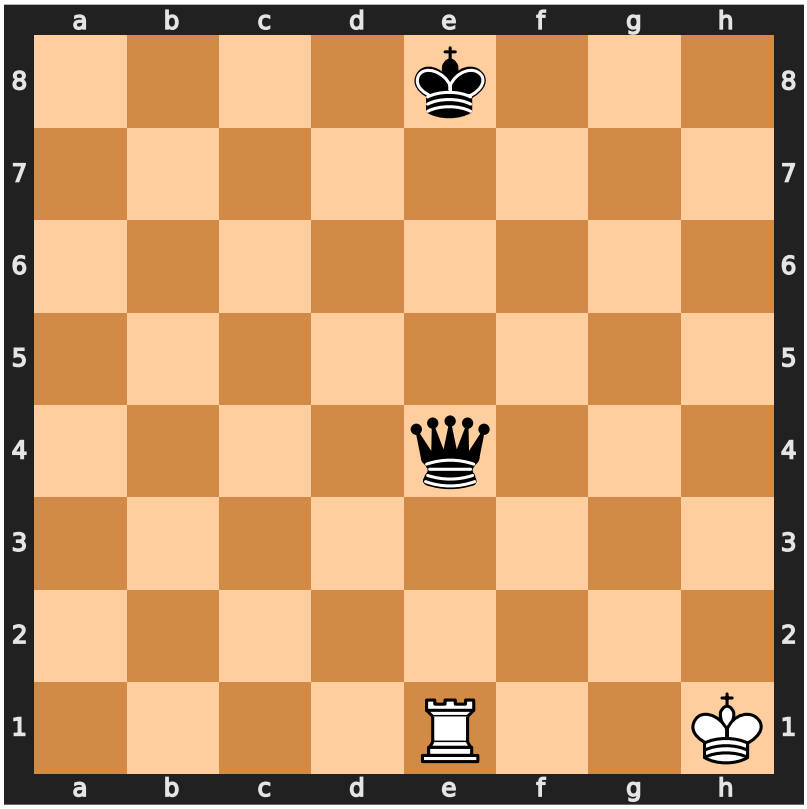

Figure 16.53: Chess Position

Task: Capture the pinned piece. **Hint 1:** Re1 pins Qe4 to Ke8. Win the queen! **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Rxe4** Captures the pinned piece.

Exercise 6.45 **Position:** See hint for piece placement.

Task: Capture the pinned piece. **Hint 1:** Bb2 pins Nd4 to Kf6. Capture. **Hint 2:** The piece cannot move without exposing the king. **Hint 3:** Take it. **Solution: 1.Bxd4+** Captures the pinned piece.

Exercise 6.46 **Position:** White: Ke1, Ba4, Pd2. Black: Ke8, Nc6.

Task: Pile up on the pinned knight with a pawn. **Hint 1:** Ba4 pins Nc6 to Ke8. **Hint 2:** d4 then d5 attacks the frozen knight. **Hint 3:** The knight cannot escape. **Solution: 1.d4!** Preparing d5 to attack the pinned knight. It will be captured.

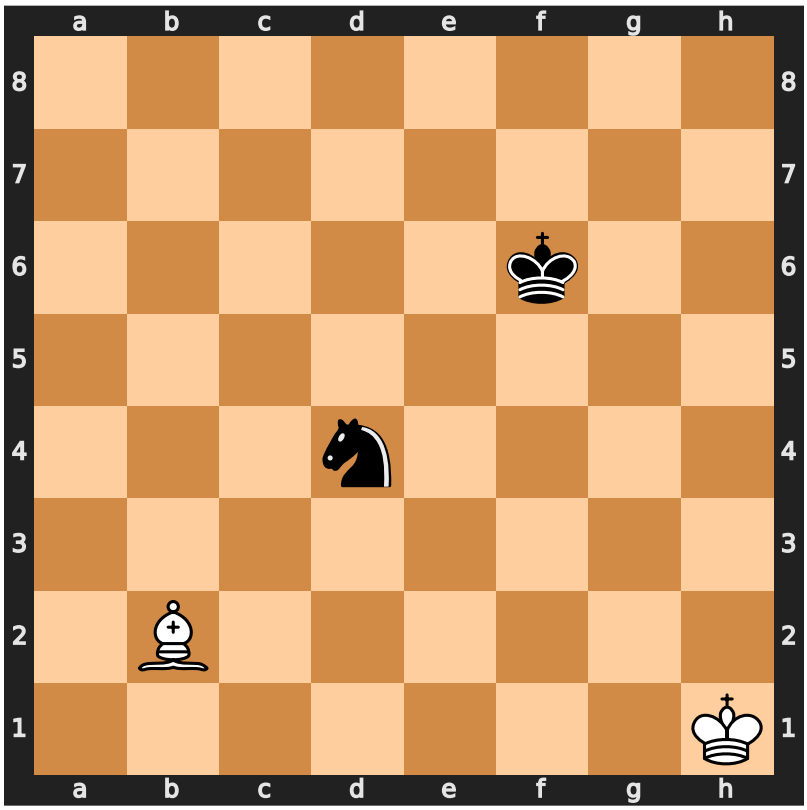

Figure 16.54: Chess Position

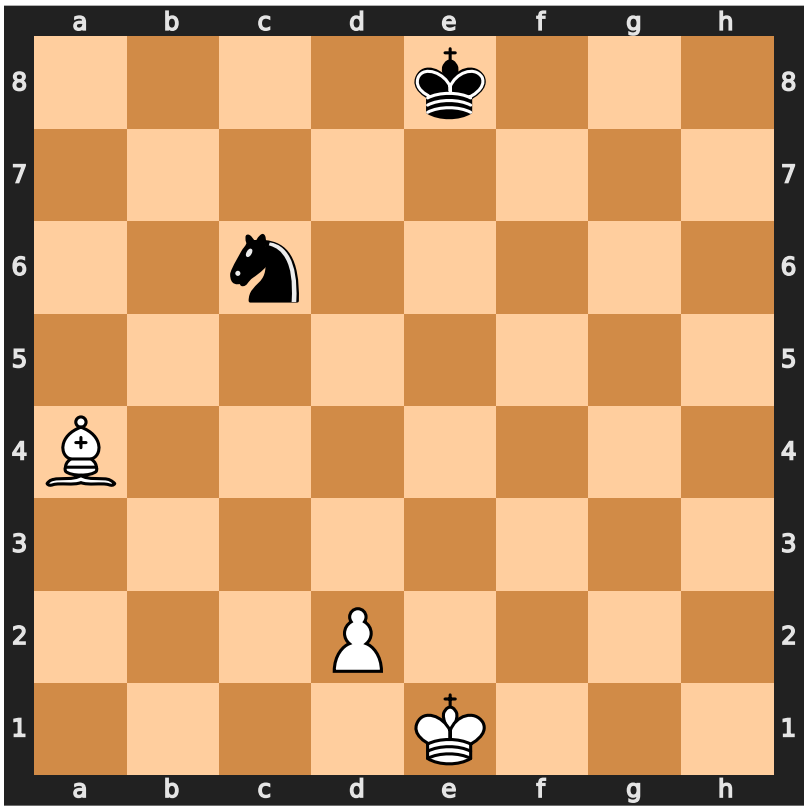

Figure 16.55: Chess Position

Exercise 6.47 **Position:** White: Ke2, Bh3. Black: Kd7, Nf5.

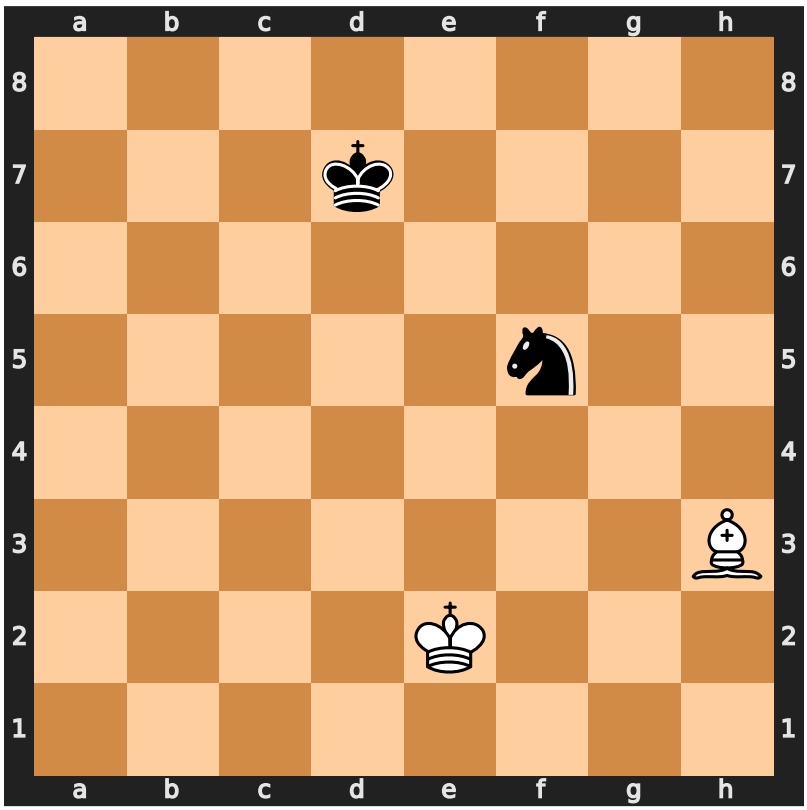

Figure 16.56: Chess Position

Task: Create a pin. **Hint 1:** Bg4 pins Nf5 to Kd7 (g4-f5-e6-d7 diagonal). **Hint 2:** The knight is now frozen. **Hint 3:** One bishop move does it. **Solution: 1.Bg4!** Pins the knight to the king. It cannot move.

Exercise 6.48 **Position:** White: Ka1, Bc1. Black: Kh6, Nf4.

Task: Capture the pinned knight. **Hint 1:** Bc1 pins Nf4 to Kh6 on the diagonal. **Hint 2:** Absolute pin. **Hint 3:** Take it. **Solution: 1.Bxf4+** Captures the pinned knight.

Exercise 6.49 **Position:** Black to move. White: Kh1, Ba4. Black: Ke8, Nc6, Bc8.

Task: Break the pin by blocking. **Hint 1:** Ba4 pins Nc6 to Ke8. **Hint 2:** Place a piece on d7 to block. **Hint 3:** Bd7 interposes. **Solution: 1...Bd7!** Blocks the pin. The knight on c6 is free to move.

Exercise 6.50 **Position:** Black to move. White: Ka1, Bg5. Black: Ke7, Nf6.

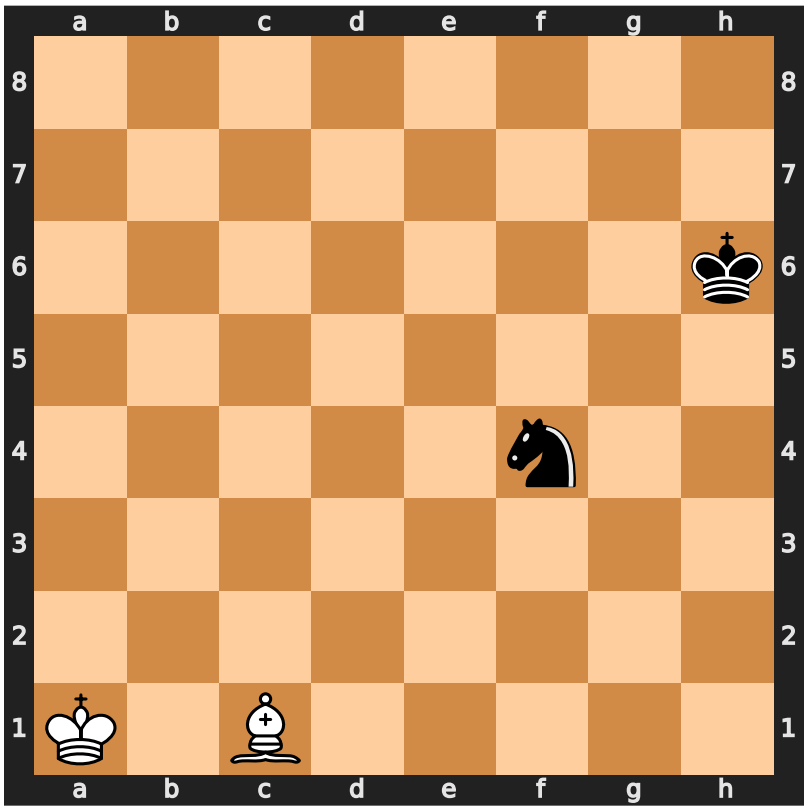

Figure 16.57: Chess Position

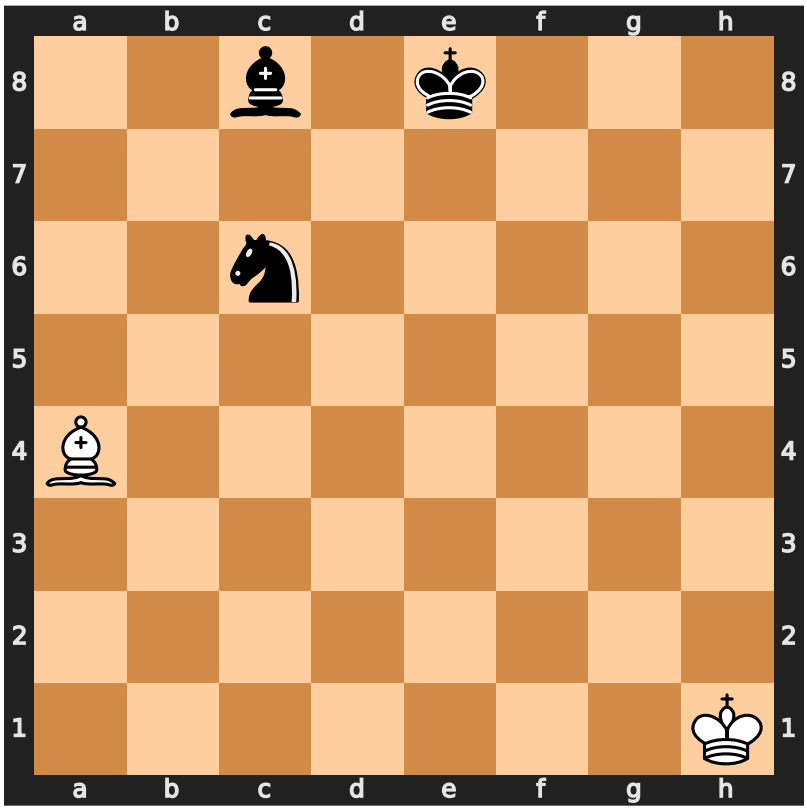

Figure 16.58: Chess Position

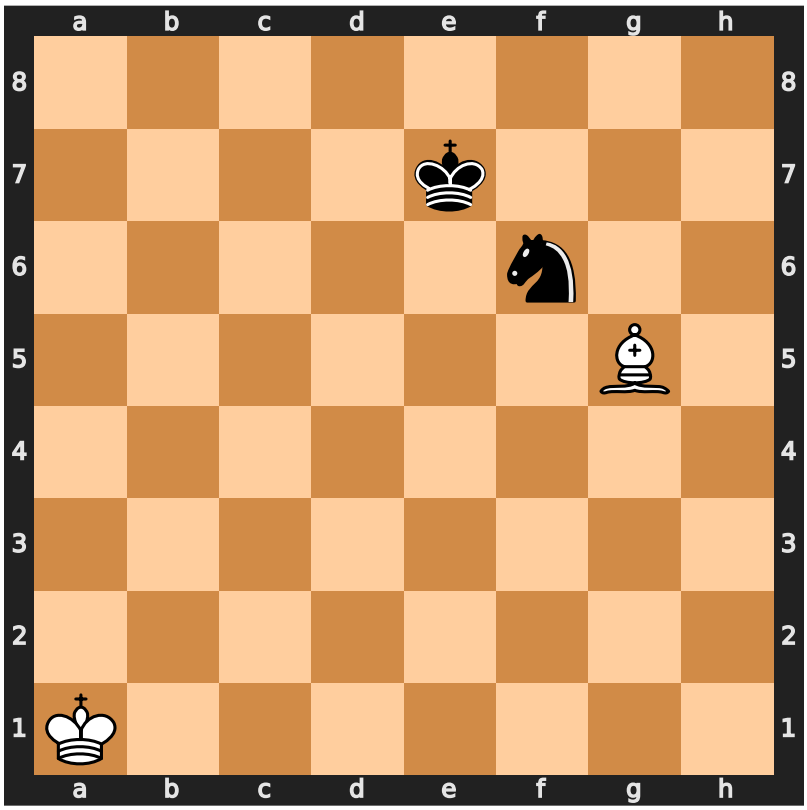

Figure 16.59: Chess Position

Task: Break the pin by moving the king. **Hint 1:** Bg5 pins Nf6 to Ke7. **Hint 2:** Move the king off the line. **Hint 3:** Kd6 works. **Solution: 1...Kd6!** King steps aside. Knight is free.

Exercise 6.51 **Position:** Black to move. Bg5 pins Nf6 to Qd8.

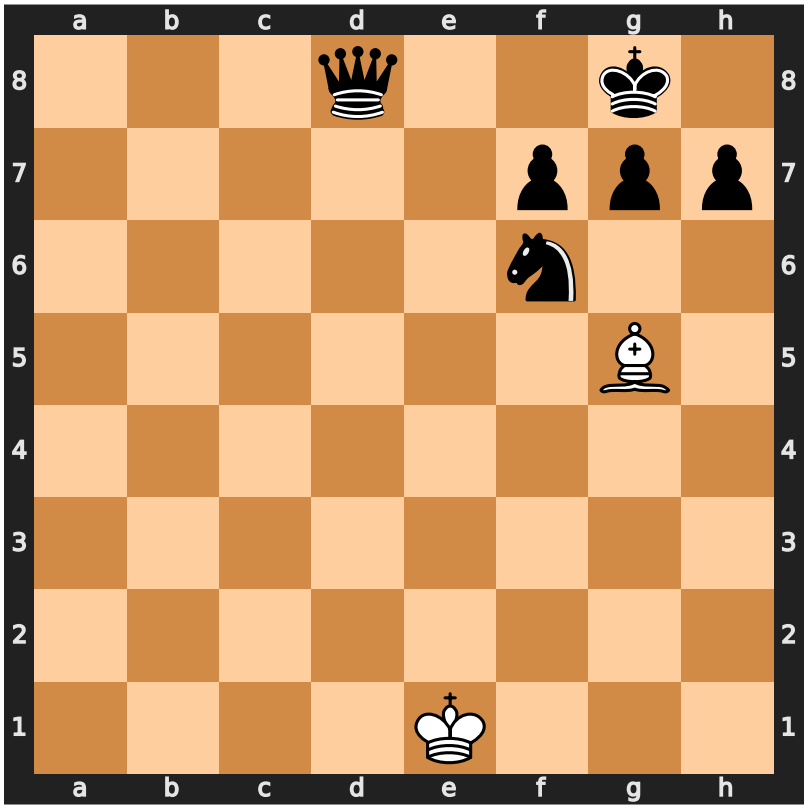

Figure 16.60: Chess Position

Task: Chase the pinning bishop. **Hint 1:** h6 attacks the bishop. **Hint 2:** Bishop must retreat or capture. **Hint 3:** If Bxf6, Qxf6 breaks the pin. **Solution: 1...h6!** Pawn kicks the bishop. Classic pin break.

Exercise 6.52 **Position:** White: Kh1, Re1. Black: Ke8, Qe5.

Task: Win the pinned queen! **Hint 1:** Re1 pins Qe5 to Ke8. **Hint 2:** The queen is frozen. **Hint 3:** Capture! **Solution: 1.Rxe5+** Takes the pinned queen! Massive material win.

Exercise 6.53 **Position:** White: Ke1, Qd1. Black: Kh8, Nd5, Rd8.

Task: Capture the pinned knight. **Hint 1:** Qd1 pins Nd5 to Rd8. **Hint 2:** Relative pin. **Hint 3:** Capture the knight. **Solution: 1.Qxd5** Takes the pinned knight.

Exercise 6.54 **Position:** White: Kh1, Bb1, Ne4. Black: Kf5, Rd3.

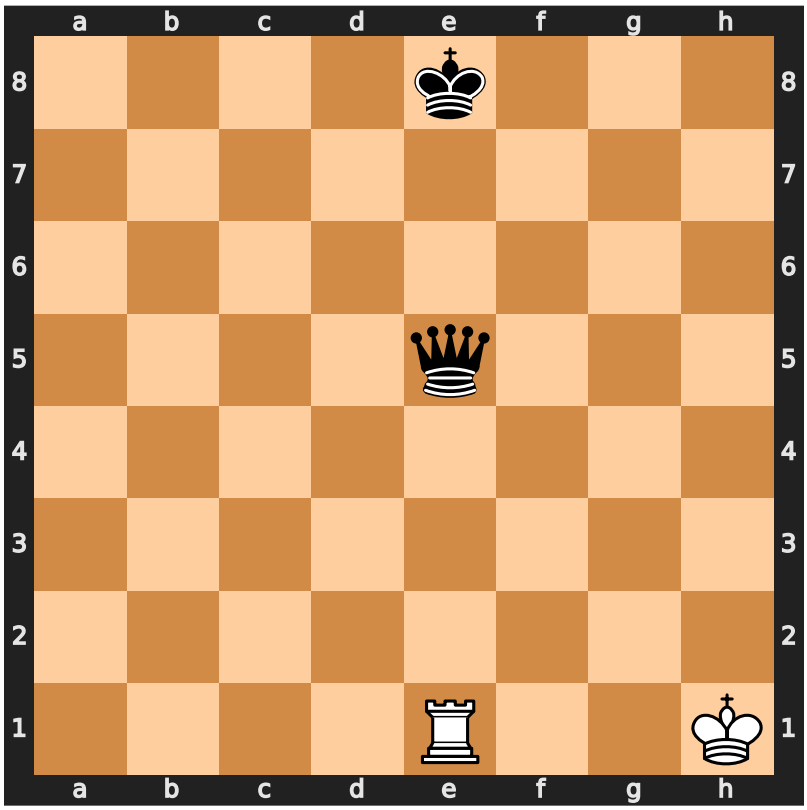

Figure 16.61: Chess Position

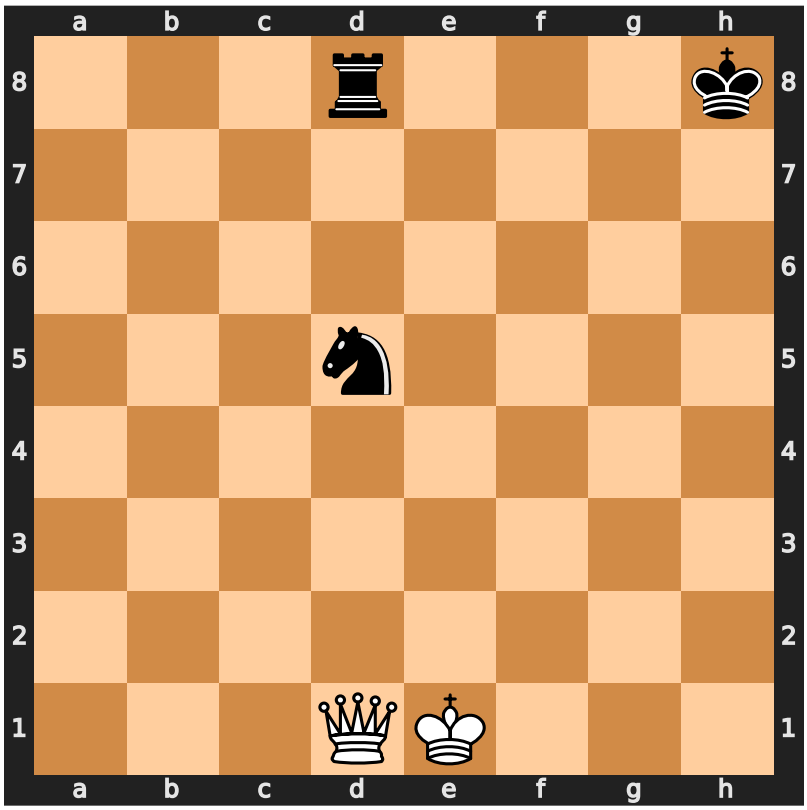

Figure 16.62: Chess Position

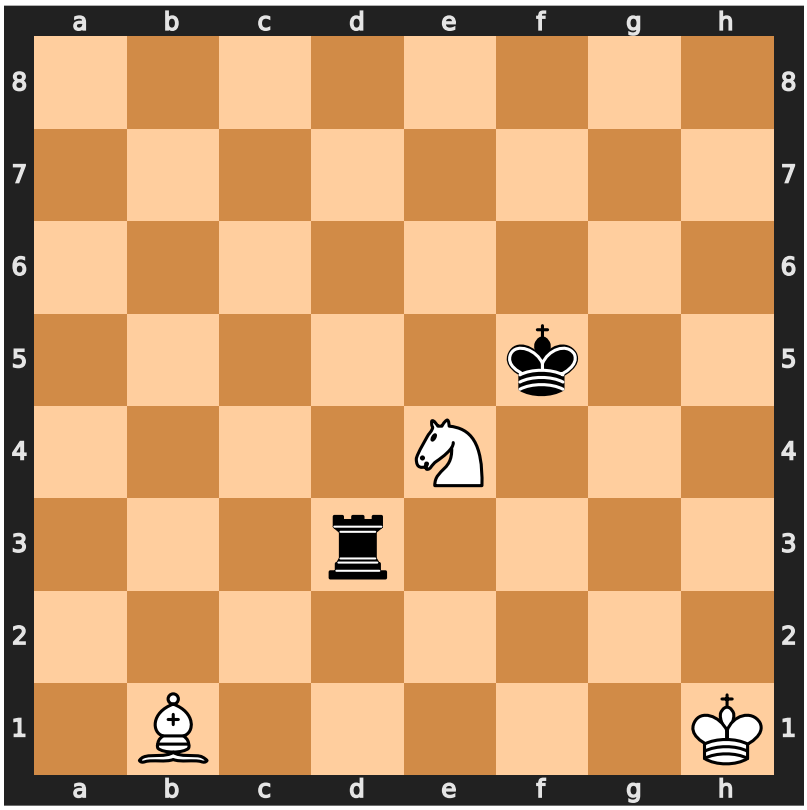

Figure 16.63: Chess Position

Task: Discovered pin! Move the knight. **Hint 1:** Bb1 aims at f5 through the d3-e4 line. **Hint 2:** Ne4 blocks. **Hint 3:** Move the knight. Rook becomes pinned! **Solution: 1.Nd2!** Reveals bishop's pin on the rook. The rook on d3 is now pinned to the king.

Exercise 6.55 **Position:** White: Ke1, Ba4, Re5. Black: Ke8, Nc6.

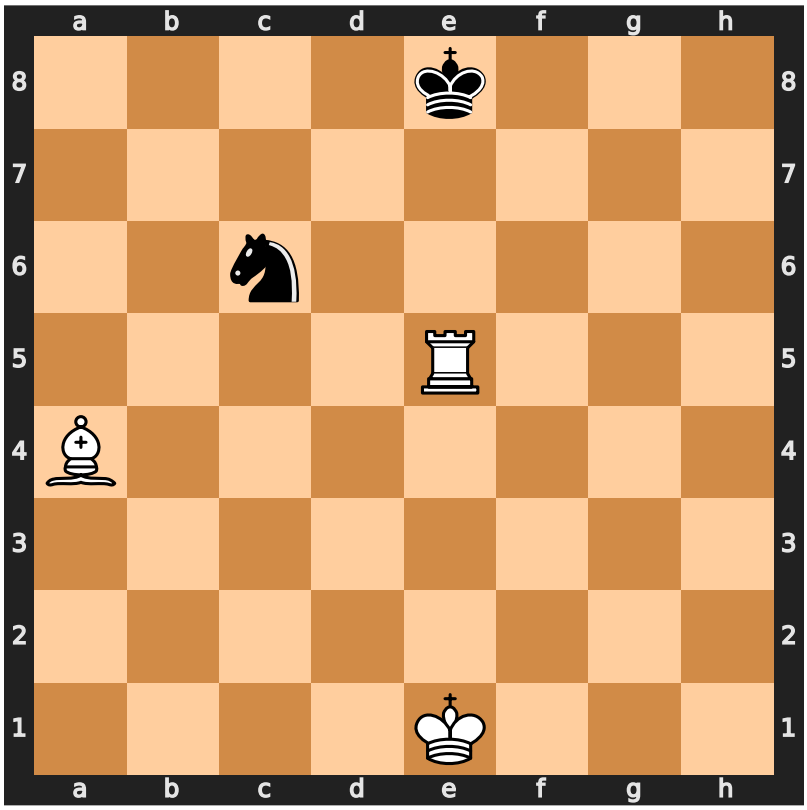

Figure 16.64: Chess Position

Task: Pin enables CHECKMATE! **Hint 1:** Ba4 pins Nc6 to Ke8. **Hint 2:** Rd8+ is check. Can the knight block? No! **Hint 3:** Mate! **Solution: 1.Re8#** Checkmate! The knight is pinned and cannot capture. Pin + back-rank = mate.

Exercise 6.56 **Position:** White: Ka1, Re1. Black: Ke6, Be3.

Task: Capture the pinned bishop. **Hint 1:** Re1 pins Be3 to Ke6. **Hint 2:** Absolute pin. **Hint 3:** Take it. **Solution: 1.Rxe3+** Captures the pinned bishop.

Exercise 6.57 **Position:** White: Kh1, Bc1. Black: Ke3, Nd2.

Task: Capture the pinned knight. **Hint 1:** Bc1 pins Nd2 to Ke3. **Hint 2:** Absolute pin. **Hint 3:** Take it. **Solution: 1.Bxd2+** Captures the pinned knight with check.

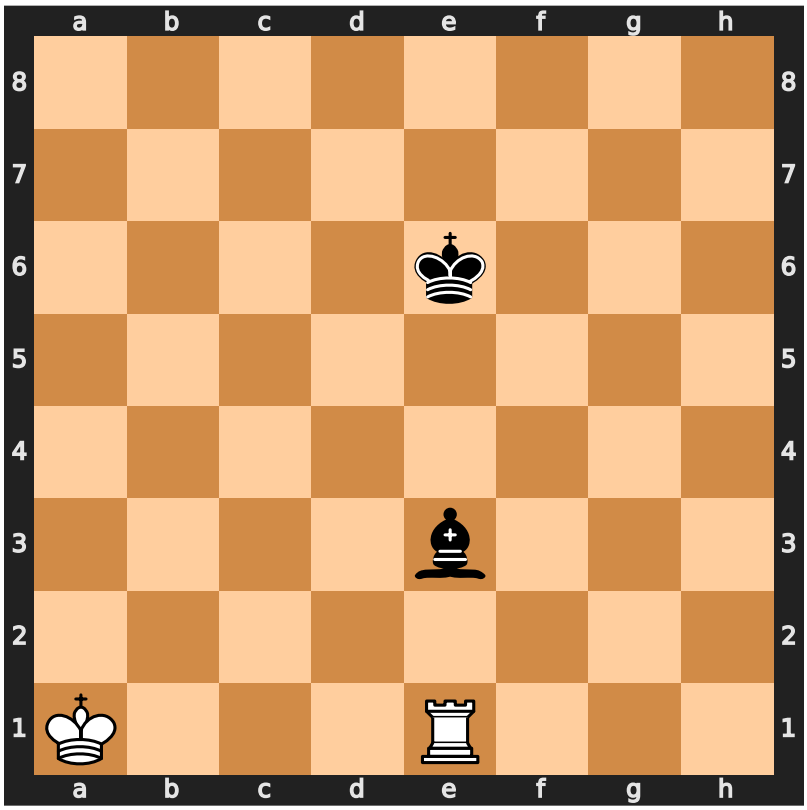

Figure 16.65: Chess Position

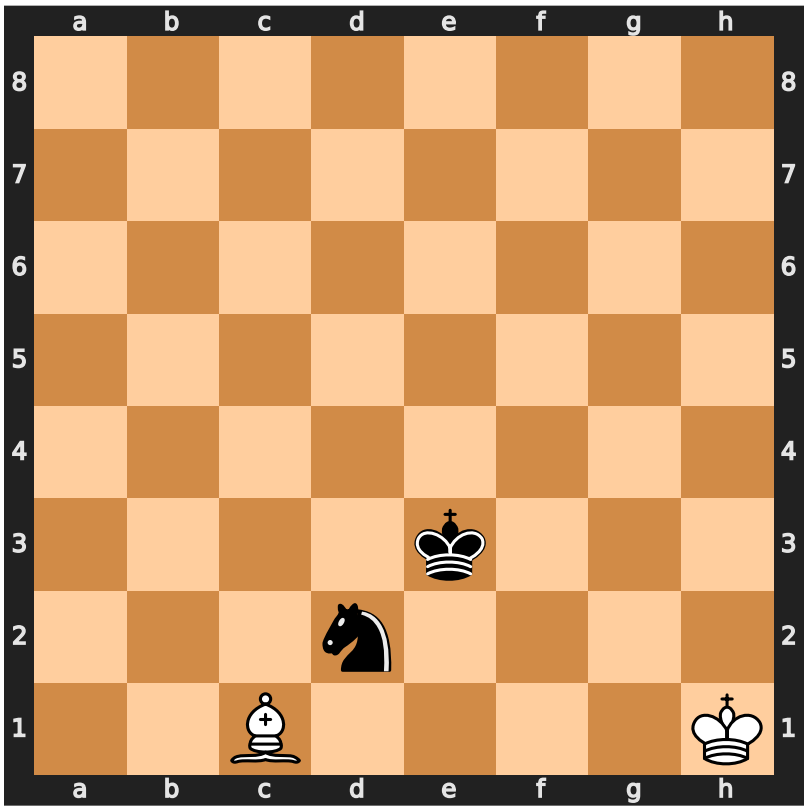

Figure 16.66: Chess Position

Exercise 6.58 **Position:** White: Kh1, Ba1. Black: Kg7, Nc3, Re5.

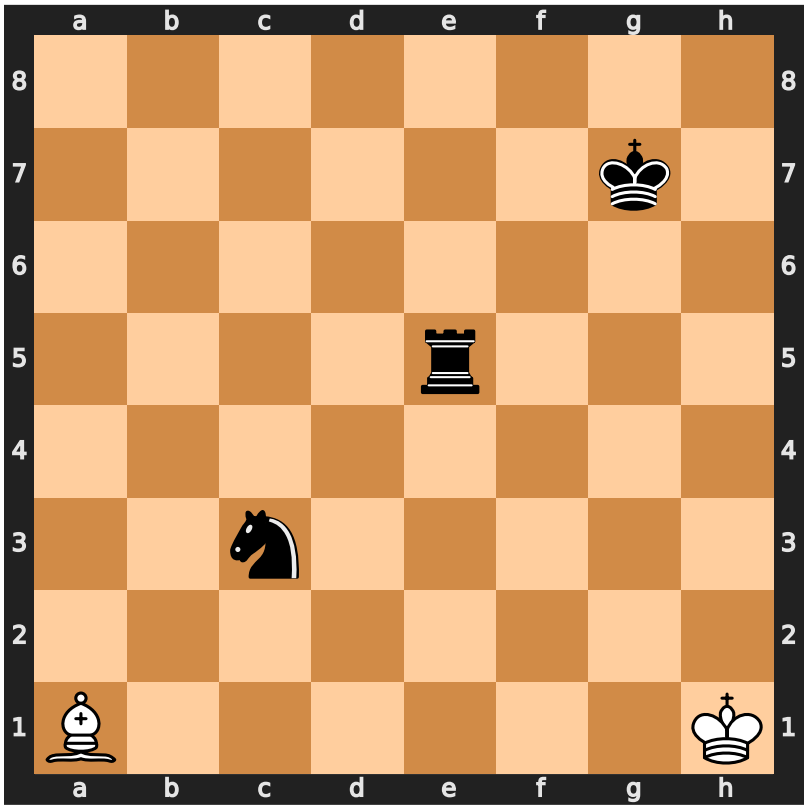

Figure 16.67: Chess Position

Task: Capture the knight, create a new pin. **Hint 1:** Ba1 pins Nc3 on the long diagonal. **Hint 2:** After Bxc3, the rook on e5 is also on this diagonal! **Hint 3:** Double benefit. **Solution: 1.Bxc3** Takes the knight. Now the bishop pins the rook to the king!

Exercise 6.59 **Position:** White: Kh1, Bc1. Black: Ka8, Ne3, Qg5.

Task: Capture piece pinned to the queen. **Hint 1:** Bc1 pins Ne3 to Qg5. **Hint 2:** Relative pin. **Hint 3:** Capture. **Solution: 1.Bxe3** Takes the knight pinned to the queen.

Exercise 6.60 **Position:** White: Ka1, Re1, Nd5. Black: Ke8, Re5.

Task: Pin + check combination. **Hint 1:** Re1 pins Re5 to Ke8. **Hint 2:** Nf6+ adds a check! **Hint 3:** After king moves, Rxe5 wins. **Solution: 1.Nf6+** Check! The rook on e5 remains pinned. After Kd8, Rxe5 wins the rook.

Exercise 6.61 **Position:** White: Ka1, Ba4, Rd1. Black: Ke8, Nc6.

Task: Pin enables checkmate! **Hint 1:** Ba4 pins Nc6 to Ke8. **Hint 2:** Rd8 is check! **Hint 3:** The knight cannot capture. Mate! **Solution: 1.Rd8#** Checkmate! The pinned knight cannot capture the rook.

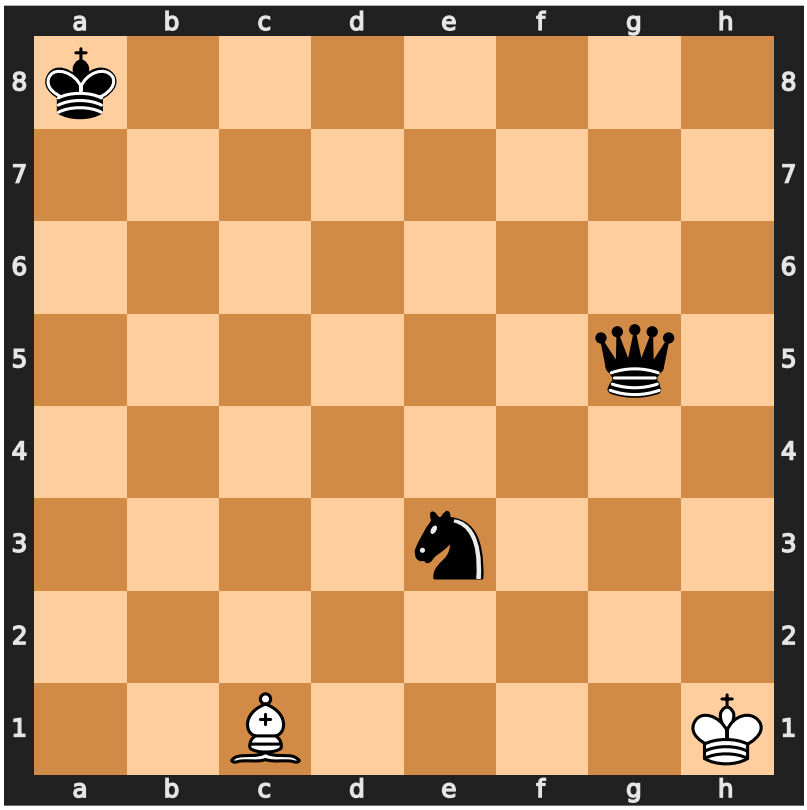

Figure 16.68: Chess Position

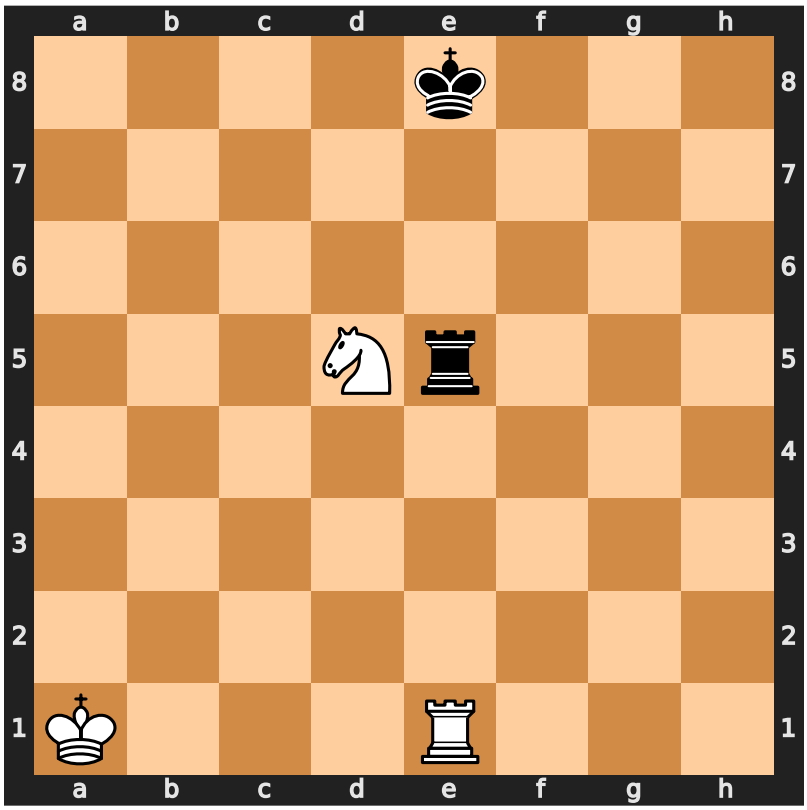

Figure 16.69: Chess Position

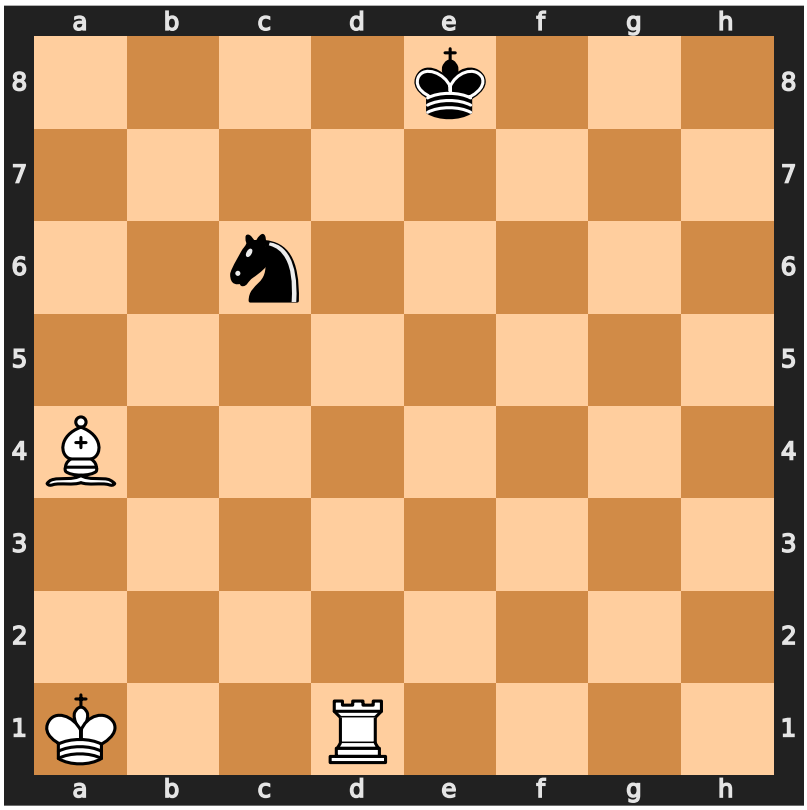

Figure 16.70: Chess Position

Exercise 6.62 **Position:** White: Ke1, Qd1, Bg5. Black: Kg8, Nf6, Qd8, Pf7,g7,h7.

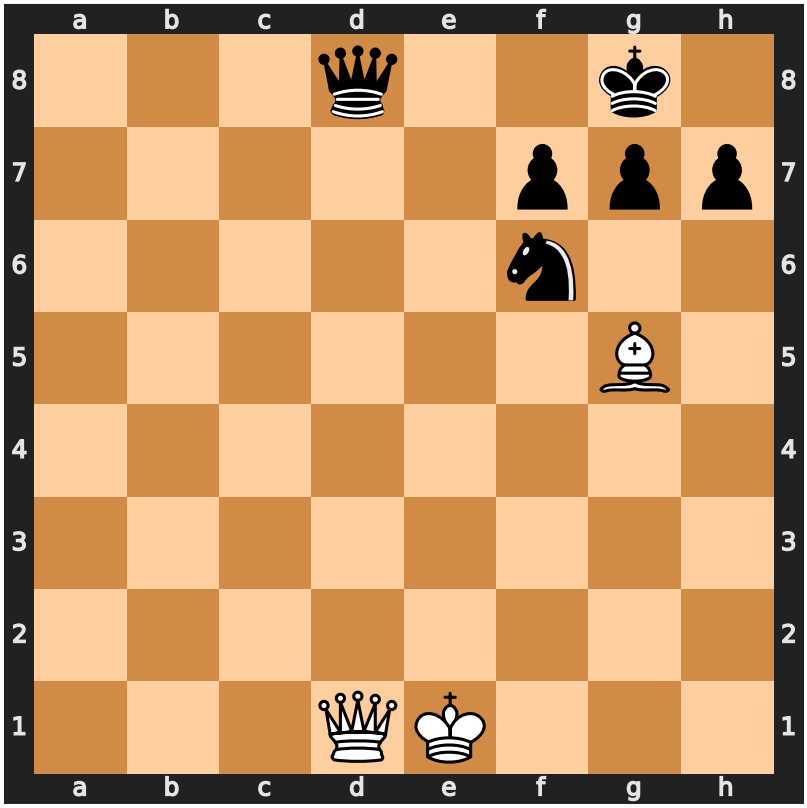

Figure 16.71: Chess Position

Task: Exploit the pin. **Hint 1:** Bg5 pins Nf6 to Qd8. **Hint 2:** Centralize the queen. **Hint 3:** Qd4 builds pressure. **Solution: 1.Qd4!** Centralizes with power. The pinned knight remains a target.

Exercise 6.63 **Position:** White: Ke1, Bh4, Pg4. Black: Kd8, Nf6.

Task: Attack the pinned knight with a pawn. **Hint 1:** Bh4 pins Nf6 to Kd8 on the h4-d8 diagonal. **Hint 2:** g5 attacks the frozen knight. **Hint 3:** It cannot escape. **Solution: 1.g5!** Pawn attacks the pinned knight. Since it cannot move, it falls. Pin + pawn is deadly.

Exercise 6.64 **Position:** White: Ke2, Bh3, Ng3. Black: Kd7, Nf5.

Task: Create a pin while the knight also attacks. **Hint 1:** Bg4 pins Nf5 to Kd7. **Hint 2:** The knight on g3 also eyes f5. **Hint 3:** Two attackers on the pinned piece. **Solution: 1.Bg4!** Pins the knight. With the Ng3 also attacking f5, the knight will fall.

Exercise 6.65 **Position:** White: Ke1, Bc4, Qh3. Black: Kg8, Ne6, Pf7,g7,h7.

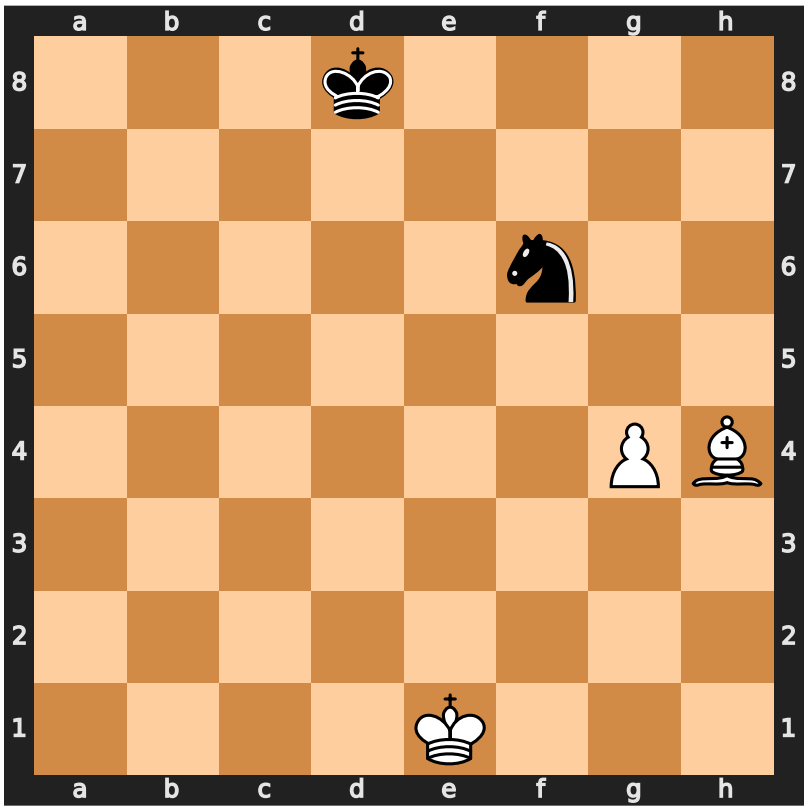

Figure 16.72: Chess Position

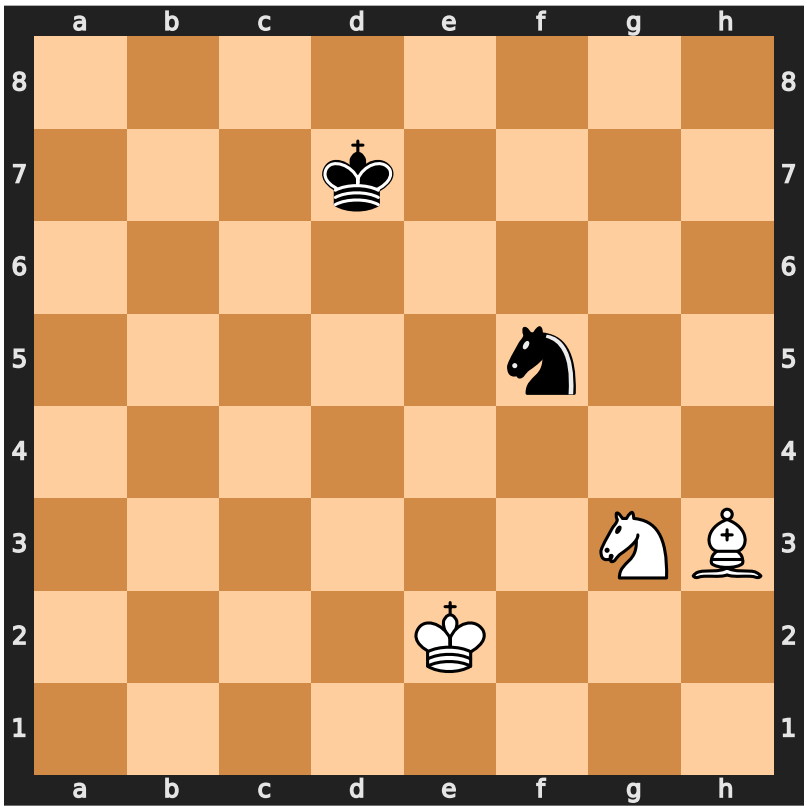

Figure 16.73: Chess Position

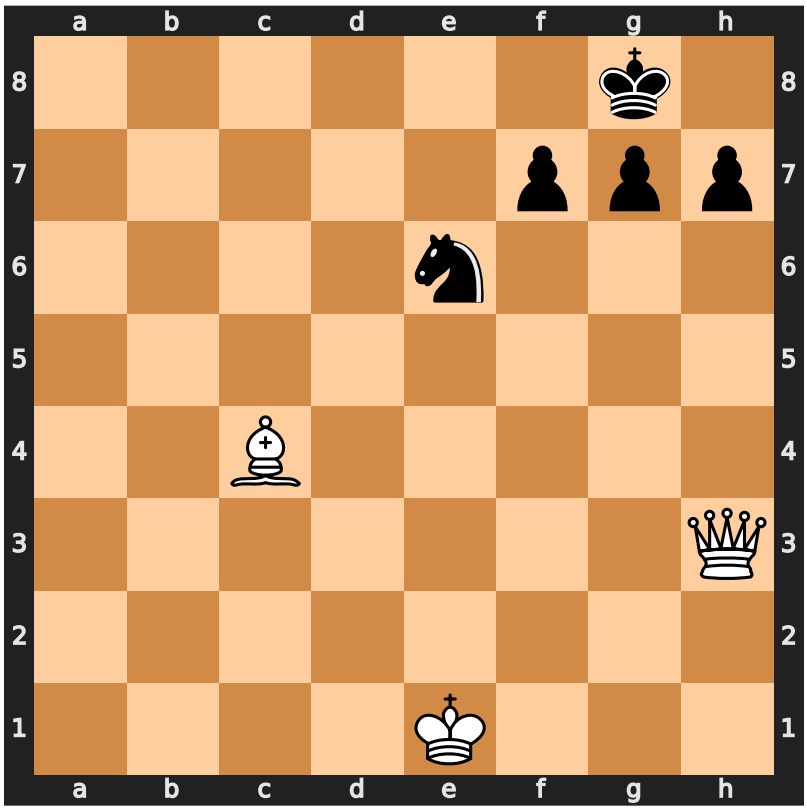

Figure 16.74: Chess Position

Task: Capture the knight. **Hint 1:** Bc4 aims through e6 toward g8. **Hint 2:** Pawn on f7 partially blocks. **Hint 3:** Qxe6! wins the knight. **Solution: 1.Qxe6!** fxe6 Bxe6. White wins a knight and pawn with a powerful bishop.

---

30 pin exercises complete. Take a break before skewers.

16.10.3 Section C: Skewer Exercises (6.66–6.85)

Exercise 6.66 **Position:** See hint for position.

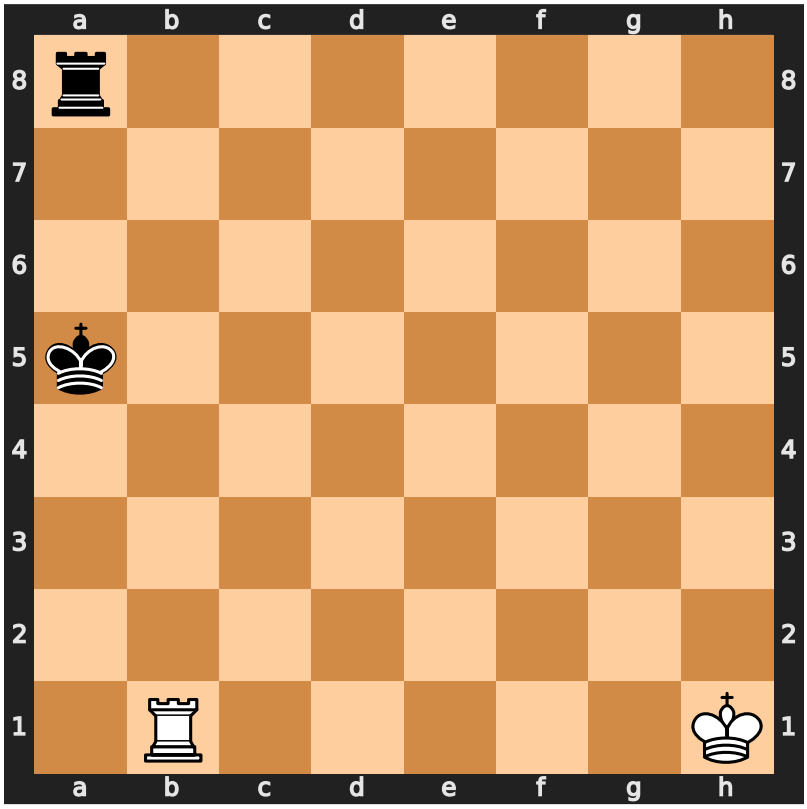

Figure 16.75: Chess Position

Task: Find the skewer. **Hint 1:** Ra1+ checks, Rxa8 follows. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ra1+** Skewer! Wins the rook.

Exercise 6.67 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Ra3+ checks on rank 3, Rxh3. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ra3+** Check, then Rxh3.

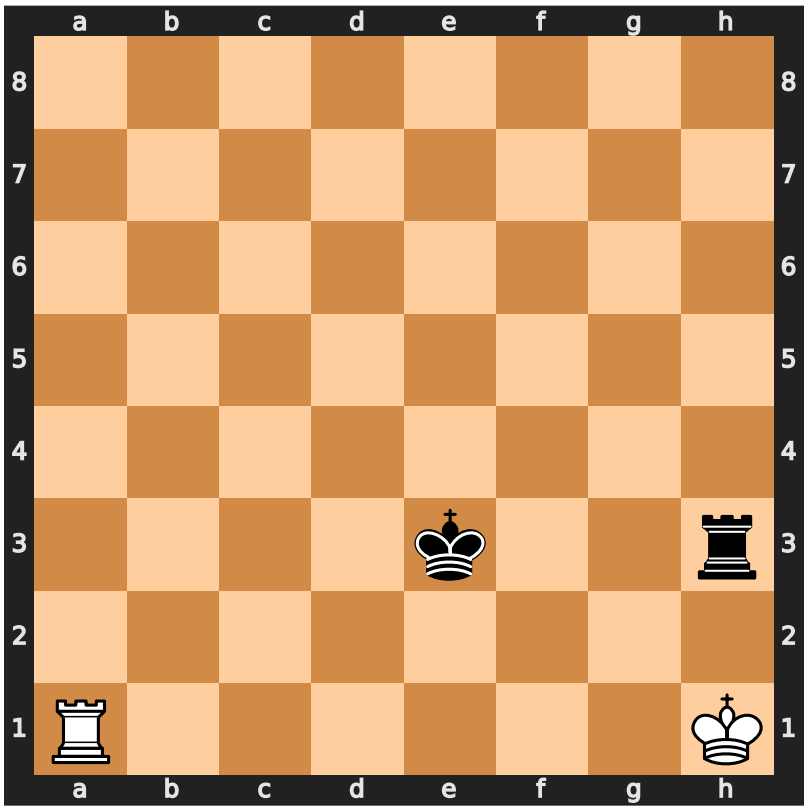

Figure 16.76: Chess Position

Exercise 6.68 **Position:** See hint for position.

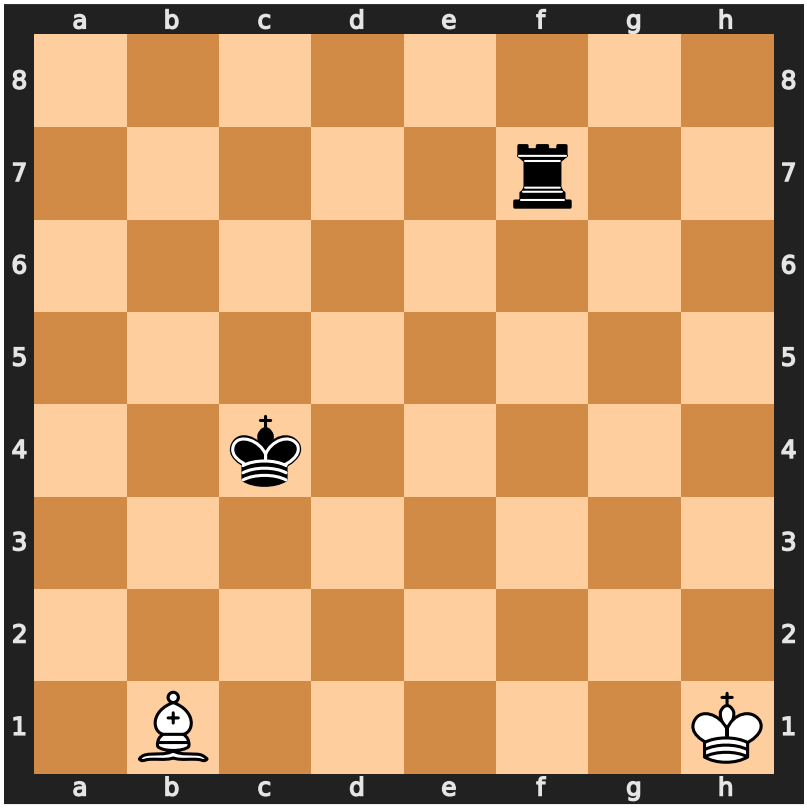

Figure 16.77: Chess Position

Task: Find the skewer. **Hint 1:** Ba2+ checks c4, Bxf7 follows. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ba2+** Bishop skewer. Wins the rook.

Exercise 6.69 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Qa7+ checks on 7th rank, Qxh7. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Qa7+** Queen skewer. Wins the rook.

Exercise 6.70 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Ra1+ checks, Rxa7 wins the queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ra1+** Skewer wins the queen!

Exercise 6.71 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Bf3+ checks d5, Bxb7 wins queen! **Hint 2:** The more valuable

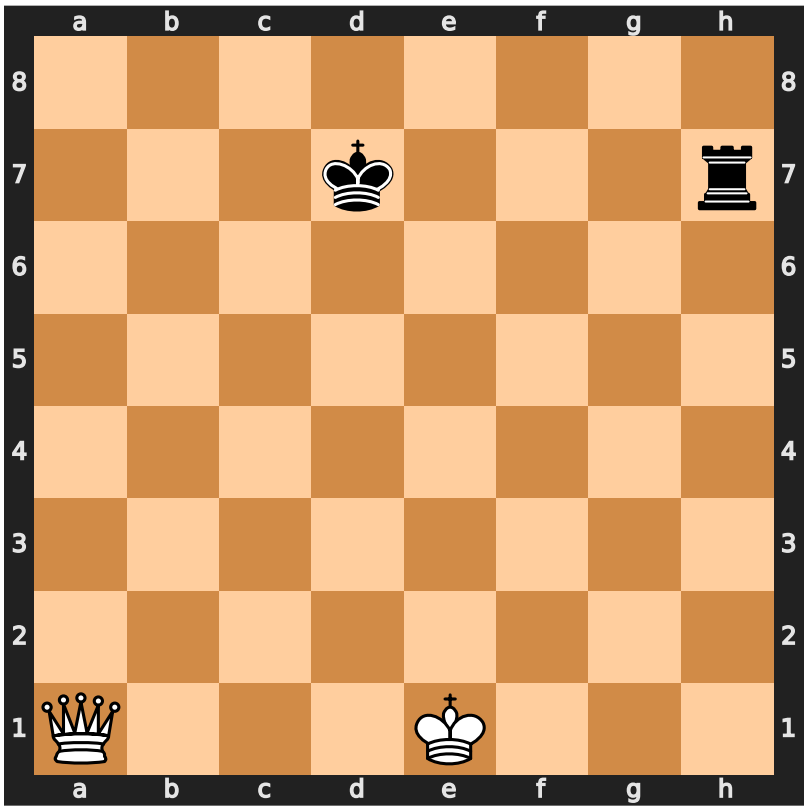

Figure 16.78: Chess Position

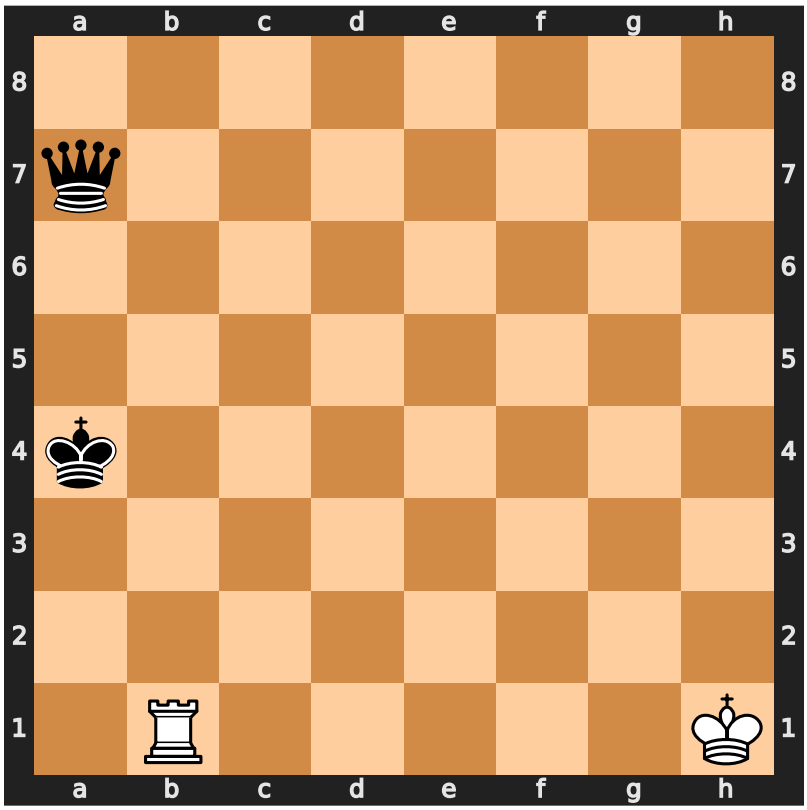

Figure 16.79: Chess Position

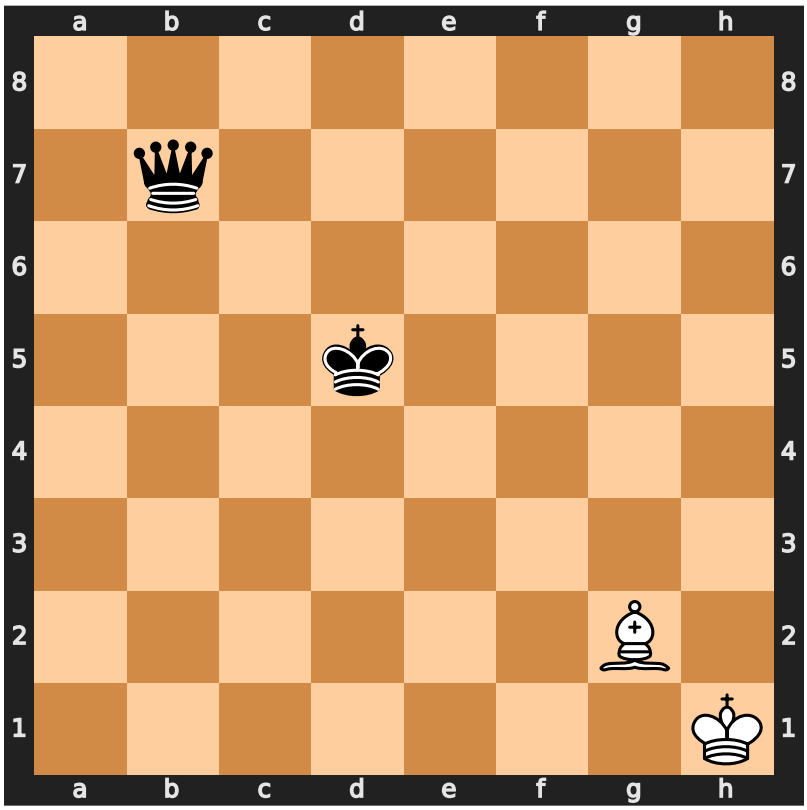

Figure 16.80: Chess Position

piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Bf3+** Bishop skewer. Wins the queen!

Exercise 6.72 **Position:** See hint for position.

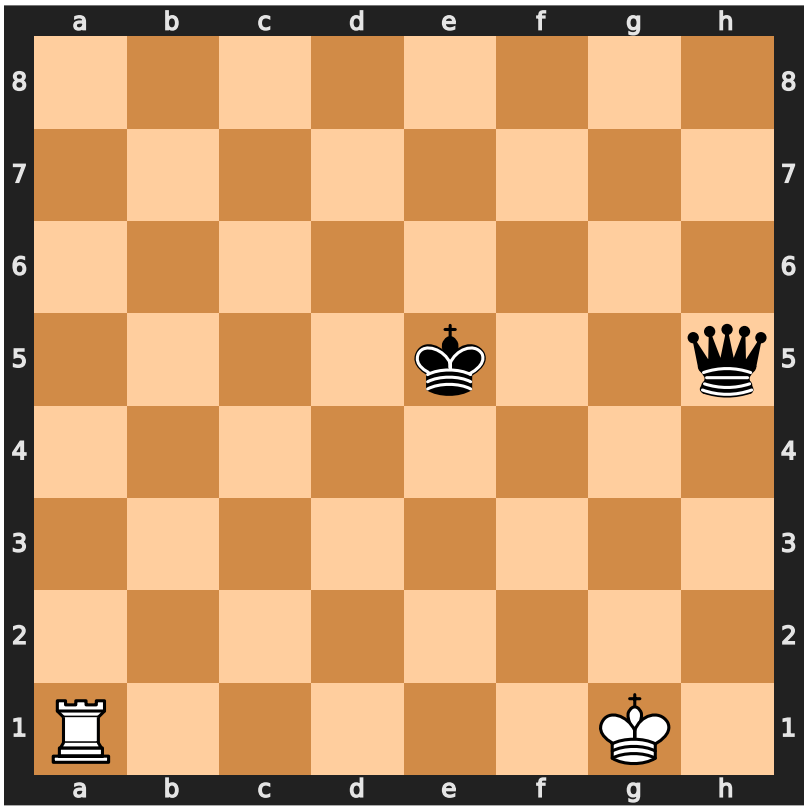

Figure 16.81: Chess Position

Task: Find the skewer. **Hint 1:** Ra5+ checks on rank 5, Rxh5. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ra5+** Skewer wins the queen!

Exercise 6.73 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Rh1+ checks on h-file, Rxh8. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Rh1+** Rook swings to h-file. Wins the queen!

Exercise 6.74 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Bc6+ checks d5, Bxg2 wins rook. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Bc6+** Diagonal skewer. Wins the rook.

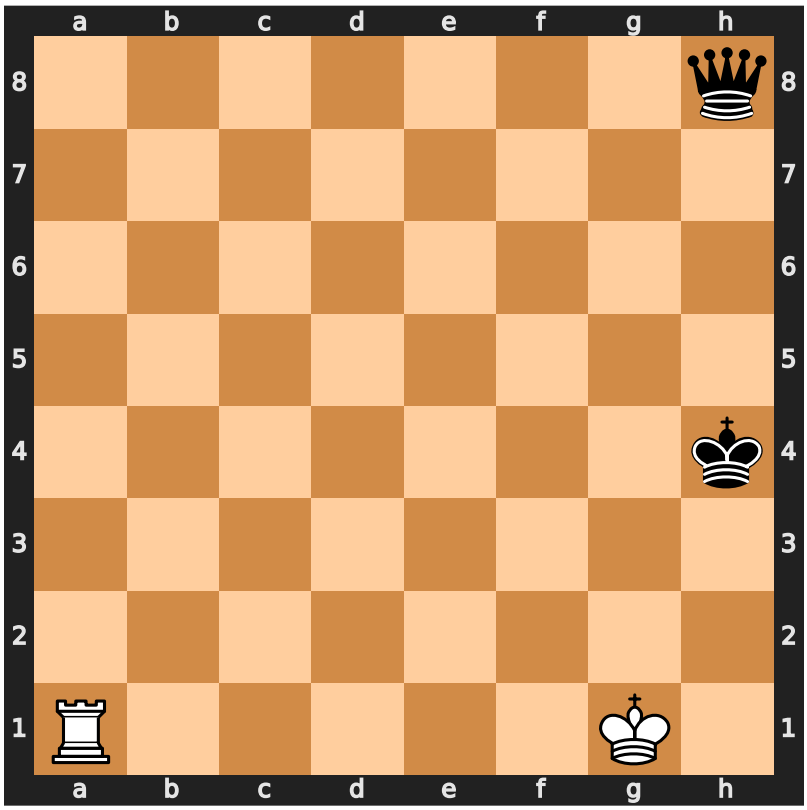

Figure 16.82: Chess Position

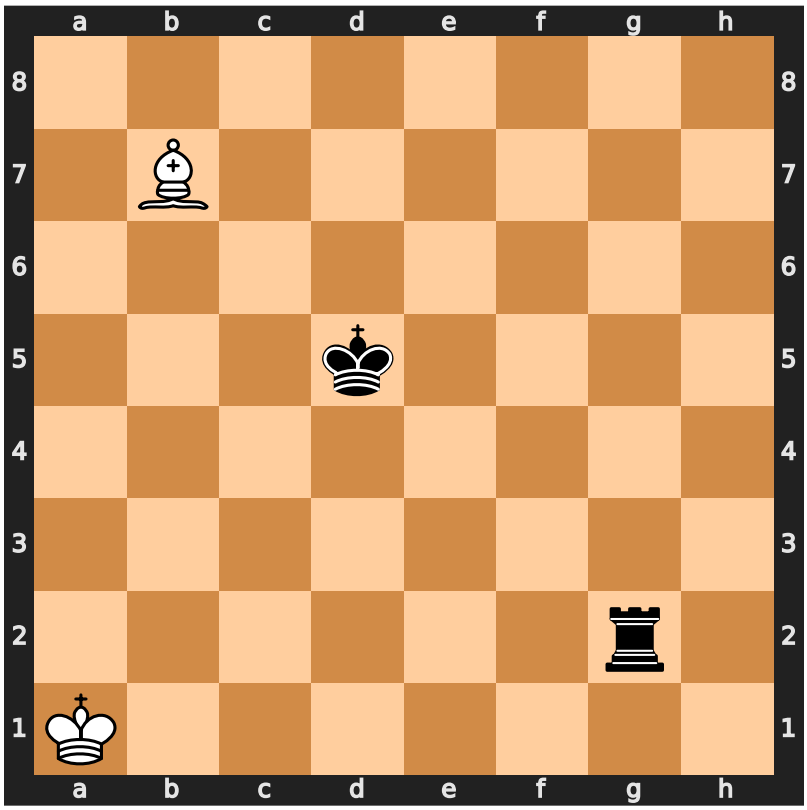

Figure 16.83: Chess Position

Exercise 6.75 **Position:** See hint for position.

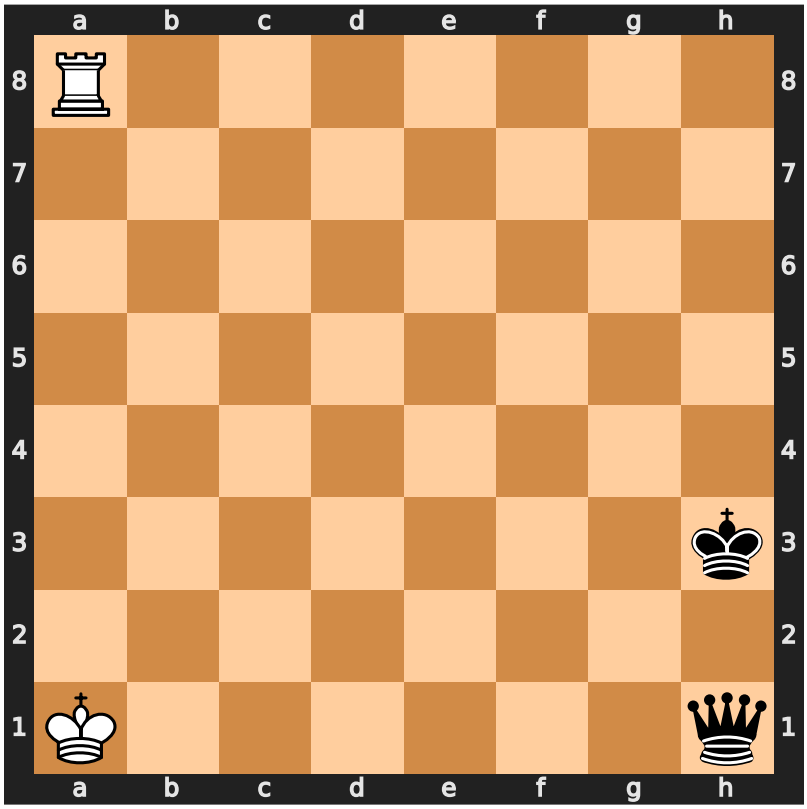

Figure 16.84: Chess Position

Task: Find the skewer. **Hint 1:** Rh8+ checks on h-file, Rxh1. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Rh8+** Rook swings. Wins the queen!

Exercise 6.76 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Qa6+ checks, Qxa8. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Qa6+** Queen skewer. Wins the rook.

Exercise 6.77 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Bd4+ checks e5, Bxb2 wins rook. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Bd4+** Bishop skewer from the corner!

Exercise 6.78 **Position:** See hint for position.

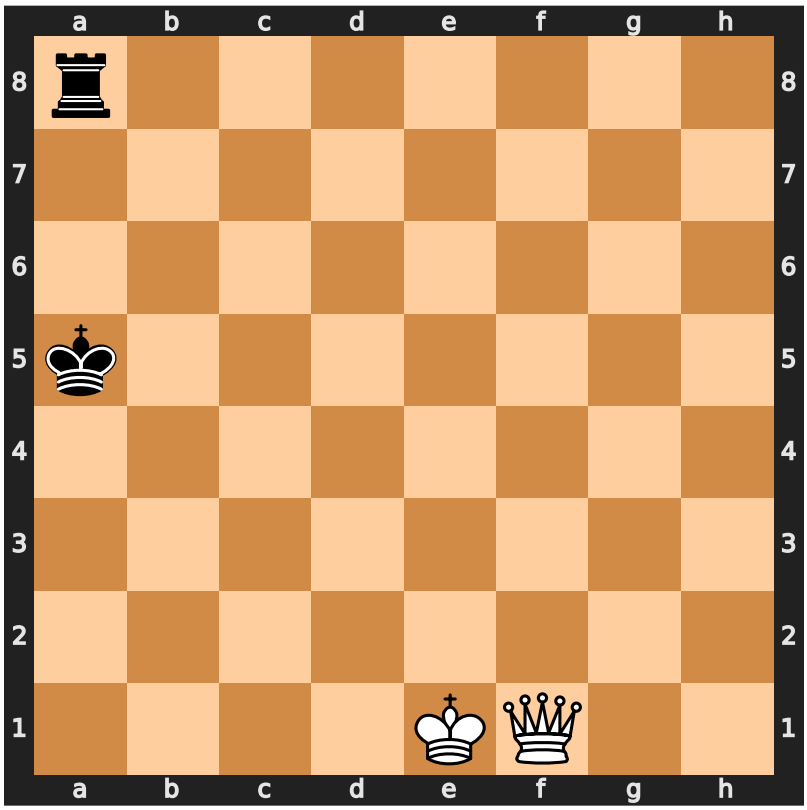

Figure 16.85: Chess Position

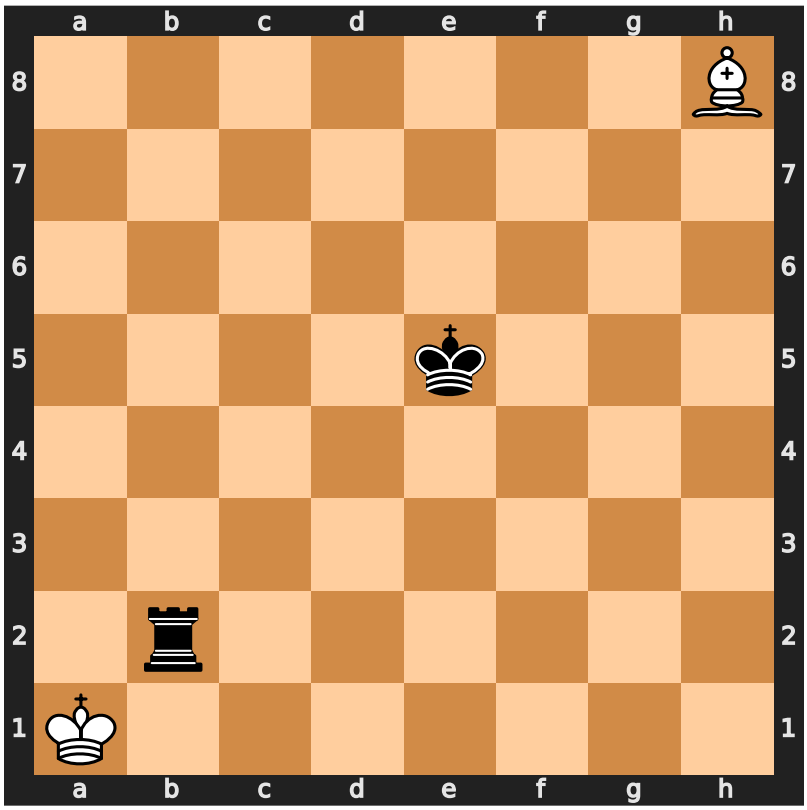

Figure 16.86: Chess Position

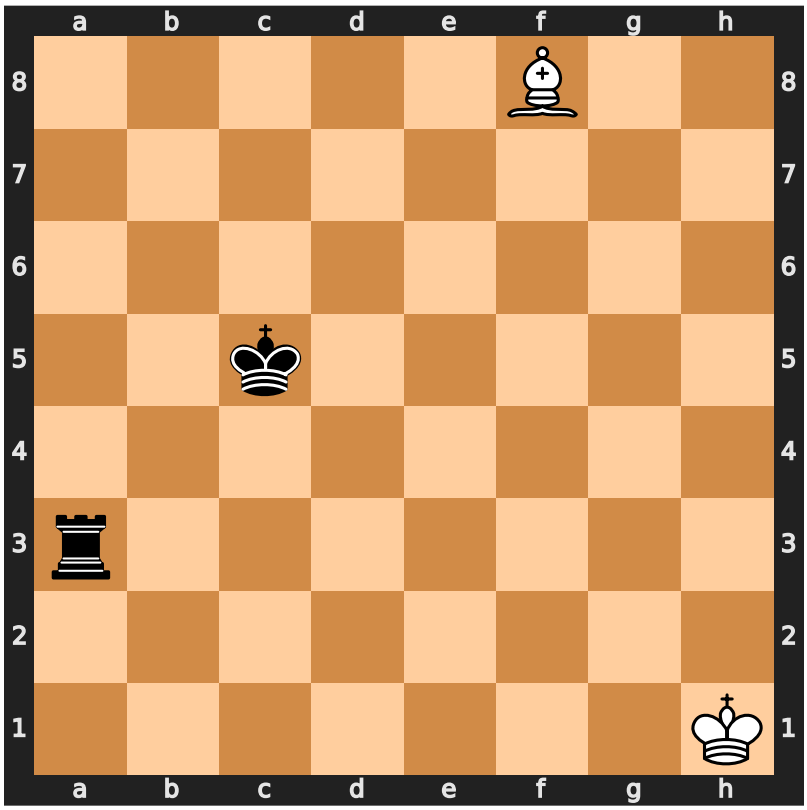

Figure 16.87: Chess Position

Task: Find the skewer. **Hint 1:** Be7+ checks c5, Bxa3 wins rook. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Be7+** Bishop skewer. Wins the rook.

Exercise 6.79 **Position:** See hint for position.

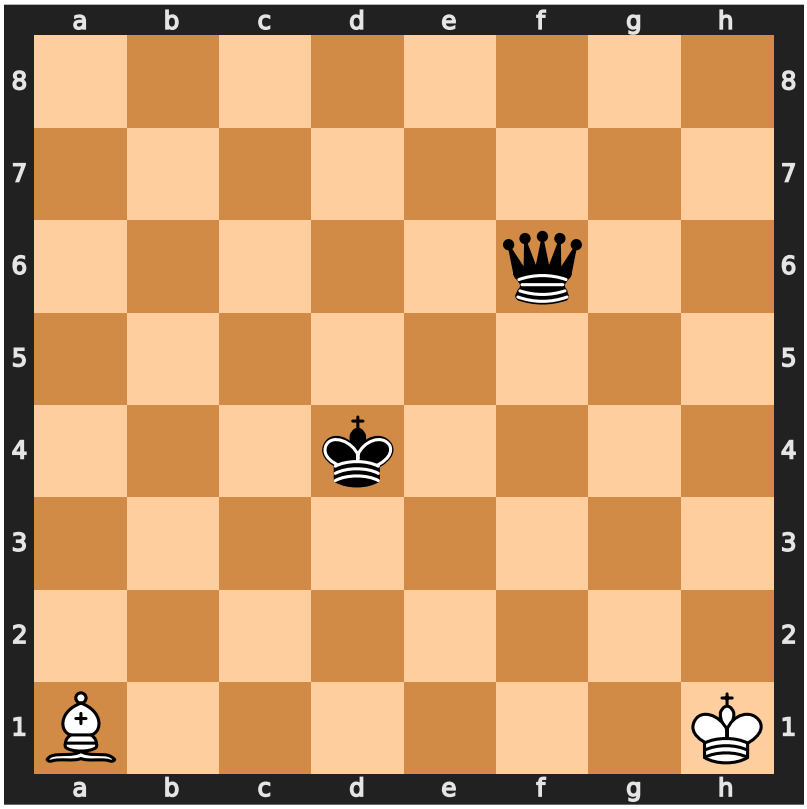

Figure 16.88: Chess Position

Task: Find the skewer. **Hint 1:** Bb2+ checks d4, Bxf6 wins queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Bb2+** Bishop skewer wins the queen!

Exercise 6.80 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Qe3+ checks on e-file, Qxe8. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Qe3+** Queen skewer. Wins the rook.

Exercise 6.81 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Qa2+ checks on diagonal, Qxg8. **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Qa2+** Diagonal skewer. Wins the rook.

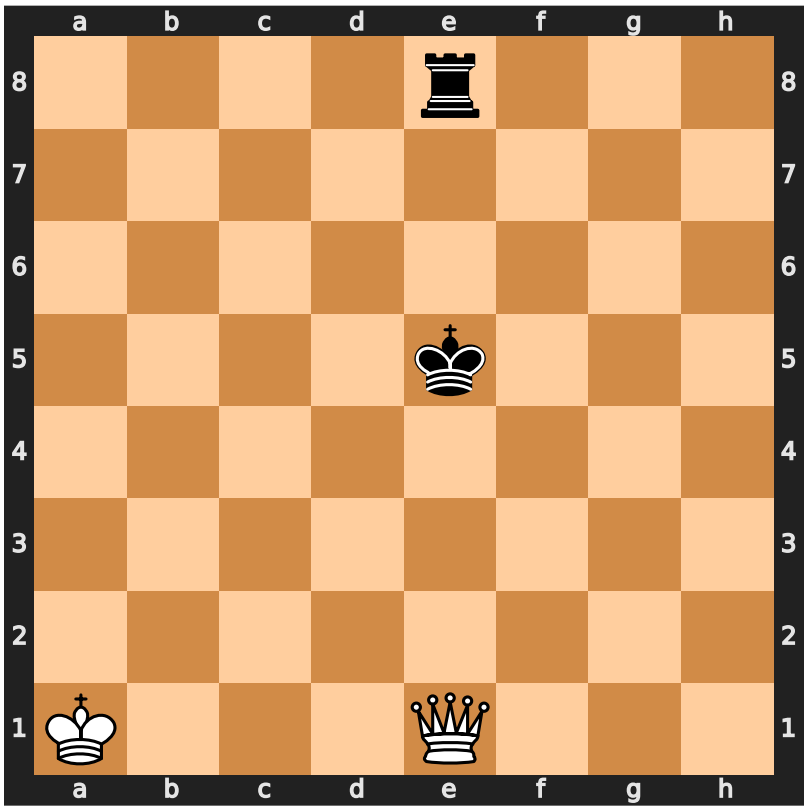

Figure 16.89: Chess Position

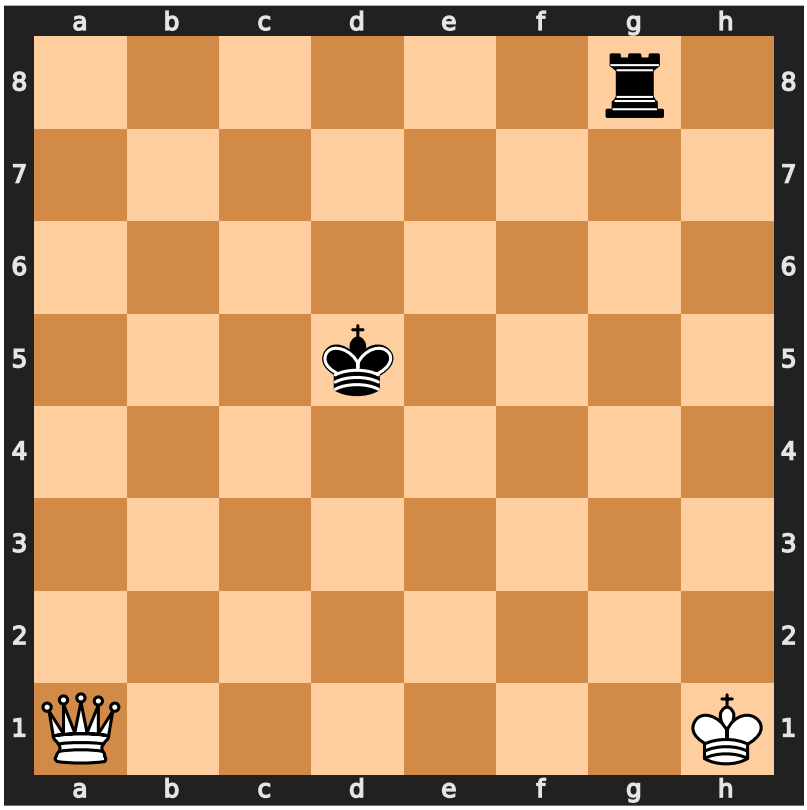

Figure 16.90: Chess Position

Exercise 6.82 **Position:** See hint for position.

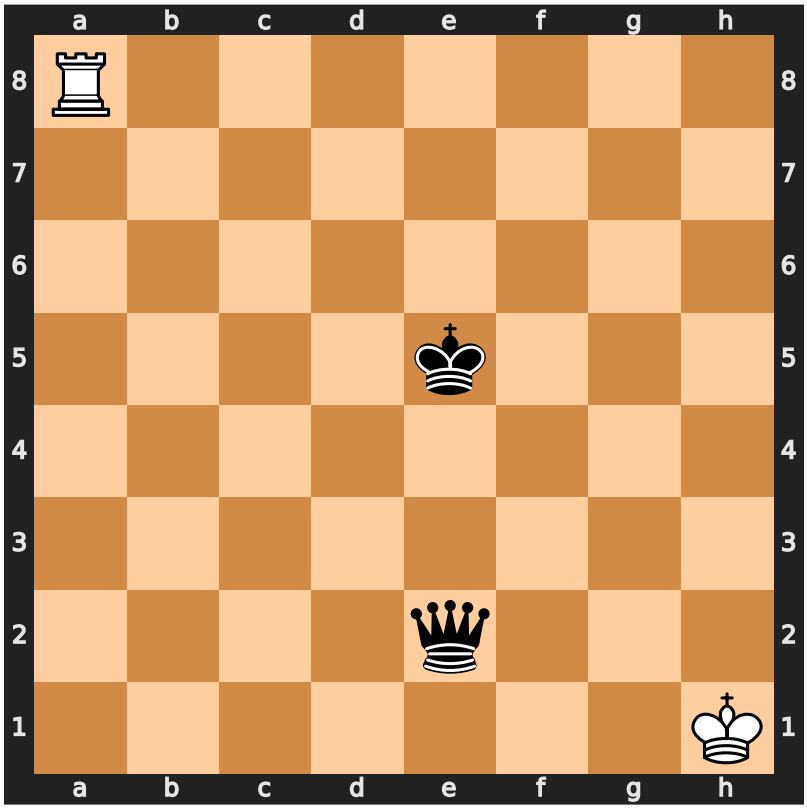

Figure 16.91: Chess Position

Task: Find the skewer. **Hint 1:** Re8+ checks, Rxe2 wins queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Re8+** Rook skewer wins the queen!

Exercise 6.83 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Rb1+ checks, Rxb8 wins queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Rb1+** Rook skewer wins the queen!

Exercise 6.84 **Position:** See hint for position.

Task: Find the skewer. **Hint 1:** Ra1+ checks, Rxa7 wins queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Ra1+** Skewer wins the queen!

Exercise 6.85 **Position:** See hint for position.

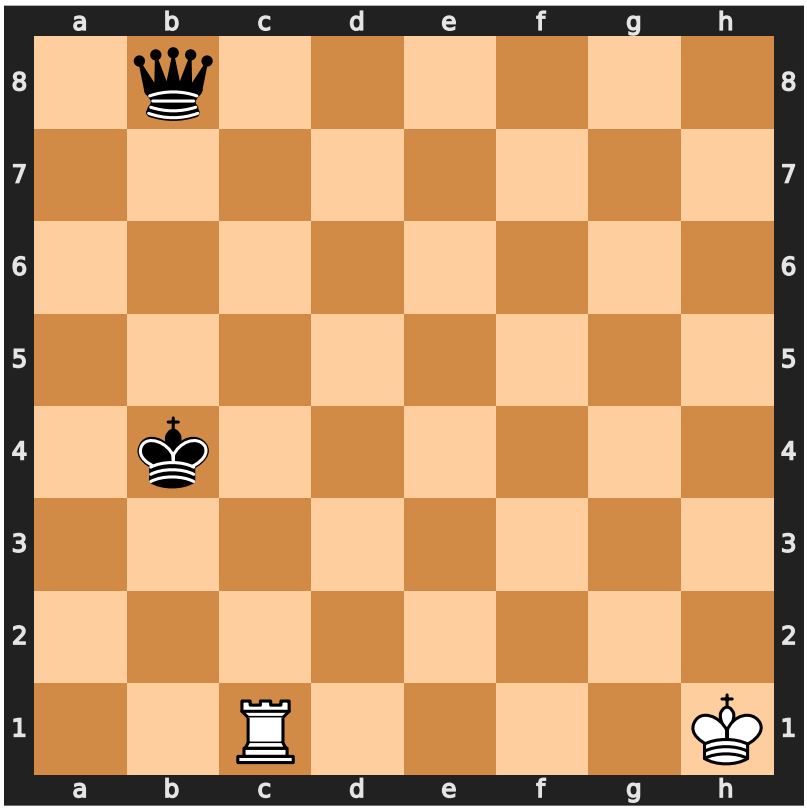

Figure 16.92: Chess Position

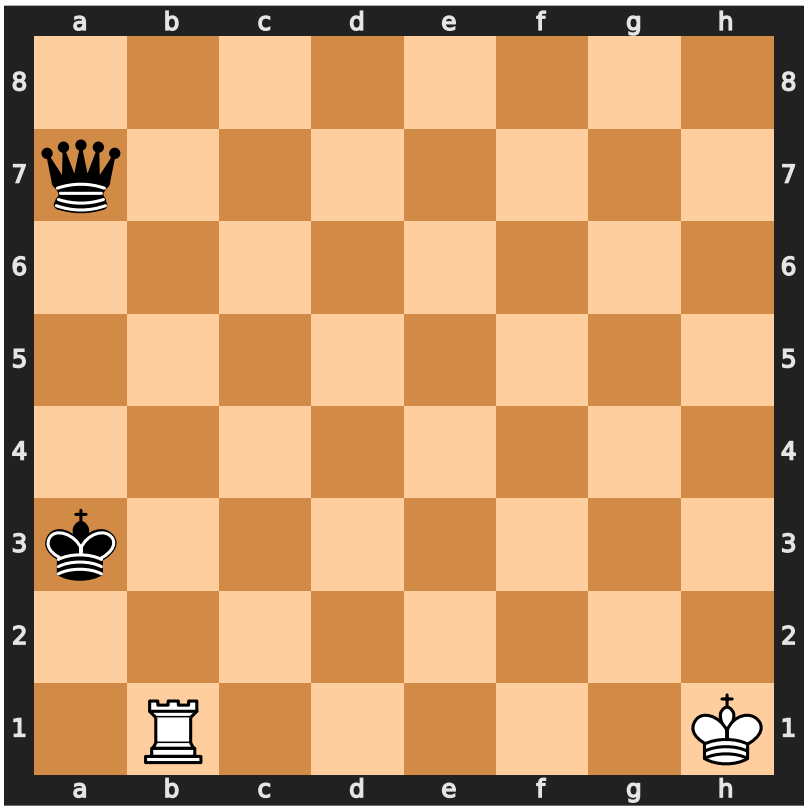

Figure 16.93: Chess Position

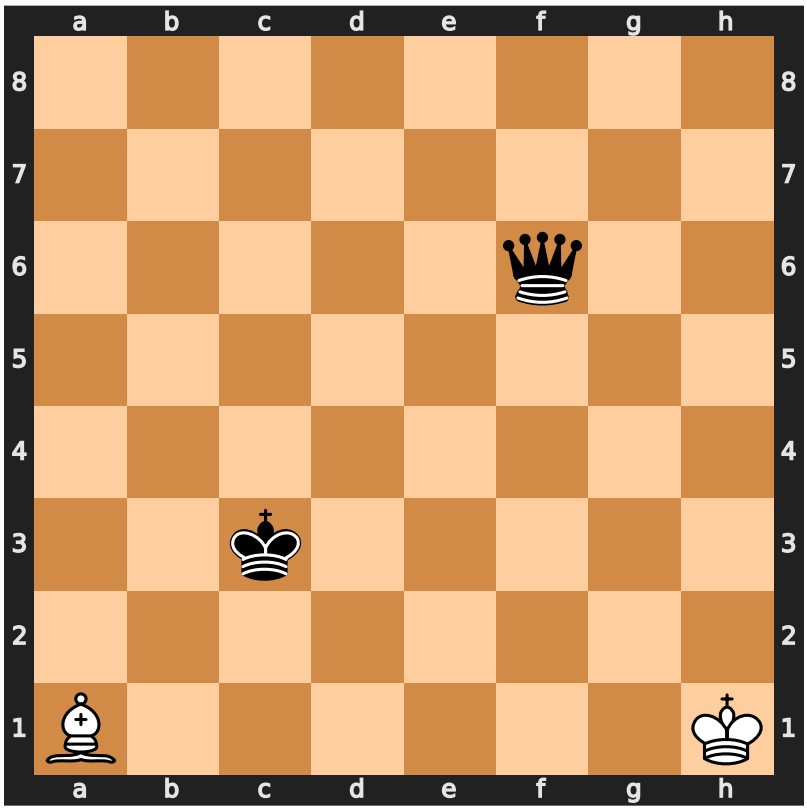

Figure 16.94: Chess Position

Task: Find the skewer. **Hint 1:** Bb2+ checks c3, Bxf6 wins queen! **Hint 2:** The more valuable piece is in front. It must move. **Hint 3:** Then capture the piece behind it. **Solution: 1.Bb2+** Bishop skewer wins the queen!

Skewer exercises complete. Three major tactics mastered!

Milestone: Forks, pins, and skewers account for most tactical wins at the beginner level.

16.10.4 Section D: Discovered Attack Exercises (6.86–6.110)

Exercise 6.86 **Position:** See hint for position.

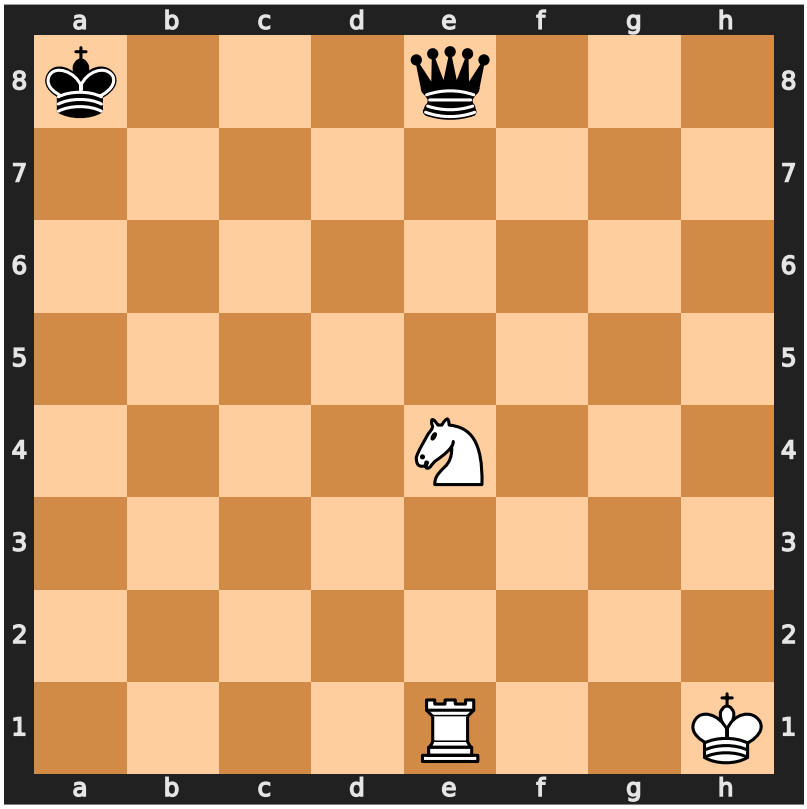

Figure 16.95: Chess Position

Task: Find the discovered attack. **Hint 1:** Re1 blocked by Ne4. Move knight, rook attacks queen. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nf6!** Discovered attack on the queen.

Exercise 6.87 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rd1 blocked by Bd4. Move bishop, rook attacks rook. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if

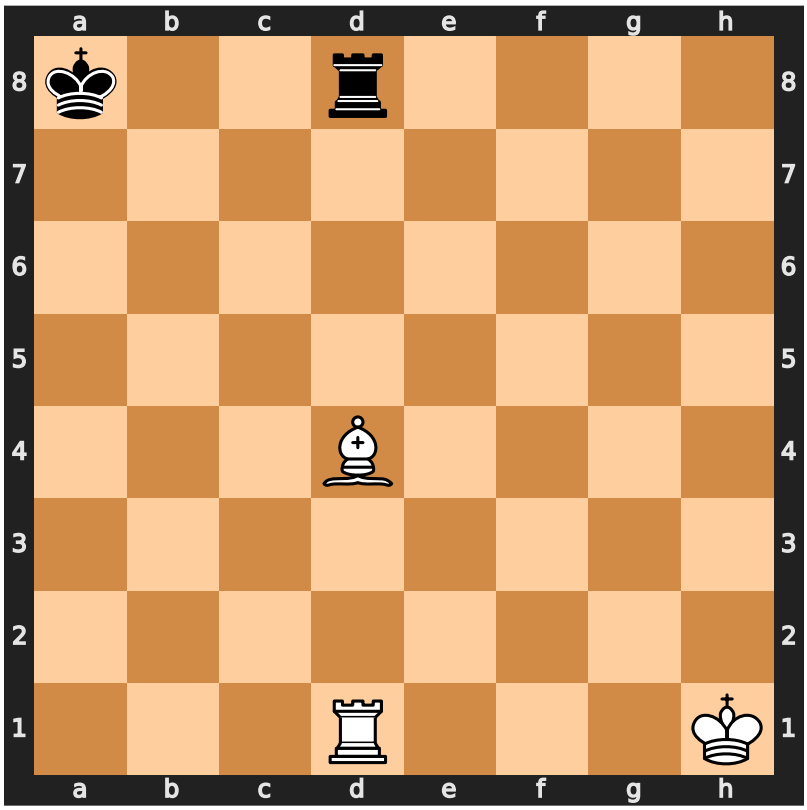

Figure 16.96: Chess Position

possible. **Solution: 1.Be5!** Discovered attack on the d-file.

Exercise 6.88 **Position:** See hint for position.

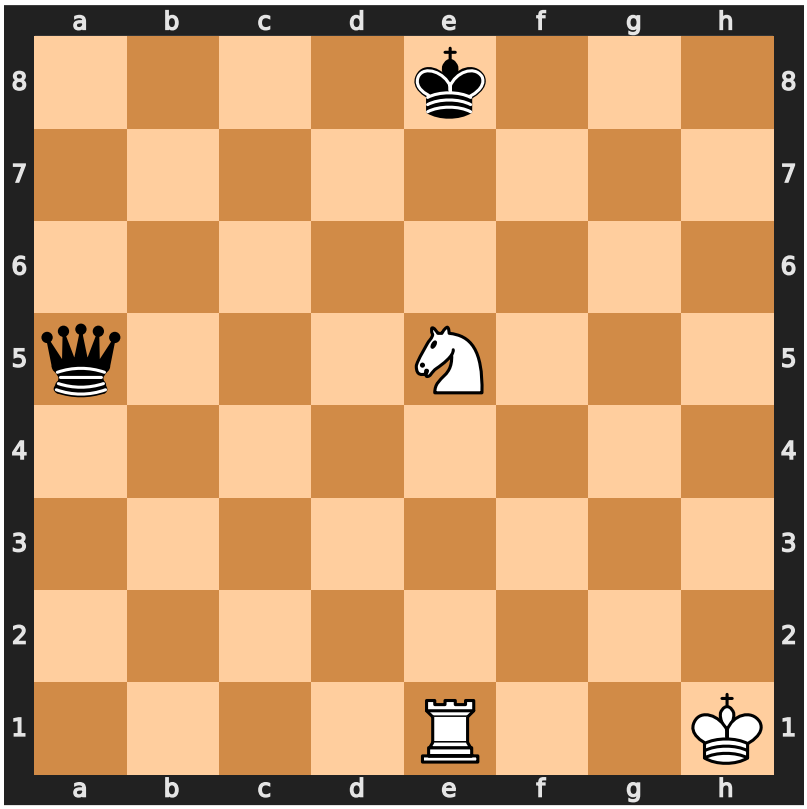

Figure 16.97: Chess Position

Task: Find the discovered attack. **Hint 1:** Re1 aims at Ke8 through Ne5. Nc4 attacks Qa5! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nc4+** Discovered check! Knight attacks queen. Queen is lost.

Exercise 6.89 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Re1 blocked by Be4. Bc6 attacks Qb7! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Bc6+** Discovered check! Bishop attacks queen. Bxb7 follows.

Exercise 6.90 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rd1 aims at Kd8 through Nd5. Nb4 attacks Qa2! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nb4+** Discovered check! Knight attacks queen.

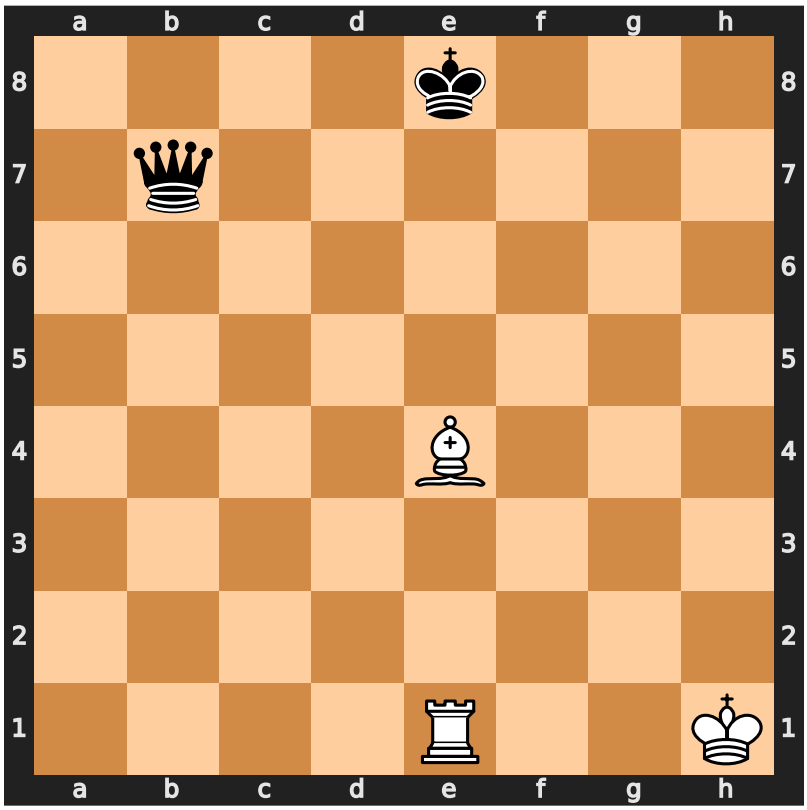

Figure 16.98: Chess Position

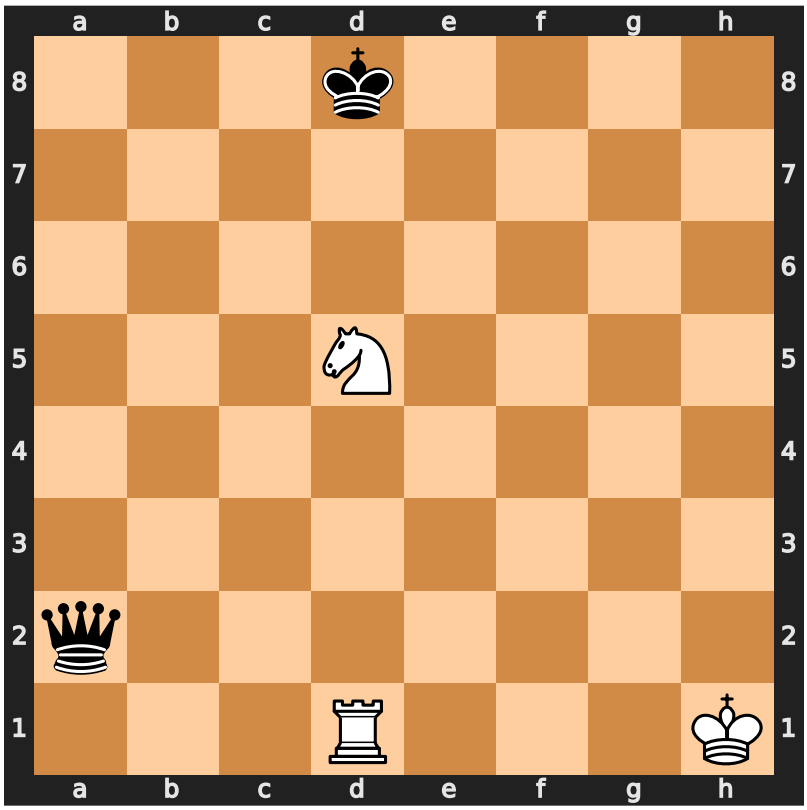

Figure 16.99: Chess Position

Exercise 6.91 **Position:** See hint for position.

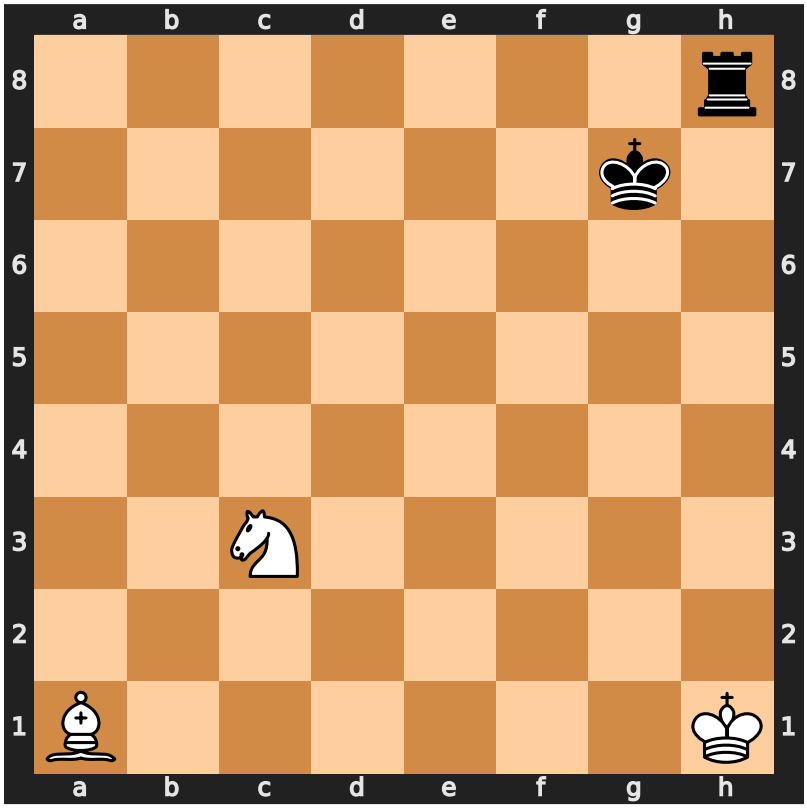

Figure 16.100: Chess Position

Task: Find the discovered attack. **Hint 1:** Ba1 aims at Kg7 through Nc3. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Ne4+** Discovered check from the bishop on the long diagonal!

Exercise 6.92 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Re1 aims at Ke8. Nd6 ALSO checks e8! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd6++ DOUBLE CHECK!** Both knight and rook give check. Only the king can move.

Exercise 6.93 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rh1 blocked by Bh4. Move bishop off h-file. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Be7+** Discovered check from the rook on the h-file!

Exercise 6.94 **Position:** See hint for position.

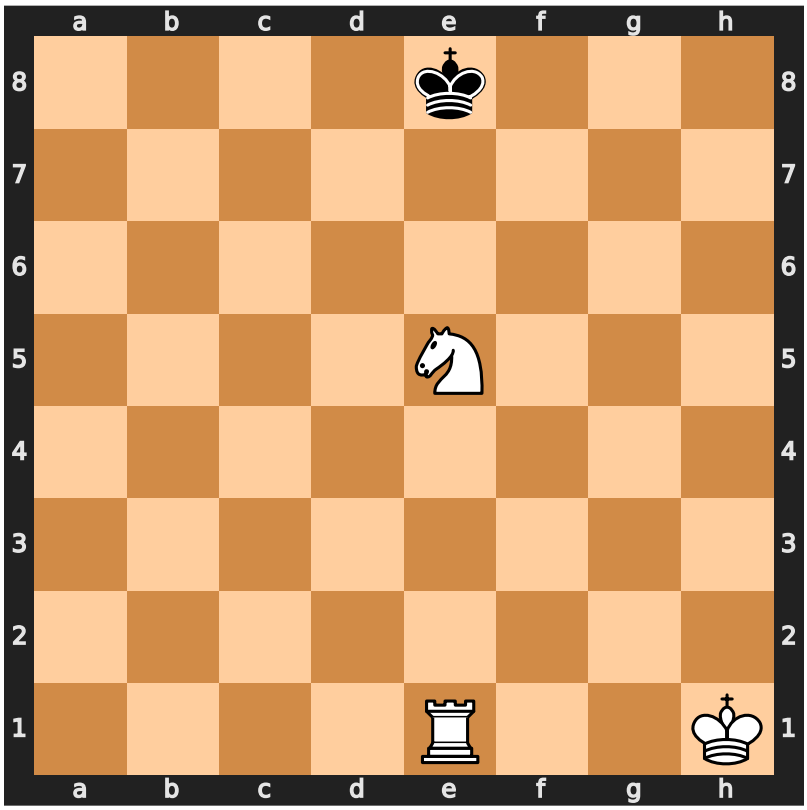

Figure 16.101: Chess Position

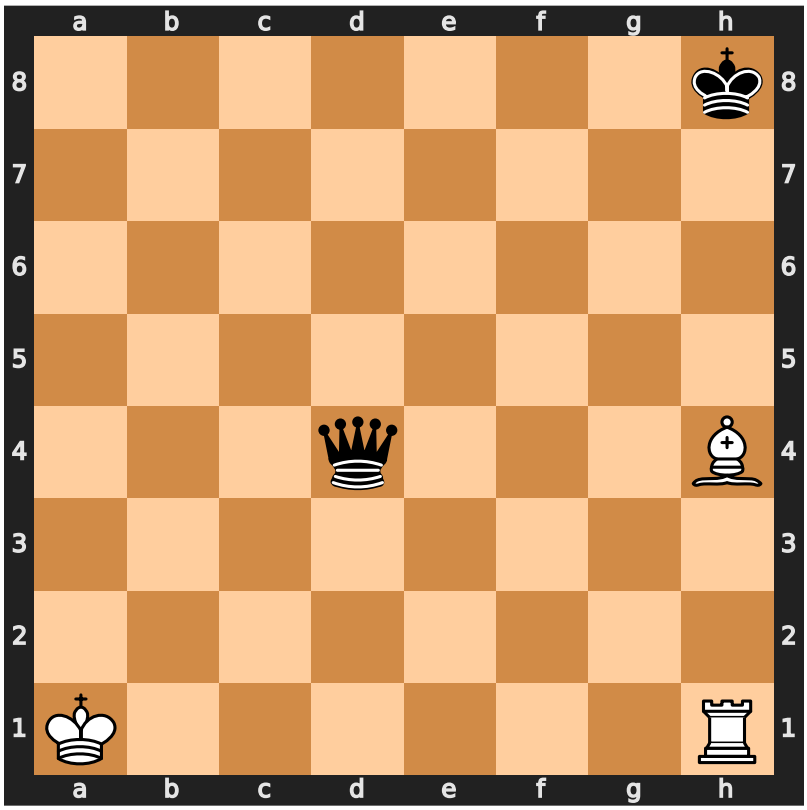

Figure 16.102: Chess Position

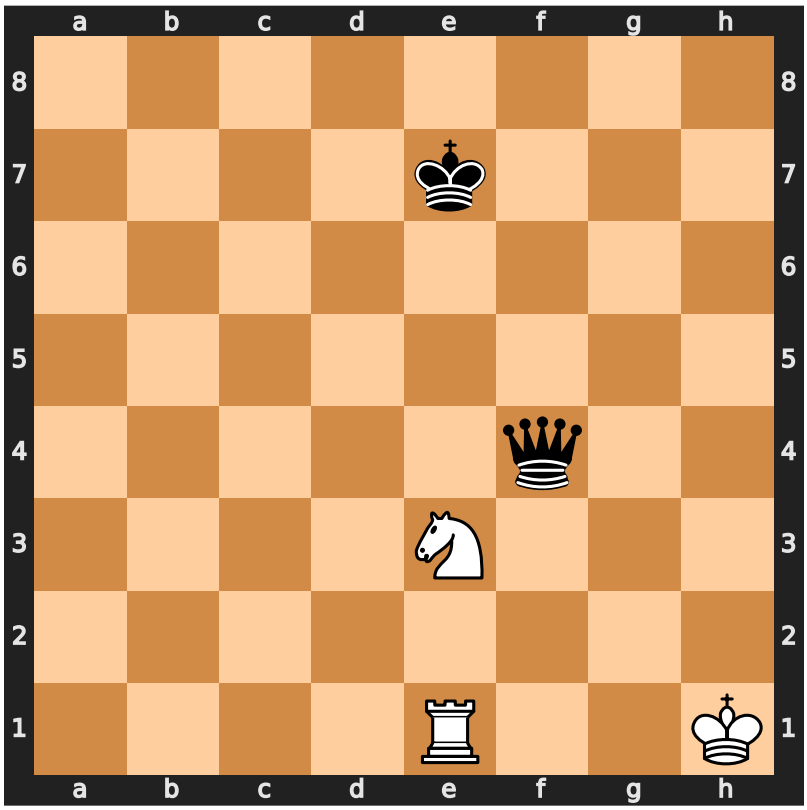

Figure 16.103: Chess Position

Task: Find the discovered attack. **Hint 1:** Re1 aims at Ke7 through Ne3. Nd5 attacks Qf4! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd5+** Discovered check! Knight attacks queen on f4. Queen is lost.

Exercise 6.95 **Position:** See hint for position.

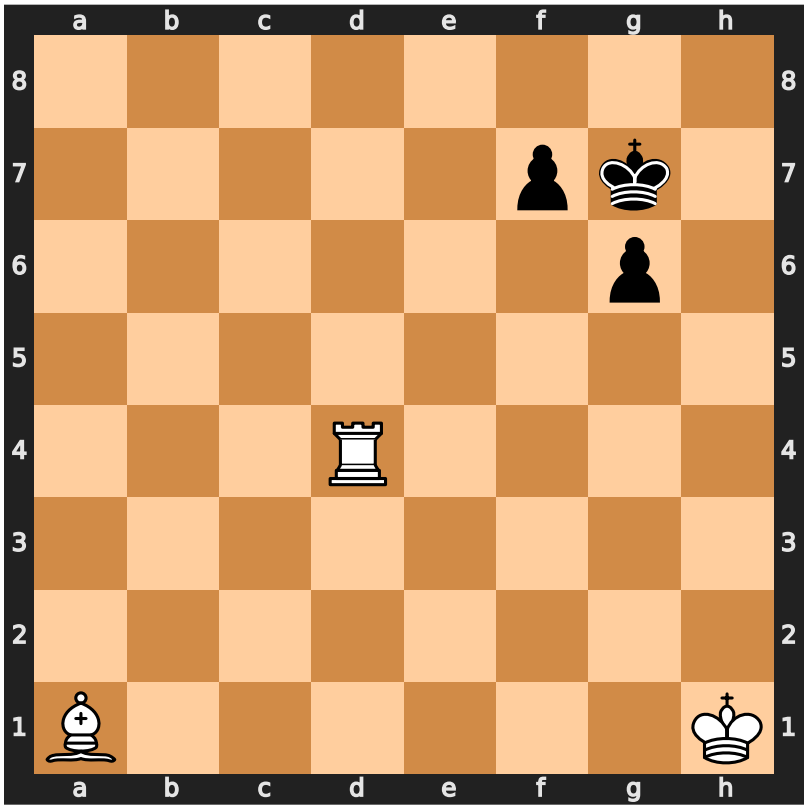

Figure 16.104: Chess Position

Task: Find the discovered attack. **Hint 1:** Ba1 aims at Kg7 through Rd4. Move rook. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Rd7+** Discovered check from the bishop! Rook invades 7th rank.

Exercise 6.96 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rd1 blocked by Nd4. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nc6!** Discovered attack on the rook on d8.

Exercise 6.97 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rc1 blocked by Nc4. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd6!** Discovered attack on the queen on c8.

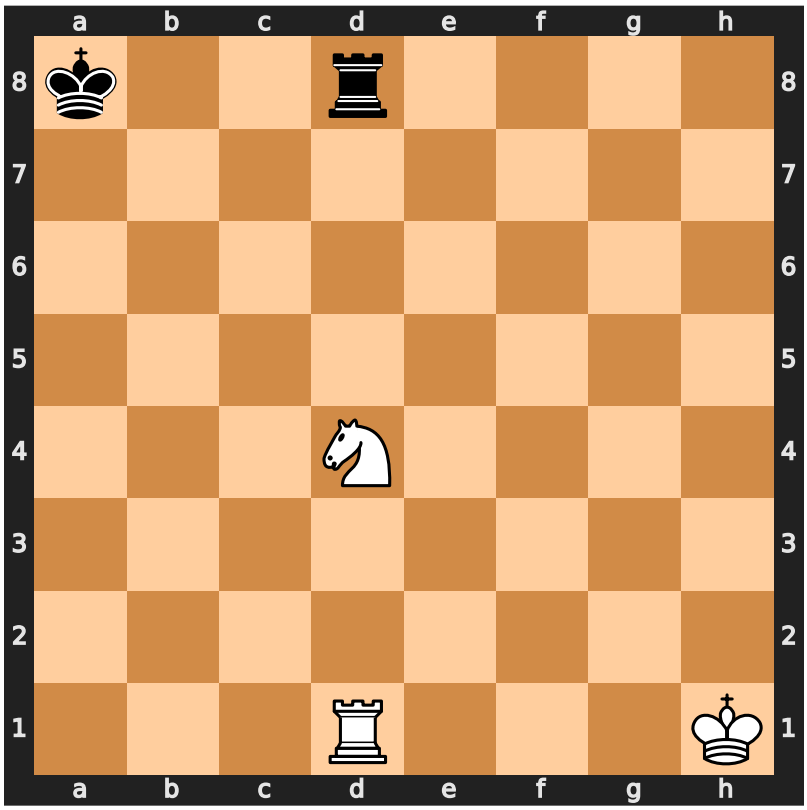

Figure 16.105: Chess Position

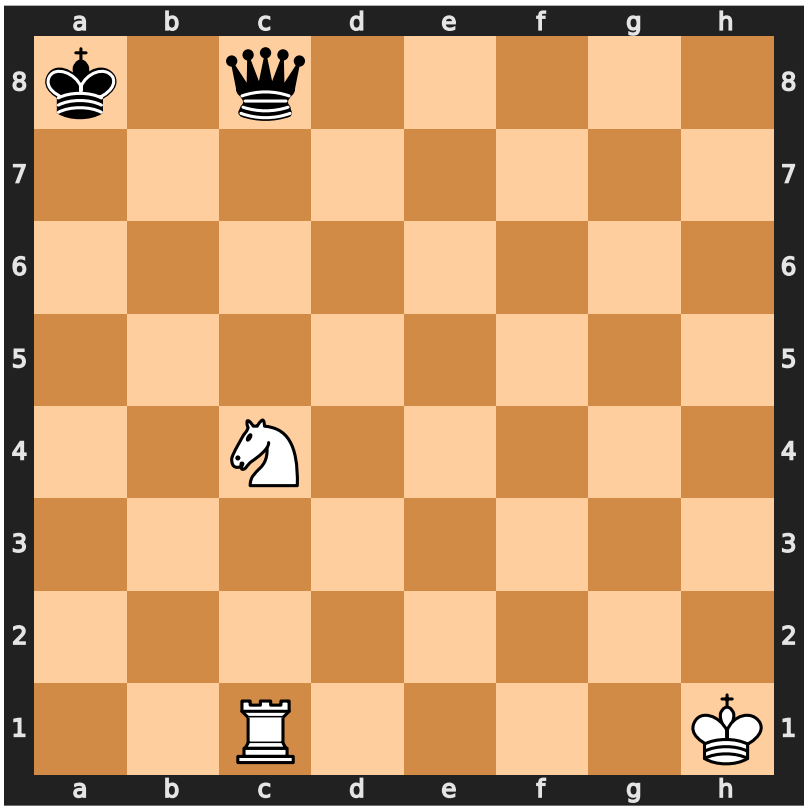

Figure 16.106: Chess Position

Exercise 6.98 **Position:** See hint for position.

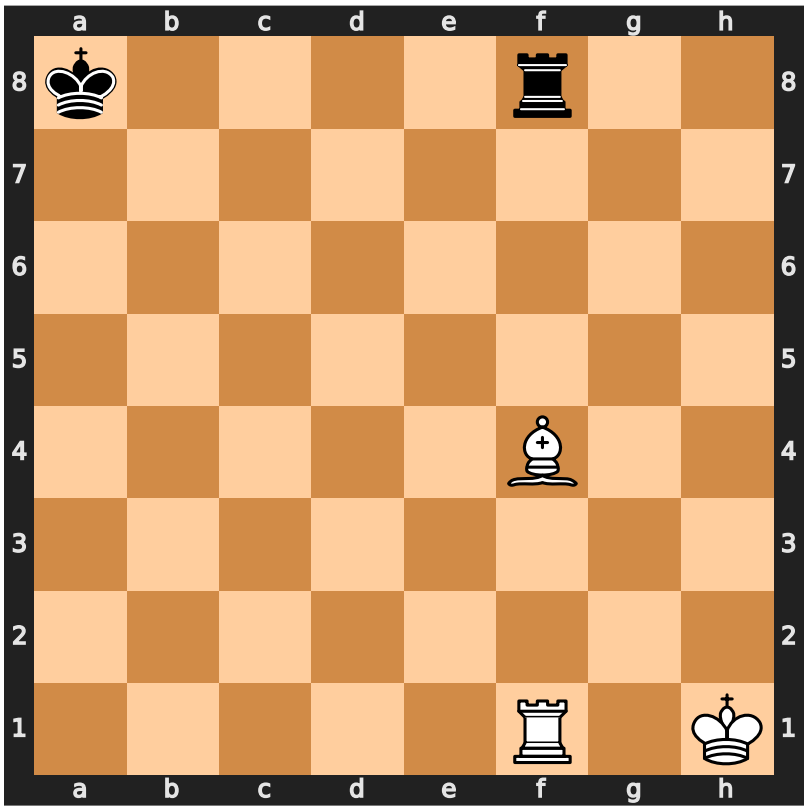

Figure 16.107: Chess Position

Task: Find the discovered attack. **Hint 1:** Rf1 blocked by Bf4. Move bishop. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Bd6!** Discovered attack on the rook on f8.

Exercise 6.99 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Ba1 aims at Kg7 through Nb2. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd3+** Discovered check from the bishop!

Exercise 6.100 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Re1 blocked by Be5. Bb2 attacks Qa1! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Bb2+** Discovered check! Bishop attacks queen. After king moves, Bxa1.

Exercise 6.101 **Position:** See hint for position.

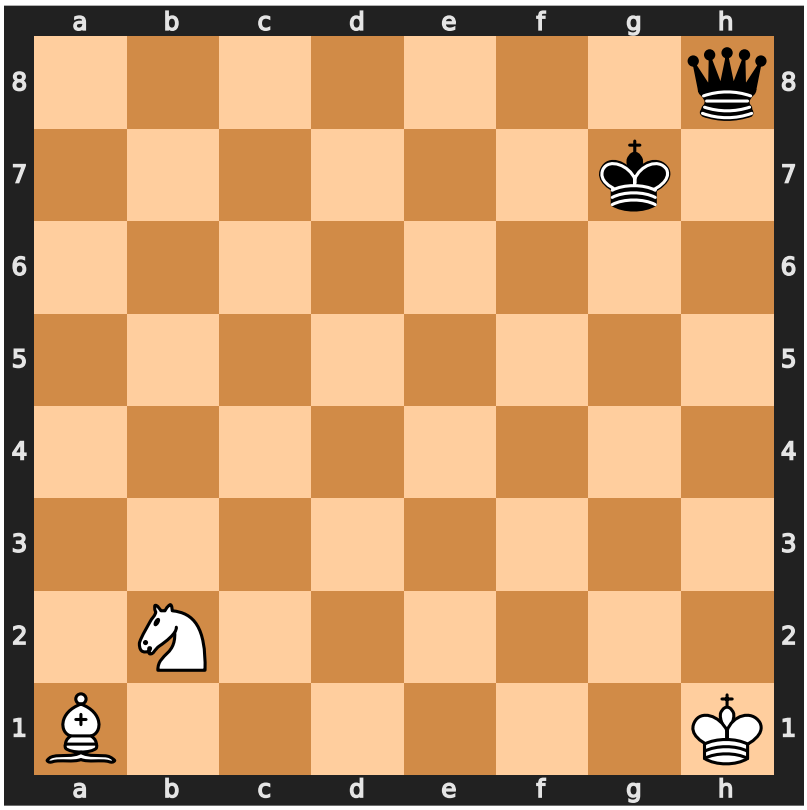

Figure 16.108: Chess Position

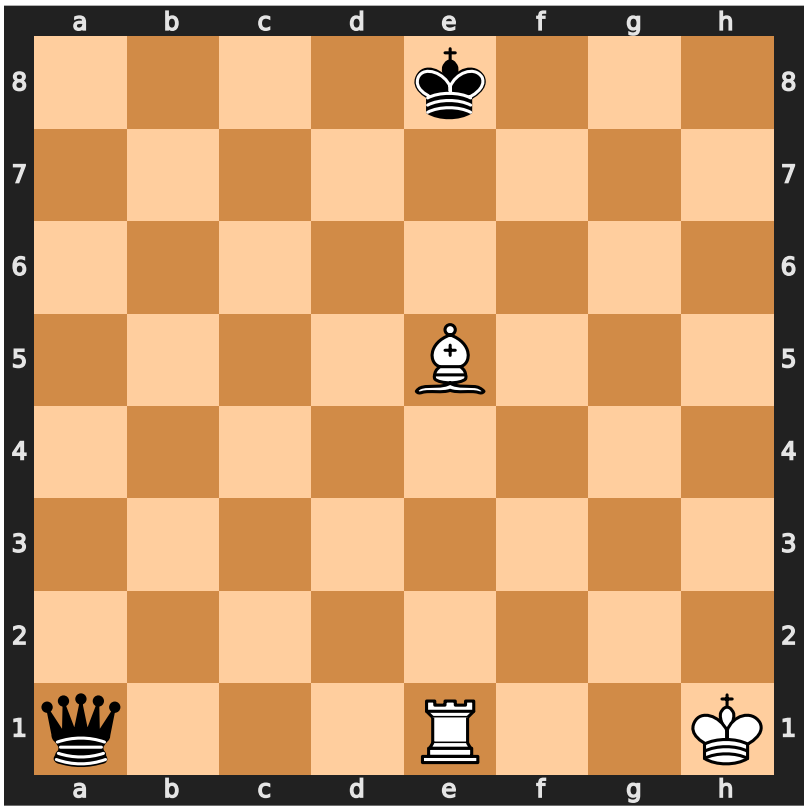

Figure 16.109: Chess Position

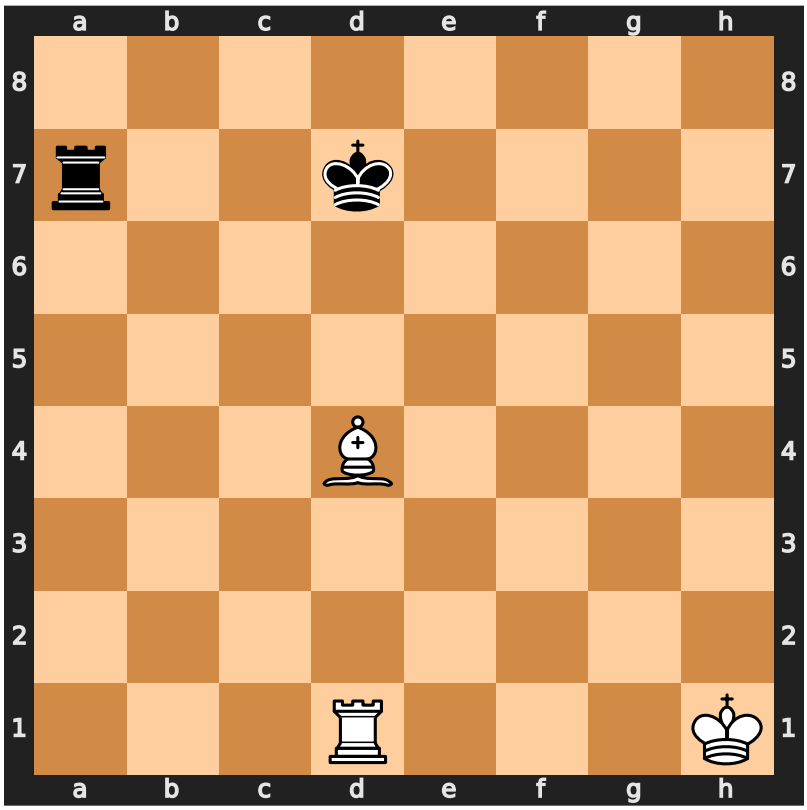

Figure 16.110: Chess Position

Task: Find the discovered attack. **Hint 1:** Rd1 aims at Kd7. Bb6 attacks Ra7! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution:** **1.Bb6+** Discovered check! Bishop attacks rook. Bxa7 follows.

Exercise 6.102 **Position:** See hint for position.

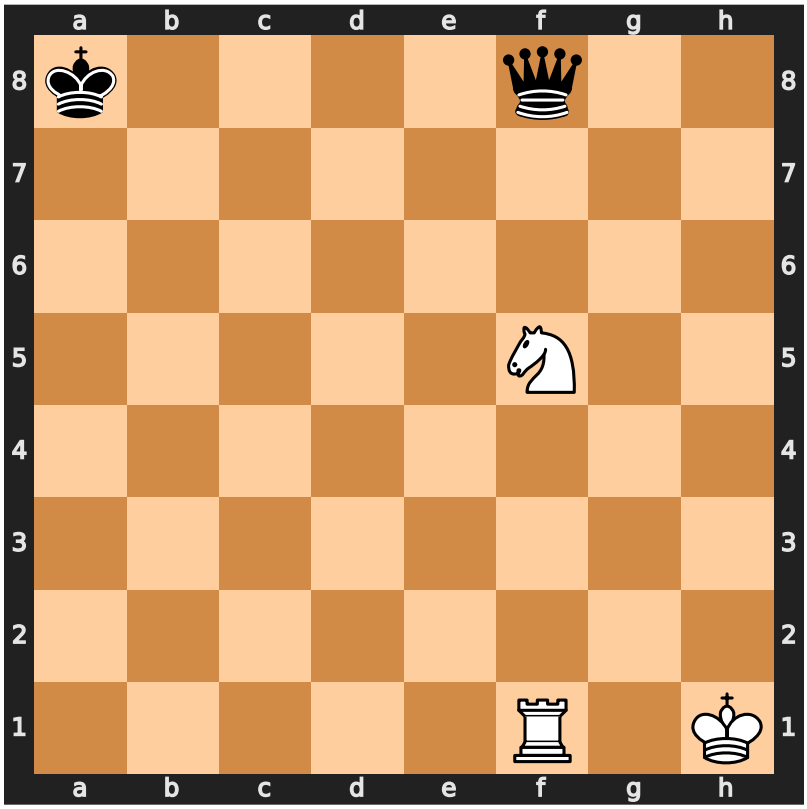

Figure 16.111: Chess Position

Task: Find the discovered attack. **Hint 1:** Rf1 blocked by Nf5. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution:** **1.Ne3!** Discovered attack on the queen on f8.

Exercise 6.103 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Rh1 aims at Kh8 through Nh5. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution:** **1.Ng3+** Discovered check from the rook!

Exercise 6.104 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Ba1 aims at Kf6 through Nc3. Move knight. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution:** **1.Ne4+** Discovered check from the bishop!

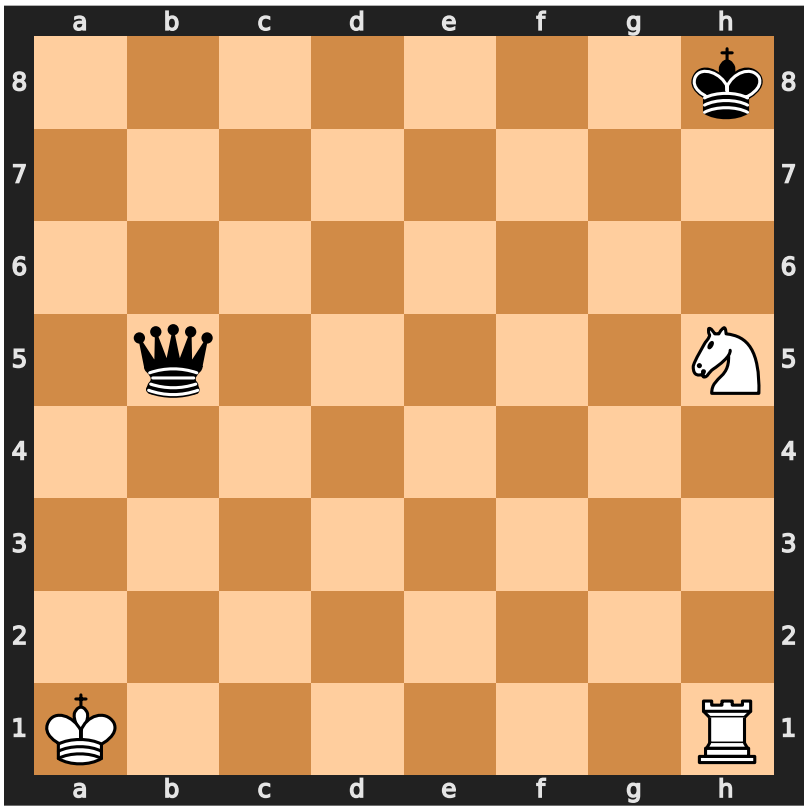

Figure 16.112: Chess Position

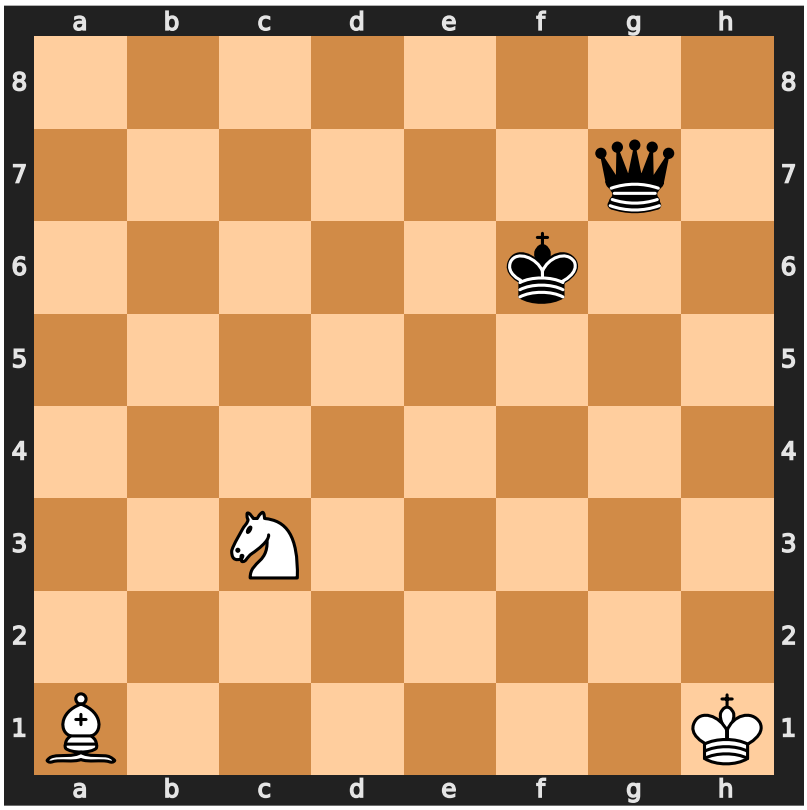

Figure 16.113: Chess Position

Exercise 6.105 **Position:** See hint for position.

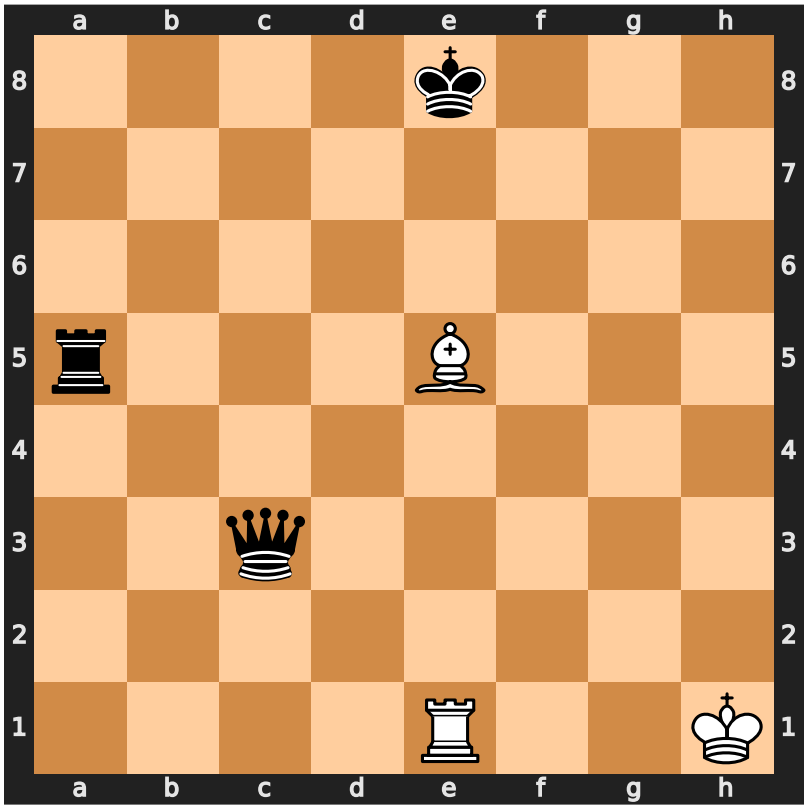

Figure 16.114: Chess Position

Task: Find the discovered attack. **Hint 1:** Re1 blocked by Be5. Bd4 attacks Qc3! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Bd4+** Discovered check! Bishop attacks queen on c3. Bxc3 follows.

Exercise 6.106 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Ba1 aims at Kg7 through Rd4. Rd7 invades! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Rd7+** Discovered check! Rook on the 7th rank is crushing.

Exercise 6.107 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Re1 through Ne4. Nd6 also checks! **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd6++ DOUBLE CHECK!** Both pieces check. Only the king can move.

Exercise 6.108 **Position:** See hint for position.

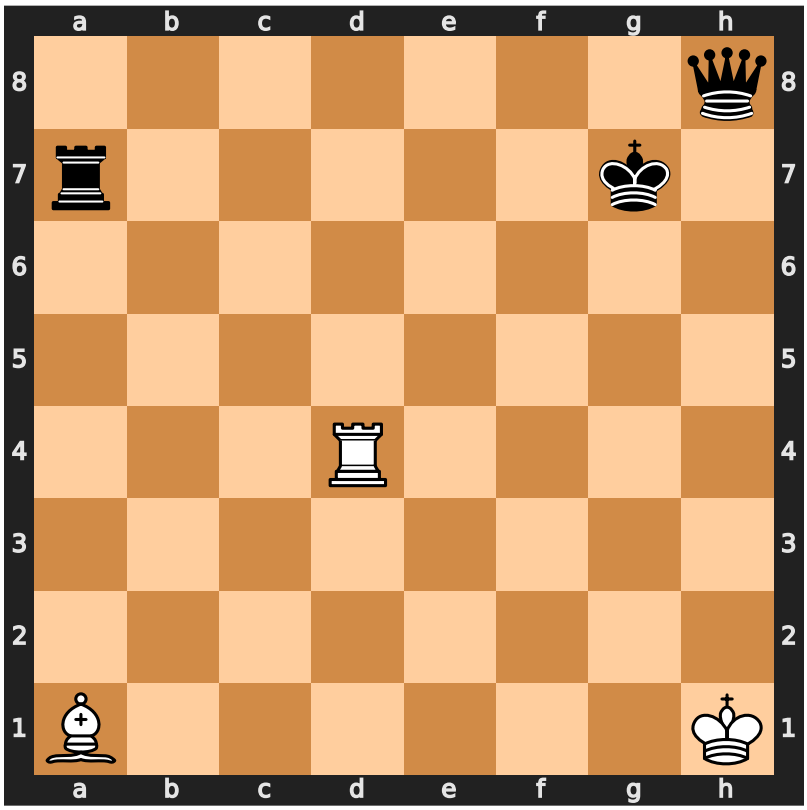

Figure 16.115: Chess Position

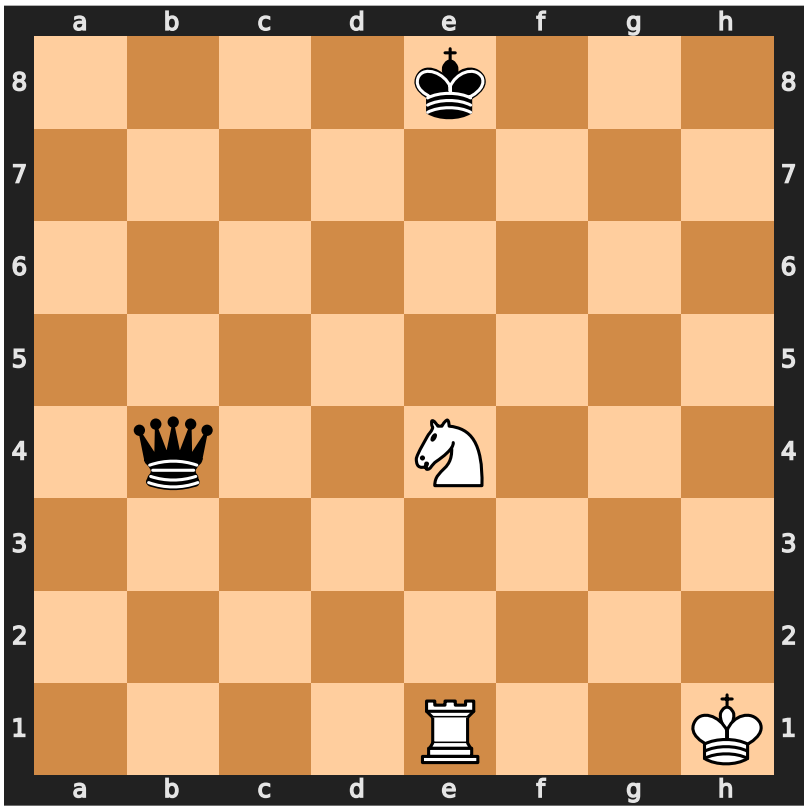

Figure 16.116: Chess Position

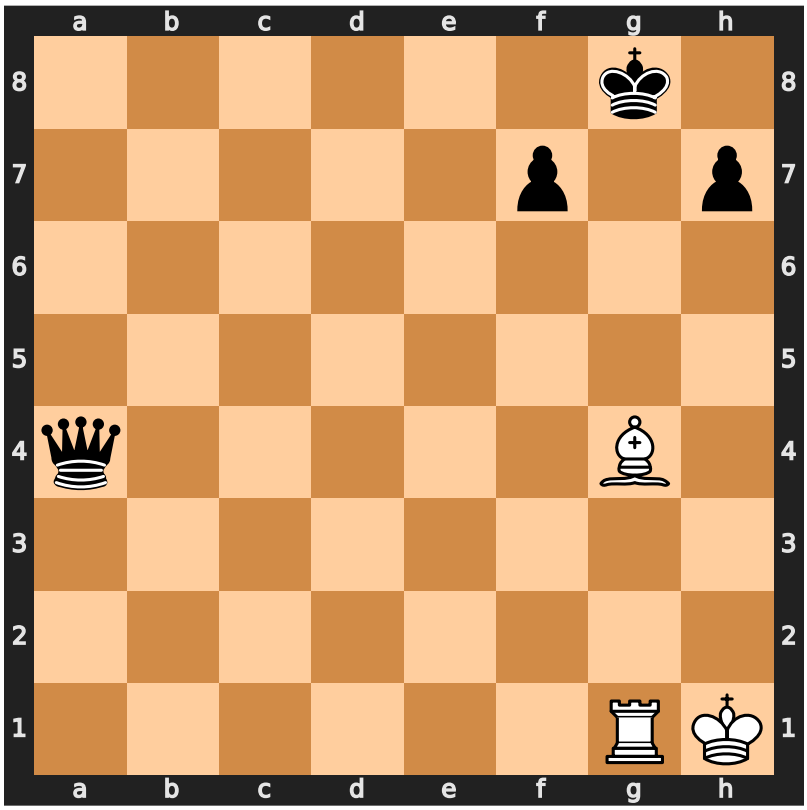

Figure 16.117: Chess Position

Task: Find the discovered attack. **Hint 1:** Rg1 blocked by Bg4. Move bishop. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Bd7+** Discovered check from the rook!

Exercise 6.109 **Position:** See hint for position.

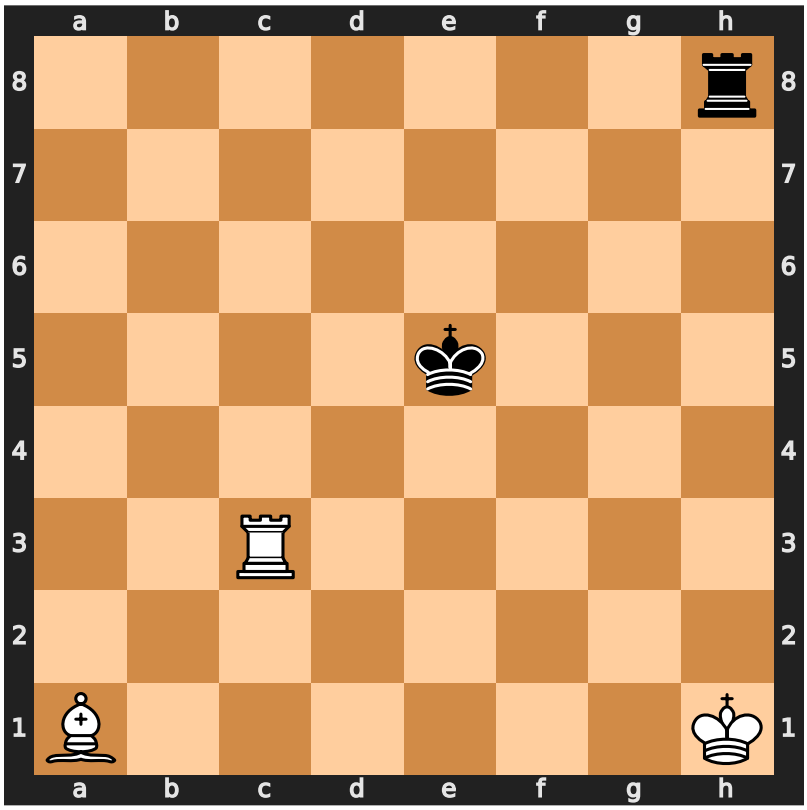

Figure 16.118: Chess Position

Task: Find the discovered attack. **Hint 1:** Ba1 through Rc3 to Ke5. Move rook. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Rc5+** Discovered check AND rook check. The king is attacked from two directions!

Exercise 6.110 **Position:** See hint for position.

Task: Find the discovered attack. **Hint 1:** Re1 through Ne5. Nd3 is close to queen. **Hint 2:** The piece behind is blocked. Move the front piece. **Hint 3:** Create a double threat if possible. **Solution: 1.Nd3+** Discovered check! The knight repositions while Black answers the rook's check.

Discovered attacks complete. Devastating when you learn to spot them.

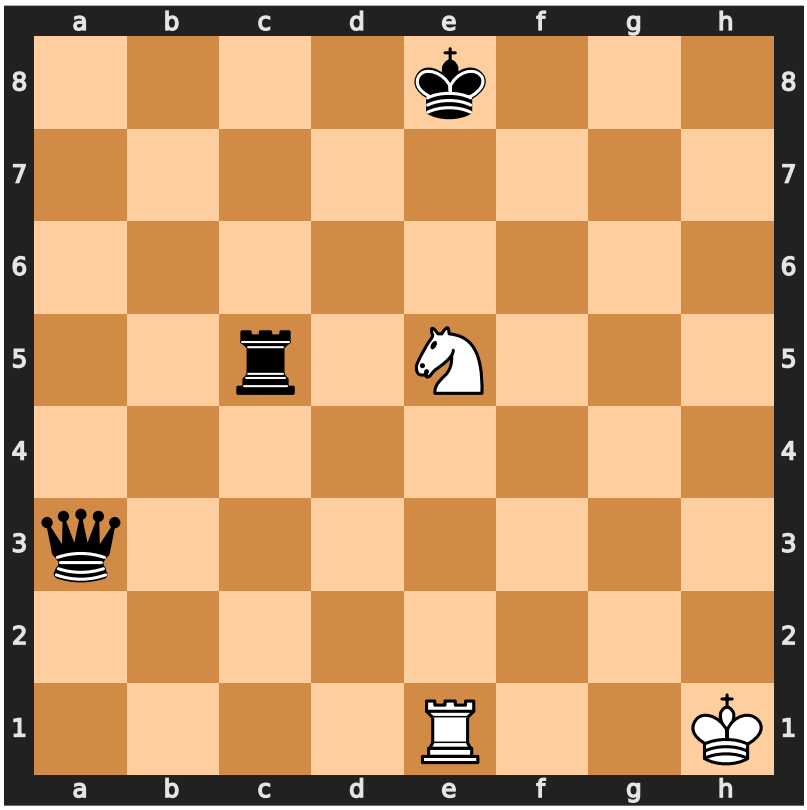

Figure 16.119: Chess Position

16.10.5 Section E: Combined Tactics (6.111–6.130)

In these exercises, **name the tactic** AND find the winning move.

Exercise 6.111 **Position:** See hint.

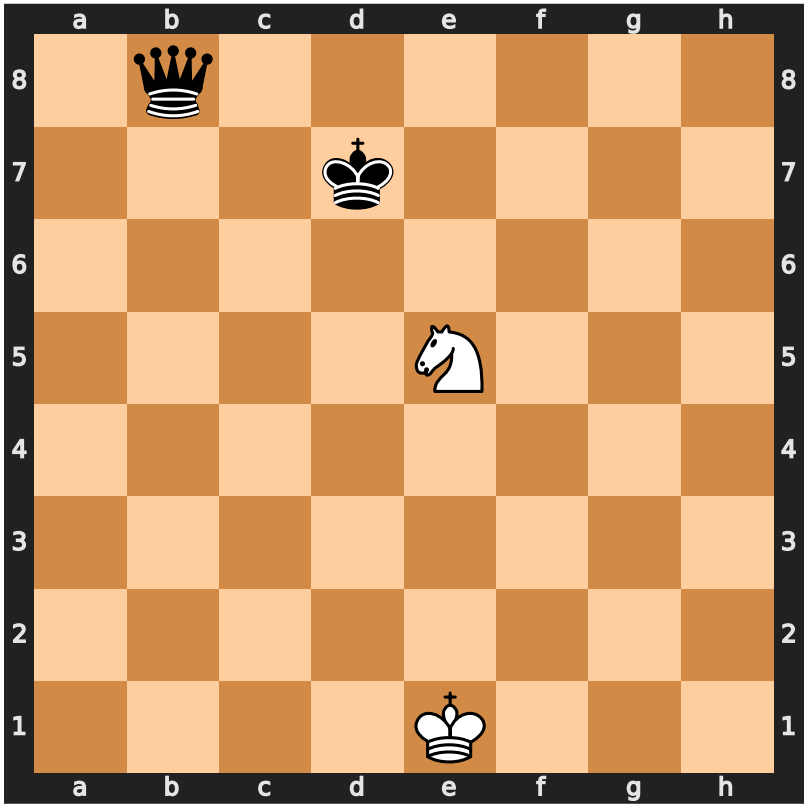

Figure 16.120: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Knight fork. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Knight fork.. 1.Nc6+** Forks king and queen.

Exercise 6.112 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pin checkmate. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pin checkmate.. 1.Rd8#** Pinned knight cannot capture!

Exercise 6.113 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Skewer. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Skewer.. 1.Ra1+** Skewer wins the queen.

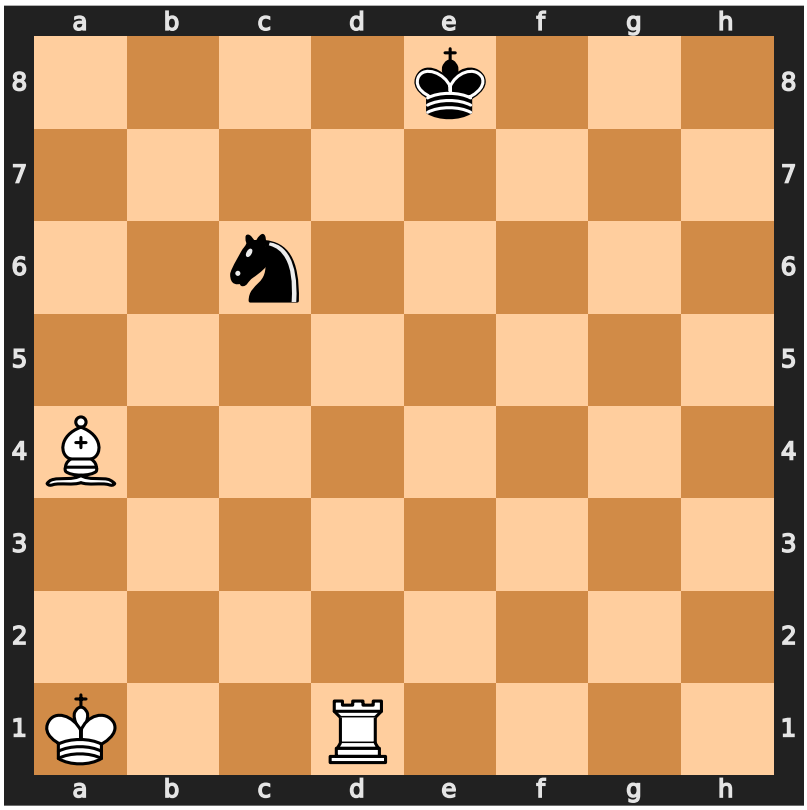

Figure 16.121: Chess Position

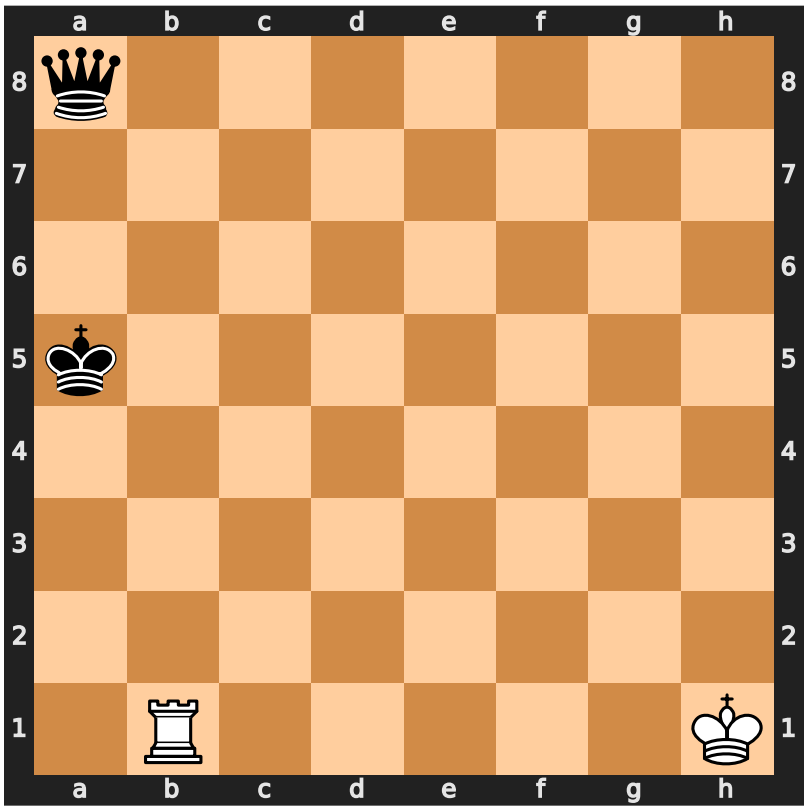

Figure 16.122: Chess Position

Exercise 6.114 **Position:** See hint.

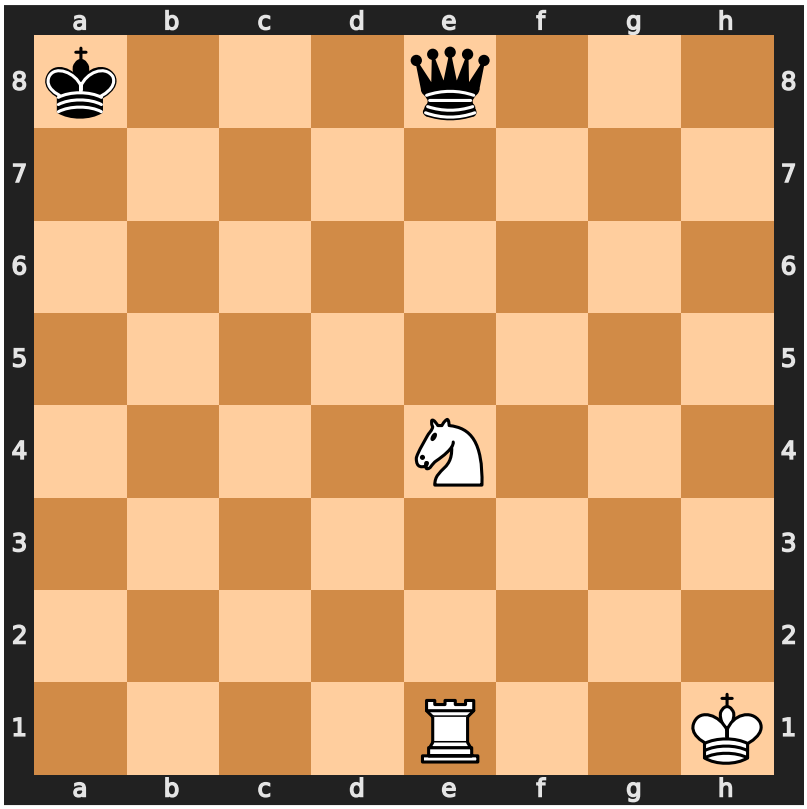

Figure 16.123: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Discovered attack. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Discovered attack.. 1.Nd6!** Rook discovers attack on the queen.

Exercise 6.115 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pawn fork. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pawn fork.. 1.d5!** Forks knight and bishop.

Exercise 6.116 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pin capture. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pin capture.. 1.Rxe5** Captures the pinned knight.

Exercise 6.117 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Skewer. **Hint 2:** Look

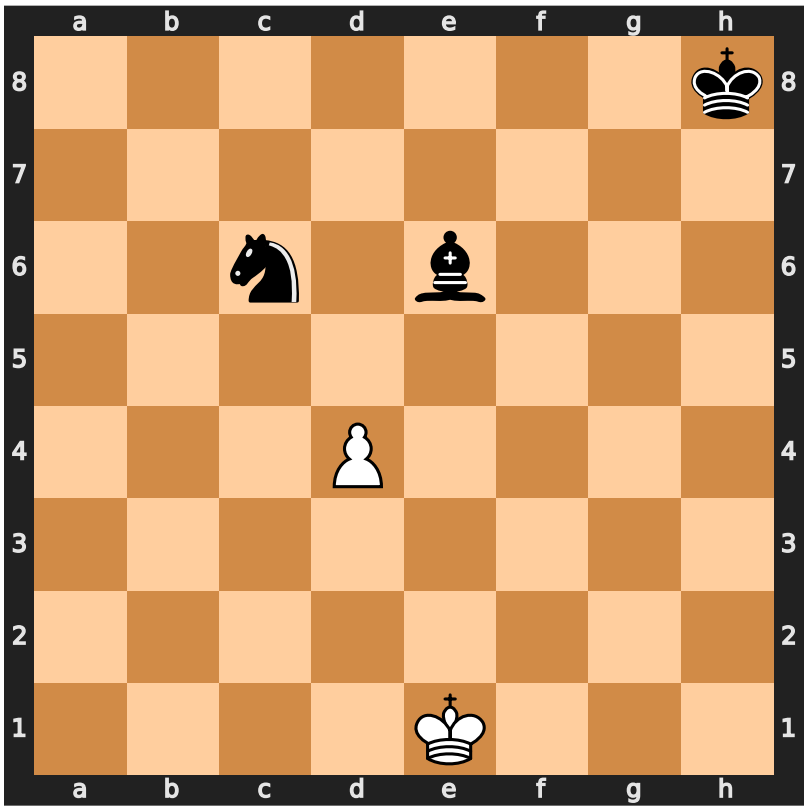

Figure 16.124: Chess Position

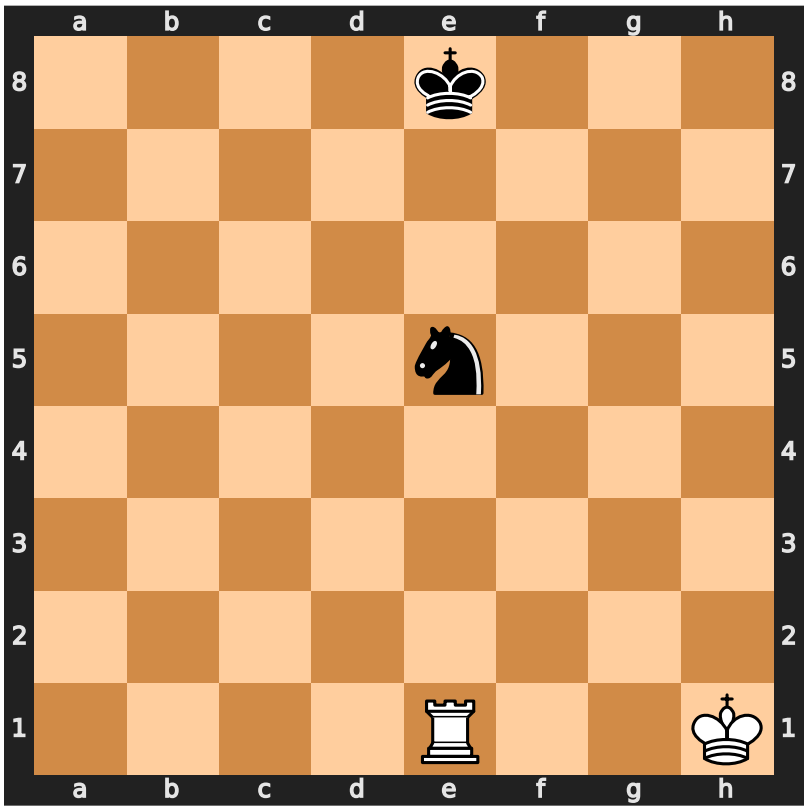

Figure 16.125: Chess Position

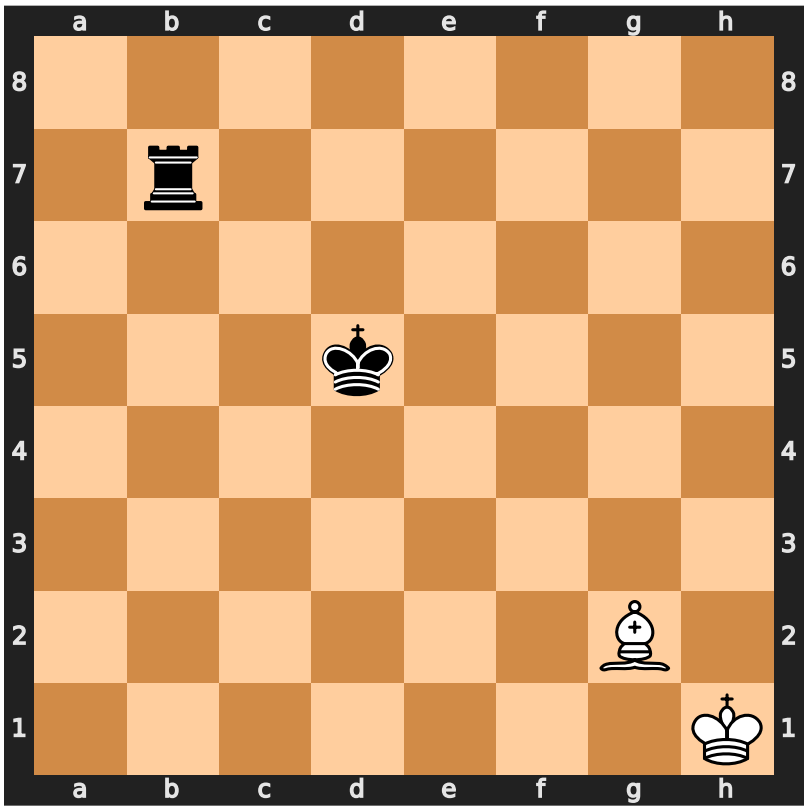

Figure 16.126: Chess Position

for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Skewer.. 1.Bf3+** Check, then Bxb7 wins the rook.

Exercise 6.118 **Position:** See hint.

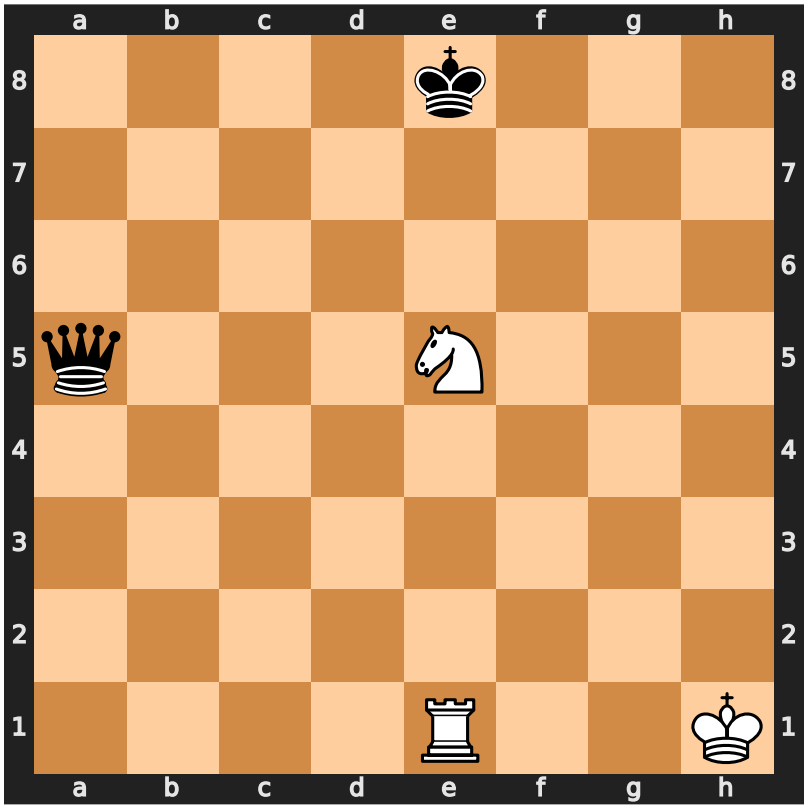

Figure 16.127: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Discovered check. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Discovered check.. 1.Nc4+** Discovered check! Knight attacks queen.

Exercise 6.119 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pin capture. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pin capture.. 1.Bxf6+** Captures the pinned knight.

Exercise 6.120 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Triple fork! **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Triple fork!. 1.Ne5+** King, queen, and rook all attacked!

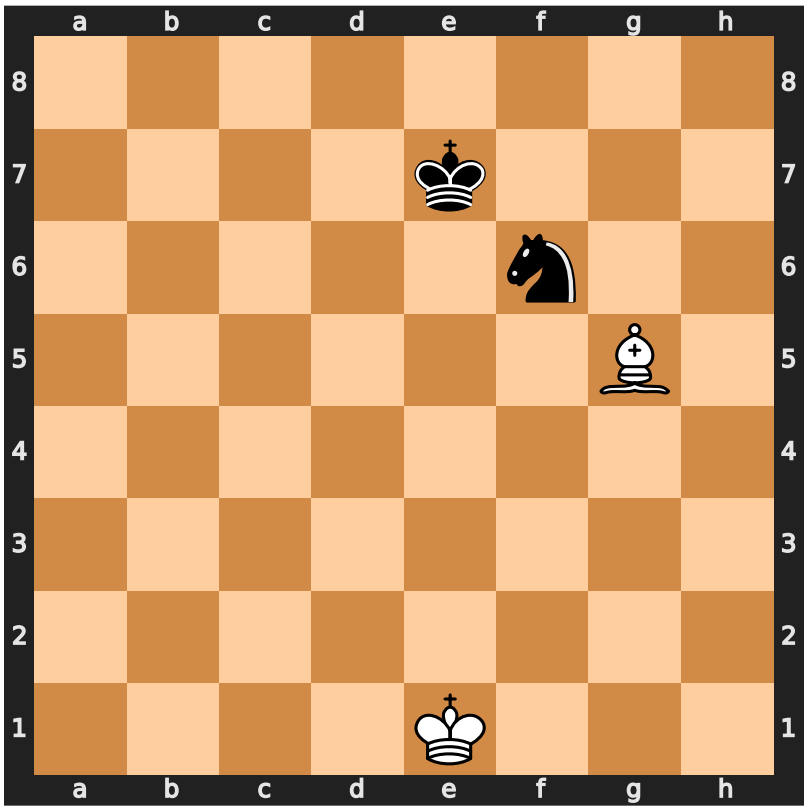

Figure 16.128: Chess Position

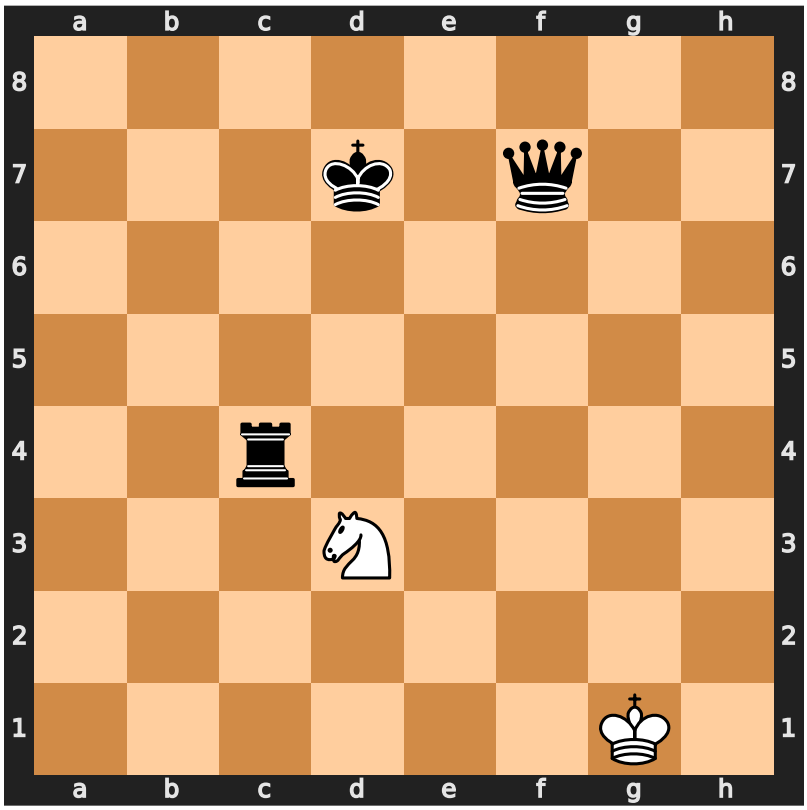

Figure 16.129: Chess Position

Exercise 6.121 **Position:** See hint.

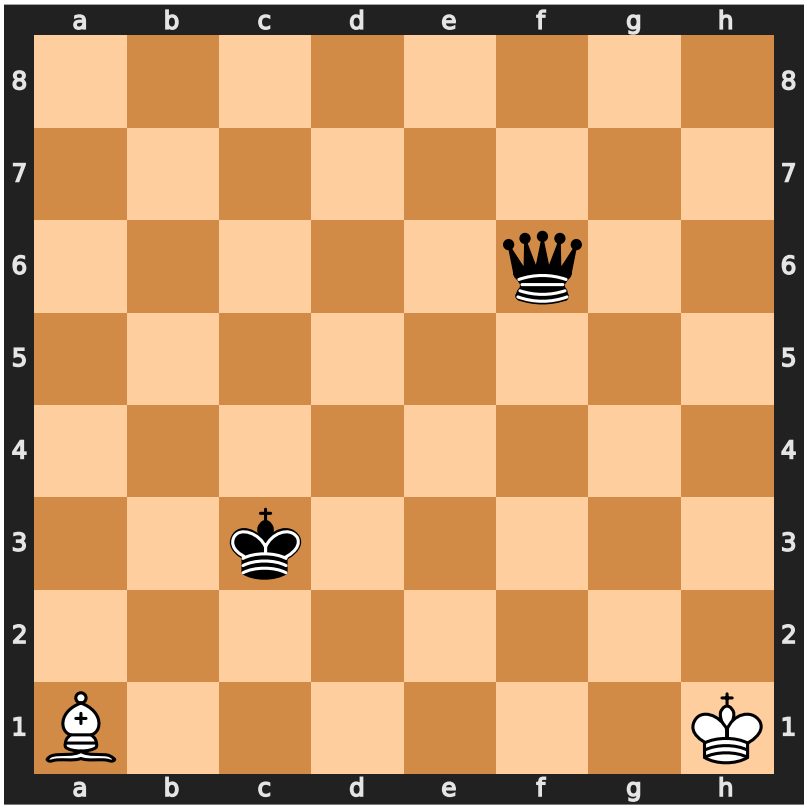

Figure 16.130: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Bishop skewer. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Bishop skewer.. 1.Bb2+** Check, then Bxf6 wins the queen.

Exercise 6.122 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Discovered check. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Discovered check.. 1.Ne4+** Bishop discovers check.

Exercise 6.123 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pin capture. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pin capture.. 1.Rxd5+** Takes the pinned bishop.

Exercise 6.124 **Position:** See hint.

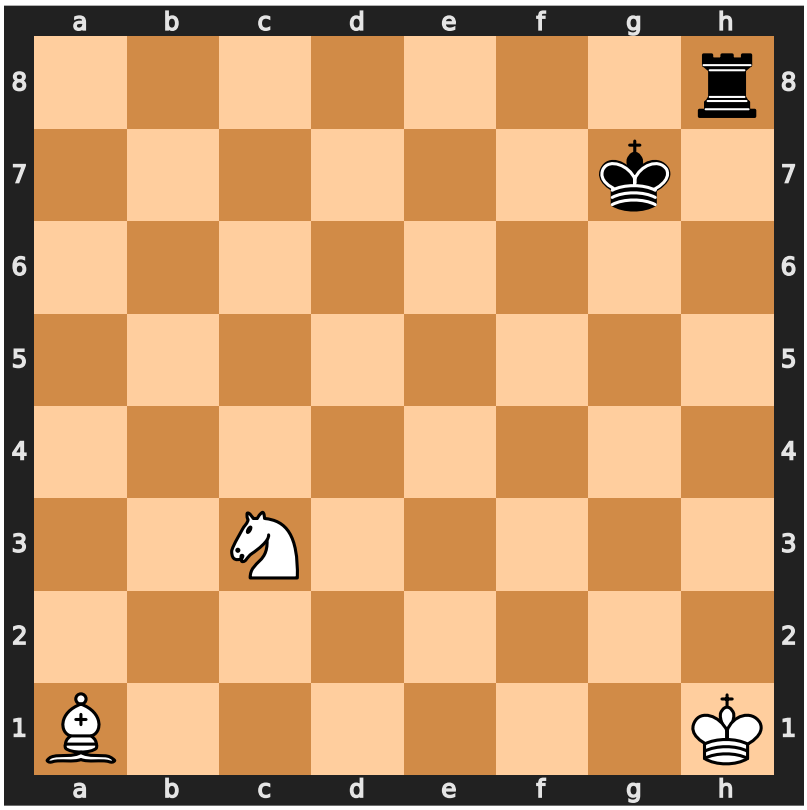

Figure 16.131: Chess Position

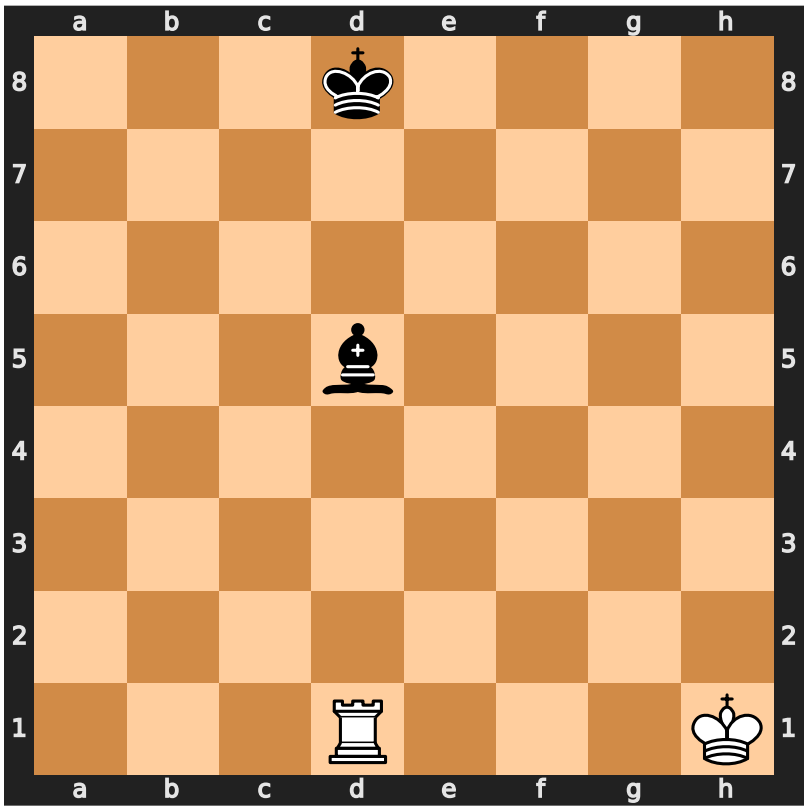

Figure 16.132: Chess Position

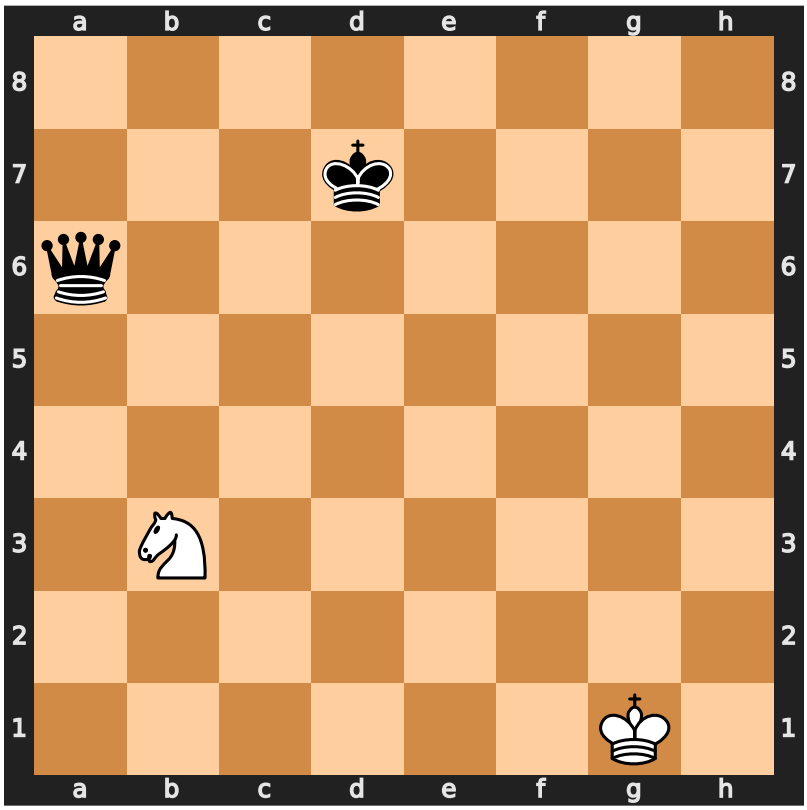

Figure 16.133: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Royal fork. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Royal fork.. 1.Nc5+** Forks king and queen.

Exercise 6.125 **Position:** See hint.

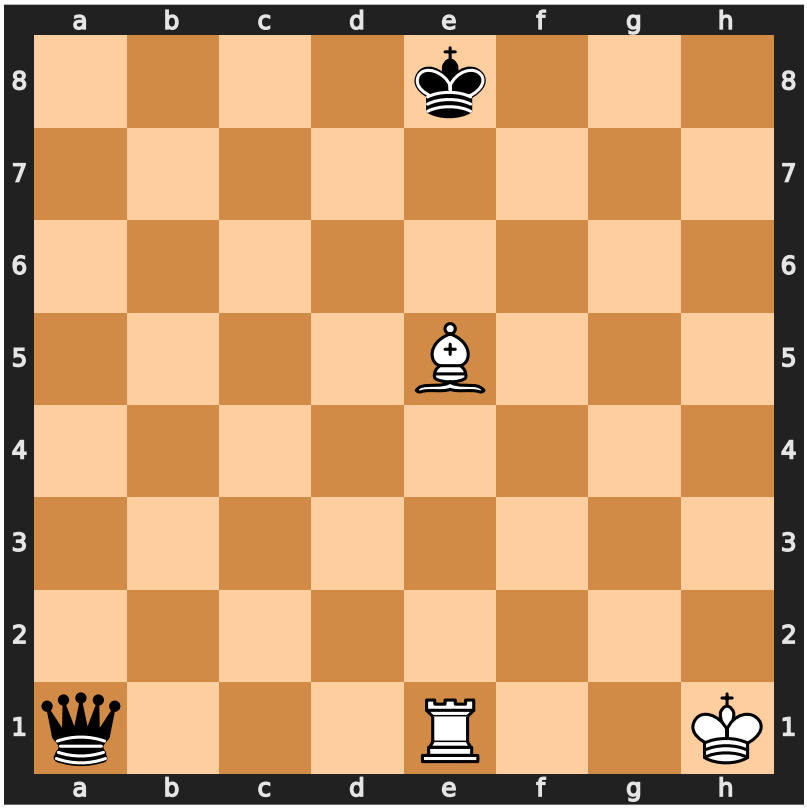

Figure 16.134: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Disc. check + queen. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Disc. check + queen.. 1.Bb2+** Discovered check! After king moves, Bxa1 wins the queen.

Exercise 6.126 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Skewer. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Skewer.. 1.Ra1+** Check, then Rxa8.

Exercise 6.127 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Queen fork. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Queen fork.. 1.Qf6+** Check, then Qxf8.

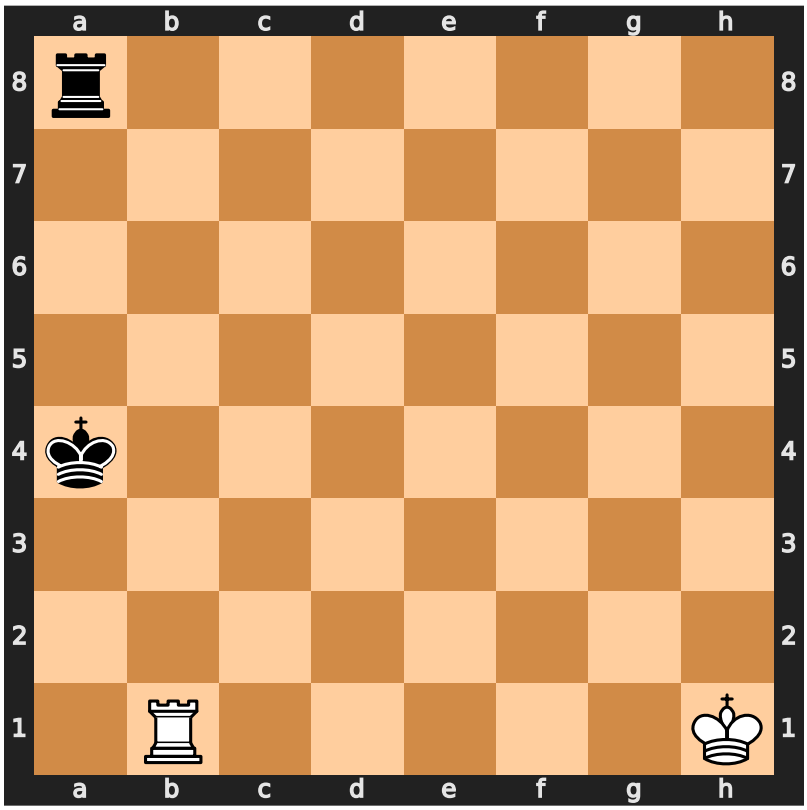

Figure 16.135: Chess Position

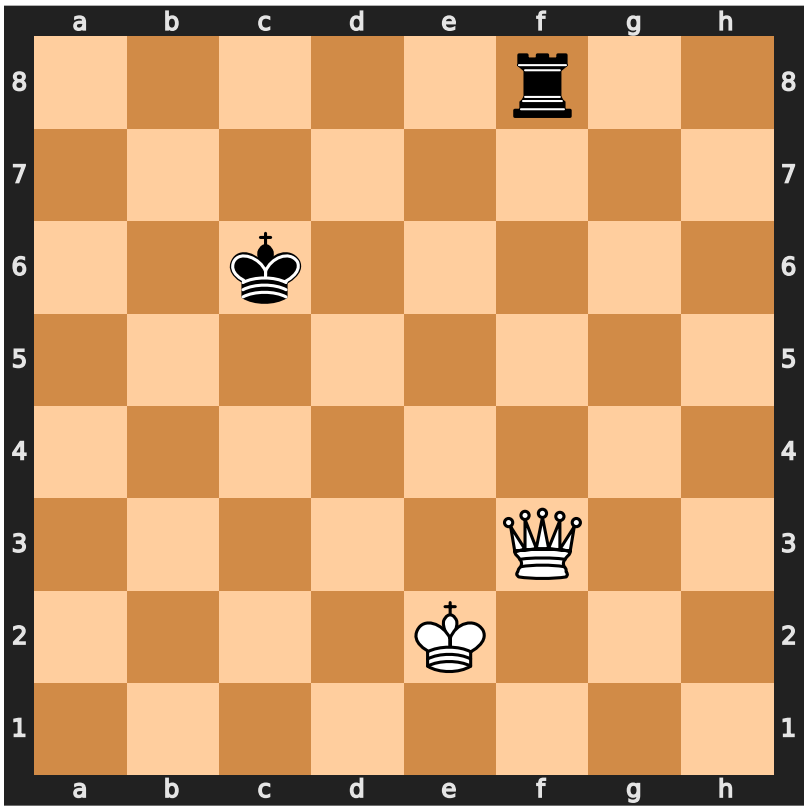

Figure 16.136: Chess Position

Exercise 6.128 **Position:** See hint.

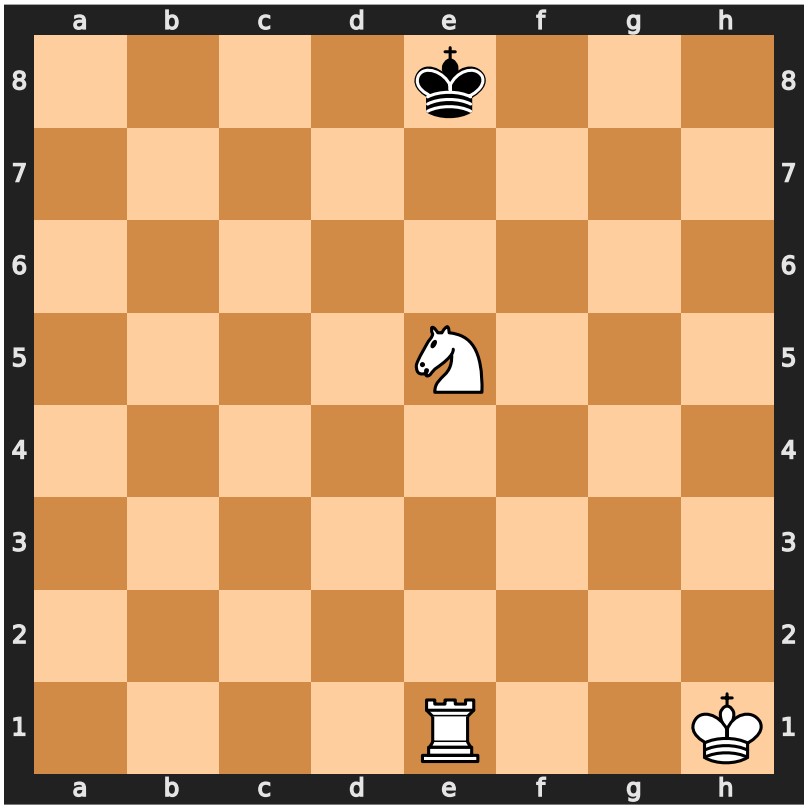

Figure 16.137: Chess Position

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Double check! **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Double check!. 1.Nd6++ Double check!** Only the king can move.

Exercise 6.129 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Pin mate. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Pin mate.. 1.Rd8#** Pinned knight cannot capture!

Exercise 6.130 **Position:** See hint.

Task: Name the tactic AND find the winning move. **Hint 1:** Tactic type: Bishop skewer. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** One move solves it. **Solution: Tactic: Bishop skewer.. 1.Bc3+** Check. After king moves, Bxg7 wins the queen.

Combined tactics complete!

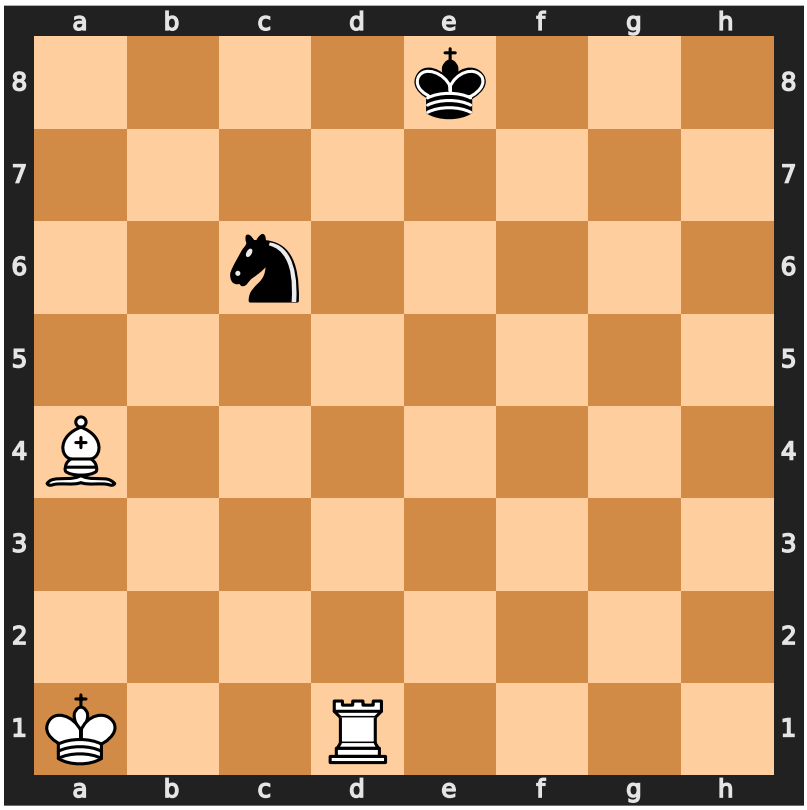

Figure 16.138: Chess Position

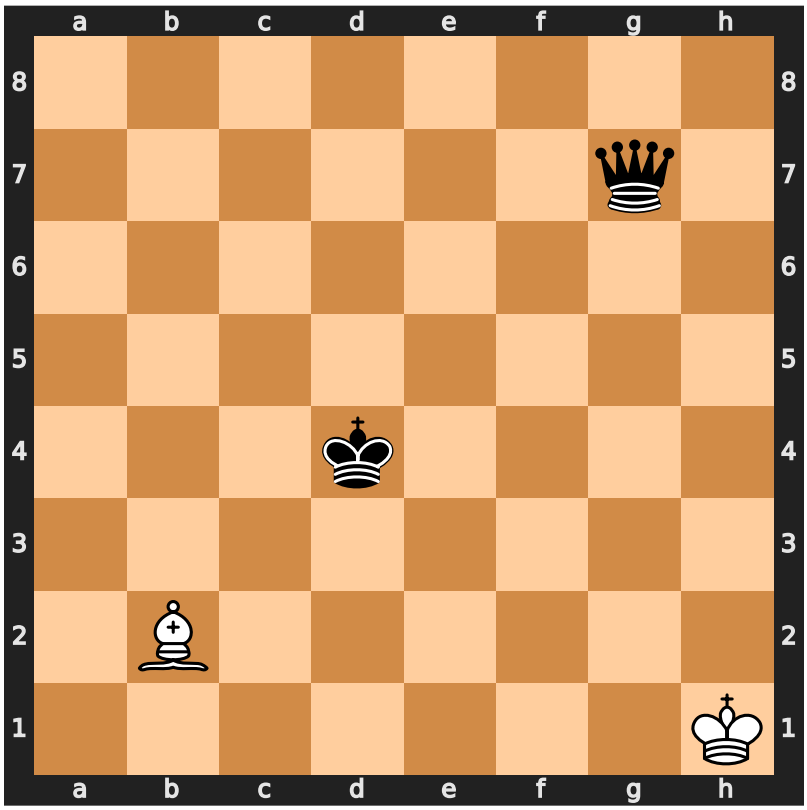

Figure 16.139: Chess Position

16.10.6 Section F: Game Position Tactics (6.131–6.140)

Positions from real games. Find the tactic.

Exercise 6.131 **Position:** Middlegame. Bg5 pins Nf6 to Qd8.

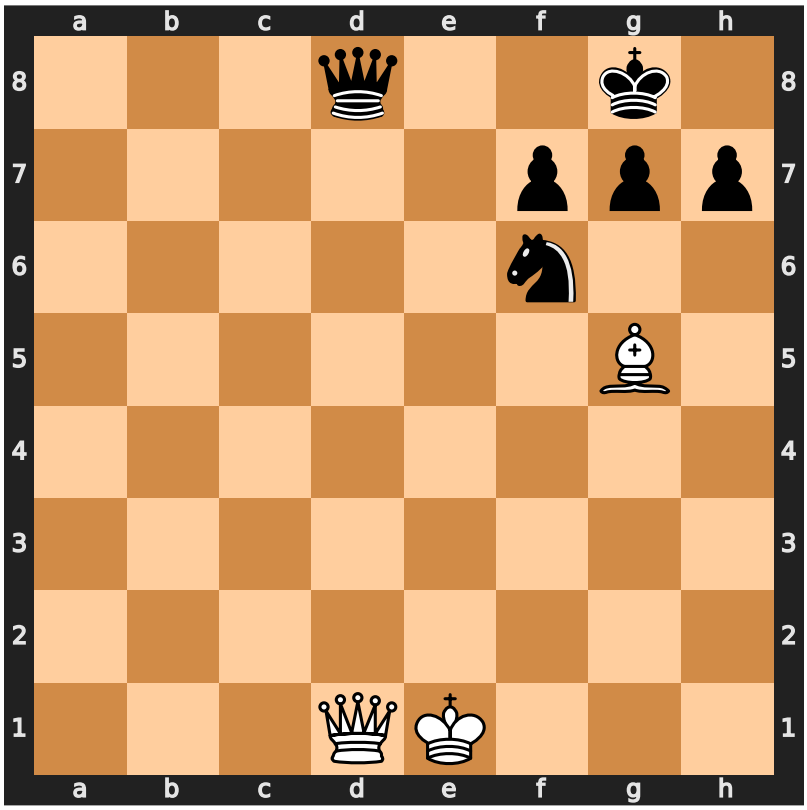

Figure 16.140: Chess Position

Task: Exploit the pin. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Bxf6!** Captures the pinned knight.

Exercise 6.132 **Position:** Knight invades f7.

Task: Find the knight fork. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nf7!** Forks queen on d8 and threatens rook.

Exercise 6.133 **Position:** Classic pattern.

Task: Knight fork with check. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nc7+** Forks king on e8 and rook on a8.

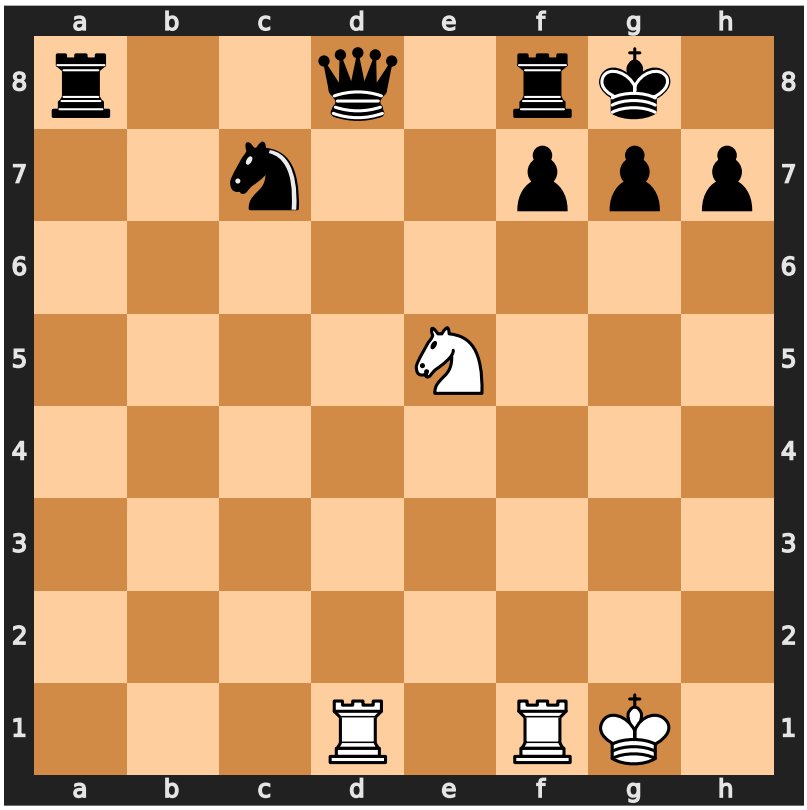

Figure 16.141: Chess Position

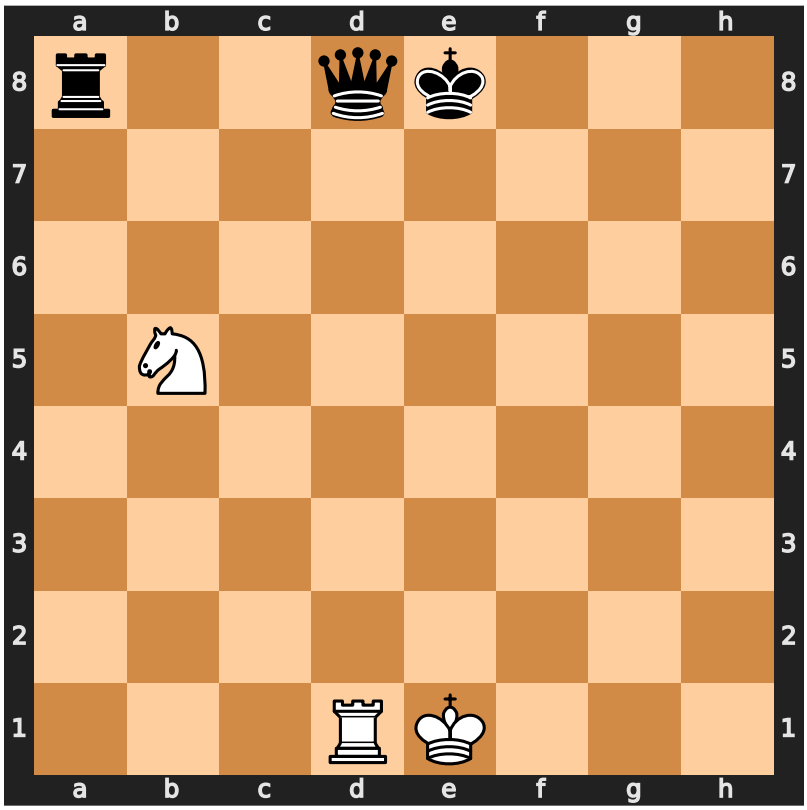

Figure 16.142: Chess Position

Exercise 6.134 **Position:** Pin on the e-file.

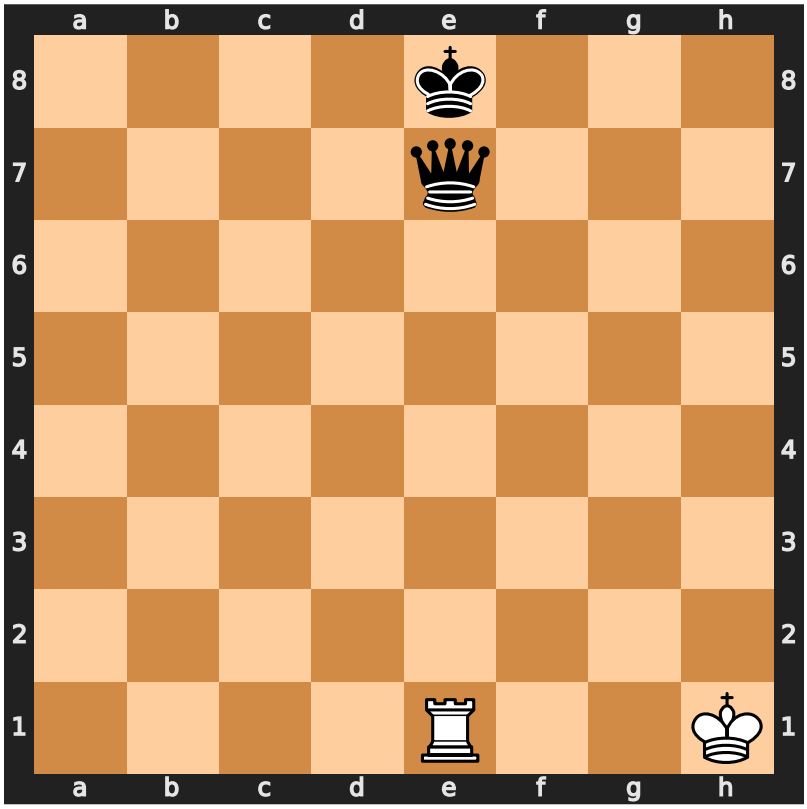

Figure 16.143: Chess Position

Task: Win the queen! **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Rxe7+** Captures the queen pinned to the king!

Exercise 6.135 **Position:** Capture + pin combination.

Task: Win the exchange. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nxe7+ Rxe7** (or Kf8) then tactics follow.

Exercise 6.136 **Position:** Sacrifice on f7!

Task: Remove the defender. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Bxf7+!** Kxf7 exposes the king. Follow-up attacks are decisive.

Exercise 6.137 **Position:** Knight check in the endgame.

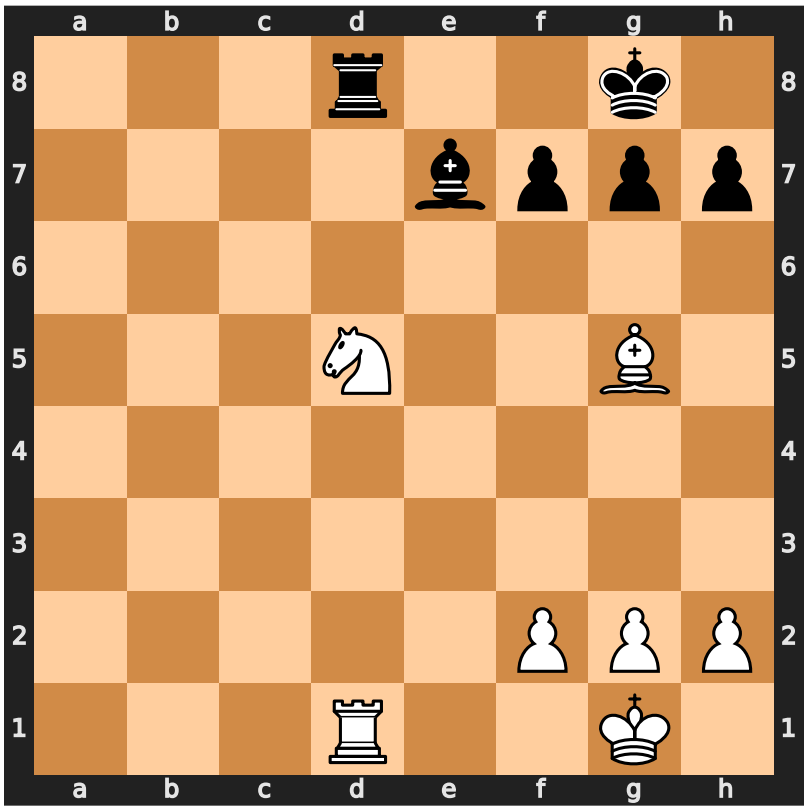

Figure 16.144: Chess Position

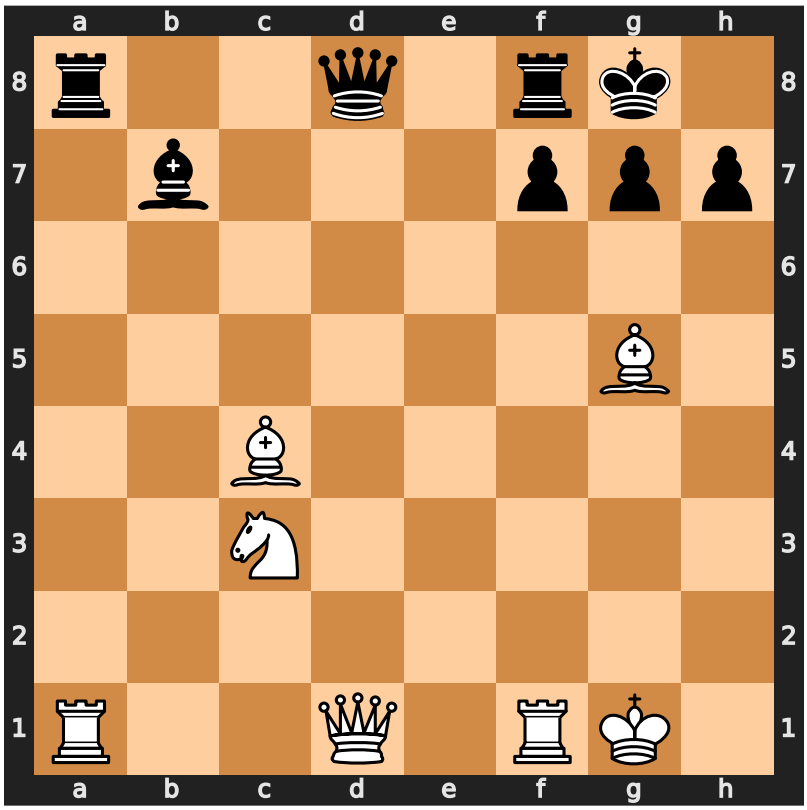

Figure 16.145: Chess Position

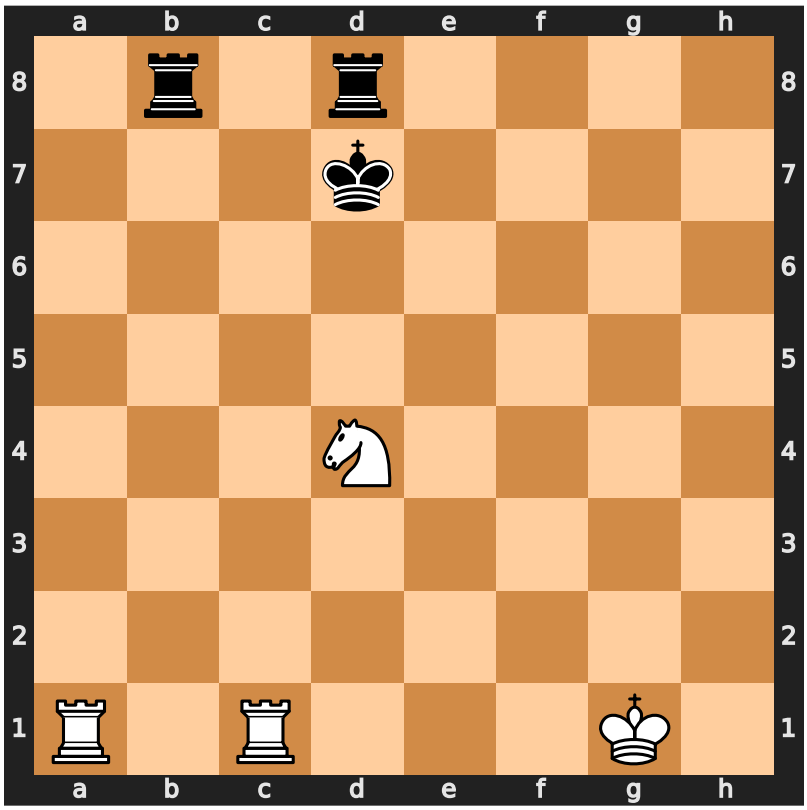

Figure 16.146: Chess Position

Task: Find the check. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nb5+** Check! The knight controls key squares.

Exercise 6.138 **Position:** Knight sacrifice!

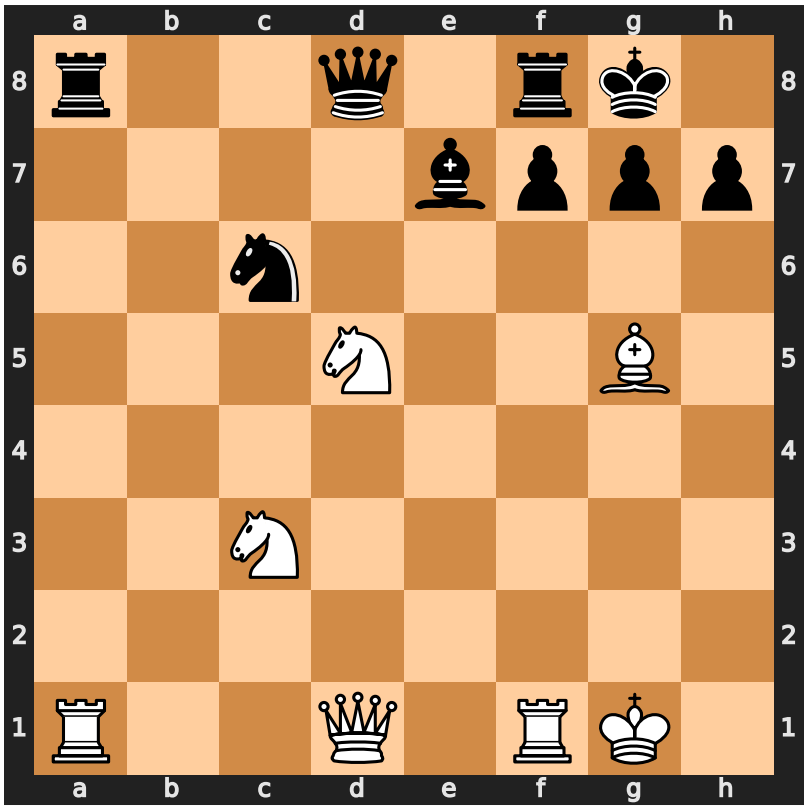

Figure 16.147: Chess Position

Task: Tactical explosion. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nf6+!** gxf6 Bxf6. Open g-file, queen attacked. Devastating.

Exercise 6.139 **Position:** Classic pin exploitation.

Task: Capture the pinned knight. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Bxf6!** Bxf6 (or exf6 or Qxf6). White wins material or damages the pawn structure.

Exercise 6.140 **Position:** Knight wreaks havoc.

Task: Find the devastating knight move. **Hint 1:** Study the position carefully. **Hint 2:** Look for checks, captures, and threats. **Hint 3:** Which tactic applies? **Solution: 1.Nd7!** Forks both rooks on d8 and f8. The knight wins the exchange at minimum.

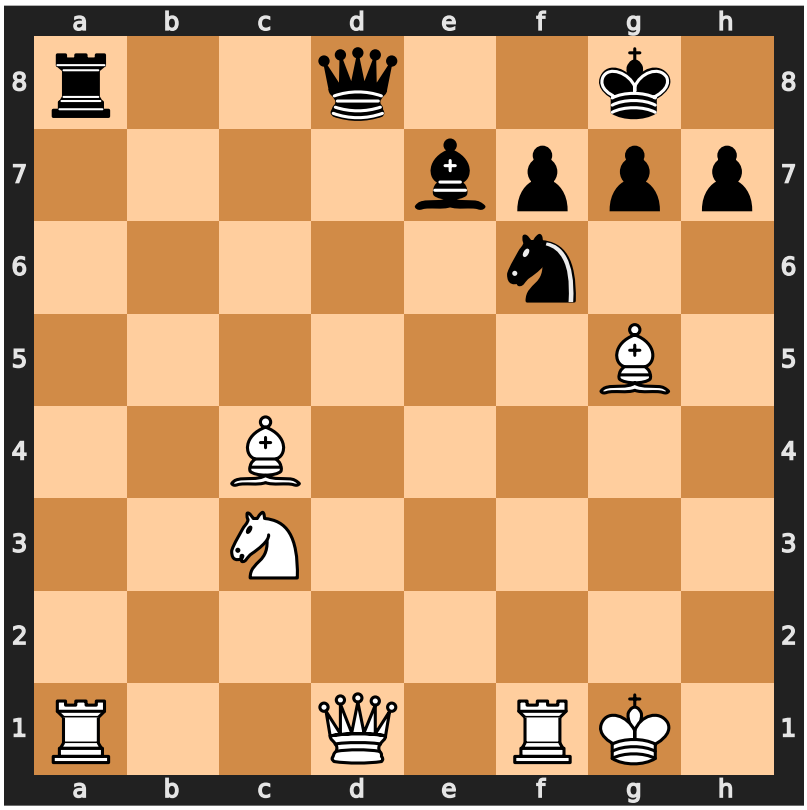

Figure 16.148: Chess Position

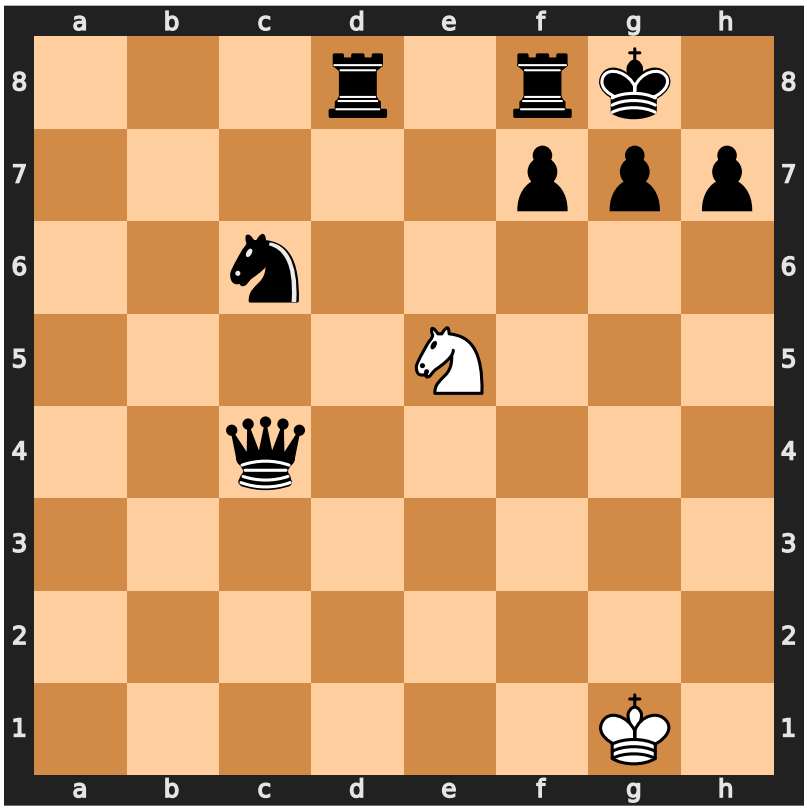

Figure 16.149: Chess Position

16.11 Key Takeaways

1. **Forks** attack two pieces at once. Knights are the best forking pieces because of their unique L-shaped movement.
2. **Pins** freeze a piece in place. Absolute pins (to the king) prevent the piece from legally moving. Exploit them by piling up attackers.
3. **Skewers** are the reverse of pins. Attack a valuable piece, force it to move, capture what is behind it.
4. **Discovered attacks** hide threats behind your own pieces. Move one piece to reveal an attack from the piece behind it. Discovered checks are devastating because the moving piece gets a "free move."
5. **Double check** is the ultimate weapon: both the moving piece and the revealed piece give check. Only the king can move.
6. **Removing the defender** and **overloading** set up every other tactic. Ask: "What is holding my opponent's position together?"
7. When you sit down at the board, always ask: "Can I create two threats with one move?"

16.12 Practice Assignment

At the board (30 minutes): 1. Set up 10 random positions. For each, ask: "Is there a fork, pin, or skewer here?" 2. Play through all 5 annotated games one more time. At each critical moment, cover the next move and try to find it yourself.

Online (30 minutes): 1. Go to **lichess.org/training** and select "Fork" as the theme. Solve 20 puzzles. 2. Switch to "Pin" and solve 20 more. 3. Try "Skewer" for 10 puzzles.

In your games (ongoing): 1. After every game, review for moments where a fork, pin, or skewer was possible (by either side). Write down any you missed. 2. Train yourself to ask "Can I fork anything?" on every move. Make this a habit.

16.13 Progress Check

If you can confidently: - Spot knight forks within 10 seconds - Identify absolute vs. relative pins - Recognize when pieces line up for a skewer - See discovered attack setups before they happen

…then you are ready for Chapter 7. Your tactical vision is developing. You are no longer a true beginner.

Estimated rating after mastering this chapter: 600–800

This is the end of the longest chapter in Volume I. You earned a real break. Go do something that is not chess. Take a walk. Listen to music. Sleep on it. When you come back, Chapter 7 will teach you opening principles and give you a system for the first moves. Well done.

Chapter 6 complete. 7 tactical patterns learned. 140 exercises solved. 5 master games studied. You are building something real.

Chapter 17

Chapter 7: Opening Principles — Development, Center, King Safety

Rating Range: Beginner (500–900)

"Help your pieces so that they can help you." — Paul Morphy

17.1 What You'll Learn

- The **Three Golden Rules** of the opening: develop your pieces, control the center, and castle your king to safety
- Why **tempo** matters and how wasting moves in the opening puts you behind
- How the great Paul Morphy crushed opponents by following these simple principles better than anyone else
- The most common **opening mistakes** beginners make (and how to avoid every one of them)
- How to recognize when the opening is over and the middlegame has begun

Welcome to the chapter where chess starts making SENSE.

Up to now, you have learned how the pieces move, how to deliver checkmate, how to count material, and how to spot basic tactics. All of that matters. But now we answer the big question that every new player asks: **"What do I do at the start of the game?"**

The answer is simpler than you think. Three rules. That is all. Follow them, and you will have a solid position out of the opening in every single game. Break them, and your opponent will punish you.

Let's get started.

17.2 Part 1: The Three Golden Rules of the Opening

Every chess opening, from the simplest to the most complex, follows the same three principles. Grandmasters follow them. Club players follow them. And from this chapter forward, you will follow them too.

Rule 1: DEVELOP your pieces. Get them off the back rank and into the action.

Rule 2: CONTROL THE CENTER. The squares d4, d5, e4, and e5 are the most important squares on the board.

Rule 3: GET YOUR KING TO SAFETY. Castle early.

That is the entire opening, distilled into three sentences. Everything else is detail. Let's explore each rule in depth.

Before we begin: these rules are not suggestions. They are laws. Break them only when you have a specific, concrete reason. Until you reach a rating of 1200 or higher, treat them as absolute.

17.3 Part 2: Development — Get Your Pieces Into the Fight

17.3.1 What Is Development?

"Development" means moving your pieces from their starting squares to active squares where they control territory, attack the opponent, and defend your own position. A piece sitting on its starting square is doing nothing. It is asleep. Your job in the opening is to wake up your army.

Think of it this way. At the start of the game, you have an army of 16 pieces, but most of them are trapped behind a wall of pawns. Your knights, bishops, rooks, and queen are all stuck. They cannot see the board. They cannot attack anything. They cannot defend anything.

Your first job is to open the door (by moving a pawn or two) and march your pieces out to strong squares. Every piece you develop is one more soldier on the battlefield. Every piece your opponent leaves at home is one less soldier defending their king.

17.3.2 The Development Count

Here is a simple way to measure who is winning the opening: **count the developed pieces.**

A piece is "developed" if it has moved from its starting square to an active square. Pawns do not count (they open lines for your pieces, but they are not "pieces" in this context). Knights, bishops, rooks, and queens count.

If you have four pieces developed and your opponent has one, you have a massive advantage. You have a four-to-one lead in development. That means you can attack with four pieces while your opponent defends with one. The math is in your favor.

Set up your board: Place White pieces in this position: king on g1 (castled), rook on f1, knight on f3, knight on c3, bishop on c4, bishop on e3, queen on d2, rook on d1, pawns on a2, b2, c2, e4, f2, g2, h2. Place Black pieces in the starting position with only the pawn on e5 moved.

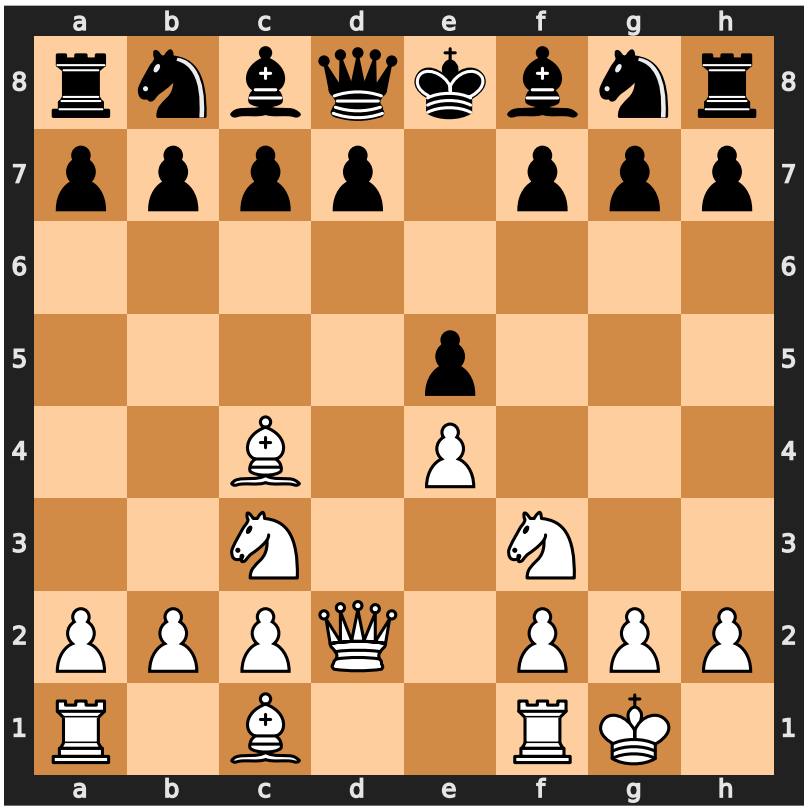

Figure 17.1: Chess Position

Look at this position. White has developed both knights, both bishops, the queen, and has castled. That is five pieces in the game and a safe king. Black has moved one pawn. Black is in serious trouble. White can launch an attack with five pieces against zero defenders.

This is what a **development lead** looks like. It is one of the most powerful advantages in chess.

17.3.3 Knights Before Bishops (Usually)

When you start developing, bring your knights out first. Why?

Knights are slow. A knight takes several moves to cross the board. A bishop can fly from one corner to the other in a single move. So get the slow pieces moving first.

Knights have obvious best squares. For White, the knights almost always go to f3 and c3. For Black, they go to f6 and c6. You rarely have to think about where to put your knights. The answer is almost always the same.

Bishops need more information. A bishop's best square depends on where the pawns are and what your opponent does. Sometimes the bishop belongs on c4. Sometimes it belongs on b5. Sometimes it belongs on e2 or even on b2 after a fianchetto. You often need to see a few moves of the game before you know where the bishop should go.

So the general rule is: **knights first, then bishops.** Get your knights to f3 and c3 (or f6 and c6 for Black), then decide where your bishops belong.

Set up your board: White pieces: king on e1, queen on d1, rooks on a1 and h1, bishops on c1 and f1, knights on f3 and c3, pawns on a2, b2, c2, d4, e4, f2, g2, h2. Black pieces: starting position with pawns on d5 and e6.

White has developed both knights to their best squares. Now White can see what Black does before choosing where to put the bishops. This is efficient, flexible development.

17.3.4 Don't Move the Same Piece Twice

Every move in the opening is precious. Each move is a unit of time called a **tempo**. If you move the same piece twice, you have spent two tempi on one piece while your opponent developed two different pieces. You fell behind.

Of course, sometimes you MUST move a piece twice. If your opponent attacks your bishop, you might need to retreat it. If a capture forces your knight to a new square, that is fine. The rule is: **do not move the same piece twice unless you are forced to or unless you gain something concrete** (like winning material or giving a strong check).

Here is what happens when you break this rule:

Set up your board: Imagine White plays: 1.e4 e5 2.Nf3 Nc6 3.Bc4 Bc5 4.Bb5?! This looks reasonable, but White just moved the bishop twice (c4 then b5) while Black developed two pieces. White is now behind in development because of the wasted tempo.

The best players move each piece once to its ideal square and then move on to the next piece.

17.3.5 Don't Bring the Queen Out Too Early

This is one of the most important rules for beginners, and one of the most commonly broken.

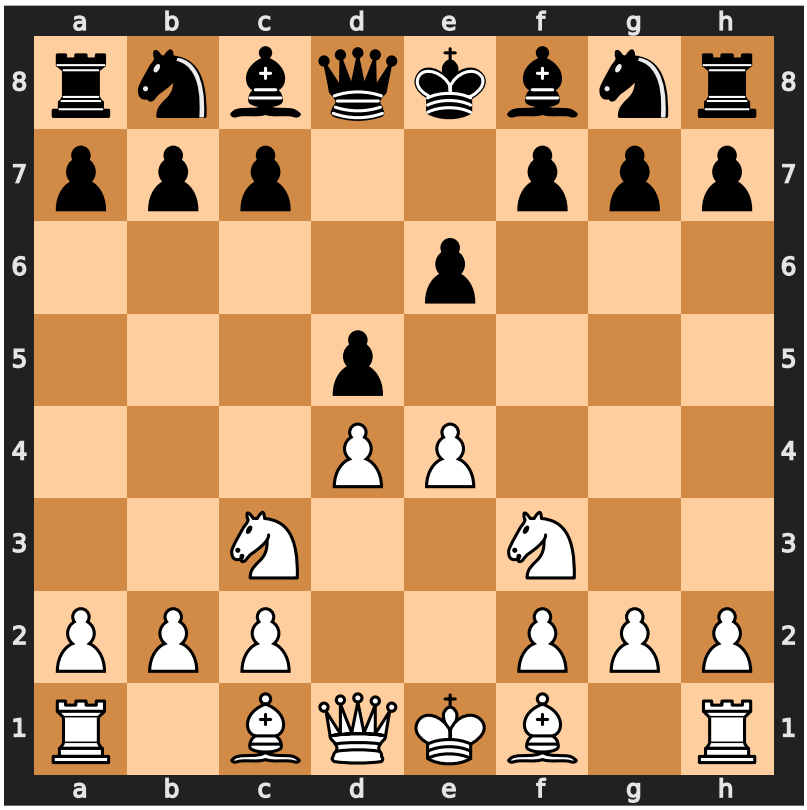

Figure 17.2: Chess Position

The queen is your most powerful piece. She is worth 9 points. She can move in any direction. She is amazing. And that is exactly why you should NOT bring her out early.

Why? Because your opponent will chase her around.

Every time your opponent develops a piece with a threat to your queen, two things happen: they develop a piece (good for them) and you waste a move running away with the queen (bad for you). Your opponent gets free development at your expense.

Set up your board: Watch this disaster unfold. White plays: 1.e4 e5 2.Qh5?! (bringing the queen out on move 2). Now Black plays 2…Nc6 (developing and defending). White plays 3.Bc4 (threatening mate on f7). Black plays 3…g6! (chasing the queen). White must retreat: 4.Qf3. Black plays 4…Nf6! (developing and attacking the e4 pawn). White plays 5.Qb3. Black plays 5…Nd4! Now the queen is being attacked again.

FEN after 5...Nd4: `r1b1kb1r/pppp1p1p/5np1/4p3/2BnP3/1Q6/PPPP1PPP/RNB1K1NR w KQkq - 0 1`

White has moved the queen THREE times and has only two pieces developed (queen and bishop). Black has moved the queen ZERO times and has three pieces developed (two knights and the g6 pawn opened the diagonal for the bishop). Black is ahead in development because White wasted time with the queen.

The lesson: Develop minor pieces (knights and bishops) first. The queen comes out later, usually after you have castled and connected your rooks.

17.3.6 Tempo: The Currency of the Opening

Every move is a tempo. A tempo is a unit of time. In the opening, time is everything.

When you develop a piece, you spend one tempo. When your opponent develops a piece, they spend one tempo. If you waste a tempo (by moving a piece twice, retreating unnecessarily, or making a pointless pawn move), your opponent gains a tempo of advantage.

Three wasted tempi in the opening is like playing the game with one fewer piece. Your opponent will have three extra pieces in the fight, and you will be scrambling to catch up.

Here is how Morphy thought about it: every tempo is a chance to bring a new piece to a strong square. If you spend 8 tempi and develop 8 pieces (including castling), while your opponent spends 8 tempi and develops 4 pieces (because they moved some pieces twice), you have a 4-piece development lead. That is enough to launch a winning attack.

17.3.7 How Morphy Exploited Development Leads

Paul Morphy was an American chess genius who played in the 1850s and 1860s. He understood development better than anyone in his era. His secret was simple: develop every piece to its best square as fast as possible, and then attack before the opponent has time to catch up.

Morphy did not play tricky openings. He did not try to surprise his opponents with unusual moves. He just developed his pieces, castled, connected his rooks, and then launched a devastating attack with his fully mobilized army against his opponent's half-developed forces.

We will study his most famous game (the Opera Game) in the annotated games section. For now, remember this: **Morphy won most of his games not because he was a better calculator or**

a deeper thinker, but because he understood that getting pieces out fast is the single most important goal of the opening.

That understanding is available to you right now. Follow the Three Golden Rules, and you are playing the opening the way Morphy did.

Good stopping point. You now understand development, tempo, and why the queen stays home. Take a five-minute break. Stretch. Then come back for center control.

17.4 Part 3: Center Control — Where the Battle Begins

17.4.1 Why the Center Matters

Look at your chessboard. Find the four squares in the middle: **e4, d4, e5, d5.** These four squares are the most important territory on the board. Whoever controls them controls the game.

Why? Because pieces in the center can reach more squares.

Set up your board: Place a White knight on e4. Count how many squares it can move to. The answer is 8. A knight in the center controls the maximum number of squares.

Now move that knight to a1 (the corner). Count again. The answer is 2. A knight in the corner controls almost nothing.

FEN (knight on e4): `8/8/8/8/4N3/8/8/4K2k w - - 0 1` **FEN (knight on a1):** `8/8/8/8/8/8/8/N3K2k w - - 0 1`

The difference is dramatic. A centralized piece is four times more powerful than a piece stuck on the edge. This is true for every piece, not just knights.

There is a classic chess saying: **"A knight on the rim is dim."** It means a knight on the edge of the board (the a-file or h-file) is weak because it controls so few squares. Keep your pieces in the center where they shine.

17.4.2 Occupying vs. Controlling the Center

There are two ways to fight for the center:

Occupying the center means placing your pawns on e4 and d4 (or e5 and d5 for Black). This is the classical approach. You plant pawns in the middle and say, "This territory is mine."

Set up your board: White pawns on e4 and d4. These pawns control four squares in Black's territory: c5, d5, e5, and f5. That is a wall of influence pushing into Black's half of the board.

Controlling the center means using pieces (especially knights and bishops) to influence the center squares without placing pawns there. This is the hypermodern approach, developed in the 1920s by players like Nimzowitsch, Reti, and Alekhine.

For example, a bishop on g2 (after the moves g3 and Bg2) does not occupy the center, but it controls the long diagonal and stares right through d5 and e4. A knight on f3 controls d4 and e5 without occupying them.

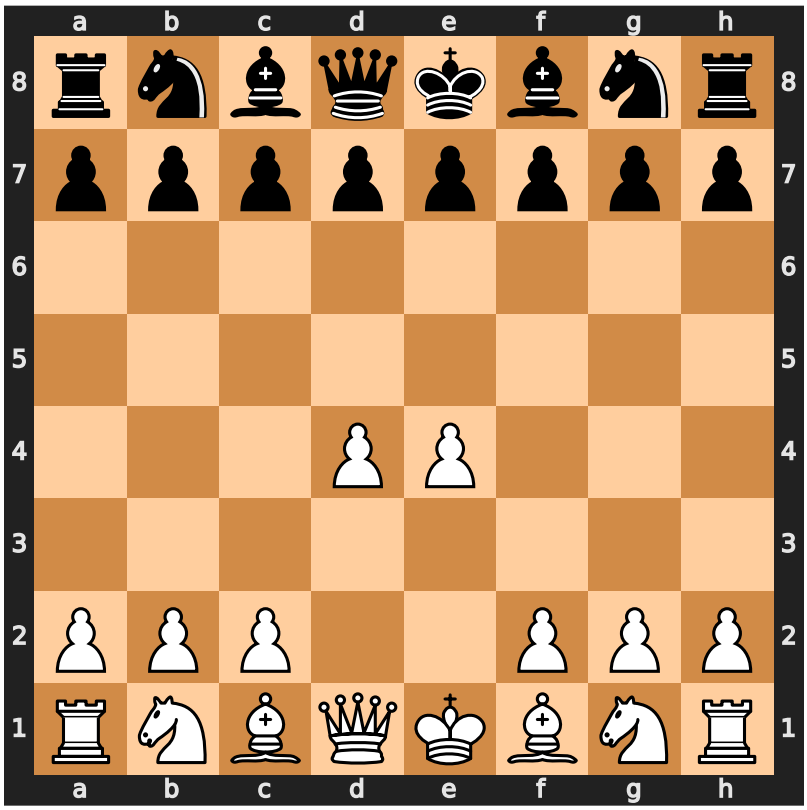

Figure 17.3: Chess Position

At the beginner level, the classical approach is better. Put your pawns on e4 and d4 when you can. It is simpler, more direct, and gives your pieces clear squares to develop to. As you improve, you will learn when the hypermodern approach is stronger. For now, occupy the center with pawns.

17.4.3 The Power of Central Pieces

Pieces in the center are stronger than pieces on the edges. We showed this with the knight, but it applies to all pieces.

Set up your board: Place a White bishop on d4. It controls 13 squares along two diagonals. Now move it to h1. It controls only 7 squares along one diagonal.

A queen in the center is a monster. A rook in the center (especially on an open file) can dominate the board. Even a king in the endgame wants to march to the center.

The takeaway: After you develop your pieces, try to place them on central squares (or squares that influence the center). A knight on e5 is almost always stronger than a knight on a3. A bishop on d3 aiming at the kingside is stronger than a bishop on b1 doing nothing.

17.4.4 How to Fight for the Center

Here is your practical guide to center control in the first few moves:

As White: 1. Play **1.e4** (or 1.d4). Both moves occupy the center with a pawn. 2. If you played 1.e4, consider playing **d4** soon (or at least d3 to support e4). 3. Develop knights to f3 and c3, where they support your center pawns. 4. Develop bishops to active squares that influence the center.

As Black: 1. After 1.e4, play **1...e5** (the most direct response, fighting for the center immediately). 2. After 1.d4, play **1...d5** (same idea). 3. Develop knights to f6 and c6 to pressure White's center. 4. Look for chances to challenge the center with …d5 or …e5.

Set up your board: A typical position after 1.e4 e5 2.Nf3 Nc6 3.Bc4 Bc5. Both sides have developed two pieces and fought for the center. This is what a healthy opening looks like.

Both sides followed the rules. Both sides are developing. Both sides are fighting for the center. This is a fair, balanced position where the better player will win through tactics and strategy in the middlegame.

17.4.5 Compare: Centralized vs. Edge Pieces

Set up your board: Position A: White knight on e5, White bishop on d3, White pawns on d4 and e4. Position B: White knight on a3, White bishop on a2, White pawns on a4 and h4.

Which army would you rather command? Position A, obviously. Those pieces in the center control the board. The pieces in Position B are on the rim, far from the action, controlling almost nothing. Edge pieces are dim. Central pieces are dominant.

You now understand why the center matters. Take a break if you need one. King safety is next, and it is the rule that will save your games.

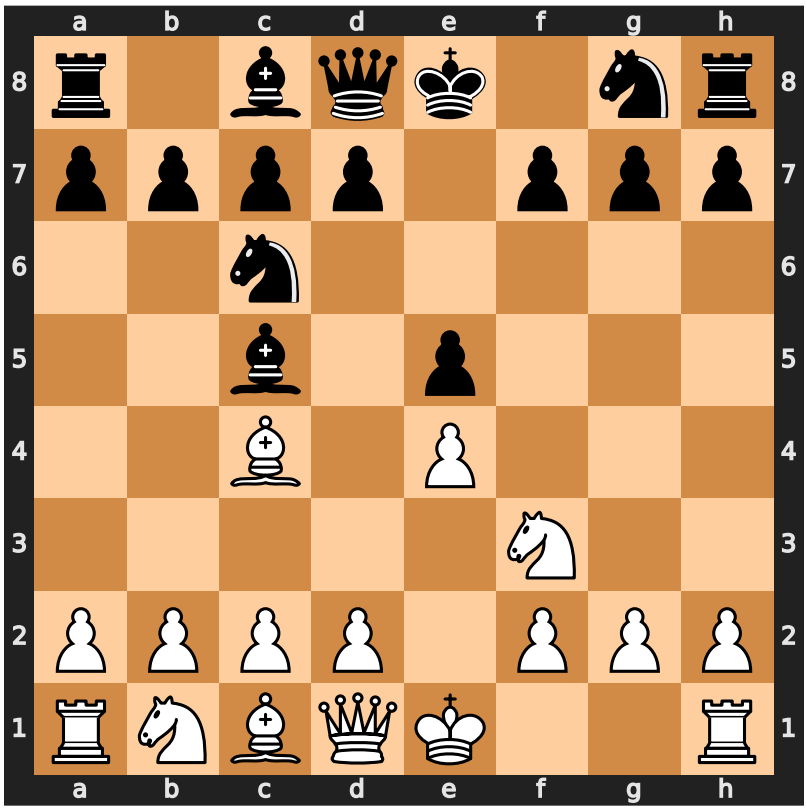

Figure 17.4: Chess Position

17.5 Part 4: King Safety — Castle Early, Castle Often

Well, you can only castle once. But do it EARLY.

17.5.1 Why Castling Matters

Your king starts the game on e1 (or e8 for Black), right in the middle of the board. That is the most dangerous place for a king. The center is where the action happens. Files open, pieces swarm, tactics explode. Your king does NOT want to be in the middle of all that.

Castling does two things at once:

1. **It moves your king to the side of the board** (usually g1 after kingside castling), where it is tucked behind a wall of pawns and harder to attack.
2. **It brings your rook toward the center** (to f1 after kingside castling), where it can join the fight.

One move, two benefits. That is incredible efficiency. No other move in chess gives you this much value.

17.5.2 Which Side to Castle

You can castle kingside (O-O) or queenside (O-O-O). For beginners, **kingside castling is almost always better.** Here is why:

- Kingside castling takes fewer moves to set up (you only need to move the knight and bishop off the back rank).
- The king ends up on g1 behind the pawns on f2, g2, and h2, which is a natural fortress.
- Queenside castling requires clearing three pieces (knight, bishop, and queen) and the king ends up on c1, where the a-pawn is sometimes undefended.

At the beginner level, aim to castle kingside by move 6 to 8. That is your goal. Develop two or three pieces, then castle.

17.5.3 The Danger of an Uncastled King

What happens when you forget to castle? Let's see.

Set up your board: White has developed nicely and castled: king on g1, rook on f1, knight on f3, bishop on c4, pawns on d4 and e4. Black has NOT castled: king on e8, queen on d8, undeveloped pieces still on the back rank.

Now imagine White opens the e-file (perhaps after an exchange on e5). The White rooks can use the open e-file to attack the Black king directly. The Black king is stuck in the center with no shelter. Every check is a disaster because the king has nowhere to hide.

This happens in countless beginner games. One player castles, the other does not. The player who castled attacks down the center with rooks and pieces, and the uncastled king falls.

The rule is simple: castle early. Do it before move 10 in every game.

17.5.4 Don't Weaken Your Castled Position

After you castle, your king sits behind a wall of pawns (usually f2, g2, and h2 for White). This wall is your king's shield. Do not move those pawns without a very good reason.

Every pawn you push in front of your king creates a weakness. The square the pawn used to protect is now undefended. Your opponent can use that weakness to launch an attack.

Bad example: After castling kingside, White plays h3, then g4, then h4. Now the pawns in front of the king are scattered and weak. The king is exposed. Black can target those weaknesses with pieces.

Good example: After castling kingside, White leaves the pawns on f2, g2, and h2 untouched. The king is safe behind its wall. White can focus on attacking in the center and on the other side of the board.

17.5.5 The h3/h6 Question

One of the most common beginner questions: "Should I play h3 (or h6) to prevent my opponent's bishop from coming to g5 (or g4)?"

The answer is: **sometimes yes, sometimes no.**

Play h3 when: - Your opponent's bishop on g4 is pinning your knight on f3 to your queen, and this pin is causing real problems. - You need to prevent a specific tactical threat involving Bg4.

Don't play h3 when: - You have not finished developing yet. Finish development first! - There is no bishop threatening to come to g4. Don't waste a tempo preventing a move your opponent was not planning to make. - You are using it as a "just in case" move. That tempo is better spent developing a piece.

The same logic applies to h6 for Black (preventing Bg5).

General rule: If you have to think about whether h3 is necessary, it probably is not. Develop a piece instead.

You now know all three Golden Rules. Development. Center. King safety. That is the foundation of every good opening. Rest here if you need to. The next section covers the most common mistakes beginners make.

17.6 Part 5: Opening Mistakes to Avoid

Now that you know the right way to play the opening, let's look at the wrong ways. Every mistake below breaks one or more of the Three Golden Rules.

17.6.1 Mistake 1: Moving the Same Piece Multiple Times

We covered this in the development section, but it deserves emphasis. Every time you move a piece that has already been developed, you are giving your opponent a free tempo. Two wasted tempi and you are behind. Three wasted tempi and you may be lost.

Example: 1.e4 e5 2.Nf3 Nc6 3.Bc4 Nf6 4.Ng5?! (moving the knight a second time to attack f7). This move looks aggressive, but it violates the principle of developing new pieces. After 4…d5! 5.exd5 Na5! (attacking the bishop) 6.Bb5+ c6 7.dxc6 bxc6 8.Be2 h6 9.Nf3 e4, Black has a strong center and a development lead. White's "tricky" knight excursion failed.

17.6.2 Mistake 2: Bringing the Queen Out Too Early

We covered this too, but here is another example of why it fails.

The Scholar's Mate Attempt: 1.e4 e5 2.Bc4 (or 2.Qh5) with the idea of Qxf7#. This checkmate (called Scholar's Mate) works against players who have never seen it. Against anyone who knows the defense, it backfires badly.

After 1.e4 e5 2.Qh5 Nc6 3.Bc4 g6! 4.Qf3 Nf6 5.g4? (a terrible move, weakening the kingside) 5…Nd4! and Black is already better. White's queen has been pushed around, White's kingside is weak, and Black is developing with tempo.

If your opponent tries Scholar's Mate on you: Stay calm. Play …Nc6 to defend e5, then …g6 to chase the queen, then develop normally. You will be ahead in development and your opponent will be struggling.

17.6.3 Mistake 3: Pawn Grabbing

"Pawn grabbing" means capturing pawns in the opening when you should be developing pieces. Yes, pawns have value. But in the opening, development has MORE value.

If your opponent offers you a pawn and you spend two moves capturing it while your opponent develops two pieces, you lost the trade. Two tempi of development is worth far more than one pawn.

General rule: Do not grab pawns in the opening unless you can do it WITHOUT falling behind in development. If capturing a pawn costs you a tempo or puts your piece on a bad square, leave the pawn alone and develop instead.

17.6.4 Mistake 4: Not Castling

We have said it before and we will say it again: CASTLE EARLY. An uncastled king is a target. Every move you delay castling is a move your king spends in danger.

Some beginners think: "I will develop one more piece and THEN castle." Then they develop one more piece and think, "OK, one MORE piece." Before they know it, it is move 15, the king is still on e1, and the opponent has launched a devastating attack.

Set a rule for yourself: Castle before move 10, unless there is a very specific reason not to (like your opponent has played something unusual that demands an immediate response). In 95% of your games, castling by move 8 is the right plan.

17.6.5 Mistake 5: Too Many Pawn Moves

In the opening, you should move one or two pawns (to open lines for your pieces and control the center) and then focus on developing pieces. Moving three, four, or five pawns before developing a single piece is a recipe for disaster.

Pawns cannot retreat. They are slow. They do not control as much territory as pieces. Every pawn move you make instead of a piece move is a tempo wasted on a slow, permanent decision.

Good opening: 1.e4 e5 2.Nf3 Nc6 3.Bc4 (two pawn moves, two piece moves so far. Efficient.)

Bad opening: 1.e4 e5 2.d3 d6 3.f4?! f5?! 4.g3?! (four pawn moves, zero piece moves. White's pieces are still asleep.)

17.6.6 Mistake 6: Moving Edge Pawns Early

Moves like a4, h4, a5, or h5 in the first few moves are almost always bad. Edge pawns do not control the center. They do not help your pieces develop. They weaken your castled position (if you push the pawns in front of your king).

Save edge pawn moves for the middlegame and endgame, when they serve a specific purpose (like creating a passed pawn or gaining space on the wing). In the opening, focus on the center.

Set up your board: Compare two positions. In Position A, White has played 1.e4 d4 Nf3 Nc3 Bc4 (five strong opening moves). In Position B, White has played 1.a4 2.h4 3.a5 4.h5 5.Ra3 (five terrible opening moves). Position A is ready for battle. Position B is a joke.

You now know the six biggest opening mistakes. If you avoid all of them, you will outplay most beginners. Take a break. The annotated games are next, and they bring all these principles to life.

17.7 Part 6: What to Do After the Opening

At some point, the opening ends and the middlegame begins. But when? How do you know the transition has happened?

17.7.1 The Opening Is Over When...

Ask yourself these three questions:

1. **Have I castled?** If yes, your king is safe.
2. **Are my knights and bishops developed?** If yes, your minor pieces are in the game.
3. **Are my rooks connected?** (Two rooks can "see" each other across the back rank with nothing between them.) If yes, your army is fully mobilized.

When all three answers are "yes," the opening is over. You are in the middlegame.

17.7.2 Now What?

Once the opening is complete, your goals shift:

Look for tactics. Now that your pieces are developed, start looking for forks, pins, skewers, and other tactical patterns from Chapter 6. Your developed pieces are weapons. Use them.

Make a plan. Ask yourself: "What weakness can I target in my opponent's position? What piece can I improve? Where should I attack?" Even a bad plan is better than no plan at all. (We will learn much more about planning in Volume II.)

Improve your worst piece. Look at your position and find your least active piece. Then find a way to make it better. Move it to a more central square, open a file for it, or trade it for an opponent's good piece.

Connect your rooks and put them on open files. Rooks are powerful on open files (files with no pawns blocking them). After the opening, look for open or half-open files and place your rooks there.

17.7.3 The Transition Checklist

Before you launch any attack or start any plan, run through this checklist:

- ☐ King is castled
- ☐ Both knights are developed
- ☐ Both bishops are developed (or one has been traded)
- ☐ Rooks are connected
- ☐ No pieces are still on their starting squares

If any of these boxes are unchecked, finish your development FIRST. Then attack.

Theory section complete. You now understand everything you need to play a good opening. The annotated games will show you these principles in action from the games of the greatest players in history.

17.8 Annotated Games

These five games demonstrate the Three Golden Rules in action. They span over a century of chess history, but the principles are the same in every one. Set up your board for each game and play through the moves. At the critical moments, pause and think before reading the annotation.

17.8.1 Annotated Game 7.1: The Opera Game

Paul Morphy vs. Duke Karl of Brunswick and Count Isouard Paris, 1858 (played at the Paris Opera House during a performance of *The Barber of Seville*)

This is the most famous teaching game in chess history. Morphy plays a perfect opening and destroys two opponents (the Duke and Count consulted on their moves together) with pure development and attacking power. Every move follows the Three Golden Rules.

Set up your board: Place all pieces in the starting position.

Opening: Philidor Defense

1.e4 e5

Both sides stake a claim in the center. So far, so good for both.

2.Nf3 d6

Morphy develops a knight (Golden Rule 1) and attacks the center (Golden Rule 2). The Duke and Count play the Philidor Defense with 2…d6. This move is passive. It defends the e5 pawn but blocks the dark-squared bishop on f8. Already, Black's development will be slightly slower.

3.d4 Bg4?!

Morphy pushes a second pawn to the center, challenging Black's e5 pawn. Black plays 3…Bg4, which develops a piece but pins the knight on f3 to the queen. The problem? Black should have dealt with the tension in the center first (3…exd4 was more natural).

4.dxe5 Bxf3

Morphy captures in the center, opening lines. Black captures the knight, giving up the bishop pair. This trade was not forced. Black's decision to exchange the bishop for the knight gives White a slight structural advantage.

5.Qxf3 dxe5

White recaptures with the queen. Normally, developing the queen early is bad, but here the queen MUST recapture (it is the only piece that can take on f3). Black recaptures in the center.

6.Bc4 Nf6

Pause and look. White has developed two pieces (queen and bishop) and both are aiming at f7, the weakest square in Black's position. Black has developed one piece (the knight on f6). White is already ahead in development.

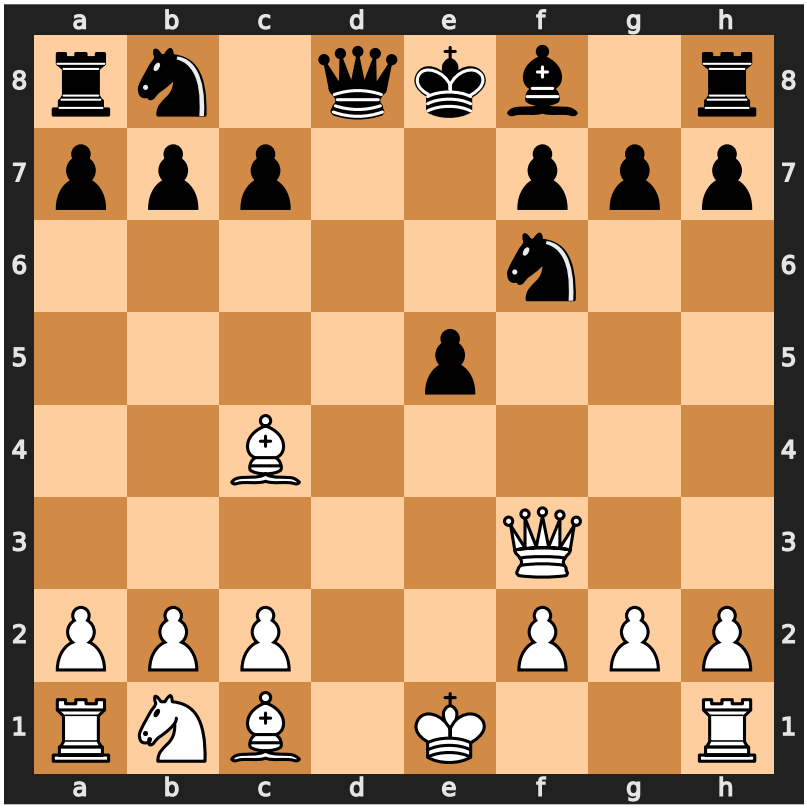

Figure 17.5: Chess Position

7.Qb3 Qe7

Morphy's queen attacks b7 AND maintains pressure on f7. Two targets with one move. Black blocks with the queen, but this is awkward. The queen on e7 blocks the bishop on f8, which means Black cannot develop the bishop and cannot castle. Notice how one bad decision leads to another.

8.Nc3 c6

Morphy develops another piece (Golden Rule 1). That is three pieces developed for White. Black plays a pawn move instead of developing. Black now has one piece developed (the knight on f6) to White's three.

9.Bg5 b5?

Pause and look. Morphy develops ANOTHER piece, and this one pins the knight on f6 to the queen. Black's position is getting worse with every move. Black tries a desperate counter with b5, hoping to chase the bishop from c4, but this weakens the queenside.

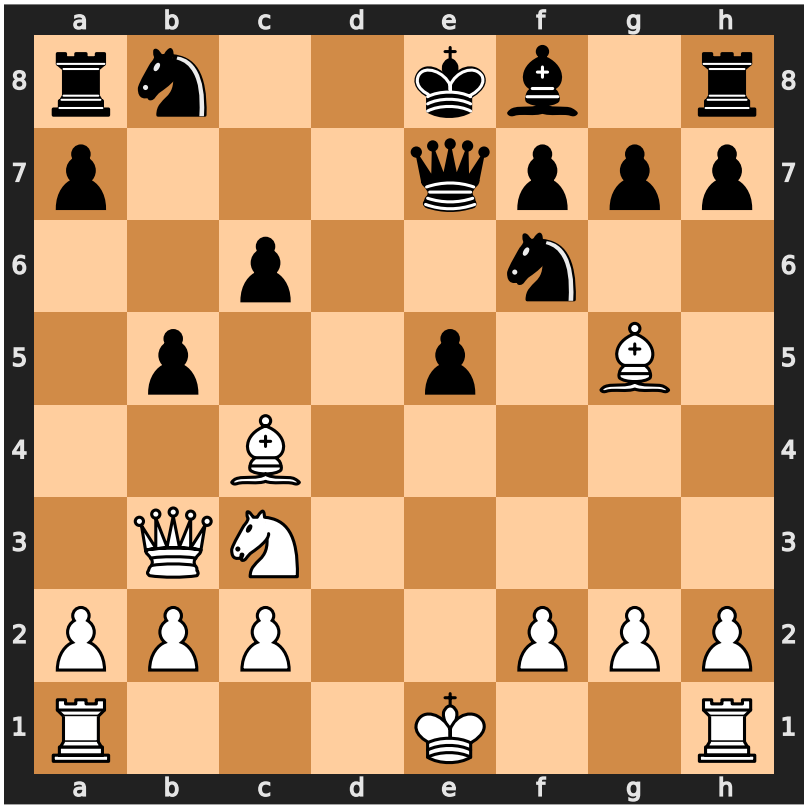

Figure 17.6: Chess Position

10.Nxb5! cxb5 11.Bxb5+ Nbd7

Morphy sacrifices a knight! After 10.Nxb5, the knight takes a pawn and attacks the Black queen and c7 simultaneously. After 10...cxb5 11.Bxb5+, White has a powerful check. The bishop pins the knight on d7 to the king. Black is in serious trouble.

12.O-O-O Rd8

Pause and look. Morphy castles queenside. Now his rook on d1 is directly aimed at Black's

pinned knight on d7 and the rook on d8. Count the developed pieces: White has the queen, both bishops, both rooks active, and the king is safe. Black has a knight on f6, a knight on d7 (pinned), and nothing else. The development difference is overwhelming.

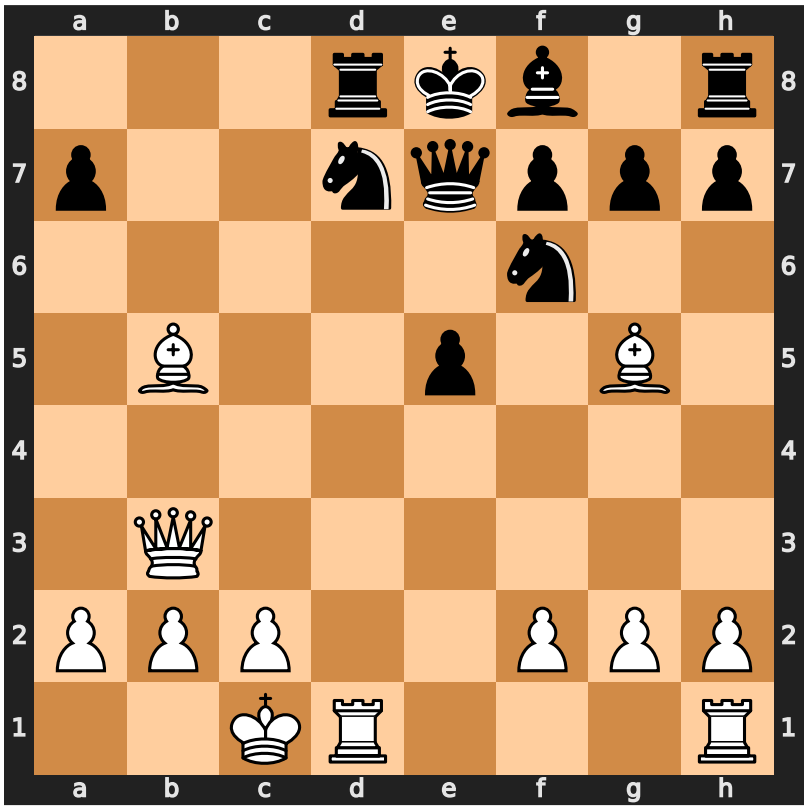

Figure 17.7: Chess Position

13.Rxd7! Rxd7 14.Rd1 Qe6

Morphy sacrifices a rook! 13.Rxd7 removes a defender. After 13…Rxd7 14.Rd1, the new rook enters with devastating effect. Black tries 14…Qe6 to block the pin and protect d7.

15.Bxd7+ Nxd7

The bishop captures on d7 with check. The knight must recapture.

Pause and look. Morphy is about to deliver one of the most beautiful checkmates in chess history.

16.Qb8+!! Nxb8 17.Rd8#

The queen sacrifices herself on b8! The knight is forced to capture. And then the rook delivers checkmate on d8. The king on e8 has nowhere to go. The f8 bishop blocks its only escape square.

FEN (final position): `1n1Rkb1r/p4ppp/4q3/4p1B1/8/8/PPP2PPP/2K5 b - - 0 1`

What this game teaches: - Morphy developed every piece before attacking. He never moved a piece twice without a concrete reason. - The development lead was devastating. By move 12, Morphy had every piece in the game while Black had almost nothing. - Sacrifices work when you have a lead in development. Morphy gave up material because his remaining pieces were enough

to deliver checkmate. - The Three Golden Rules won this game: development, center control, king safety (castling queenside brought the rook into the attack).

The Opera Game is the greatest lesson in development ever played. Take a moment to appreciate it. Set it up again from the start and play through it one more time.

17.8.2 Annotated Game 7.2: The Immortal Game

Adolf Anderssen vs. Lionel Kieseritzky London, 1851

If the Opera Game is the greatest lesson in development, the Immortal Game is the greatest example of what happens when you sacrifice everything for the attack. Anderssen gives up a bishop, both rooks, and his queen, and still delivers checkmate with just three minor pieces. This game is wild, chaotic, and unforgettable.

Set up your board: Starting position.

Opening: King's Gambit

1.e4 e5 2.f4 exf4

Anderssen plays the King's Gambit, sacrificing a pawn for fast development and an open f-file. Kieseritzky accepts the gambit.

3.Bc4 Qh4+ 4.Kf1 b5?! 5.Bxb5 Nf6

White develops the bishop. Black brings out the queen early (breaking our rule!) with check. White's king moves to f1, losing the right to castle. Black pushes b5, a speculative pawn sacrifice. White captures. Black develops a knight.

Pause and look. Both sides are breaking rules here. White cannot castle. Black brought the queen out early. This game is from 1851, before opening principles were fully understood. Watch what happens.

6.Nf3 Qh6 7.d3 Nh5

White develops the knight to its best square and chases the queen. Black retreats the queen (already moved it twice!) and then moves the knight to h5 (the rim!). Remember: "A knight on the rim is dim."

8.Nh4 Qg5 9.Nf5 c6

The knight dance continues. White's knight reaches the powerful f5 square. Black plays another pawn move instead of developing.

10.g4! Nf6 11.Rg1!

Pause and look. Anderssen ignores the attacked bishop on b5 and instead develops the rook with 11.Rg1! This is a key moment. Material does not matter as much as development and attacking chances. White would rather develop a new piece than save the bishop.

11...cxb5 12.h4 Qg6 13.h5 Qg5 14.Qf3

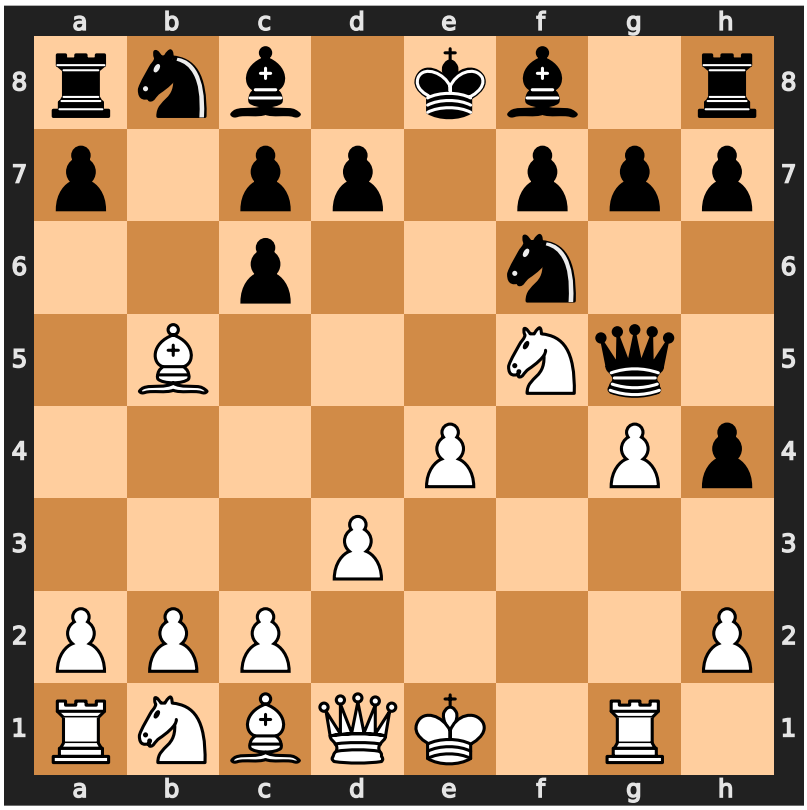

Figure 17.8: Chess Position

Black captures the bishop (winning material). White pushes the h-pawn, chasing Black's queen AGAIN. The queen has now moved five times. That is five tempi wasted on the queen while White developed pieces and advanced pawns with threats.

14...Ng8

The knight retreats all the way back to g8. It started on g8, went to f6, and now returns home. Two tempi completely wasted. Black's development is a disaster.

15.Bxf4 Qf6 16.Nc3 Bc5

White develops another piece. Black finally develops the bishop.

17.Nd5! Qxb2 18.Bd6!

White plays the powerful Nd5, attacking the queen from a commanding central square. Black captures the b2 pawn with the queen (pawn grabbing while behind in development!). White plays the stunning Bd6, blocking the Black king from castling and preparing a vicious attack.

Pause and look. Count the material. White has sacrificed a bishop AND is about to lose both rooks. But look at White's piece activity. The knight on d5 is dominant. The bishop on d6 controls critical squares. White's pieces are coordinated for attack. Black's pieces are scattered and uncoordinated.

18...Bxg1 19.e5!

Black captures the rook. White advances the e-pawn with tempo, opening lines.

19...Qxa1+ 20.Ke2 Na6

Black captures the other rook with check! White has now sacrificed BOTH rooks. But White's king steps to e2, and the attack continues.

21.Nxg7+ Kd8 22.Qf6+! Nxf6 23.Be7#

FEN (final position): `r1bk3r/p2pBpNp/n4n2/1p1Pp2P/4P1Pp/3P4/P1P1K3/q5b1 b - - 0 1`

Anderssen delivers checkmate with just a bishop and two knights after sacrificing his queen, both rooks, and a bishop. The Black king on d8 is trapped. The bishop on e7 and the knight on g7 work together to seal every escape square.

What this game teaches: - Development and piece activity can be worth more than material. Anderssen's pieces were active and coordinated. Kieseritzky's pieces were passive and scattered. - Moving the queen early cost Kieseritzky dearly. The queen moved five times in the opening while Anderssen developed piece after piece. - Pawn grabbing is dangerous. Black kept capturing pawns and rooks instead of developing pieces, and paid the ultimate price. - "A knight on the rim is dim." Black's knight going to h5 and then back to g8 was a complete waste of time.

17.8.3 Annotated Game 7.3: The Evergreen Game

Adolf Anderssen vs. Jean Dufresne Berlin, 1852

This game has been called "evergreen" because its beauty never fades. Anderssen sacrifices a rook and then his queen to deliver a stunning checkmate. But look beneath the fireworks: the game is

won by superior development and center control.

Set up your board: Starting position.

1.e4 e5 2.Nf3 Nc6 3.Bc4 Bc5

A classical opening. Both sides develop knights and bishops toward the center. Textbook play.

4.b4!? Bxb4 5.c3 Ba5 6.d4 exd4 7.O-O

Anderssen plays the Evans Gambit, sacrificing a pawn (and then another) for rapid development and open lines. After 7.O-O, White has sacrificed two pawns but has castled, placed a bishop on c4 aiming at f7, and opened the center.

Pause and look. Count the tempi. White has developed the knight, both bishops, castled, and pushed three center pawns. Black has developed the knight and bishop but has spent time capturing pawns. White's development is ahead.

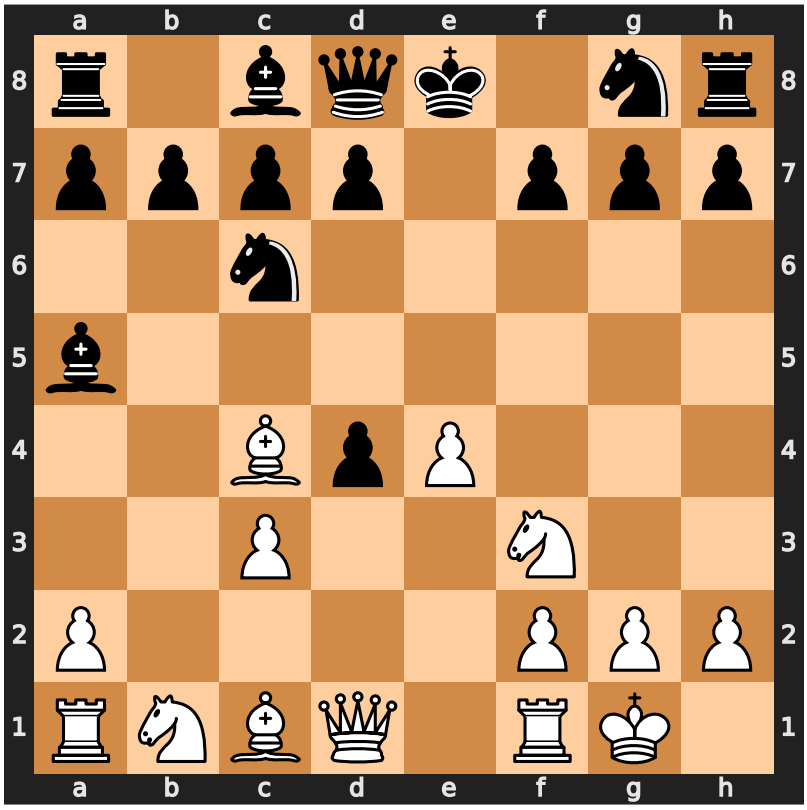

Figure 17.9: Chess Position

7...d3?! 8.Qb3 Qf6 9.e5 Qg6

Black tries to hold the extra pawn with d3, but this pawn is overextended and hard to defend. White develops the queen to b3, attacking b7 and f7. Black's queen comes out to f6 (early queen alert!) and then retreats to g6.

10.Re1 Nge7 11.Ba3

White brings the rook into the game and develops the bishop to a3, where it prevents Black from castling by targeting e7. Development, development, development.

11...b5 12.Qxb5 Rb8 13.Qa4 Bb6

Black pushes b5 to chase the queen, but White captures and maintains the pressure. Black's position is becoming cramped.

14.Nbd2 Bb7 15.Ne4 Qf5

White brings the knight into the game via d2-e4, a strong central square. Black finally develops the bishop to b7 and repositions the queen.

16.Bxd3 Qh5

White captures the overextended d3 pawn. The bishop on d3 is now powerfully placed.

17.Nf6+! gxf6 18.exf6 Rg8

Pause and look. White sacrifices the knight on f6! After gxf6, the e-pawn advances to f6 with devastating effect, cutting off the knight on e7 from defending. The pawn on f6 is a dagger aimed at Black's king.

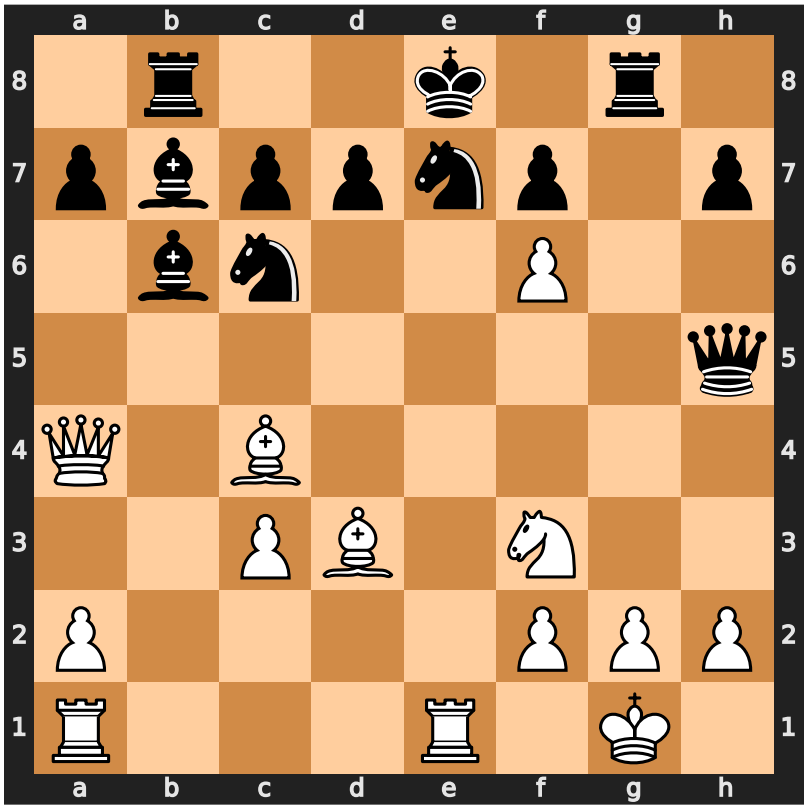

Figure 17.10: Chess Position

19.Rad1! Qxf3!?

White calmly develops the last rook into the game. Every single White piece is now active. Black captures the knight on f3 with the queen (if 19...Qxf3, this looks like Black is winning material, but...).

20.Rxe7+! Nxe7 21.Qxd7+!! Kxd7 22.Bf5+ Ke8 23.Bd7+ Kf8 24.Bxe7#

The finish is breathtaking. White sacrifices the rook with 20.Rxe7+! Then White sacrifices the QUEEN with 21.Qxd7+! After the king captures, 22.Bf5+ forces the king back, 23.Bd7+ drives it to f8, and 24.Bxe7 is checkmate. Two bishops deliver the final blow.

FEN (final position): `1r3kr1/pbppBp1p/1b6/5B2/8/2P2q2/P4PPP/3R2K1 b - - 0 1`

What this game teaches: - Sacrificing pawns for development can be powerful (the Evans Gambit gives up material for tempo). - When all your pieces are active and your opponent's are not, sacrifices become possible because you have more attackers than your opponent has defenders. - The pawn on f6 (after Nf6+ gxf6 exf6) is a perfect example of how a well-placed pawn can destroy an opponent's king safety. - Development wins games. Anderssen had every piece working. Dufresne did not.

Three masterpieces down, two to go. Take a break if your brain is buzzing. That is a sign that you are learning.

17.8.4 Annotated Game 7.4: Morphy Shows the Way

Paul Morphy vs. Adolf Anderssen Paris, 1858 (Casual Game)

Morphy vs. Anderssen: the two greatest attacking players of the 19th century, face to face. Morphy demonstrates his trademark style: develop every piece to its best square, gain a lead in development, and use that lead to win.

Set up your board: Starting position.

1.e4 e5 2.Nf3 d6 3.d4 exd4 4.Qxd4 Nc6 5.Bb5 Bd7

Morphy opens with 1.e4 (center control) and develops the knight (development). He pushes d4 to open the center. After the exchange, the queen recaptures on d4. This is one of the rare cases where the queen develops early because it recaptures on a central square. Black develops the knight and bishop.

Pause and look. Both sides are developing, but Morphy has a slight edge: his queen is centralized and his bishop is active on b5, pinning the knight to the king (or at least threatening Bxc6).

6.Bxc6 Bxc6 7.Nc3 Nf6 8.O-O Be7

Morphy trades the bishop for the knight, damaging Black's pawn structure (doubled c-pawns). He develops the second knight and castles. Black develops the remaining minor pieces.

9.Nd5! Bxd5 10.exd5 O-O

Morphy plays the strong Nd5, centralizing the knight on the most powerful square on the board. Black exchanges it, and now White's d5 pawn is a wedge in Black's position. Black finally castles.

11.Bg5 Re8

White develops the last minor piece with a pin on the knight. Every White piece is now developed or actively placed.

Pause and look. Compare the positions. White: king is safe (castled), all pieces are developed, rooks can connect easily. Black: king is safe (castled), pieces are developed but passive, the d6 pawn is a weakness. White's development is more purposeful. Each piece aims at Black's position.

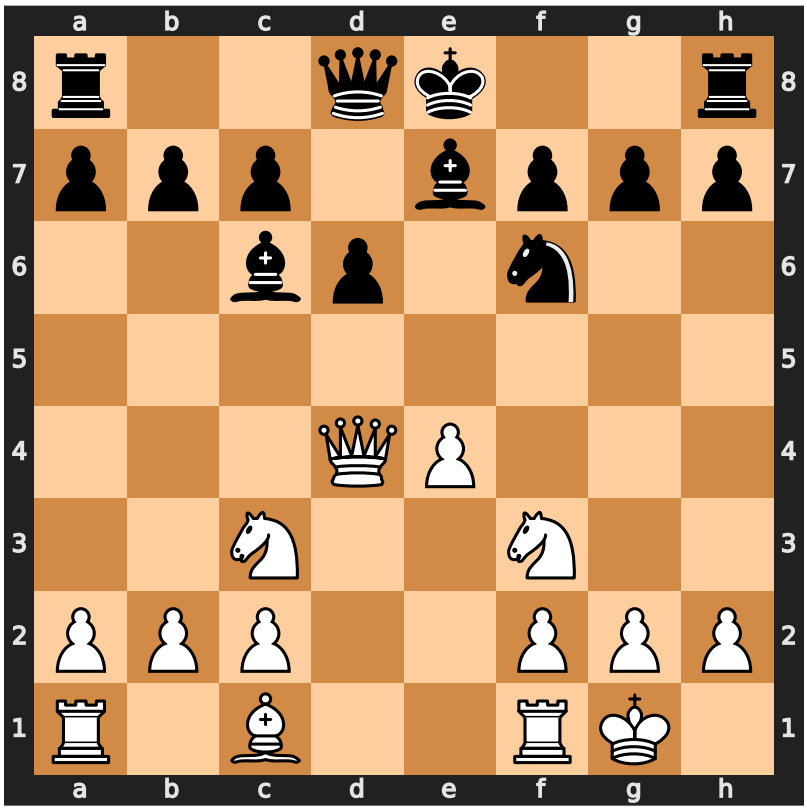

Figure 17.11: Chess Position

12.Rfe1 Nd7 13.Bxe7 Qxe7 14.Rxe7! Rxe7 15.c4

White places the rook on the open e-file (connecting the rooks) and trades pieces to simplify into a winning endgame. After 14.Rxe7, White has given up a rook for Black's queen trade, reaching an endgame where White's better pawn structure and more active pieces give a lasting advantage.

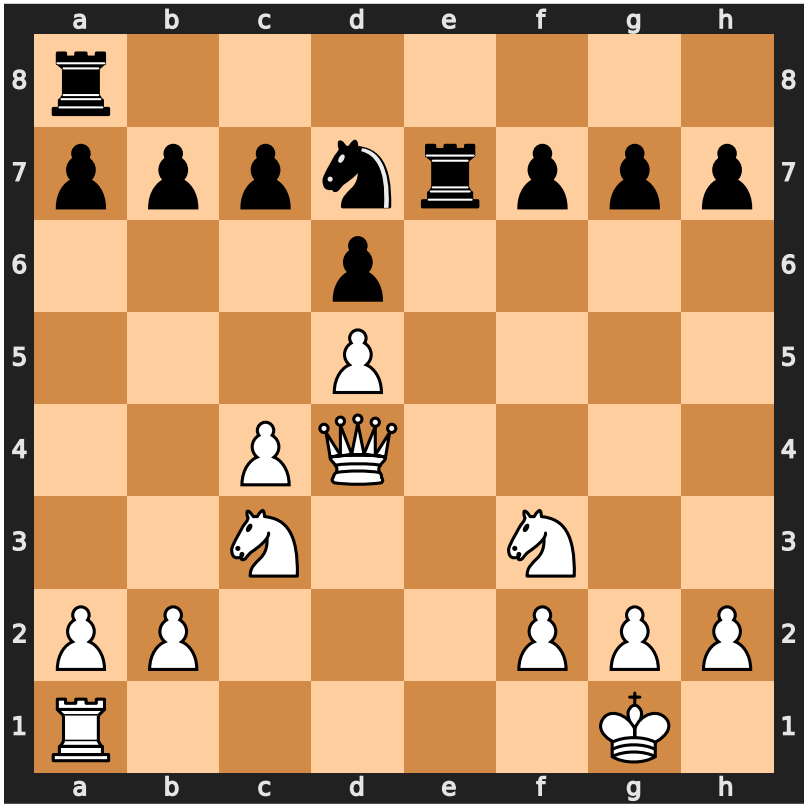

Figure 17.12: Chess Position

The game continued, and Morphy converted his positional advantage into a win. The exact continuation matters less than the lesson.

What this game teaches: - Morphy did not need flashy sacrifices to win. He simply developed better, faster, and more purposefully than his opponent. - Centralizing pieces (Nd5, queen on d4, rook on e1) gives your pieces maximum power. - Sometimes the best use of a development lead is to trade into a favorable endgame, not to launch a direct attack. - Even Anderssen, one of the greatest attackers in history, could not overcome Morphy's superior development.

17.8.5 Annotated Game 7.5: Zukertort's Masterpiece

Johannes Zukertort vs. Joseph Henry Blackburne London, 1883

This game is considered one of the finest positional masterpieces of the 19th century. Zukertort builds his position patiently, gains a development and space advantage, and then unleashes a stunning combination. The opening principles are quieter here, but no less powerful.

Set up your board: Starting position.

1.c4 e6 2.e3 Nf6 3.Nf3 b6 4.Be2 Bb7 5.O-O d5 6.d4 Bd6

A quiet opening. Both sides develop pieces and fight for the center. White plays the English Opening with a quick kingside castle. Black develops in a "Queen's Indian" setup with the bishop fianchettoed on b7.

Pause and look. By move 6, White has castled and developed two minor pieces. Black has developed two minor pieces but has not yet castled. White has a small advantage in king safety.

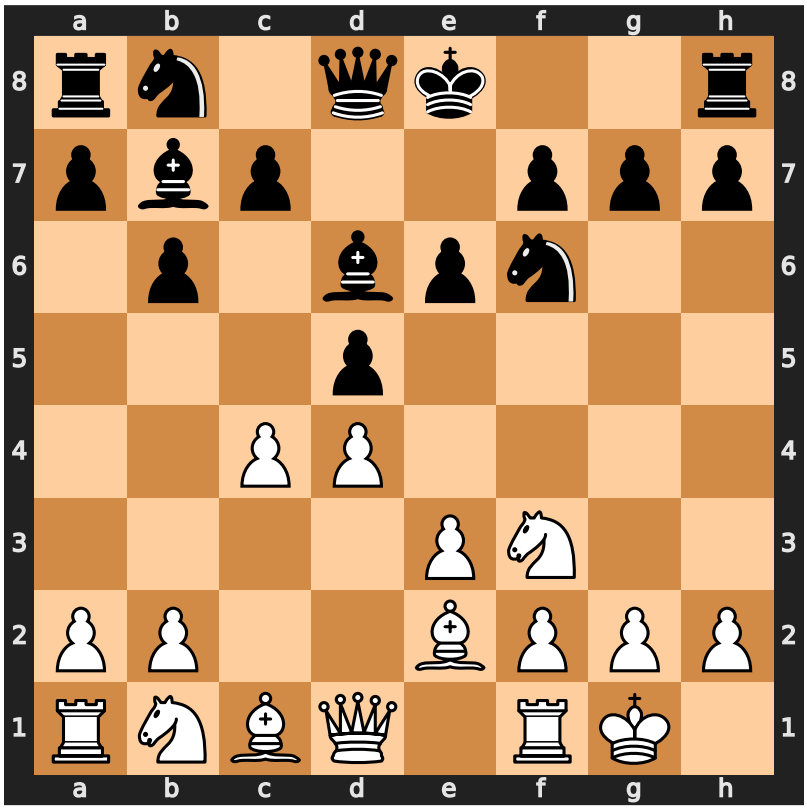

Figure 17.13: Chess Position

7.Nc3 O-O 8.b3 Nbd7 9.Bb2 Qe7

Both sides continue developing. White places the bishop on b2, controlling the long diagonal. Black castles (good!) and develops the remaining knight.

10.Nb5 Ne4 11.Nxd6 cxd6 12.Nd2 Ndf6 13.f3 Nxd2 14.Qxd2 dxc4 15.Bxc4 d5 16.Bd3

A series of exchanges simplifies the position, but White emerges with a subtle advantage. The White bishops on b2 and d3 are powerful, aiming at Black's kingside. Both rooks are ready to swing into action.

17.Rae1 Rfc8 18.e4! Rac8

Pause and look. Zukertort pushes e4! This central advance is the key to the game. White's center is surging forward, and the bishops come alive. The position is starting to open up, which favors the side with better piece coordination.

19.e5 Ne8 20.f4 g6

White's center pawns march forward (e4-e5, f4). Black's knight is pushed back to e8 (the rim! the starting square!). The development advantage is becoming an attacking advantage.

21.Re3 f5 22.exf6 Nxf6 23.f5! Ne4 24.Bxe4 dxe4 25.fxg6 Rc2

The center explodes. White's pawns rip open Black's kingside. After 25.fxg6, the pawn on g6 is a battering ram aimed at Black's king. Black tries to counterattack with Rc2, but it is too late.

Pause and look. White is about to deliver one of the greatest combinations in chess history.

26.gxh7+ Kh8 27.d5+! e5 28.Qb4!

The pawn on h7 delivers check, and the king retreats to h8. Then Zukertort reveals the hidden power of d5+ (a discovered check from the bishop on b2!). The queen swings to b4 with decisive threats.

28...R8c5 29.Rf8+! Kxh7 30.Qxe4+ Kg7 31.Bxe5+ Kxf8 32.Bg7+ Kg8 33.Qxe7

White wins decisively. The combination starting with 29.Rf8+! is a classic example of how superior development and central control lead to a winning attack. Black resigned.

FEN (after 33.Qxe7): `6k1/p3QpBp/1p6/2rP4/8/8/P1r3PP/6K1 b - - 0 1`

What this game teaches: - Even quiet openings require development and king safety. White castled early and developed every piece before attacking. - Central pawn advances (e4, e5, d5) are powerful when supported by well-placed pieces. - The bishop pair (Bb2 and Bd3/Be4) proved devastating on the open board. - Patient development followed by a well-timed central advance is a winning strategy at every level.

All five games complete. Each one demonstrates the Three Golden Rules. Development. Center control. King safety. Set up any of these games again whenever you want to remind yourself how the opening should be played.

17.9 Exercises

35 exercises covering the opening principles you learned in this chapter. Work through them on your board. Cover the solution and try to find the answer yourself before peeking.

Difficulty guide: = straightforward, = requires thought, = challenging

---

17.9.1 Section A: What's the Best Developing Move? (Exercises 7.1–7.10)

Exercise 7.1 **Position:** White to play. White has played 1.e4 e5. All other pieces are on starting squares.

Task: What is White's best developing move? **Hint 1:** Develop a knight first. **Hint 2:** Which knight goes to which square? Think about center control. **Hint 3:** The knight should attack the e5 pawn. **Solution: 2.Nf3!** Develops a knight, attacks the center (e5), and prepares to castle kingside. This is the most popular second move in chess history.

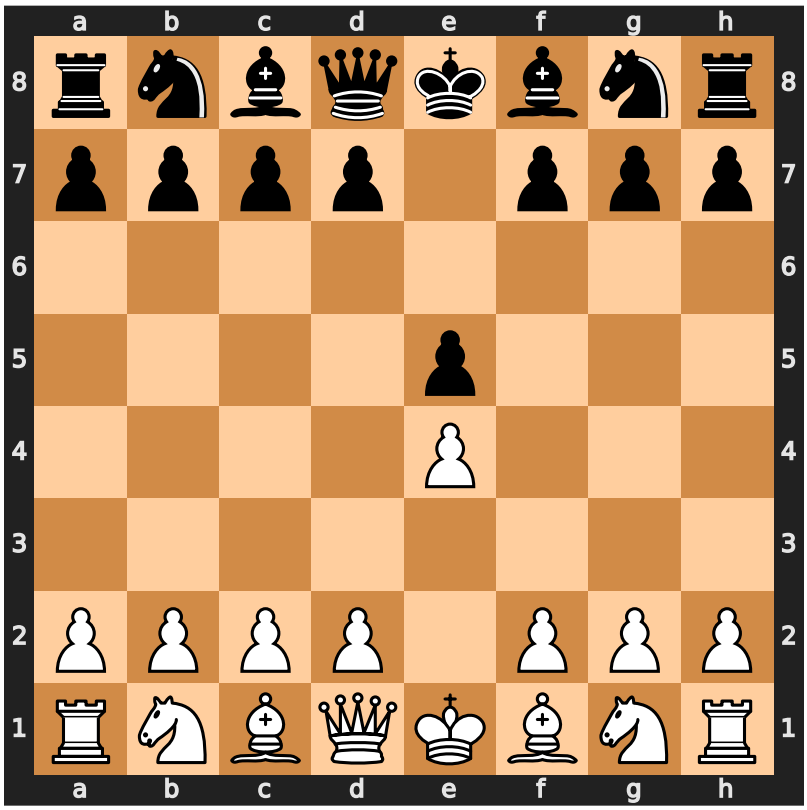

Figure 17.14: Chess Position

Exercise 7.2 **Position:** White to play after 1.e4 e5 2.Nf3 Nc6. All other pieces on starting squares.

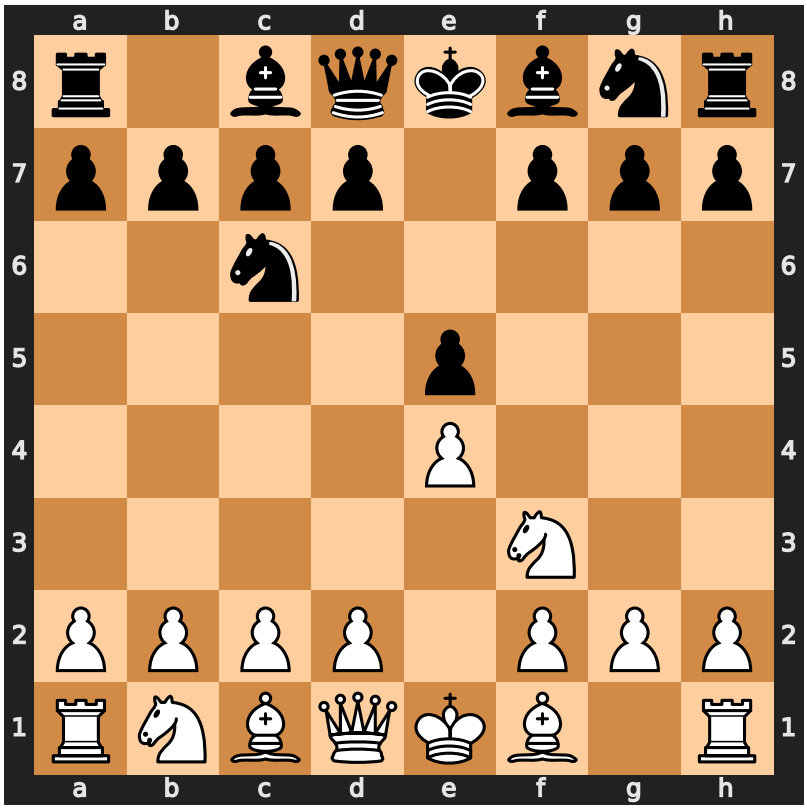

Figure 17.15: Chess Position

Task: What is White's best developing move? **Hint 1:** Develop a minor piece. **Hint 2:** A bishop move. Which bishop? **Hint 3:** Aim it at a key target. **Solution: 3.Bc4** or **3.Bb5.** Both develop the bishop to an active diagonal. Bc4 aims at f7 (Black's weakest square). Bb5 puts pressure on the c6 knight. Both are excellent.

Exercise 7.3 **Position:** White to play. White has: king on e1, queen on d1, rooks on a1 and h1, bishops on c1 and c4, knights on f3 and b1, pawns on a2, b2, c2, d4, e4, f2, g2, h2. Black has developed normally.

Task: Should White develop another piece or castle? **Hint 1:** How many pieces has White developed? **Hint 2:** Is the king safe? **Hint 3:** Castling IS a developing move (it activates the rook). **Solution: O-O!** (Castle kingside.) White has two pieces developed. Castling gets the king to safety AND brings the rook into the game. Golden Rule 3: castle early.

Exercise 7.4 **Position:** Black to play after 1.d4 d5 2.c4 e6 3.Nc3. Black has: king on e8, queen on d8, rooks on a8 and h8, bishops on c8 and f8, knights on b8 and g8, pawns on a7, b7, c7, d5, e6, f7, g7, h7.

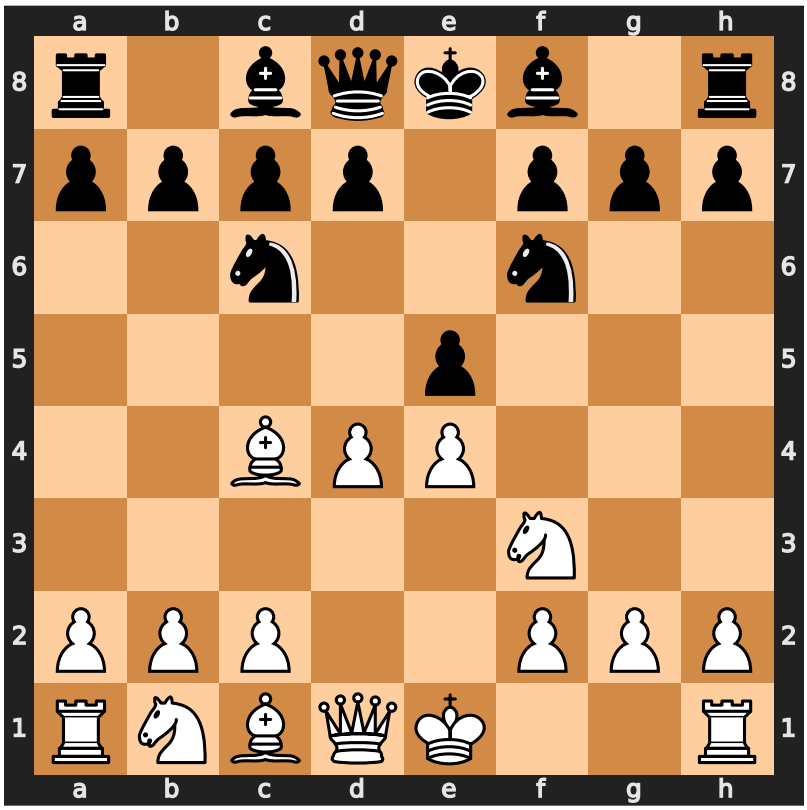

Figure 17.16: Chess Position

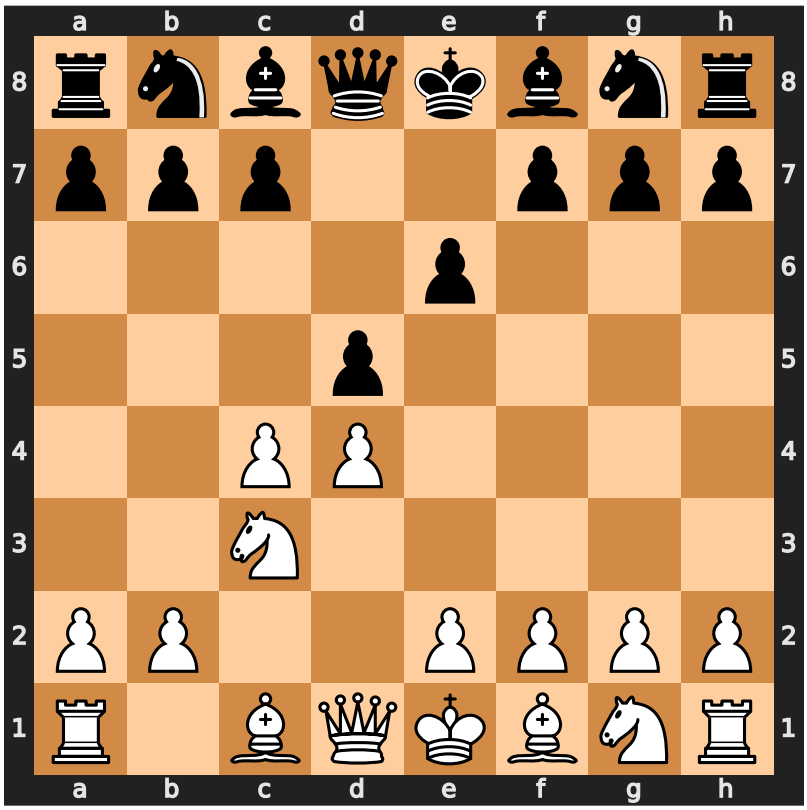

Figure 17.17: Chess Position

Task: What is Black's best developing move? **Hint 1:** Develop a knight. Which one? **Hint 2:** The knight should influence the center. **Hint 3:** It should go to f6. **Solution: 3...Nf6!** Develops the knight to its best square, attacks e4, and prepares to castle. Classic development.

Exercise 7.5 **Position:** White to play. White has: king on e1, queen on d1, rooks on a1 and h1, bishops on c1 and e2, knight on f3, knight on c3, pawns on a2, b2, c2, d4, e4, f2, g2, h2. Black has a similar development.

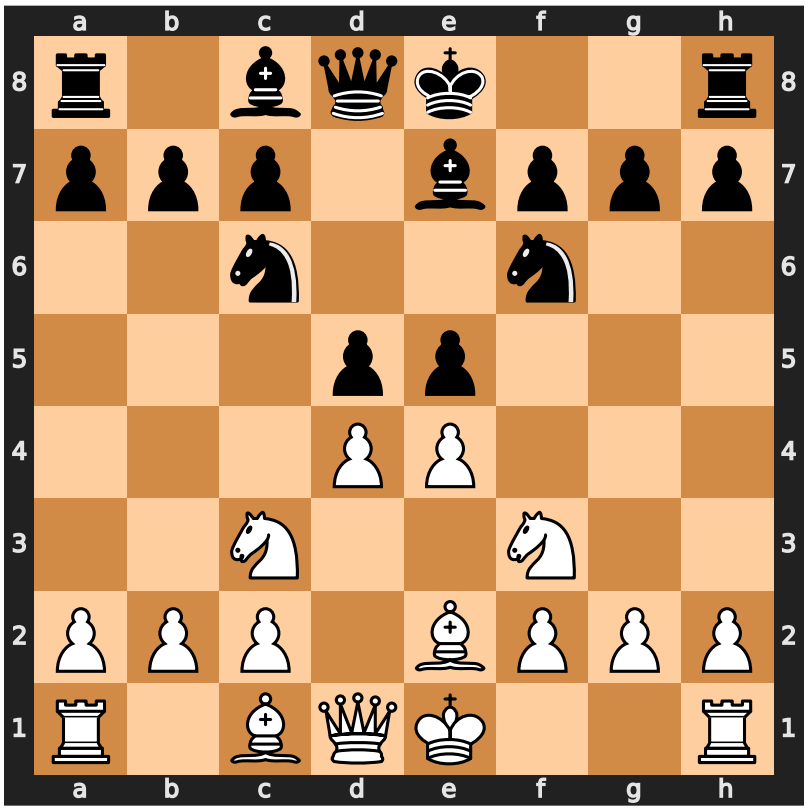

Figure 17.18: Chess Position

Task: What should White do? **Hint 1:** All minor pieces are developed. **Hint 2:** The king is still on e1. **Hint 3:** Golden Rule 3. **Solution: O-O!** Castle immediately. All minor pieces are out, so it is time to get the king to safety. Do not waste another move.

Exercise 7.6 **Position:** White to play. White has: king on g1 (castled), rook on f1, rook on a1, bishop on c4, bishop on c1, knight on f3, queen on d1, pawns on a2, b2, c2, d4, e4, f2, g2, h2.

Task: White is ahead in development. What is the best way to increase the advantage? **Hint 1:** A piece is still on its starting square. **Hint 2:** The c1 bishop needs to join the game. **Hint 3:** Where should it go? Think about pins and central influence. **Solution: Bg5!** (or Nc3.) Bg5 develops the last minor piece and pins the f6 knight to the queen (once Black plays …Qd8 or has the queen there). Nc3 also develops a piece. Both are strong. The key insight: develop the piece that is still asleep.

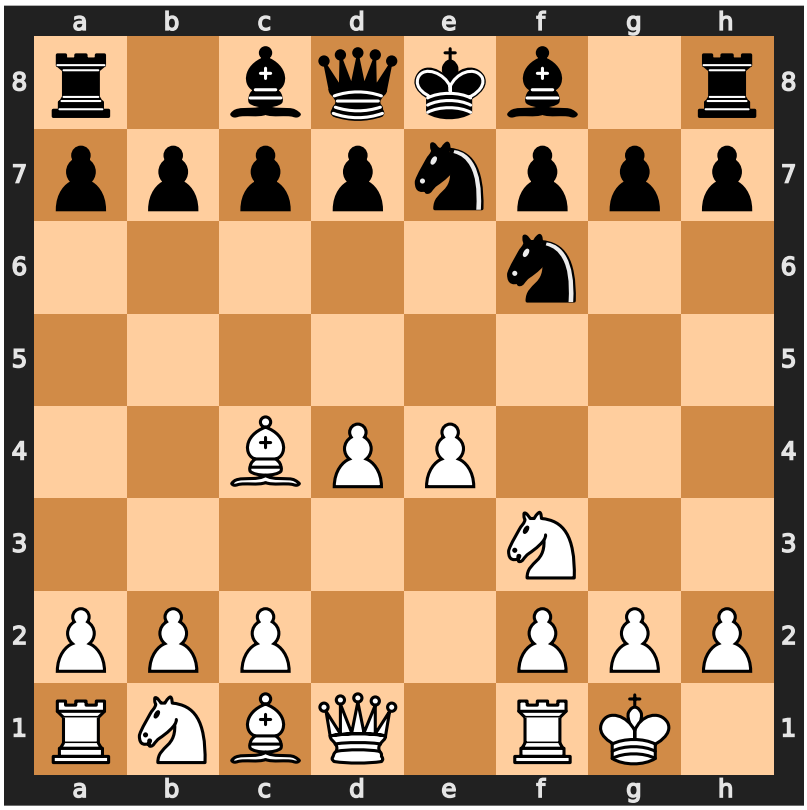

Figure 17.19: Chess Position

Exercise 7.7 **Position:** Black to play. White has developed three pieces and castled. Black has: king on e8, queen on d8, rooks on a8 and h8, bishops on c5 and c8, knight on c6, knight on g8, pawns on a7, b7, d7, e5, f7, g7, h7.

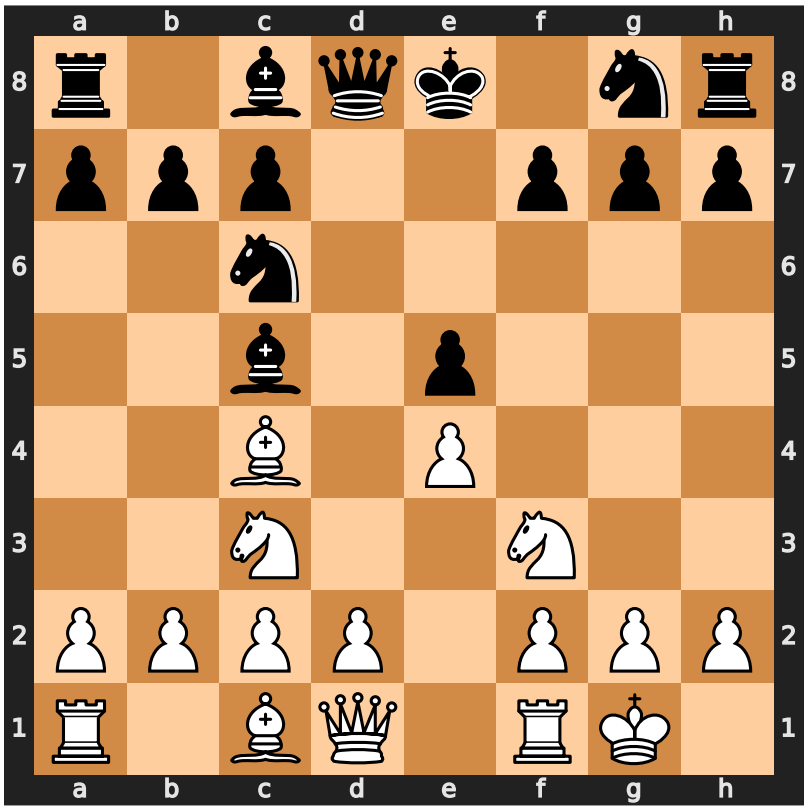

Figure 17.20: Chess Position

Task: What is Black's best developing move? **Hint 1:** Which piece has not moved? **Hint 2:** A knight is still on g8. **Hint 3:** Where should it go? **Solution: Nf6!** Develops the last knight to its ideal square, attacks e4, and prepares to castle. After Nf6 and O-O, Black will have completed basic development.

Exercise 7.8 **Position:** White to play. White has castled and developed both knights and one bishop. The other bishop is still on c1.

Task: Which developing move is strongest? **Hint 1:** The c1 bishop needs to move. **Hint 2:** Think about where it can be most active. **Hint 3:** Consider Be3 or Bg5. **Solution: Be3!** Develops the bishop to an active square where it supports the center (d4 push), eyes the a7-g1 diagonal, and challenges Black's active bishop on c5. Bg5 is also playable, but Be3 is more flexible.

Exercise 7.9 **Position:** White to play in a complex position. White has: king on g1, queen on d1, rooks on a1 and f1, bishop on g5 (developed), bishop on d3 (developed), knight on c3, pawns on a2, b2, c2, d4, e4, f2, g2, h2. Black is castled with pieces on natural squares.

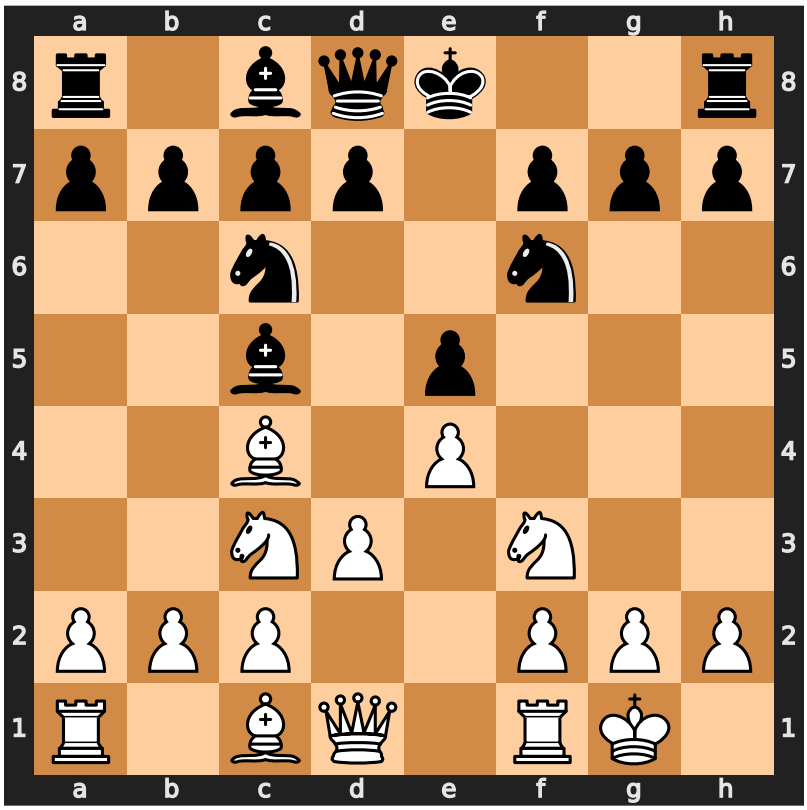

Figure 17.21: Chess Position

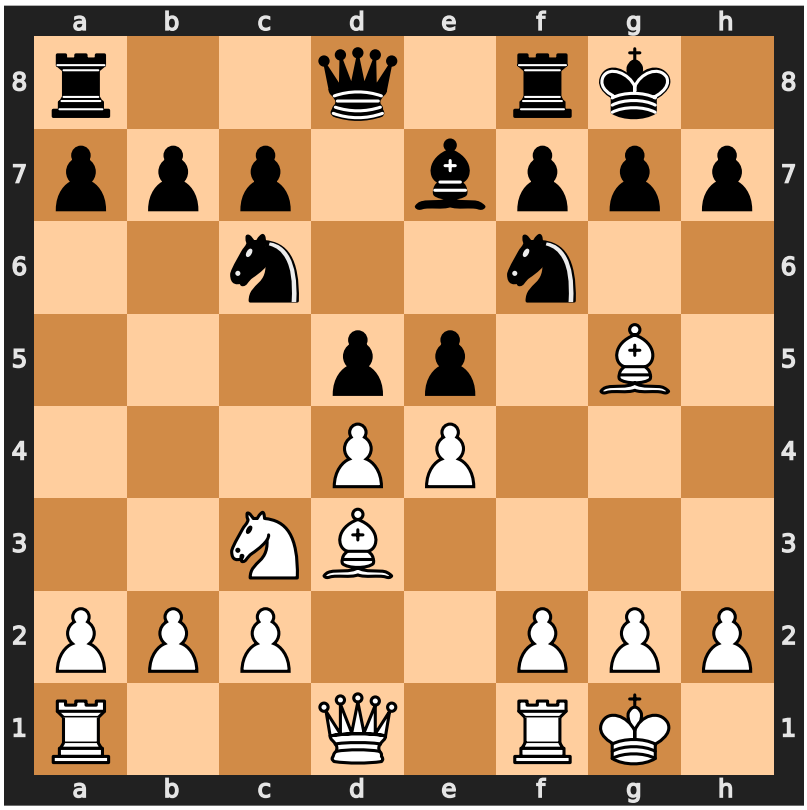

Figure 17.22: Chess Position

Task: White has good development. What is the best plan? **Hint 1:** All minor pieces are out. What is still undeveloped? **Hint 2:** The rooks are not connected. **Hint 3:** How can you connect the rooks and finish development? **Solution: Qe2** (or Qd2). Moving the queen off d1 connects the rooks along the back rank. Now both rooks can move to the best open files. This completes White's development: every piece is active, the rooks are connected, and the king is safe. Time for the middlegame!

Exercise 7.10 **Position:** Black to play after 1.e4 e5 2.Nf3 Nc6 3.Bc4 Nf6 4.d3 Bc5 5.O-O. Black has: king on e8, queen on d8, rooks on a8 and h8, bishops on c5 and c8, knights on c6 and f6, pawns on a7, b7, c7, d7, e5, f7, g7, h7.

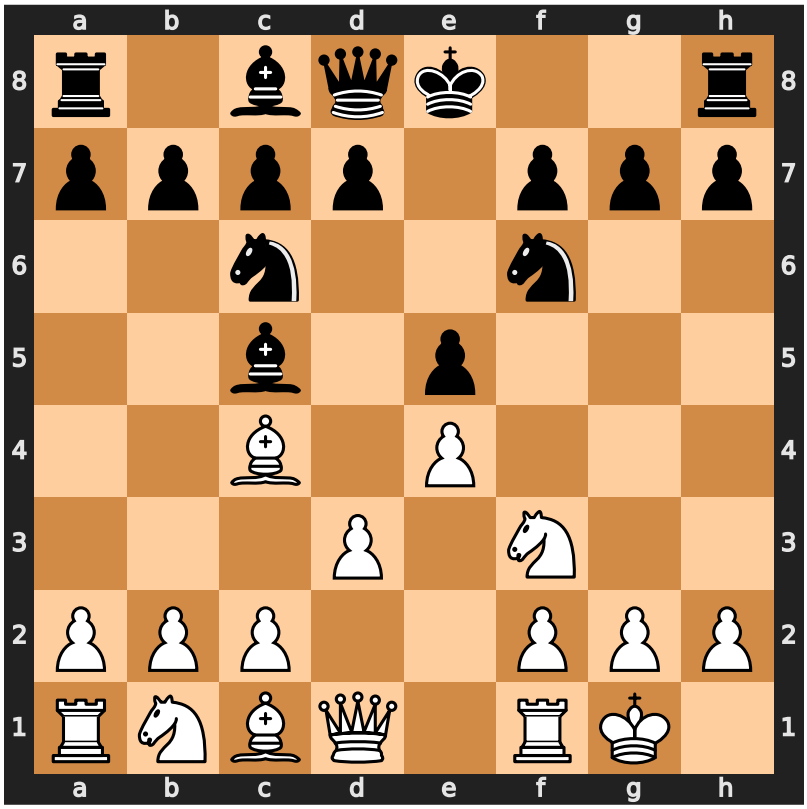

Figure 17.23: Chess Position

Task: What should Black do? **Hint 1:** Golden Rule 3! **Hint 2:** Black has developed three pieces. **Hint 3:** Castle! **Solution: O-O!** Black has three pieces developed and can castle immediately. Do it! Get the king to safety and the rook toward the center.

Ten developing move exercises done. Good work. Ready for more?

17.9.2 Section B: Which Side Has Better Development? (Exercises 7.11–7.15)

Exercise 7.11 **Position:** Count developed pieces for both sides.

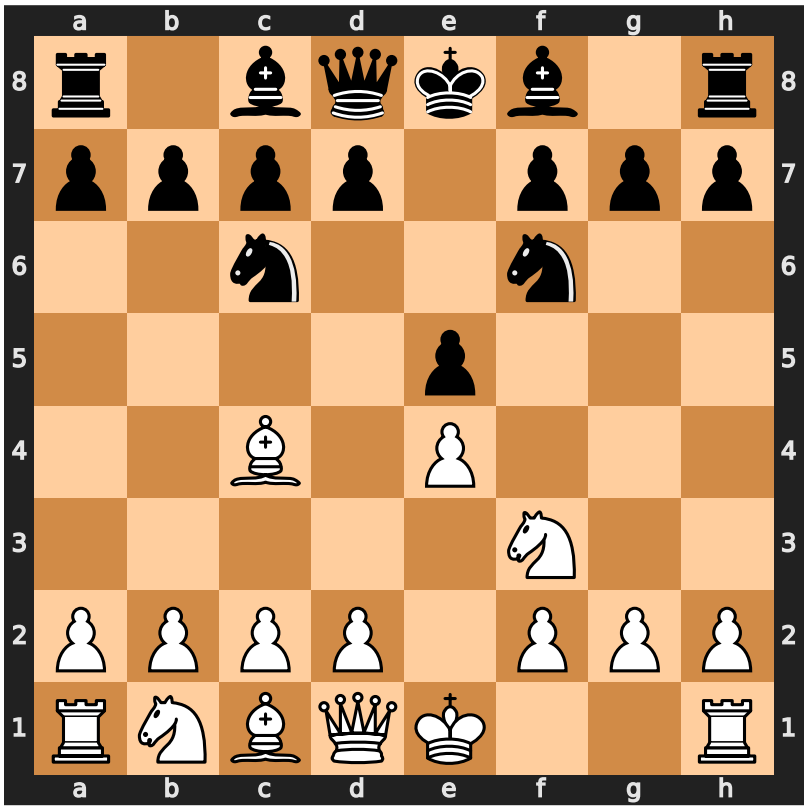

Figure 17.24: Chess Position

Task: Who has better development? **Hint 1:** Count White's developed pieces. **Hint 2:** Count Black's developed pieces. **Hint 3:** Are they equal? **Solution: Equal development.** White has 2 pieces developed (Nf3, Bc4). Black has 2 pieces developed (Nc6, Nf6). Neither side has castled. Development is equal. The battle continues.

Exercise 7.12 **Position:** A lopsided development battle.

Task: Who has better development and by how much? **Hint 1:** Count White's developed pieces. **Hint 2:** Count Black's developed pieces. **Hint 3:** What is the difference? **Solution: White has much better development.** White: 2 knights developed plus 2 center pawns (4 moves spent productively). Black: 1 knight developed, 0 other pieces (1 move spent productively). White leads by 3 tempi. Black needs to catch up fast.

Exercise 7.13 **Position:** White has castled and developed aggressively. Black has not castled.

Task: Who has better development? What should Black do about it? **Hint 1:** Count pieces for both sides, including castling. **Hint 2:** White has castled. Black has not. **Hint 3:** What is Black's most urgent move? **Solution: White has better development.** White: 3 pieces developed + castled (4 productive moves). Black: 2 pieces developed, king still on e8 (2 productive moves).

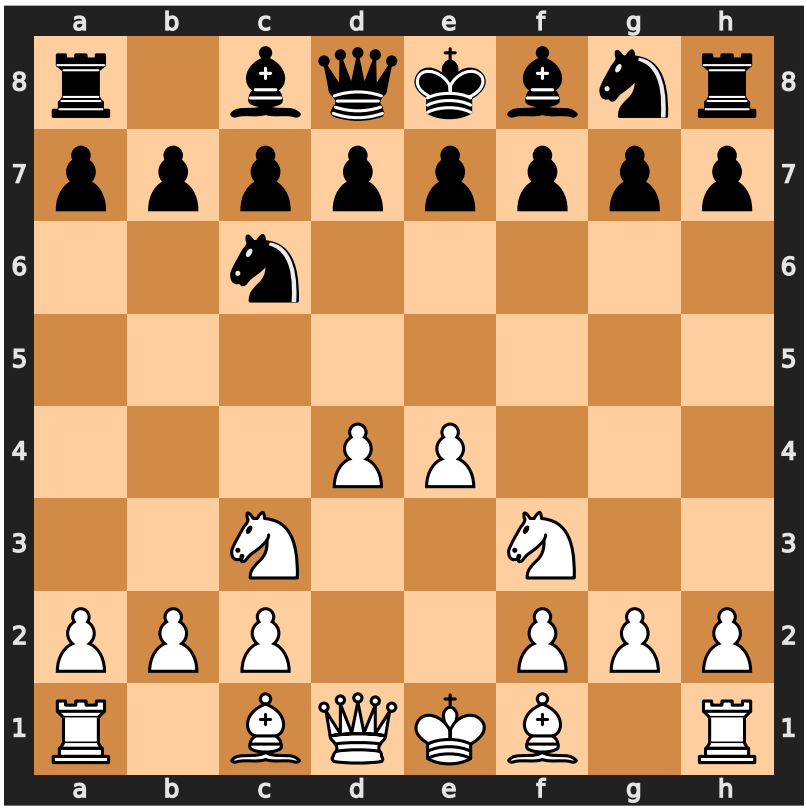

Figure 17.25: Chess Position

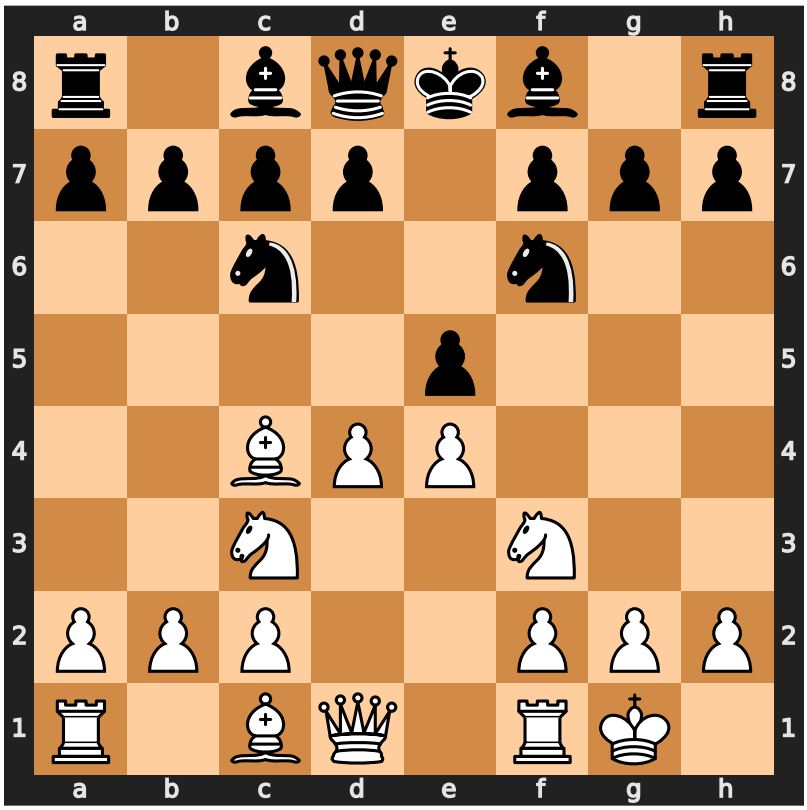

Figure 17.26: Chess Position

Black's most urgent move: **develop a bishop (Be7 or Bc5) and castle as soon as possible.** Every move Black delays castling, the danger grows.

Exercise 7.14 **Position:** An unusual situation where Black is ahead.

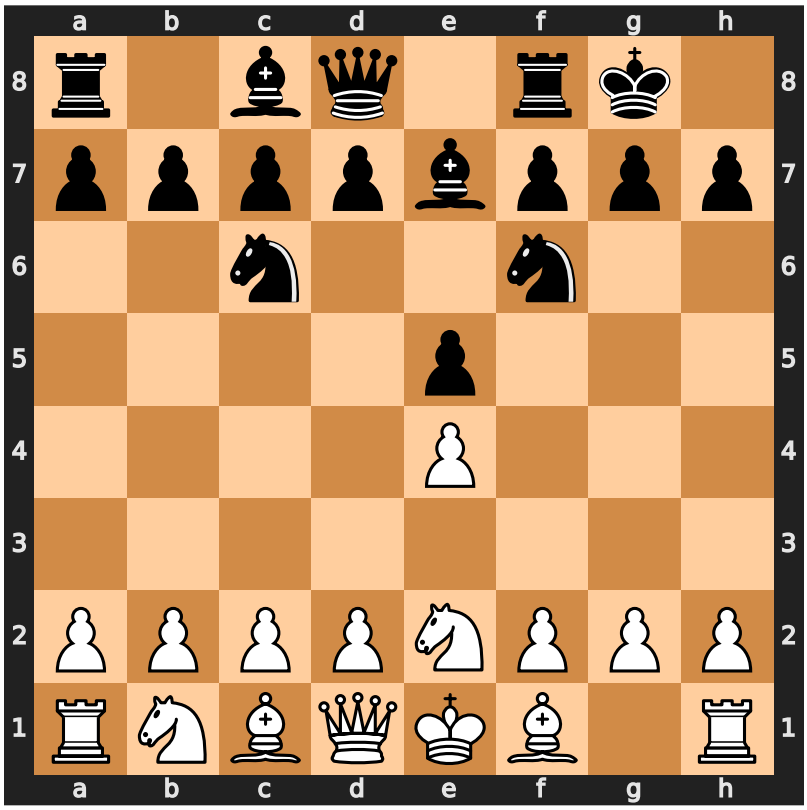

Figure 17.27: Chess Position

Task: Who has better development? **Hint 1:** Count Black's developed pieces. **Hint 2:** Count White's developed pieces. **Hint 3:** Who has castled? **Solution: Black has MUCH better development!** Black: 3 pieces developed (Nc6, Nf6, Be7) + castled = 4 productive moves. White: 1 piece developed (Ne2 on a mediocre square), has NOT castled = 1 productive move. Black leads by 3 tempi. White is in trouble and needs to develop urgently.

Exercise 7.15 **Position:** A tricky position where material and development disagree.

Task: Both sides have 3 pieces developed. Who has the better position, and why? **Hint 1:** Development is equal. Look deeper. **Hint 2:** Who can castle sooner? **Hint 3:** Consider the pawn center and piece activity. **Solution: White has the slightly better position** despite equal piece count. Reason: White can castle immediately (O-O), while Black's king is still in the center and will take at least one more move to castle (after …Be7). White's center (d3+e4 vs d5+e5) is solid, and the Bg5 pin on the f6 knight creates real pressure. Small advantages add up.

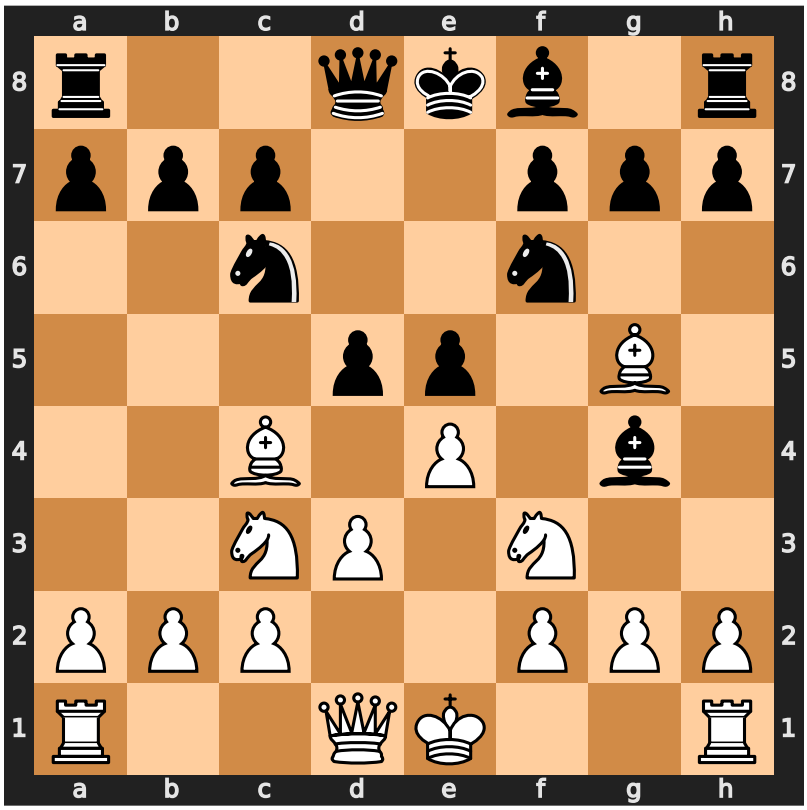

Figure 17.28: Chess Position

17.9.3 Section C: Find the Opening Mistake (Exercises 7.16–7.20)

Exercise 7.16 **Position:** Black has just played 3…Qf6 in the position below.

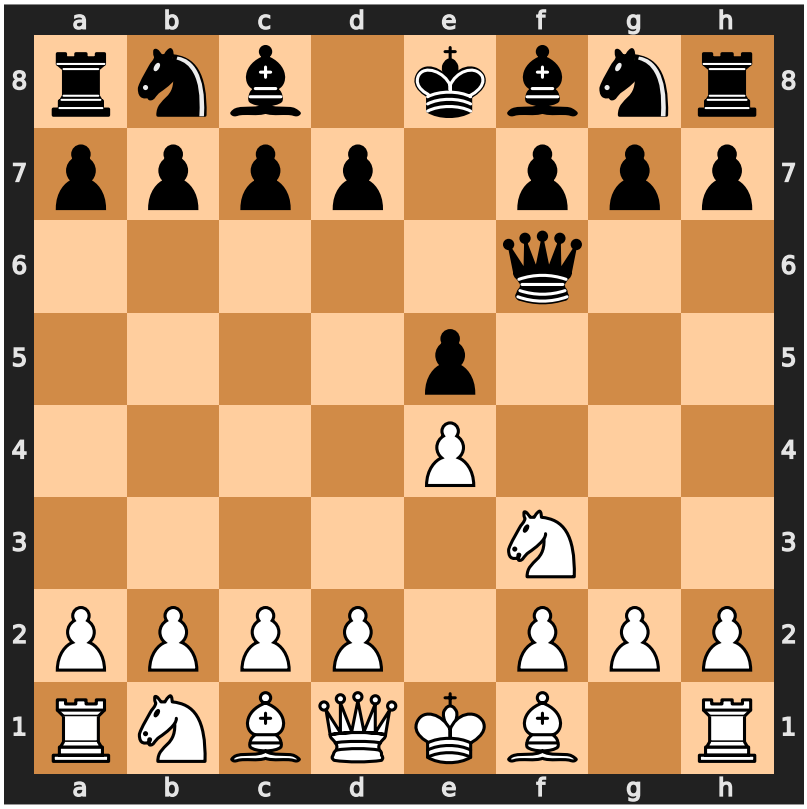

Figure 17.29: Chess Position

Task: What opening mistake did Black make? **Hint 1:** Look at the queen. **Hint 2:** Is this too early for the queen? **Hint 3:** What square does the queen block? **Solution: Black brought the queen out too early AND put it on f6, which blocks the f6 square for the knight.** The g8-knight's best square is f6, but the queen is sitting there. Black will have to move the queen again, wasting a tempo, and the knight will take extra time to develop.

Exercise 7.17 **Position:** White has played 1.e4 e5 2.Nf3 Nc6 3.Nf3-g5?! (moving the knight a second time).

Task: What mistake did White make? **Hint 1:** Where was the knight before? **Hint 2:** How many times has the knight moved? **Hint 3:** What principle did White violate? **Solution: White moved the knight twice** (f3 then g5) instead of developing a new piece. This wastes a tempo. 3.Bc4, 3.Bb5, or 3.Nc3 would all develop a NEW piece. White fell behind in development for a speculative knight sally.

Exercise 7.18 **Position:** White has played: 1.e4 e5 2.d3 d6 3.a3?! a6 4.h3?! h6.

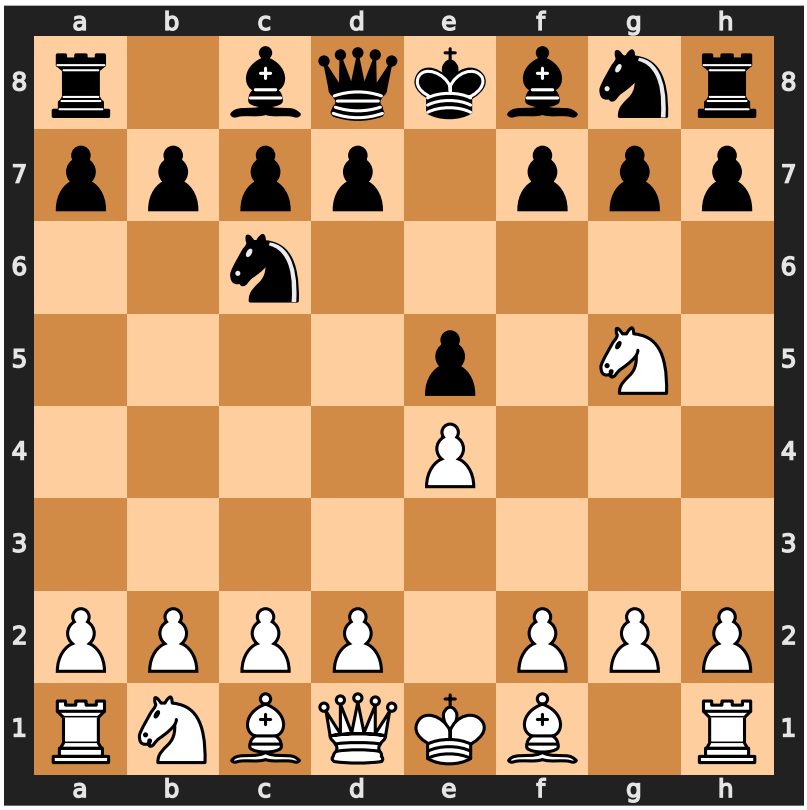

Figure 17.30: Chess Position

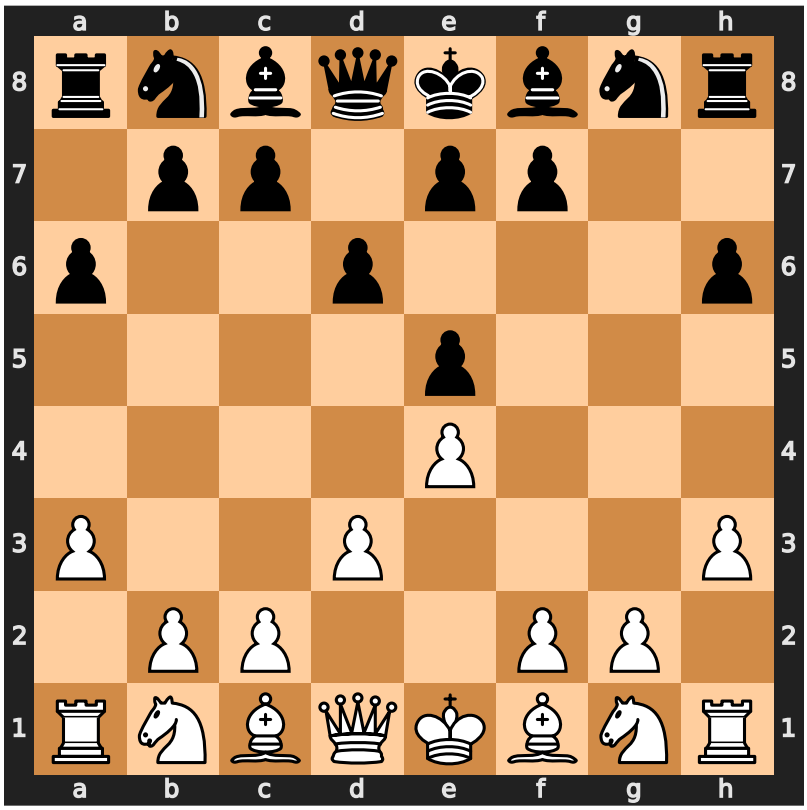

Figure 17.31: Chess Position

Task: BOTH sides made opening mistakes. What are they? **Hint 1:** Count the developed pieces for each side. **Hint 2:** How many pawn moves were played? **Hint 3:** Not a single piece has been developed! **Solution: Both sides made too many pawn moves and developed zero pieces.** After 4 moves each, neither side has a single knight or bishop in the game. Both players violated Golden Rule 1 (develop your pieces). They should have played Nf3, Nc6, Bc4, etc. instead of a3, h3, a6, and h6.

Exercise 7.19 **Position:** Black has played 1.e4 e5 2.Nf3 Nc6 3.Bc4 Nd4?! (moving the knight a second time to attack the bishop).

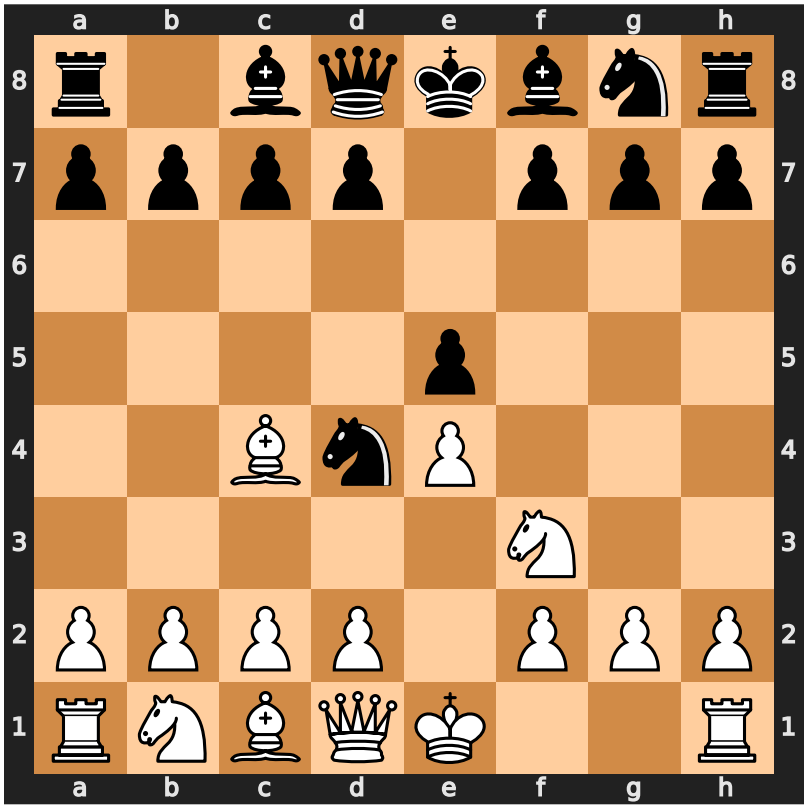

Figure 17.32: Chess Position

Task: What mistake did Black make? How should White respond? **Hint 1:** Black moved the knight twice. **Hint 2:** White can develop AND gain a tempo. **Hint 3:** What happens after Nxd4? **Solution: Black moved the c6-knight a second time to d4.** This wastes a tempo. White responds with **Nxe5!** (not Nxd4, which gives Black the tempo back). After Nxe5, White threatens Qh5 with a double attack on f7 and d4. Black's knight on d4 is misplaced and hard to defend. White gains material and development.

Exercise 7.20 **Position:** A common beginner trap. White played: 1.e4 e5 2.Qh5 (early queen!) Nc6 3.Bc4 g6?? (a natural-looking move, but…).

Task: White played the queen out early (a mistake in principle), but Black blundered. Find the winning move for White. **Hint 1:** Look at the f7 square. **Hint 2:** White's queen and bishop both

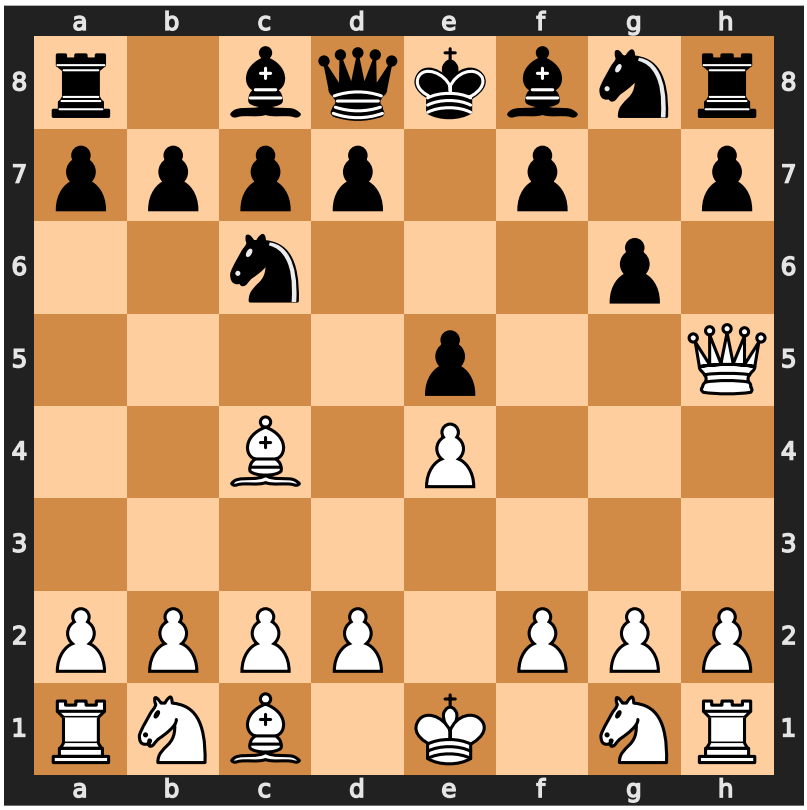

Figure 17.33: Chess Position

target f7. **Hint 3:** Is f7 defended? **Solution: Qxf7#!!** Scholar's Mate! The queen captures on f7 with checkmate. The king on e8 cannot escape. This is why you must be alert even when your opponent makes an opening "mistake" like bringing the queen out early. Always check for tactics! (Note: 3…g6 was the blunder. The correct defense was 3…Qe7 or 3…Nf6 or even 3…Qf6.)

17.9.4 Section D: Should White Castle Here? (Exercises 7.21–7.25)

Exercise 7.21 **Position:** White has: king on e1, both knights and bishops developed, rook on h1, queen on d1. Black has a similar setup. Nothing is threatening.

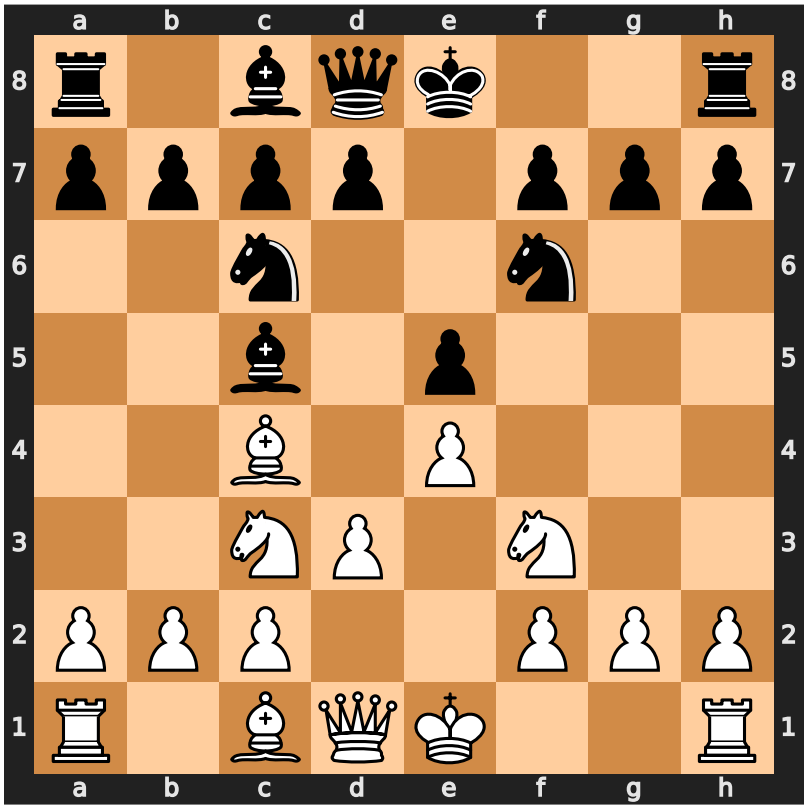

Figure 17.34: Chess Position

Task: Should White castle here? **Hint 1:** Are White's minor pieces developed? **Hint 2:** Is anything preventing castling? **Hint 3:** Golden Rule 3. **Solution: YES! Castle immediately with O-O.** All minor pieces are developed. Nothing prevents castling. There is no reason to delay. Get the king to safety now.

Exercise 7.22 **Position:** White has the king on e1 and only one piece developed (Nf3). The bishop on f1, knight on b1, bishop on c1 are all still home.

Task: Should White castle on this move? **Hint 1:** CAN White castle right now? **Hint 2:** What pieces are between the king and the rook? **Hint 3:** The bishop on f1 blocks castling. **Solution:**

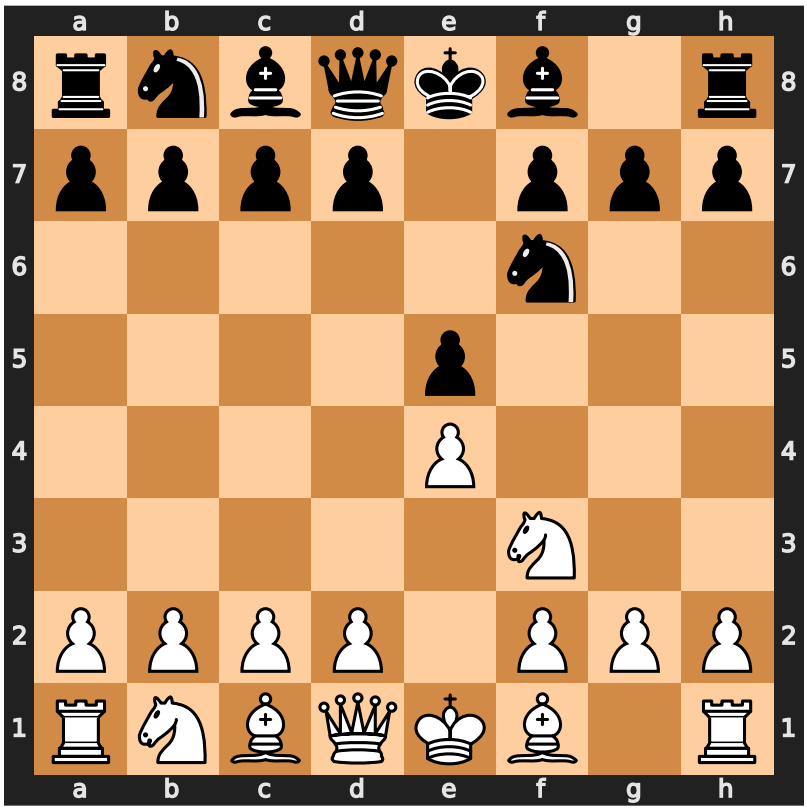

Figure 17.35: Chess Position

White CANNOT castle yet. The f1-bishop is in the way. White must develop the bishop first (Bc4, Bb5, or Be2) before castling is possible. Do so on the next move, then castle the move after.

Exercise 7.23 **Position:** White has developed both knights and the light-squared bishop. The dark-squared bishop is still on c1. White CAN castle.

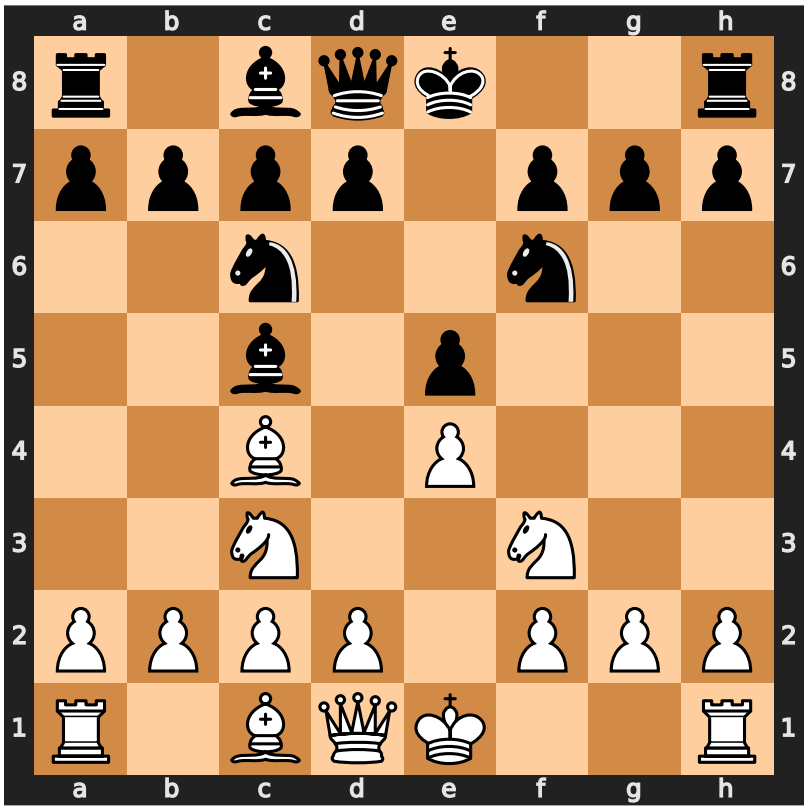

Figure 17.36: Chess Position

Task: Should White castle, or develop the c1-bishop first? **Hint 1:** Is the king safe on e1 right now? **Hint 2:** Is there any tactical danger? **Hint 3:** Think about priorities. Which Golden Rule is most urgent? **Solution: Castle! (O-O)** King safety comes first. The c1-bishop can be developed AFTER castling. If you wait to develop the bishop, your opponent might open the center and expose your king. Castle first, develop later. Safety is the priority.

Exercise 7.24 **Position:** White has developed all pieces. The center is open. Black's pieces are aiming at White's uncastled king.

Task: White has a STRONG development but forgot to castle. Is this dangerous? **Hint 1:** Look at the open e-file. **Hint 2:** Black has a rook on f8 and a bishop on g4 pinning the knight. **Hint 3:** If the center opens further, the king on e1 will be a target. **Solution: YES, this is dangerous! White must castle immediately.** The Bg4 pin is annoying, and if Black manages to open the e-file with …dxe4, the king on e1 could face a direct attack from the rook. White should play **O-O** right now, before it is too late. This is a perfect example of why you should not delay castling.

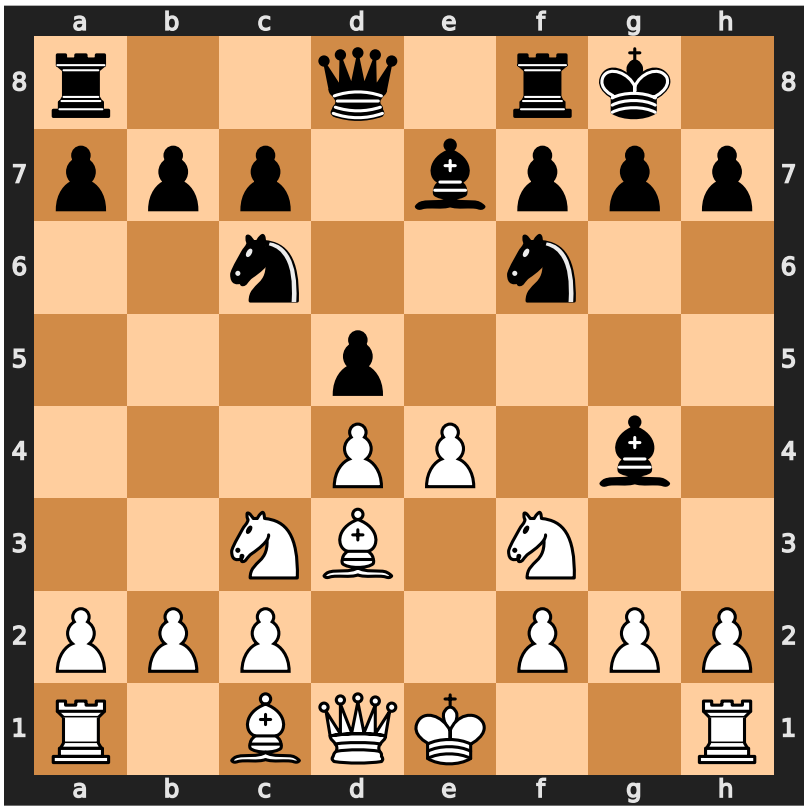

Figure 17.37: Chess Position

Exercise 7.25 **Position:** White has developed three pieces and can castle. But White also has a chance to play Nxe5, winning a pawn. Which is better?

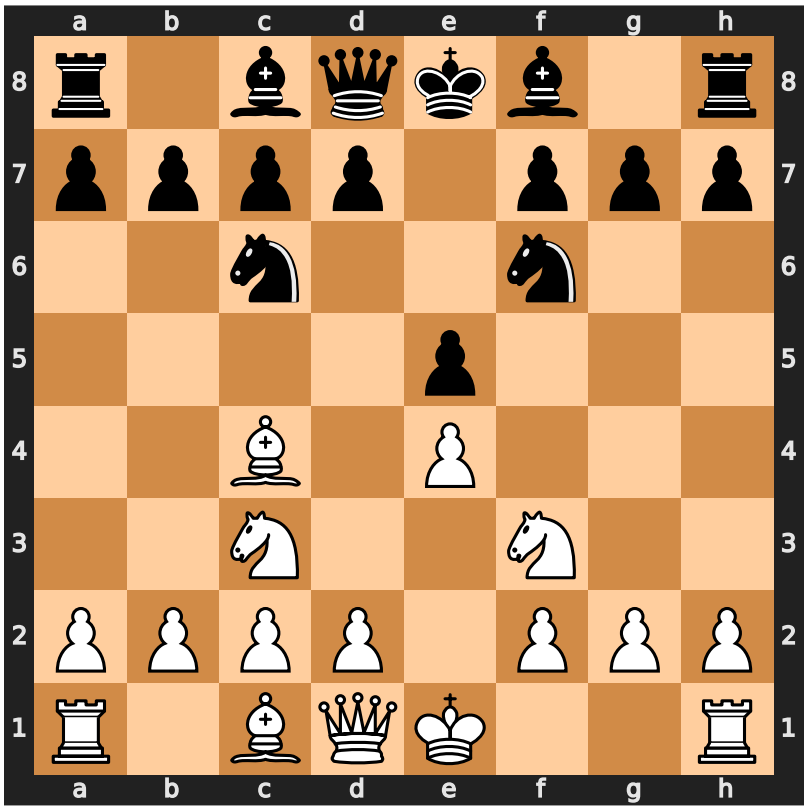

Figure 17.38: Chess Position

Task: Should White castle (O-O) or grab the pawn (Nxe5)? **Hint 1:** Is Nxe5 safe? What happens after Nxe5 Nxe5? **Hint 2:** After Nxe5, Black can play …d5! attacking the bishop. **Hint 3:** After …d5, Black gains the center and develops with tempo. Was the pawn worth it? **Solution: Castle! (O-O)** is better. After Nxe5 Nxe5, Black plays d5! with a strong center, attacking the bishop on c4 and gaining a tempo. White has won a pawn but lost the center and the initiative. Castling keeps the position balanced and the king safe. Do not grab pawns when you can castle.

Castling exercises done. You are over halfway through. Keep going, or take a break and come back.

17.9.5 Section E: What's White's Best Plan After the Opening? (Exercises 7.26–7.30)

Exercise 7.26 **Position:** White has castled, developed all pieces, and connected the rooks. The position is quiet.

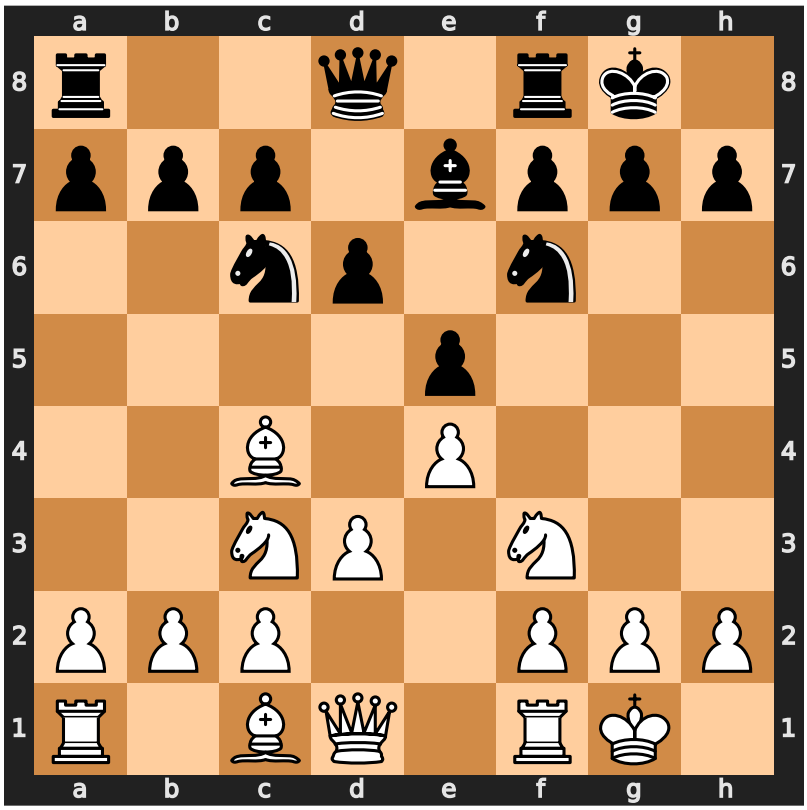

Figure 17.39: Chess Position

Task: The opening is over. What should White's first middlegame idea be? **Hint 1:** Look for the least active White piece. **Hint 2:** The c1-bishop is still on its starting square. **Hint 3:** Where should it go? **Solution: Develop the c1-bishop!** Play Be3 or Bg5. The bishop is the only piece still on its starting square. Placing it on e3 supports a future d4 push and controls key squares. After this, White's development is truly complete.

Exercise 7.27 **Position:** White has fully developed. Black has a weakness on d6. Both sides have castled.

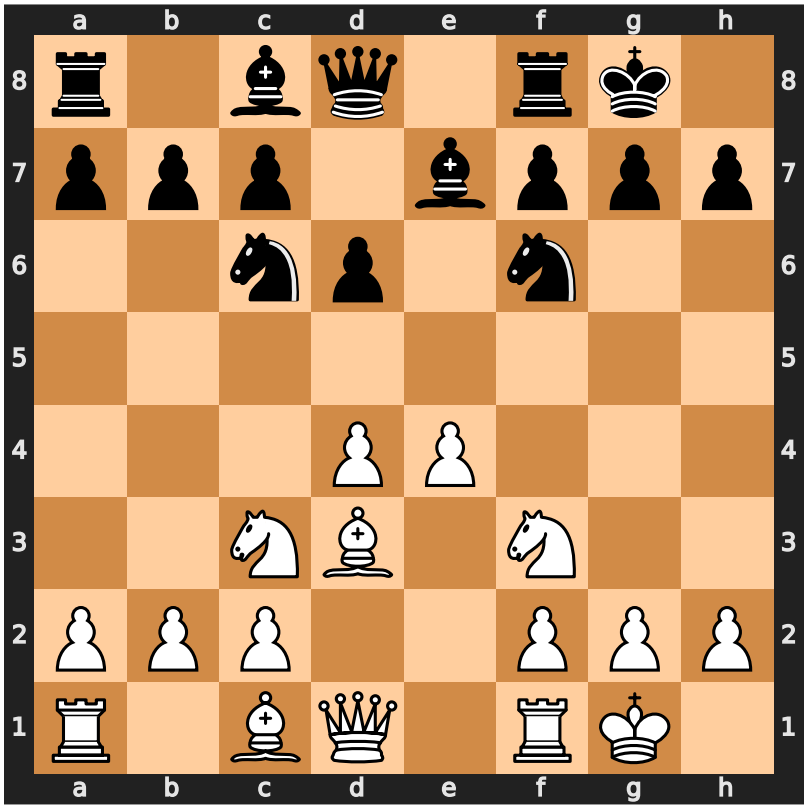

Figure 17.40: Chess Position

Task: What is White's best plan? **Hint 1:** Look at Black's pawn structure. **Hint 2:** The d6 pawn is a potential weakness. **Hint 3:** How can White put pressure on d6? **Solution: Target the weak d6 pawn.** White can play Bf4 (attacking d6 directly), followed by Qd2 or Nd5 to increase pressure. Placing a rook on d1 also adds to the pressure. When you see a weakness, aim your pieces at it. That is the beginning of a middlegame plan.

Exercise 7.28 **Position:** Both sides have castled and developed. The center is locked (pawns on e4/d4 vs e5/d5). No immediate tactics.

Task: What is White's best plan when the center is locked? **Hint 1:** You cannot break through in the center (it is locked). **Hint 2:** Where should you attack instead? **Hint 3:** Think about the flanks (kingside or queenside). **Solution: Attack on the flanks.** When the center is locked,

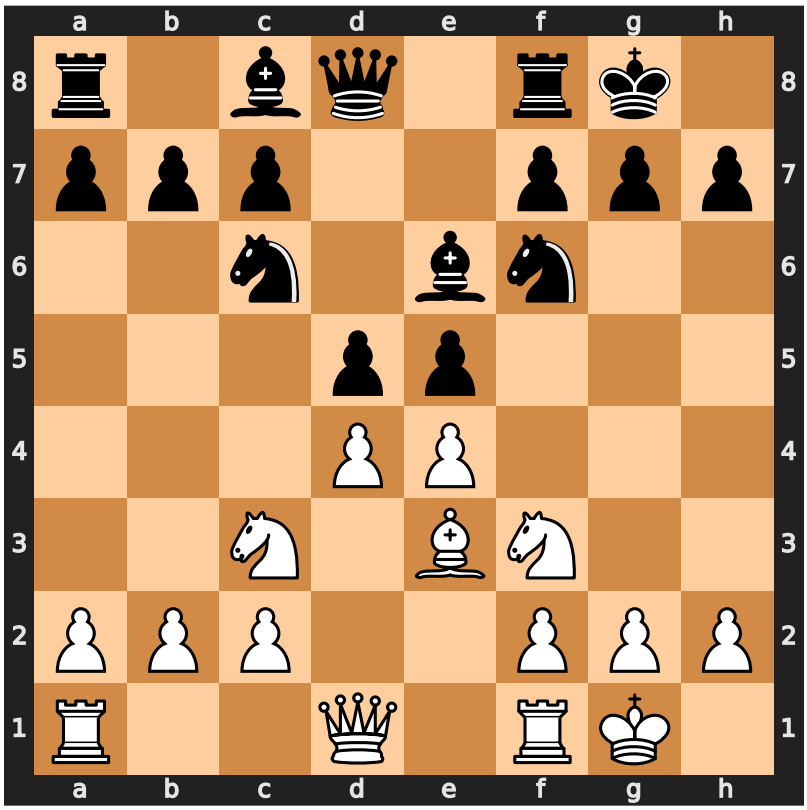

Figure 17.41: Chess Position

look for a pawn advance on the kingside (f4, g4) or queenside (a3, b4, c5). White might play Nd2 followed by f4, trying to open lines on the kingside. The side with more space on a particular flank should attack there.

Exercise 7.29 **Position:** White has completed development and has an open e-file. Where should the rook go?

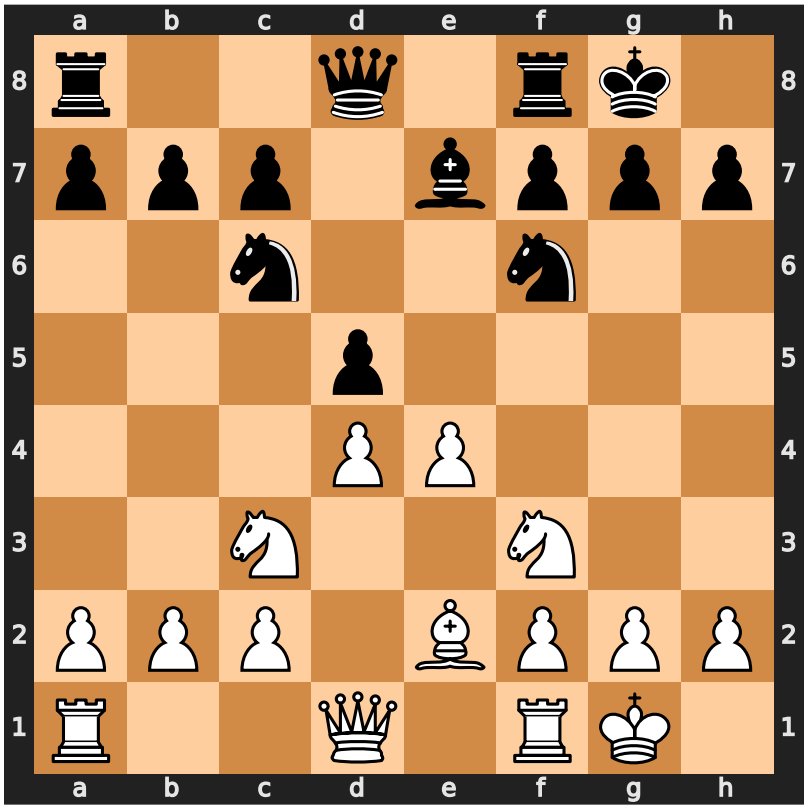

Figure 17.42: Chess Position

Task: Which rook goes to e1, and what is the strategic idea? **Hint 1:** An open file is a highway for rooks. **Hint 2:** The f1-rook can go to e1. **Hint 3:** Once on e1, the rook pressures the e-file and the e7 bishop. **Solution: Rfe1!** Place the f1-rook on the open e-file. This puts pressure on Black's e7 bishop and the entire e-file. The a1-rook stays on a1 for now, ready to swing to d1 or c1 as needed. Rooks belong on open files. Find them and use them.

Exercise 7.30 **Position:** White has completed development. Black's pieces are slightly passive. What is White's best improving move?

Task: Find the best plan for White. **Hint 1:** White's worst piece might be the c1-bishop. **Hint 2:** Is there a way to improve it? **Hint 3:** Think about the d5 square and piece redeployment (Nd5, for example). **Solution: Play a4! (preventing ...b5)** followed by **Bg5** (pinning the f6 knight) and potentially **Nd5** (placing a knight on the ideal outpost). White's plan is to prevent Black from expanding on the queenside (a4 stops ...b5) and then improve pieces. Bg5 creates the pin, and Nd5 occupies the best square on the board. This is proactive middlegame play.

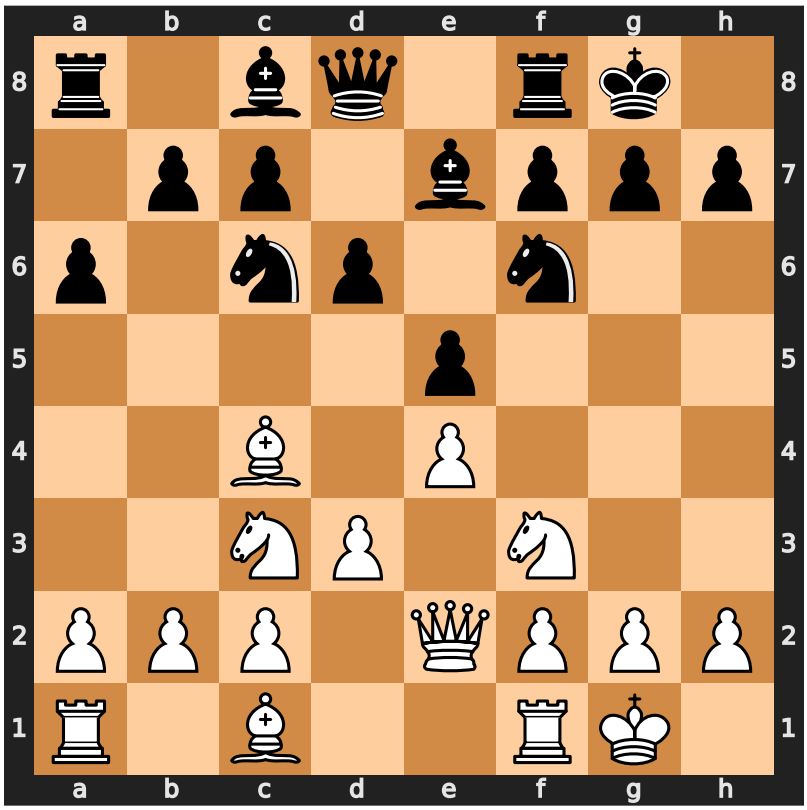

Figure 17.43: Chess Position

17.9.6 Section F: Punish the Early Queen (Exercises 7.31–7.35)

Exercise 7.31 **Position:** Black has played 2…Qh4 after 1.e4 e5, bringing the queen out on move 2.

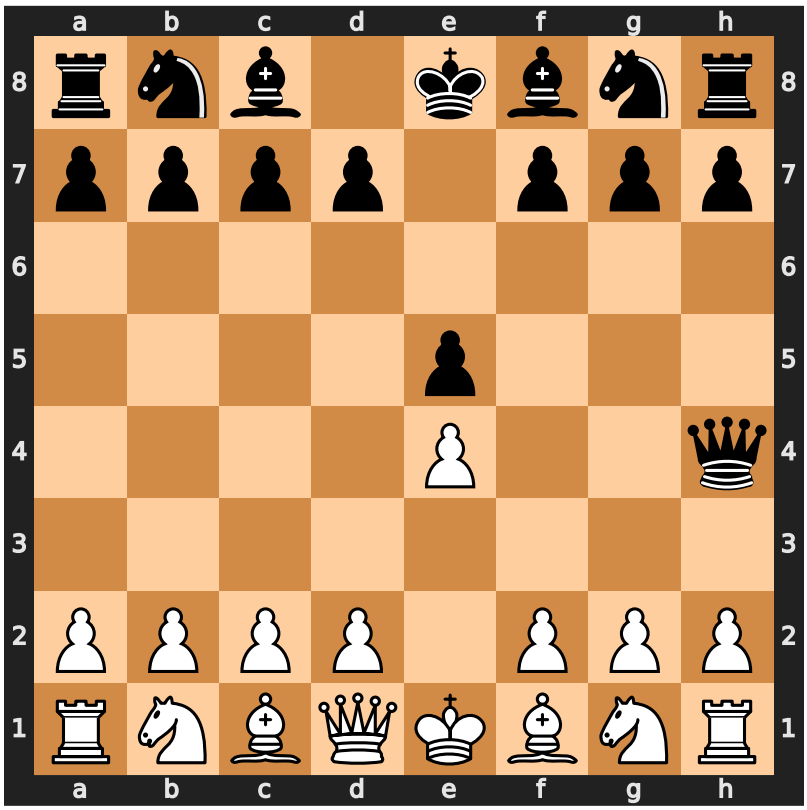

Figure 17.44: Chess Position

Task: How should White respond? **Hint 1:** Develop a piece that attacks the queen. **Hint 2:** A knight can go to a square that threatens the queen. **Hint 3:** The knight also defends key squares. **Solution: Nc3!** Develops a knight (Golden Rule 1) and prepares to chase the queen later. White can also consider Nf3, which directly attacks the queen and forces it to move. After Nf3, the queen must waste another tempo retreating. White gains development at the queen's expense.

Exercise 7.32 **Position:** White played 1.e4 e5 2.Qf3?! (queen out early). You are Black.

Task: How should Black develop while punishing White's early queen? **Hint 1:** Develop a knight. **Hint 2:** Put it on a square where it is protected and attacks the center. **Hint 3:** Does the knight create any threats against the queen? **Solution: Nf6!** Develops a knight to its best square, attacks the e4 pawn, and prepares to castle. If White plays Qxf7+, that is Scholar's Mate, so we must be careful. But after Nf6, Black defends against any immediate threats while developing naturally. White's queen on f3 is misplaced and will need to move again.

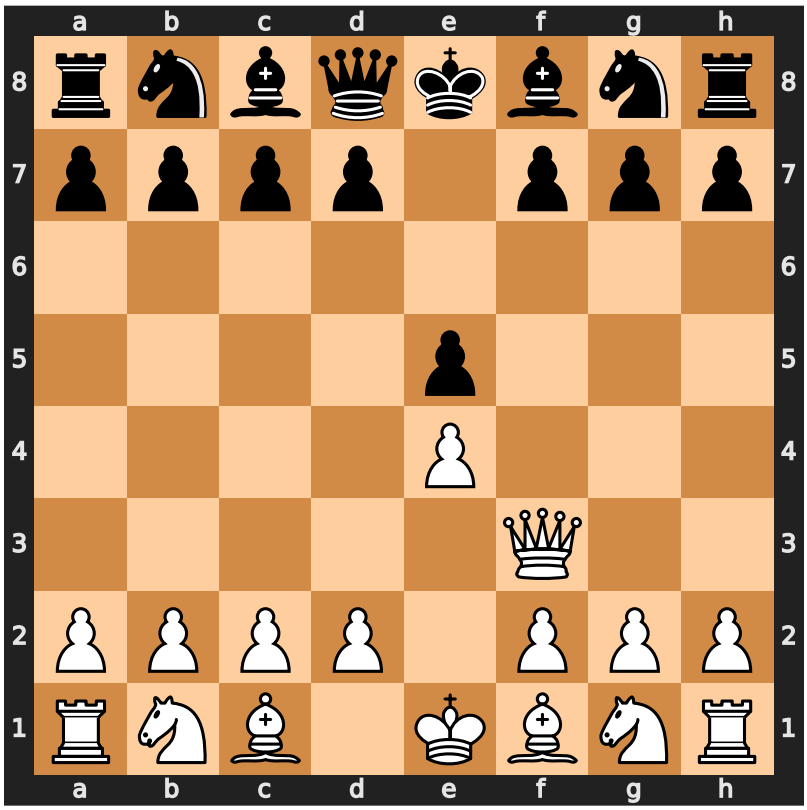

Figure 17.45: Chess Position

Exercise 7.33 **Position:** White has played 2.Qh5 and 4.Qxf7+ Ke7 in a Scholar's Mate attempt gone wrong. Now White's queen is on f7 but the king is safe on e7.

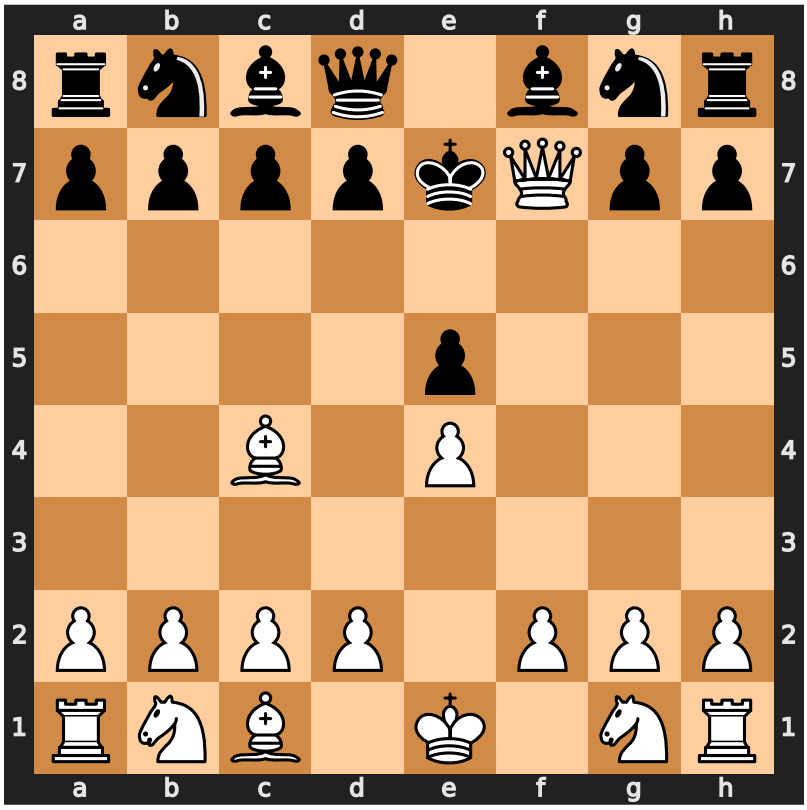

Figure 17.46: Chess Position

Task: Black's king moved to e7 to escape the check. How should Black continue to punish White's queen adventure? **Hint 1:** The queen on f7 is advanced and has few safe squares. **Hint 2:** Develop a piece that attacks the queen. **Hint 3:** Nf6 does double duty. **Solution: Nf6!** Attacks the queen (the knight on f6 threatens e4 and g4, limiting the queen's retreats) while developing. After the queen retreats, Black will develop rapidly with d5, Be6, Nbd7, etc. White wasted several tempi on the queen while Black develops with threats. Black is already better despite the king on e7.

Exercise 7.34 **Position:** White has brought the queen to g4 on move 3, attacking g7.

Task: Black played …g6 to defend g7. Is there a better way to handle White's queen? **Hint 1:** Developing while defending is ideal. **Hint 2:** Instead of g6 (a pawn move that weakens the kingside), what knight move defends AND develops? **Hint 3:** What about Nf6? **Solution: Nf6 would have been better than g6.** After Nf6, the knight develops AND attacks the queen on g4, forcing it to retreat. Black develops a piece and gains a tempo. The move g6 defended g7 but weakened the kingside (the dark squares around the king are now weaker) and did NOT develop a piece. Lesson: when you can develop while defending, always choose development.

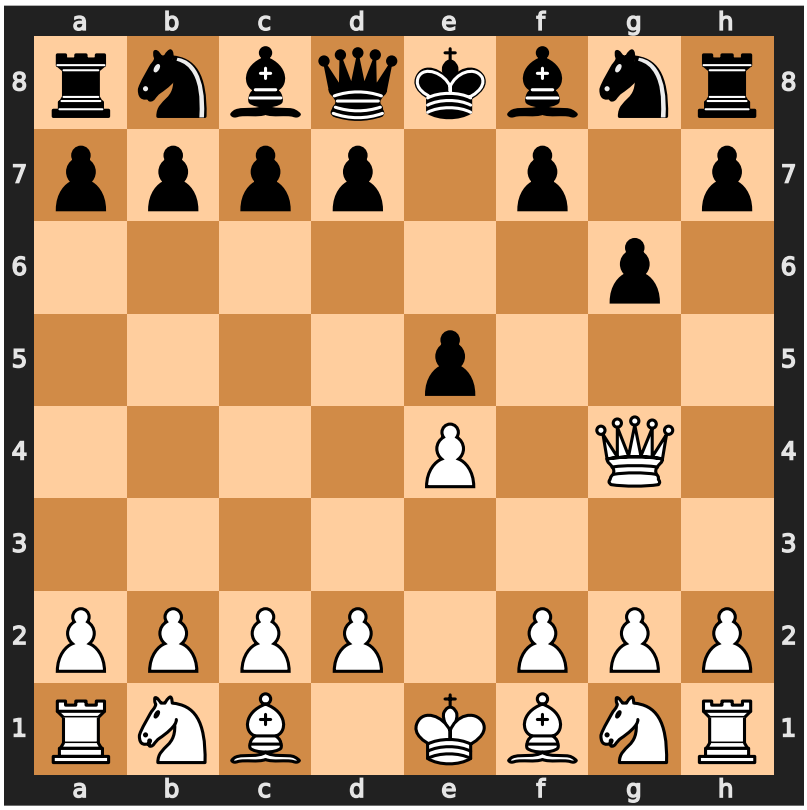

Figure 17.47: Chess Position

Exercise 7.35 **Position:** White brought the queen to h5 and the bishop to c4, threatening Scholar's Mate (Qxf7#). Black has defended with …g6 and …Bg7. Now the queen is stuck.

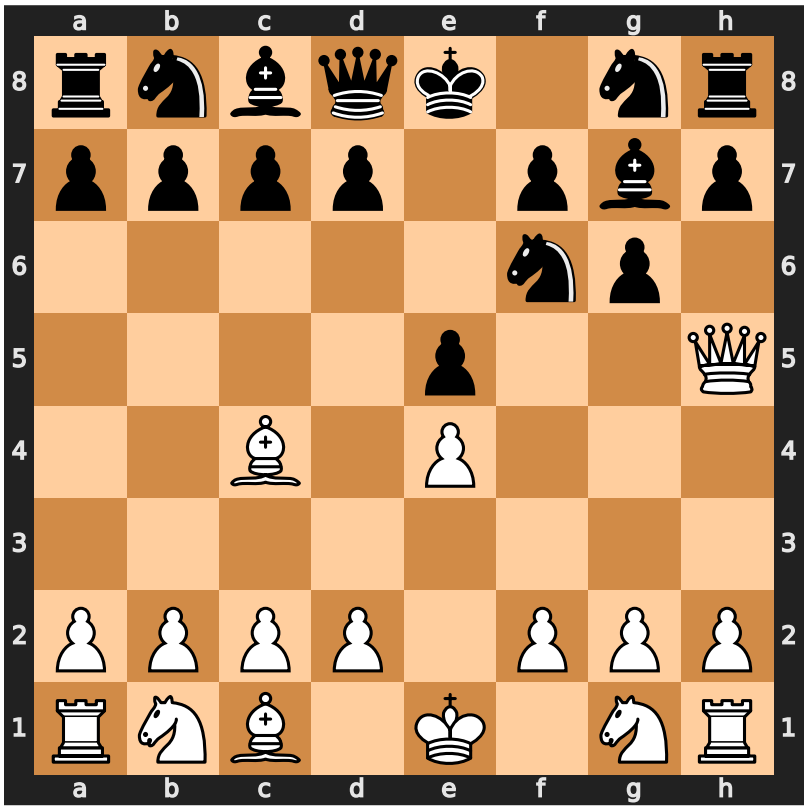

Figure 17.48: Chess Position

Task: White's queen is on h5 and the bishop is on c4. Black has defended well with g6, Nf6, and Bg7. Assess the position: who is better and why? **Hint 1:** Count developed pieces for both sides. **Hint 2:** White: queen (h5, misplaced) and bishop (c4). Black: knight (f6), bishop (g7). **Hint 3:** Who will castle first? Who has more active minor pieces? **Solution: Black is better!** White has the queen (on a poor square, it will be chased by …Nf6-h5 or …d6 and …Be6) and the bishop. That is 2 pieces, but the queen counts as a weakness here because it is exposed and will waste more time retreating. Black has 2 pieces developed (Nf6 and Bg7), the pawn on g6 guards the king, and Black can castle next move (O-O). After castling, Black will play d5, kicking the c4 bishop, and suddenly White's "attacking" setup collapses. The early queen came out to play and accomplished nothing.

All 35 exercises complete! Outstanding work. If you solved most of them, you truly understand opening principles.

17.10 Key Takeaways

1. **The Three Golden Rules** govern every opening: Develop your pieces, control the center (d4, d5, e4, e5), and castle your king to safety. Follow them in every game.

2. **Development is the most important factor in the opening.** A lead of 2-3 tempi in development can lead to a crushing attack. Count your developed pieces and compare them to your opponent's.

3. **Knights before bishops, and don't move the same piece twice.** Get your knights to f3/c3 (or f6/c6) first, then decide where the bishops belong. Every piece should move once to its best square.

4. **Don't bring the queen out early.** She will get chased around, and you will fall behind in development. Let the minor pieces do the early work.

5. **Castle before move 10** in every game. An uncastled king is a target. After castling, do not push the pawns in front of your king without a good reason.

6. **The opening is over when you have castled, developed your minor pieces, and connected your rooks.** Then it is time for the middlegame: look for tactics, make a plan, and improve your worst piece.

7. **Avoid the six deadly mistakes:** Moving a piece twice, bringing the queen out early, grabbing pawns, not castling, making too many pawn moves, and pushing edge pawns before developing.

17.11 Practice Assignment

At the board (20 minutes): 1. Play through the Opera Game (Game 7.1) from memory. Try to remember every move. If you get stuck, check the notation and continue. 2. Set up the starting position and play the first 8 moves of a game as White, following all three Golden Rules. Then play 8 moves as Black. Check: did you follow every rule?

Online (30 minutes): 1. Go to **lichess.org** and play 3 games. In each game, focus on one Golden Rule: - Game 1: Focus on development. Count your developed pieces after every move. - Game 2: Focus on center control. Place your pawns on e4/d4 and keep your pieces centralized. - Game 3: Focus on castling early. Castle before move 8 no matter what. 2. After each game, review the opening. Did you follow the Three Golden Rules? Where did you break them?

In your games (ongoing): 1. Before every game, say to yourself: "Develop, center, castle." Make it a habit. 2. After every game, check: "Did I follow the Three Golden Rules? Where did I go wrong?" 3. When reviewing your games, look at the moment the opening ended. Were your rooks connected? Were all your pieces developed? If not, identify the move where you went wrong.

17.12 Progress Check

If you can confidently: - Name the Three Golden Rules of the opening without looking them up - Develop your pieces to natural squares (Nf3, Nc3, Bc4, Bg5, O-O) in the first 8 moves - Castle before move 10 in most games - Recognize when your opponent brings the queen out too early and punish it by developing with tempo - Identify who has better development in any position by counting developed pieces - Explain why "a knight on the rim is dim"

…then you are ready for Chapter 8. You now understand how to start a chess game. You know what the great masters knew: develop, control the center, and get your king to safety. The rest is practice.

Estimated rating after mastering this chapter: 700–900

Chapter 7 complete. Seven chapters of Volume I done. You have come a long way from learning how the pieces move. You now understand rules, checkmates, tactics, and opening principles. That is a real chess foundation. Take a long break. Go outside. Play a game for fun. When you come back, Chapter 8 will deepen your understanding even further. Well done.

Chapter 7 complete. Three Golden Rules learned. 5 master games studied. 35 exercises solved. You are no longer guessing in the opening. You have a plan.

Chapter 18

Chapter 8: Your First Repertoire – London System and Pirc/Modern Basics

Rating Range: Beginner (600–1000)

> *"The opening is just the beginning of a long journey. Understand the ideas, and you will never get lost."* – Anatoly Karpov

---

18.1 What You'll Learn

- Why every chess player needs a **repertoire** and how to build your first one
- How to play the **London System** as White: a solid, principled setup you can use at any level
- How to play the **Pirc/Modern Defense** as Black against 1.e4: a flexible, fighting system
- The key **ideas and plans** behind each opening so you never feel lost after move 5
- How to handle your opponent's most common responses in both systems

This is the chapter where you stop guessing in the opening. You walk into every game with a plan. That changes everything.

18.2 Part 1: Why You Need a Repertoire

18.2.1 What Is an Opening Repertoire?

A repertoire is your set of prepared openings. It is the collection of systems you play as White and as Black. Think of it as your toolkit. A carpenter does not show up to a job wondering which tools to bring. The carpenter brings the same trusted tools every day, knows them inside and out, and gets the job done.

Your opening repertoire works the same way. You choose your systems. You learn the ideas behind them. You practice them in game after game. Over time, you know your openings so well that the first 5 to 10 moves feel natural. You spend your thinking time on the middlegame, where it matters most.

18.2.2 The Problem with Improvising

Without a repertoire, you are making it up as you go from move 1. Every game starts with the same question: "What should I play?" You try one thing this game, something else next game, and you never build deep understanding of anything.

This is exhausting and unreliable. You waste mental energy in the opening, and you reach unfamiliar positions every single time. Your opponent might know the position well, but you are seeing it for the first time. That is a disadvantage you do not need.

18.2.3 What You Need Right Now

At the beginner level, you need exactly two things:

1. **One system as White.** Something you play after 1.d4, regardless of what Black does.
2. **One system as Black.** Something you play against 1.e4, regardless of what White does.

That is all. Two openings. Two sets of ideas. Two structures you learn deeply.

We will cover Black's options against 1.d4 briefly at the end of this chapter and in full detail in Volume II. For now, we focus on the two systems that will carry you the furthest with the least memorization.

18.2.4 Why These Two Systems?

We chose the **London System** (White) and the **Pirc/Modern Defense** (Black) for three reasons:

1. They are SOLID. These openings do not rely on tricks or traps. They follow sound principles: develop your pieces, control the center, castle your king to safety. If your opponent plays well, you still have a good position.

2. They are PRINCIPLED. Every move in both systems has a clear purpose. You will understand WHY you play each move, not just memorize a sequence. Understanding beats memorization every time.

3. They are SCALABLE. These are not "beginner openings" you will outgrow. World Championship contender Vladimir Kramnik played the London System at the highest level. Garry Kasparov used the Pirc Defense as a surprise weapon against the world's best players. You can play these openings at 600 rating or 2600 rating. The ideas work at every level.

18.2.5 Understanding Over Memorization

Here is the most important idea in this entire chapter:

Learn the IDEAS behind the moves, and the moves come naturally.

You do not need to memorize 20 moves of theory. You need to understand what your pieces want to do and why they go to certain squares. When you understand the plan, you can figure out the right move even in positions you have never seen before.

A player who memorizes moves is helpless when the opponent deviates. A player who understands ideas adapts to anything.

We will learn both systems this way: idea first, then moves.

Take a moment. You are about to learn your first real opening system. Once you learn the London System, you will have a plan for every single game you play as White. That is huge. Ready? Let's go.

18.3 Part 2: The London System as White

18.3.1 What Is the London System?

The London System is a "system" opening. That means you play the same setup of pieces regardless of what your opponent does. Whether Black plays 1…d5, 1…Nf6, 1…e6, or 1…g6, your first seven or eight moves stay almost identical.

This is why the London is perfect for building a repertoire. One setup covers everything. You learn it once, and you can play it against any opponent, at any level, for the rest of your chess career.

The London System starts with 1.d4 and features an early Bf4. It was named after the 1922 London tournament where several top players adopted this setup. In the modern era, players like Kramnik, Rapport, and Carlsen have all used it at the highest level.

18.3.2 The London Setup: Piece by Piece

Set up your board. Place all the pieces in the starting position. Now, play through the following moves for White, one at a time. We will explain each move as we go.

Move 1: d4

Push the d-pawn two squares. This is your first move in every London System game. You grab space in the center and open lines for your queen and your dark-squared bishop.

Move 2: Bf4

Develop your bishop to f4. This is the London bishop, and it is the signature move of the entire system.

CRITICAL RULE: Always play Bf4 BEFORE you play e3. If you play e3 first, the bishop gets trapped inside the pawn chain and cannot reach f4. The dark-squared bishop must come out first. This is the single most important move order detail in the London System.

The bishop on f4 controls the important c1-h6 diagonal. It watches over key central squares, supports your d4 pawn, and can become an attacking piece aimed at the enemy king later.

Move 3: e3

Support your d4 pawn with e3. Now the pawn on d4 is solid. It has backup. The e3 pawn also opens a diagonal for your light-squared bishop, which will go to d3 on the next move.

Notice: e3 comes AFTER Bf4. The bishop is already outside the pawn chain, free and active.

Move 4: Nf3

Develop your knight to its best square. Nf3 controls the center (d4, e5), develops a piece, and prepares castling. This is a move you already know from the principles in earlier chapters: develop knights toward the center.

Move 5: Bd3

Place your light-squared bishop on d3. This is an excellent square. The bishop aims at the kingside, particularly the h7 pawn near the enemy king. It supports a future e3-e4 pawn push. And it works well with the knight on f3 and the bishop on f4.

Move 6: Nbd2

Develop your other knight to d2. Why d2 instead of c3? Two reasons:

First, c3 is reserved for the c-pawn. You want to play c3 to support d4 and prepare possible queenside expansion with b4. If the knight sits on c3, the c-pawn is blocked.

Second, the knight on d2 is flexible. It can go to f3 later (after the other knight moves to e5). It can go to b3. It can even reroute through f1 to e5 or g3 for a kingside attack. The d2 square keeps all options open.

Move 7: c3

Push the c-pawn to c3. This solidifies your d4 pawn, gives your queen the c2 square, and prepares a possible b4 push for queenside space. Your pawn structure is now rock-solid: d4, e3, c3 form a triangle that is very hard to break.

Move 8: O-O

Castle kingside. Your king is safe. Your rook moves to f1, where it supports the f-file and connects with the other rook.

You are fully developed.

Here is what the ideal London setup looks like:

This FEN shows a typical London position against Black's standard setup. Look at your pieces: - Pawns on c3, d4, e3: a fortress in the center - Bishop on f4: controlling the dark diagonal - Bishop on d3: aiming at the kingside - Knight on f3: guarding d4 and e5 - Knight on d2: ready to reroute - King castled safely on g1 - Rooks ready to connect on d1 and e1 (or f1)

Every piece has a job. Nothing is wasted. This is the beauty of the London System.

Good stopping point. Set up this position on your board and study it. Get familiar with where every piece stands. When you can set up the London from memory, you are ready for the next section.

18.3.3 Key London Ideas and Plans

Now that you know the setup, let's talk about what to DO from this position. A solid setup means nothing if you do not have a plan.

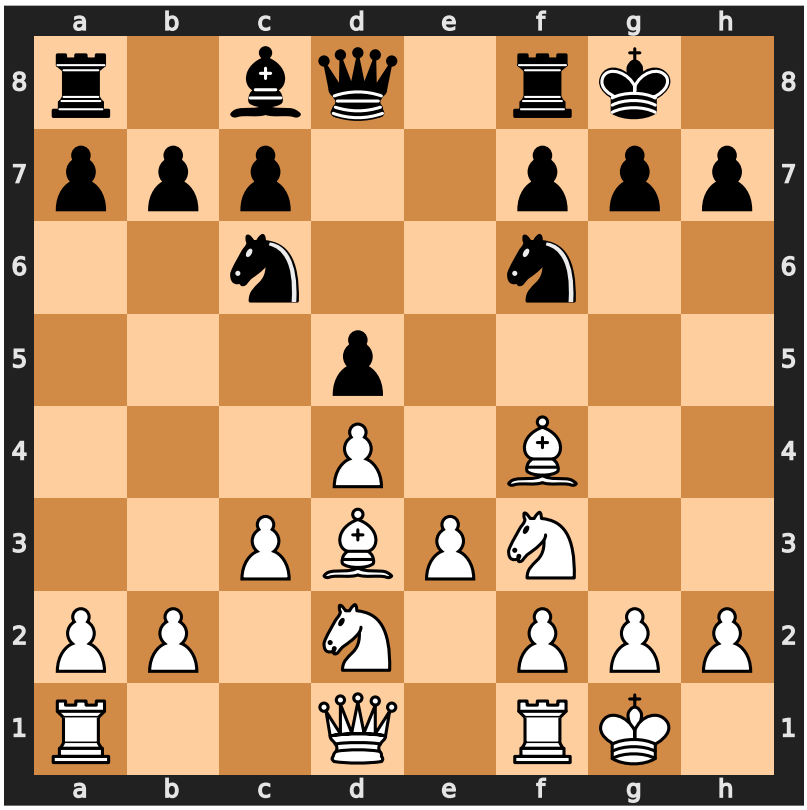

Figure 18.1: Chess Position

18.3.3.1 Plan 1: The e3-e4 Pawn Break

This is your most common plan. You want to push the e-pawn from e3 to e4, opening the center and giving your pieces more room.

How to prepare it: 1. Play Qe2 (supporting e4) 2. Play Rae1 (putting the rook behind the e-pawn) 3. Push e4!

When e4 happens, the center opens up. Your bishops become active. Your knights can jump to powerful squares. And your opponent has to react to your aggression.

Sometimes you can play e4 without Qe2 and Rae1, if the position allows it. But preparing it first is safer and more reliable.

18.3.3.2 Plan 2: The Ne5 Outpost

The e5 square is often available for your knight. A knight on e5 is a monster. It sits deep in enemy territory, controls key squares (d7, f7, c6, d3), and is hard to remove.

The knight often goes from f3 to e5. When that happens, your other knight (on d2) can move to f3 to take over guarding duties. This "knight relay" is a common London technique.

A knight on e5 is especially strong when it cannot be chased away by a Black pawn on f6. Watch for opportunities to plant your knight there.

18.3.3.3 Plan 3: Kingside Attack

When Black castles kingside, you can sometimes launch a direct attack on the king. The plan involves: 1. h3 (securing space and preventing …Ng4) 2. Qe2 or Qf3 (moving the queen toward the kingside) 3. g4 (aggressive pawn push) 4. Ne5 and Ndf3-g5 (bringing knights toward the king)

This is a more advanced plan, but at the beginner level, many opponents will not know how to defend against it. Even the threat of g4 can create panic.

18.3.3.4 Plan 4: Queenside Expansion

If the kingside is blocked, you can expand on the queenside: 1. b4 (grabbing space) 2. a4 (more space) 3. Qb3 (pressure on b7 and d5)

This plan works well when Black has played …c5 and you have exchanged pawns, giving you a half-open c-file for your rook.

18.3.4 Remembering the Plans

Here is a simple way to remember your four London plans:

1. **e4 break** – open the center
2. **Ne5 outpost** – plant a knight in enemy territory
3. **Kingside attack** – go after the king with h3, Qf3, g4
4. **Queenside expansion** – push b4, a4, grab space

In most games, you will use Plan 1 or Plan 2. Plans 3 and 4 are situational. But knowing all four gives you flexibility. When one plan is blocked, switch to another.

Good place to pause. You now know the London setup AND the plans behind it. That puts you ahead of most players at your rating level. They know moves. You know ideas. Take a break, then we will look at how the London handles Black's most common responses.

18.3.5 London vs Common Black Responses

The beauty of the London is that your setup barely changes. But you do need to know how to handle a few common responses from Black.

18.3.5.1 London vs 1...d5 (The Most Common Response)

After 1.d4 d5, Black mirrors your pawn push. This is the most common response you will face. Your plan is unchanged: 2.Bf4, 3.e3, 4.Nf3, 5.Bd3, and continue with the full setup.

Set up your board: 1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Bd6

Black develops the bishop to d6, attacking your London bishop. What do you do?

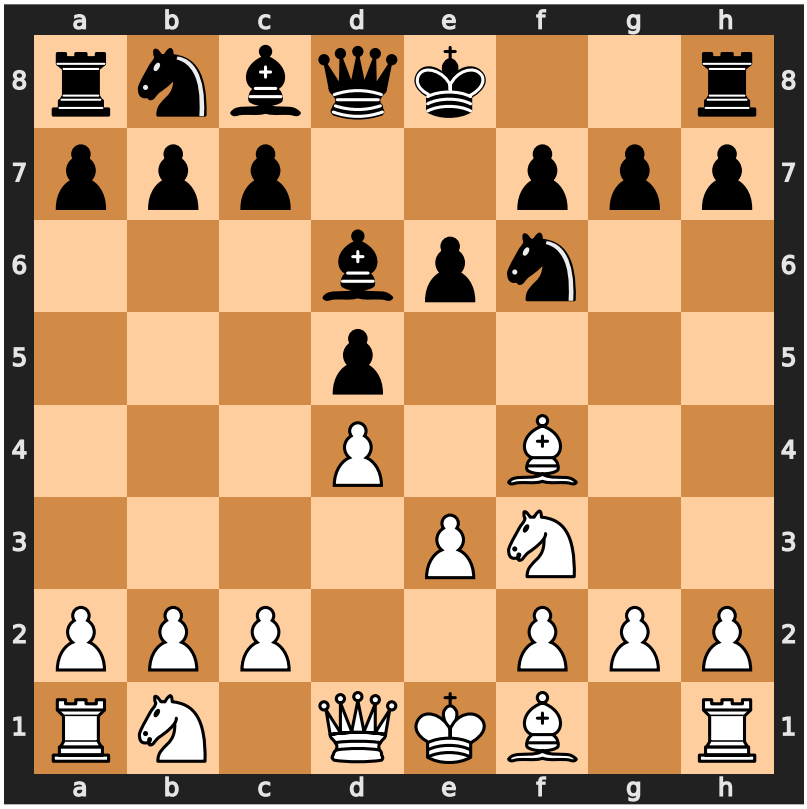

Figure 18.2: Chess Position

You have three good options: - **Bg3:** Retreat the bishop. It stays on a good diagonal (c7-g3) and is safe. - **Bxd6:** Trade bishops. This simplifies the position but gives you a comfortable game. - **Bg5:** Some players sidestep to g5, pinning the knight.

The best choice for beginners is **Bg3.** It keeps the bishop active and avoids early trades. After …Bxg3, you recapture with hxg3, opening the h-file for your rook. That h-file can become a weapon later in the game.

18.3.5.2 London vs 1...Nf6 (The Second Most Common)

After 1.d4 Nf6, Black develops a knight first. Your response: 2.Bf4, same as always.

Watch for one trick: Black might play …Nh5, attacking your bishop on f4. Do not panic. You can play Bg5, Be5, or Bg3. If Black plays …Nxg3, you get the open h-file, which is good for you.

Key tip: If Black plays …Nh5 early, the knight is on the edge of the board. It will need to come back to the center. Black has spent two moves (Nf6, Nh5) just to trade your bishop. That is two moves not spent on development. You are fine.

18.3.5.3 London vs 1...c5 (Benoni-Style)

After 1.d4 c5, Black attacks your d4 pawn right away. Do not panic about the tension.

Play 2.d5 (grabbing space), 2.e3 (keeping things solid), or 2.c3 (supporting d4). For beginners, 2.d5 is the simplest. It grabs central space, and you continue with Bf4, e3, Nf3, and the rest of the London setup.

If Black plays …cxd4, recapture with exd4 and keep your central pawn on d4. Your position remains solid.

18.3.5.4 London vs the King's Indian Setup (1...Nf6, 2...g6, 3...Bg7)

When Black fianchettoes the bishop to g7, be extra careful about your dark squares. Black's bishop on g7 is a powerful piece aimed at your queenside.

Your setup stays the same, but pay attention to: - Keep the pawn on d4 well-supported (c3 is important) - Consider h3 early to control the g4 square - The knight on e5 is especially valuable in these positions

Set up your board: 1.d4 Nf6 2.Bf4 g6 3.e3 Bg7 4.Nf3 O-O 5.Be2 d6 6.h3 Nbd7 7.O-O

Notice White chose Be2 instead of Bd3 here. Against the King's Indian setup, Be2 is often better because Bd3 can be a target for …Nh5 tricks and …e5 pawn pushes. Be2 is more flexible and keeps the bishop out of danger.

This is a good example of adapting the London setup slightly without changing the fundamental ideas.

18.3.5.5 Move Order Summary

Here is your London move order checklist:

Move	What to Play	Why
1	d4	Grab the center
2	Bf4	The London bishop – ALWAYS before e3
3	e3	Support d4, open line for Bd3

Move	What to Play	Why
4	Nf3	Develop, guard d4/e5, prepare castling
5	Bd3 (or Be2)	Active diagonal, support e4 plan
6	Nbd2	Flexible knight, keeps c3 open
7	c3	Fortress the center, prepare Qc2 or b4
8	O-O	King safety, connect rooks

Follow this order in every game. Adjust only when Black forces you to (for example, if Black attacks your Bf4 early).

You now know the London System inside and out. You have the setup, the plans, and you know how to handle Black's common responses. That is a complete opening system for White. Every time you sit down as White, you know exactly what to do. That confidence is worth more than any amount of memorization. Take a well-earned break.

18.4 Part 3: The Pirc/Modern Defense as Black

18.4.1 What Is the Pirc/Modern Defense?

The Pirc Defense (pronounced "peerts") is named after Slovenian Grandmaster Vasja Pirc. The Modern Defense is its close cousin. Together, they give you a flexible, fighting system against 1.e4.

The basic idea: against 1.e4, you play 1…d6, 2…Nf6, 3…g6, 4…Bg7. You let White occupy the center with pawns and then attack that center from the sides.

This is called a "hypermodern" approach. Classical chess says: "Occupy the center with pawns." Hypermodern chess says: "Let your opponent occupy the center, then tear it apart." Both approaches work. The Pirc/Modern uses the hypermodern philosophy.

Why is this a good choice for your repertoire?

Flexibility. The Pirc/Modern setup works against almost anything White plays after 1.e4. White can play aggressively or quietly, and your basic setup stays the same.

Fighting spirit. This is not a passive defense. You are coiled like a spring, waiting for the right moment to strike with …e5 or …c5. When you strike, the position explodes into activity.

Rich middlegames. The Pirc/Modern leads to complex, interesting positions where understanding matters more than memorization. This is exactly what we want for building chess skills.

Grandmaster approved. Kasparov played it as a surprise weapon. Seirawan, Nunn, and many modern grandmasters have used it. It is a legitimate defense at every level.

18.4.2 The Pirc/Modern Setup: Piece by Piece

Set up your board. Starting position. Black is playing against 1.e4.

Move 1: …d6 (after 1.e4)

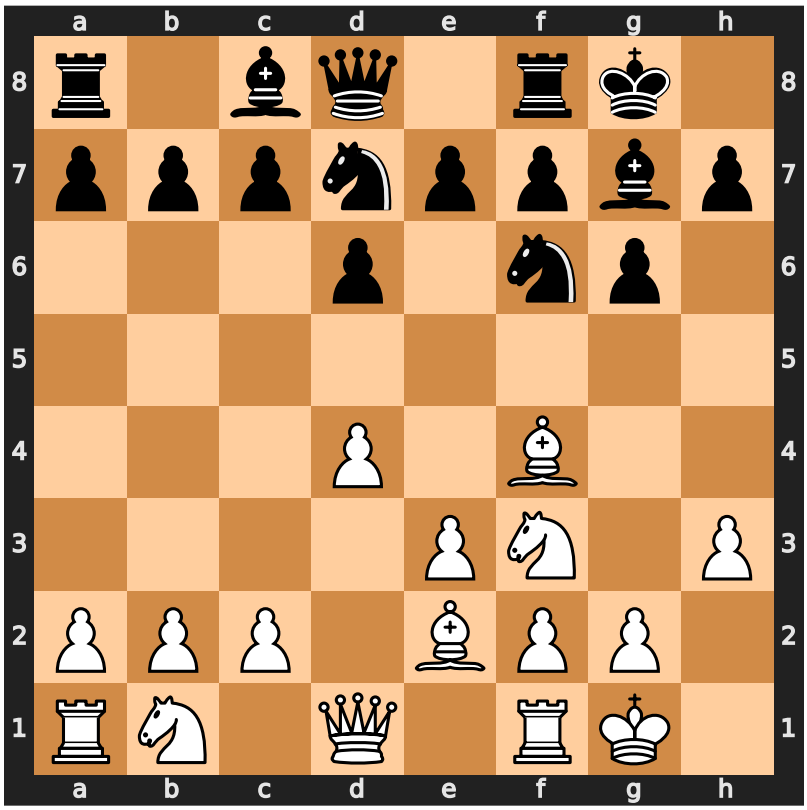

Figure 18.3: Chess Position

Push the d-pawn one square. This modest move has big ideas behind it. It prepares …Nf6 (attacking White's e4 pawn), keeps the center flexible, and opens a diagonal for the dark-squared bishop.

Why not 1…e5? There is nothing wrong with 1…e5. But it leads to open games where both sides need to know a lot of specific theory (Ruy Lopez, Italian Game, Scotch Game, and more). The Pirc sidesteps all of that. You play YOUR system, on YOUR terms.

Move 2: ...Nf6 (after White plays 2.d4)

Develop the knight to f6. It attacks the e4 pawn and controls the center. White has to decide what to do about the attack on e4. Most commonly, White will play 3.Nc3 to defend it.

Move 3: ...g6 (after White plays 3.Nc3)

Prepare to fianchetto the bishop. The g6 pawn also helps control the center (the f5 and h5 squares) and gives the king a safe shelter after castling.

Move 4: ...Bg7

Place the bishop on g7. This is your most powerful piece in the Pirc/Modern. The bishop on g7 is a monster on the long diagonal (a1-h8). It looks at the center, the queenside, and can even support kingside attacks. It applies constant pressure on White's d4 pawn.

As Nimzowitsch taught us, a piece can control the center without sitting in the center. The g7 bishop does exactly this. It controls d4 and e5 from a distance, like a sniper.

Move 5: ...O-O

Castle kingside. Your king is tucked safely behind the g6 pawn and the g7 bishop. This is a very solid defensive setup. The king on g8, with the bishop on g7 and pawn on g6, is hard to attack.

After castling, your plan is to strike back.

Set up your board: A typical Pirc position after 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O

Look at Black's position. The setup is compact and solid. White has more space (pawns on d4 and e4), but Black's pieces are well-placed, and the g7 bishop is pointing right at the center.

Now Black needs a plan to fight back.

You have the Pirc/Modern setup. Before we talk about plans, set this position up on your board. Get familiar with where every Black piece sits. This is your home base as Black against 1.e4. Come back when you are comfortable with it.

18.4.3 Key Pirc/Modern Ideas and Plans

18.4.3.1 The g7 Bishop: Your Best Friend

The bishop on g7 is the star of the Pirc/Modern. It sits on the long diagonal (a1 to h8) and pressures the entire center. Here is why it matters:

- It attacks White's d4 pawn
- It controls the e5 square
- It supports a future …e5 or …c5 push
- It defends the king along the diagonal

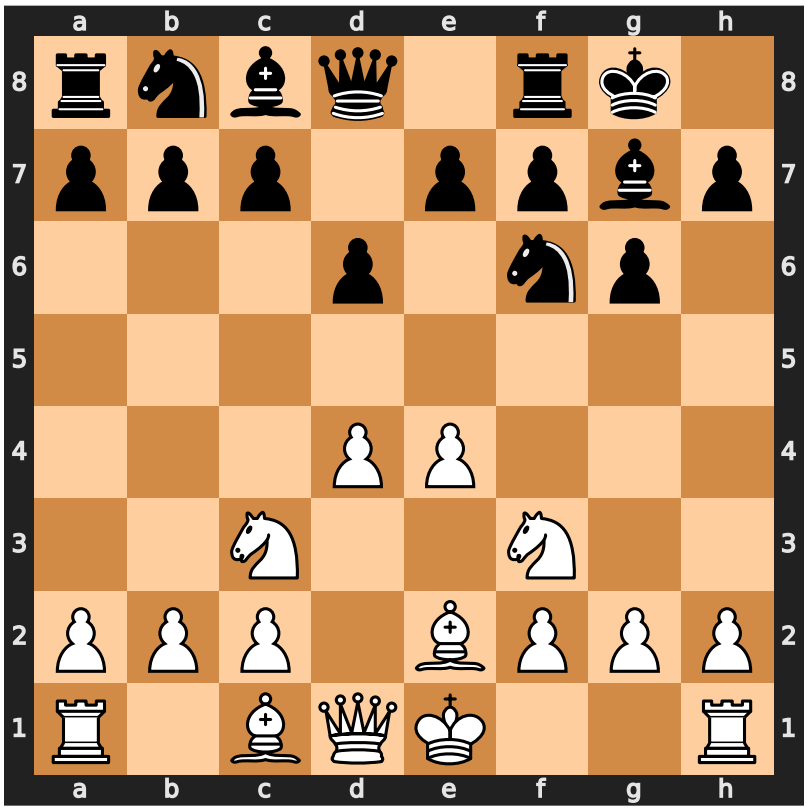

Figure 18.4: Chess Position

Never trade this bishop unless you get something very valuable in return. It is the heart of your position. Guard it. Use it. Build your plans around it.

18.4.3.2 Plan 1: Strike with ...e5

The most common Pirc counterattack is pushing …e5 to challenge White's center.

When to play …e5: - After you have castled and developed your pieces - When your knight is on d7 or c6 (supporting …e5) - When White does not have a strong response like d5

What happens after …e5: If White plays dxe5, you recapture with dxe5, and the center opens up. Your g7 bishop becomes even more active on the open diagonal. If White does not take, you create tension in the center that works in your favor.

Warning: Do not play …e5 too early. If you push …e5 before you are fully developed, White might take advantage. Develop your pieces first, then strike.

18.4.3.3 Plan 2: Strike with ...c5

The other main counterattack comes from the queenside. Playing …c5 attacks White's d4 pawn from a different direction.

When to play …c5: - When …e5 is not available or not good yet - When White has overextended in the center - After moves like …a6 (preparing …b5) or …Qa5 (putting pressure on White)

The …c5 push is especially effective when White has played f3 or f4 (weakening the a7-g1 diagonal, which your g7 bishop covers).

18.4.3.4 Plan 3: The Rubber Band Principle

This is the most important strategic idea in the Pirc/Modern:

Let White overextend, then snap back.

Imagine a rubber band. The more you stretch it, the more forcefully it snaps back. In the Pirc/Modern, White has more space. White has pawns on d4 and e4, sometimes even on f4. This looks scary, but those pawns are stretched thin. They need pieces to support them.

Your job is to wait patiently, develop all your pieces, and then attack White's center at the right moment. When the center collapses, White's entire position falls apart.

This requires patience. It requires trust. You need to believe that your position is strong even when it looks cramped. If you have followed the Pirc setup correctly, you ARE strong. The counterattack will come.

18.4.3.5 Plan 4: ...b5 and Queenside Play

In some positions, you can expand on the queenside with …a6, …b5, and …Bb7. This develops your last piece (the c8 bishop, which is often the hardest piece to develop in the Pirc), creates space on the queenside, and puts pressure on the center from yet another angle.

18.4.4 Remembering the Plans

Here are your four Pirc/Modern plans:

1. **...e5 break** – strike the center directly
2. **...c5 break** – attack the center from the queenside
3. **Rubber band** – let White overextend, then snap back
4. **...b5 expansion** – develop the queen's bishop and grab queenside space

In most games, you will use Plan 1 or Plan 2. Plan 3 is the underlying philosophy that governs your timing. Plan 4 is for when the center is locked.

You are doing great. You now have a complete opening system for Black too. Two systems: one as White (London), one as Black (Pirc/Modern). Take a break. When you come back, we will look at how the Pirc handles White's most common setups.

18.4.5 Pirc/Modern vs Common White Setups

Your basic Pirc setup (1…d6, 2…Nf6, 3…g6, 4…Bg7, 5…O-O) works against everything. But White has several ways to set up, and you should know the character of each one.

18.4.5.1 vs The Classical System (Nf3, Be2)

White plays: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O

This is the most common and solid setup for White. No fireworks, just steady development. Your plan: play …c6 (supporting …d5 or preparing …b5), or play …Nbd7 followed by …e5 when ready.

Set up your board: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O 6.O-O c6 7.h3 Nbd7

Black is solid. The knight on d7 prepares …e5. The pawn on c6 supports the center. This is a comfortable position for Black with clear plans.

18.4.5.2 vs The Austrian Attack (f4)

White plays: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.f4

This is aggressive. White pushes the f-pawn to f4, grabbing more space and preparing a kingside attack. This looks scary, but it has a weakness: the e1-a5 diagonal is weakened (no pawn on e3 or f2 to block it), and White's king is less safe.

Your plan: develop normally with …Bg7, …O-O, then look for …c5 or …e5 to strike back at the overextended center.

Key tip: Against the Austrian Attack, timing is everything. Strike back at the center before White builds up too much attacking force. Do not wait too long.

18.4.5.3 vs f3 Systems (Samisch-Type)

White plays: 1.e4 d6 2.d4 Nf6 3.f3

White supports e4 with f3, planning to build a big center with Be3 and Qd2. The f3 pawn is solid but takes away the f3 square from the knight.

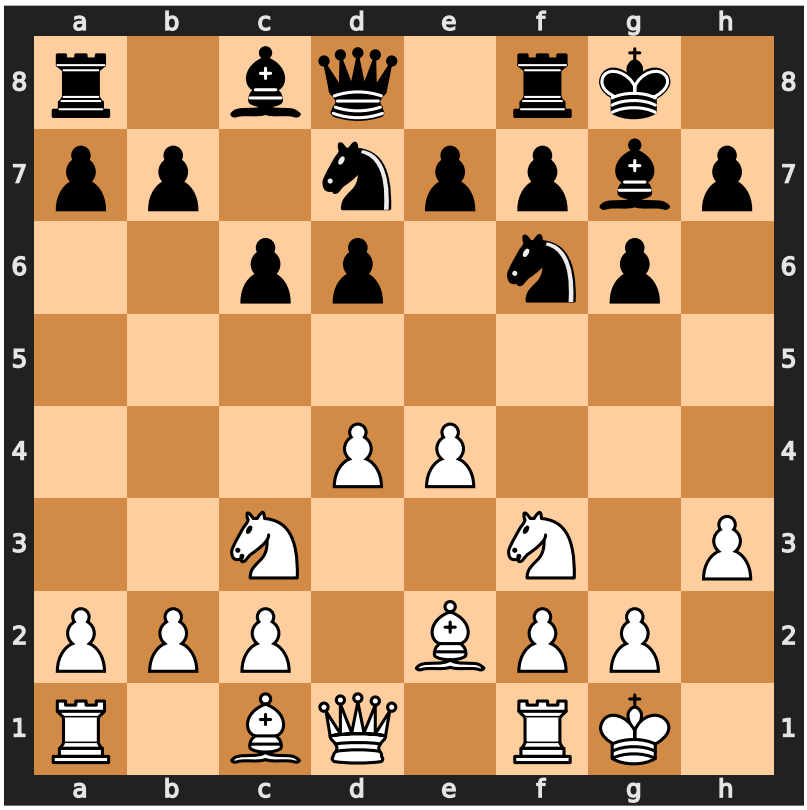

Figure 18.5: Chess Position

Your plan: …e5 is strong here. Push …e5, challenge the center, and take advantage of the fact that White's knight cannot go to f3.

18.4.5.4 vs The Four Pawns Attack

White plays: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.f4 Bg7 5.e5

White tries to push you off the board with pawns. This is the most aggressive approach, but it is also the most fragile. All those pawns need support, and if one falls, the whole structure can collapse.

Your plan: play …dxe5, open the center, and use your pieces to exploit the holes White has created. The g7 bishop becomes a monster when the center opens.

18.4.5.5 What NOT to Play

Do not play the Pirc/Modern against 1.d4. The Pirc/Modern is designed to fight against 1.e4, where White has a pawn on e4 that you can target. Against 1.d4, the dynamics are different, and the Pirc setup is less effective.

Against 1.d4, you need a separate response. We cover this briefly in the next section and fully in Volume II, Chapter 18.

18.5 Part 4: What About Black vs 1.d4?

You have your White system (London) and your Black system against 1.e4 (Pirc/Modern). But what about games where you are Black and your opponent plays 1.d4?

For now, at the beginner level, you have two simple options:

18.5.1 Option 1: Queen's Gambit Declined (Solid)

Play 1.d4 d5, and after 2.c4, play 2…e6.

This is the Queen's Gambit Declined (QGD). It is one of the oldest and most respected defenses in chess. Your setup is straightforward: develop your knight to f6, your bishop to e7, castle kingside, and fight for the center.

You do not need to know a lot of theory here. Just play solid, develop your pieces, and wait for your chance to push …c5 and free your position.

18.5.2 Option 2: King's Indian Setup (Aggressive)

Play 1.d4 Nf6, and after 2.c4, play 2…g6 with the idea of 3…Bg7.

This is the King's Indian Defense. The setup is similar to your Pirc/Modern against 1.e4, with the fianchettoed bishop on g7. If you like the Pirc, you might enjoy the King's Indian too.

The King's Indian leads to sharper, more tactical games. It is a great weapon, but it requires more specific knowledge than the QGD. We will cover it in detail in Volume II, Chapter 18.

For your first games as Black against 1.d4, the QGD (1...d5, 2...e6) is the safer choice. It is solid, easy to learn, and teaches good positional habits. You can always switch to the King's Indian later when you are ready for more aggressive play.

You now have a complete beginner repertoire: London System as White, Pirc/Modern as Black against 1.e4, and QGD as Black against 1.d4. Three systems. Three sets of ideas. That covers every possible game you will play. Take a moment to appreciate how far you have come in just one chapter.

18.6 Annotated Master Games

Now let's watch these ideas in action. The following five games show the power of methodical play, sound development, and the opening principles you have learned.

For each game, set up your board and play through every move. At key moments, pause and think about what you would play before reading on.

18.6.1 Game 1 of 5: Emanuel Lasker vs Frank Marshall (New York, 1907)

"The Power of Methodical Play"

Emanuel Lasker was World Champion from 1894 to 1921, the longest reign in chess history. Frank Marshall was one of America's strongest players, famous for his brilliant tactical play. In this game from their World Championship match, Lasker demonstrates how patience and positional understanding defeat wild attacks.

Opening: French Defense, MacCutcheon Variation (C12) **Result:** 1-0

This game is included not because it features the London or Pirc, but because it shows the PRINCIPLES behind both systems: methodical development, control of key squares, and exploiting an opponent who violates basic opening principles.

Set up your board with the starting position.

1.e4 e6

Marshall plays the French Defense. Black puts a pawn on e6, preparing …d5 to challenge White's center. The French is a solid defense, but it locks in the light-squared bishop (on c8), which is a long-term problem for Black.

2.d4 d5

Both sides establish central pawns. The pawn tension in the center (e4 vs d5) is the heart of the French Defense. White must decide how to handle it.

3.Nc3 Nf6

White develops a knight to defend e4. Black develops a knight to attack e4. Both sides are following opening principles: develop pieces, fight for the center.

4.Bg5 Bb4

Lasker pins the Black knight on f6 to the queen. Marshall plays the MacCutcheon Variation, pinning the White knight on c3 to the king. Both sides are using pins, a tactic you learned in Chapter 6.

5.Nge2 dxe4

Black captures the e4 pawn. This is a critical moment.

6.a3 Be7

White forces the bishop to retreat. Black goes to e7, a modest square.

7.Bxf6 gxf6

Pause and look: White trades bishop for knight and damages Black's pawn structure. Black now has doubled f-pawns (f6 and f7). This is a permanent weakness. The h-file is half-open, and Black's king will have trouble finding safety.

Opening principle: Pawn structure matters. These doubled pawns will haunt Black for the rest of the game.

8.Nxe4 f5

White recaptures the pawn with the knight, placing it on a strong central square. Black pushes …f5 to chase the knight, but this weakens the kingside further.

9.N4c3 c6

The knight retreats, and Black shores up the center. But look at Black's position: the kingside pawns are a mess, the bishop on c8 is still stuck, and castling kingside looks dangerous.

10.Ng3 Bd6

White reroutes the knight to g3, aiming at the weakened kingside. Black develops the bishop, but the position is already uncomfortable.

11.Be2 Qc7 12.Nh5 Nd7 13.O-O Nf6 14.Nxf6+ Kf8

Pause and look: After the knight trade on f6, Black must recapture with the king (14…Kf8) because the g-pawn is gone. The Black king on f8 has not castled and will not castle. It is stuck in the center, exposed and vulnerable.

Opening principle: King safety is everything. Black neglected to castle, and now it is too late.

FEN (after 14...Kf8): `r1b2k1r/ppq2p1p/2pbpN2/5p2/3P4/P1N5/1PP1BPPP/R2Q1RK1 w - - 0 15`

15.Bd3 Bd7 16.Re1 Rg8 17.Nh5 Be8 18.Qh5 Bxh5 19.Nxh5

Lasker trades queens but keeps a powerful knight on h5. Even without queens, Black's position is terrible. The king is exposed, the pawns are weak, and White's pieces are far more active.

20.f4 Kd8 21.g3 Kc8 22.Nf6 Re8 23.b4 Kb8 24.a4 a6 25.a5 Ka8 26.Rab1 Rb8

Watch what Lasker does. He is not rushing. He improves his position piece by piece. The knight on f6 is dominant. The pawns on b4 and a5 grab queenside space. The rooks are centralized. Black is squeezed from every direction.

Opening principle: When you have a better position, there is no need to rush. Improve your pieces slowly. Your opponent will run out of good moves.

27.Re3 Rg5 28.Rbe1 Qd8 29.Bc4 Re7

Pause and look: White's pieces are perfectly coordinated. The rooks are doubled on the e-file. The bishop is active on c4. The knight on f6 dominates the position. Black has no counterplay.

30.Bxe6! fxe6 31.Rxe6 1-0

Lasker sacrifices the bishop to rip open the position. After Bxe6 fxe6, the rook recaptures on e6 with devastating effect. Black's position collapses completely. Marshall resigned.

FEN (final position): `kr1q4/1p2r2p/p1ppRN2/P4pr1/1P1P1P2/2N3P1/2P4P/4R1K1 b - - 0 31`

Positional patterns in this game: - **Pawn structure damage** (doubled f-pawns gave White a permanent target) - **King safety neglect** (Black never castled and paid a terrible price) - **Piece coordination** (White's pieces worked together like a machine) - **Patience** (Lasker improved his position slowly before striking)

Why this works: Lasker did not need tricks or flashy sacrifices (until the very end). He followed basic principles: develop pieces, damage the opponent's structure, exploit weaknesses. Marshall's position looked playable on the surface, but every move made it slightly worse.

What to remember: When your opponent's king is stuck in the center, you do not need to launch a wild attack. Just keep developing, keep improving, and the winning blow will present itself.

18.6.2 Game 2 of 5: Harry Nelson Pillsbury vs Georg Marco (Paris, 1900)

"The Kingside Pawn Storm"

Pillsbury was one of the greatest attacking players of the 19th century. In this game, he shows how to build a kingside attack from a quiet Queen's Gambit opening. The lesson: even in closed positions, you can create winning chances by systematically pushing your pawns toward the enemy king.

Opening: Queen's Gambit Declined (D53) **Result:** 1-0

Set up your board with the starting position.

1.d4 d5 2.c4 e6 3.Nc3 Nf6 4.Bg5 Be7

Standard Queen's Gambit Declined. Both sides develop naturally. White pins the knight with Bg5. This is a classical setup that has been played thousands of times.

5.e3 O-O 6.Nf3 b6

Black castles and plays …b6 to develop the bishop to b7. This is a reasonable plan, but it takes time.

7.Bd3 Bb7 8.cxd5 exd5

White trades in the center. After …exd5, Black's pawn structure is symmetrical, but the light-squared bishop on b7 is blocked by its own pawn on d5. This is a subtle problem that will matter later.

Pause and look: Black's d5 pawn blocks the b7 bishop. This means White has a slight advantage because White's dark-squared bishop on g5 is active and pinning the knight, while Black's bishop on b7 is "biting into its own pawn." This concept is called a "bad bishop."

9.Ne5 Nbd7 10.f4 c5

Pillsbury plays Ne5, establishing a powerful knight in the center. Then f4, supporting the knight and building toward a kingside attack.

Black tries to counterattack with …c5, hitting White's center from the side. Good idea in principle.

11.O-O c4 12.Bc2 a5

White castles. Black pushes …c4, closing the queenside. But this has a drawback: Black no longer has …c5 to challenge White's center. The queenside is locked, so the fight will happen on the kingside, where Pillsbury is already ahead.

Opening principle: When you close the queenside, the battle shifts to the kingside. If your opponent is already set up for a kingside attack, closing the queenside helps them, not you.

13.Qf3 Re8 14.Qh3 Nf8

White brings the queen to h3, pointing at the kingside. The h3 square is a powerful post for the queen in many Queen's Gambit positions. It pressures h7 and supports f5 or g4 pushes.

Black moves the knight to f8 to defend the kingside. But the knight on f8 is passive.

15.Rf3!

Pause and look: This is the key move of the game. Pillsbury lifts the rook from f1 to f3, where it can swing to the h-file (Rh3) or g-file (Rg3). This "rook lift" is a standard attacking technique that you will see again and again.

15...Ne4 16.Bxe7 Qxe7 17.Rh3 f5

Black trades the dark-squared bishops and tries to block the kingside with …f5. But this weakens the e6 and g6 squares.

18.Bxe4 fxe4

The bishop on c2 captures the knight on e4, forcing Black to recapture with the f-pawn. Now Black's kingside is full of holes.

19.g4 Qf6 20.g5 Qe7

Pillsbury pushes g4 and g5, a full kingside pawn storm. The pawns march forward, opening lines toward Black's king. Black's queen retreats, trying to defend.

21.Rg3 Kh8 22.Rf1 Re6 23.Rf2 Rae8 24.Rfg2 R8e7 25.Qh5 Bc8

White doubles rooks on the g-file. The pressure is immense. Black's bishop retreats to c8, trying to defend, but there are too many weaknesses.

26.Nxe4! dxe4 27.d5 Rd6 28.Nf7+! Rxf7 29.Qxf7 Qxf7 30.gxh7+ 1-0

Pause and look at the final combination: Pillsbury sacrifices the knight on e4, then the knight on f7, and finally captures on h7 with a discovered check from the g-file. The combination wins decisive material.

FEN (after 30.gxh7+): After gxh7+, White has a pawn on h7 with discovered check from the g-file. Black's position is hopeless.

Attacking patterns in this game: - **Rook lift** (Rf3-h3 or Rf3-g3, a key attacking technique) - **Pawn storm** (g4-g5, marching pawns toward the enemy king) - **Knight sacrifice** (Nxe4 and Nf7+ to break through) - **Systematic buildup** (Pillsbury did not rush; he built pressure methodically)

Why this works: Pillsbury understood that the queenside was closed, so he turned all his firepower toward the kingside. Every move brought another piece toward Black's king. By the time the final combination arrived, the position was already overwhelming.

What to remember: When one side of the board is closed, attack on the other side. Build your attack piece by piece. The rook lift (Rf1-f3-h3 or Rf1-f3-g3) is one of the most powerful attacking techniques you can learn.

Two intense games. Take a break. Stretch. Move around. The next three games will be here when you get back.

18.6.3 Game 3 of 5: Siegbert Tarrasch vs Georg Marco (Dresden, 1892)

"The Teacher of Germany"

Tarrasch was called "the Teacher of Germany" because he believed chess could be taught through clear principles. This game is a perfect example. Every move follows classical logic: develop pieces, control open files, exploit weaknesses. It is chess as a science.

Opening: Ruy Lopez, Morphy Defense (C77) **Result:** 1-0

Set up your board with the starting position.

1.e4 e5 2.Nf3 Nc6 3.Bb5 a6 4.Ba4 Nf6

The Ruy Lopez, one of the oldest and most respected openings in chess. White develops the bishop to b5 (then a4 after …a6) to put pressure on the knight that defends e5. Black develops naturally.

5.d3 d6 6.c3 Be7

Both sides play solidly. White plays d3 (the closed Ruy Lopez), keeping the center stable. c3 prepares a future d4 push. Black develops the bishop.

7.Nbd2 O-O 8.Nf1 b5 9.Bc2 d5

Tarrasch reroutes the knight via d2-f1, heading for g3 or e3. This knight maneuver is a hallmark of the Ruy Lopez. Black pushes …d5, challenging the center.

10.Qe2 dxe4 11.dxe4 Be6 12.Ng3 Qd7

The center opens slightly. Both sides develop. White's knight reaches g3, an active square eyeing f5.

Pause and look: White's knight on g3 aims at f5 and h5. The Nf5 jump would be powerful, attacking Black's e7 bishop and pressuring the kingside. This is the kind of knight maneuver that wins games at every level.

13.O-O Rad8 14.Bg5 Qe8 15.Nh4 Bc8

White castles and develops the bishop to g5, pinning the knight. The knight goes to h4, heading for f5.

Black retreats the bishop to c8. This is a sign that Black is running out of good moves. When a developed piece retreats to its starting square, something has gone wrong.

16.Nhf5 Bxf5 17.Nxf5 Nd7 18.Bxe7 Nxe7 19.Qg4 Ng6

White gets the knight to f5, and Black is forced to trade it. After the trades, White has a clear advantage: better piece placement, pressure on g7, and a strong pawn center.

20.Nxg7!

Pause and look: The knight captures on g7, sacrificing material. This is not a reckless attack. Tarrasch calculated that the open g-file and the weakened Black king will lead to a decisive attack.

20...Kxg7 21.Qh5 Rh8 22.Rd1 Qf8 23.f4 exf4 24.Rxf4 Nde5

Black tries to defend by bringing the knight to e5, but Tarrasch has too much firepower aimed at the exposed king.

25.Rg4+ Kf6 26.Rf1+ Ke6 27.Rxg6+! fxg6 28.Qxg6+ Kd7 29.Bb3 Qf6 30.Qg4+ Kc6 31.e5 Qf5 32.Qe2 Ng6 33.Be6 Rd2 34.Qxb5+ 1-0

The final combination is a series of checks and captures that win material and force resignation. Tarrasch's attack flows naturally from his superior piece placement.

FEN (after 34.Qxb5+): `7r/2p4p/p1k1B1n1/1Q2Pq2/8/2P5/PP1r2PP/5RK1 b - - 0 34`

Classical principles in this game: - **Knight maneuvers** (Nd2-f1-g3-f5, a standard Ruy Lopez technique) - **Piece activity** (every White piece had a clear purpose) - **Exploiting the pin** (Bg5 pinning the knight, creating tactical opportunities) - **King safety** (once Black's g-pawn was removed, the king was fatally exposed)

Why this works: Tarrasch played "by the book." He followed classical principles at every step. When Black gave him a weakness (the g7 pawn), he attacked it with everything he had. This game proves that principles work. You do not need genius to play good chess. You need good habits.

What to remember: As Tarrasch taught: "First, develop your pieces. Then, improve them. Then, attack the weakness." This is the recipe for winning chess.

18.6.4 Game 4 of 5: A London System Model Game

"The London in Action"

This instructive game fragment shows how the London System works in practice. Follow the London setup move by move and watch how the ideas we discussed translate into a winning attack.

Opening: London System (D02) **Result:** 1-0

Set up your board with the starting position.

1.d4 d5 2.Bf4

The London bishop comes out immediately. Before e3. This is the correct move order.

2...Nf6 3.e3 e6 4.Nf3 Bd6

Black develops the bishop to d6, attacking the London bishop. This is the most common challenge Black throws at you.

5.Bg3!

White retreats the bishop to g3 rather than trading. Why? Because after ...Bxg3, White recaptures with hxg3, opening the h-file for the rook. That open h-file is a weapon.

5...O-O 6.Bd3 c5 7.c3 Nc6 8.Nbd2 Qe7

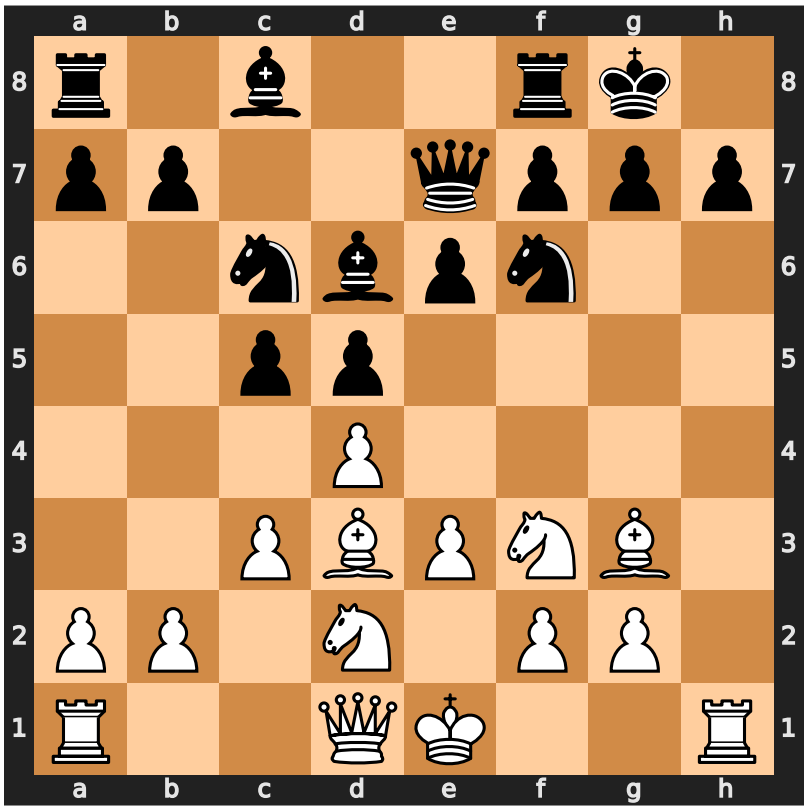

Figure 18.6: Chess Position

Pause and look: White has the complete London setup. Pawns on d4, e3, c3. Bishops on g3 and d3. Knights on f3 and d2. The king is ready to castle. Now what?

9.O-O Bxg3 10.hxg3

Black takes the bishop. White recaptures with the h-pawn, opening the h-file. The rook on h1 (now f1, but the h-file is open) has a clear line toward the enemy king.

10...b6 11.Qe2 Bb7 12.e4!

The e4 break! This is Plan 1 in action. White pushes e4, opening the center and activating the bishops.

12...dxe4 13.Nxe4 Nxe4 14.Bxe4 Rad8 15.Rad1

White recaptures on e4 with the knight, then the bishop recaptures on e4. Now the bishop on e4 is a monster, aiming at both sides of the board. White's rooks are centralized and active.

15...cxd4 16.cxd4 Nb4?

Black tries to create counterplay by jumping the knight to b4, but this loses time.

17.Ng5! h6 18.Bh7+ Kh8 19.Qe4!

Pause and look: White has a powerful attack. The bishop on h7 pins the king to the corner. The queen on e4 threatens Qxa8 and also eyes g6. The knight on g5 targets f7 and h7. All of White's pieces are coordinated in the attack.

Opening principles demonstrated: - **Bf4 before e3** (correct London move order) - **Bg3 instead of trading** (opening the h-file) - **e4 pawn break** (Plan 1 executed perfectly) - **Piece coordination** (bishop, queen, and knight all point at the king)

Why this works: White followed the London System recipe step by step. There was no need for memorized theory or brilliant sacrifices. The opening setup led naturally to a strong middlegame position. The e4 break opened the position at the right moment, and the attack played itself.

What to remember: Trust the London setup. Follow the plans. The attack will come.

18.6.5 Game 5 of 5: A Pirc Defense Model Game

"The Pirc Counterattack"

This game fragment shows the Pirc/Modern Defense in action. Watch how Black waits patiently, lets White overextend, and then strikes back with devastating effect.

Opening: Pirc Defense, Classical Variation (B08) **Result:** 0-1

Set up your board with the starting position.

1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O

The standard Pirc setup. Black has fianchettoed the bishop, castled, and is ready to start the counterattack.

6.O-O c6 7.h3 Nbd7 8.Be3 Qc7

Black plays …c6 (preparing …d5 or …b5), develops the knight to d7, and places the queen on c7. This is patient, solid play. Black is in no rush.

9.Qd2 b5!

Black expands on the queenside with …b5. This gains space and prepares …Bb7, developing the last minor piece.

10.a3 Bb7 11.Bd3 a5

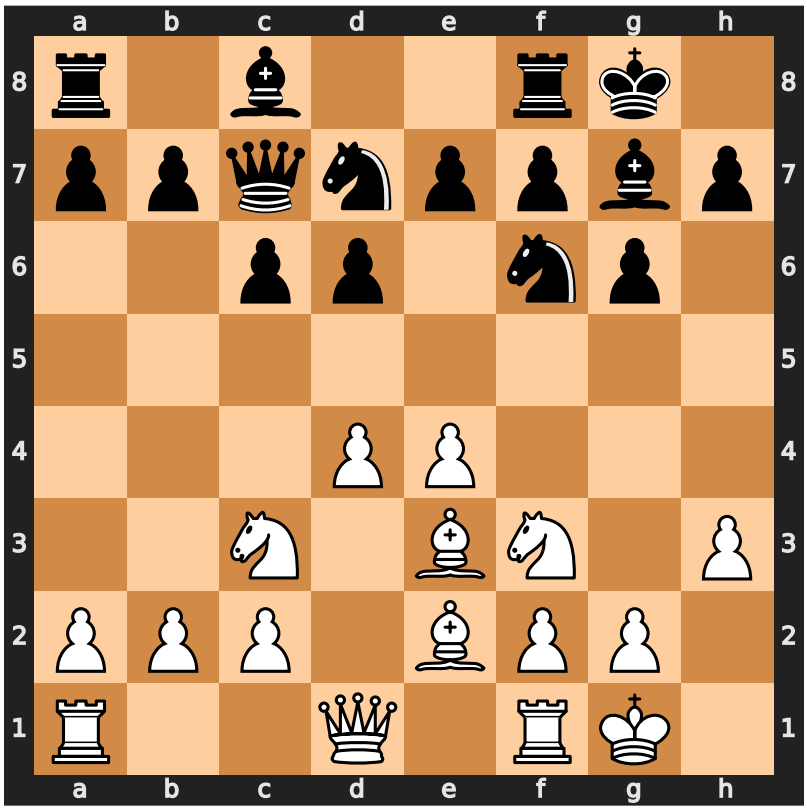

Figure 18.7: Chess Position

The bishop reaches b7, where it pressures e4. Black also pushes …a5 to keep the queenside active. White's center looks strong, but Black is building counterplay on both sides.

12.Rfe1 e5!

Pause and look: The central strike. Black plays …e5, attacking White's d4 pawn directly. This is Plan 1 of the Pirc Defense in action. Black waited until fully developed, then struck at the center.

13.dxe5 dxe5 14.Bc4 Rfd8 15.Qe2 Nc5

After the center opens, Black's pieces come alive. The knight lands on c5, an aggressive outpost. The rooks are active. The g7 bishop breathes fire down the long diagonal.

15...Nc5 is a strong move because the knight on c5 attacks the bishop on d3 or c4 and controls important central squares. Black's position is now at least equal and possibly better.

Pirc principles demonstrated: - **Patience** (Black developed fully before striking) - **...e5 break** (Plan 1, timed perfectly) - **g7 bishop activated** (the long diagonal opens after …e5) - **Queenside expansion** (…b5, …a5, …Bb7 created counterplay) - **Rubber band principle** (White had space, but Black snapped back)

Why this works: Black trusted the Pirc setup. Instead of panicking about White's space advantage, Black developed calmly and waited for the right moment. When …e5 came, the whole position changed. The g7 bishop went from "looking at a wall of pawns" to "controlling the longest diagonal on the board."

What to remember: In the Pirc/Modern, patience is not weakness. Patience is preparation. When you strike, you strike with everything.

You have now studied five games showing methodical play, kingside attacks, classical principles, the London System in action, and the Pirc counterattack. That is a lot of chess. Take a real break before the exercise section. Come back fresh.

18.7 Exercises

30 exercises testing your understanding of the London System and Pirc/Modern Defense. Set up each position on your board or load the FEN into a chess program. Try to solve before reading hints.

Difficulty: = straightforward | = requires planning | = deep combination

---

18.7.1 Section A: London System Moves (Exercises 8.1 to 8.10)

Exercise 8.1 **Position:** White has played 1.d4. Black played 1…d5. White to move.

Task: What is the correct London System move? Choose between Bf4, e3, Nf3, or c4. **Hint 1:** The London System's signature move comes first. **Hint 2:** Which piece must come out BEFORE the e-pawn moves? **Hint 3:** The dark-squared bishop needs to get outside the pawn chain. **Solution: 2.Bf4!** The London bishop comes out immediately. If you play e3 first, the bishop gets stuck behind the pawn. Always Bf4 before e3.

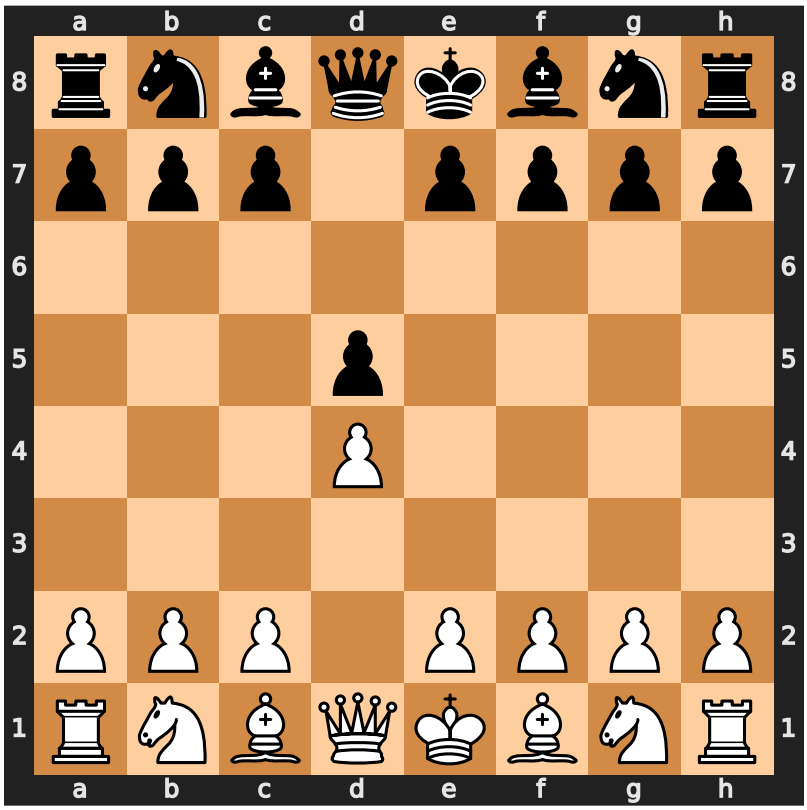

Figure 18.8: Chess Position

Exercise 8.2 **Position:** White: Kd1 area pieces after 1.d4 d5 2.Bf4. Black plays 2…Nf6. White to move.

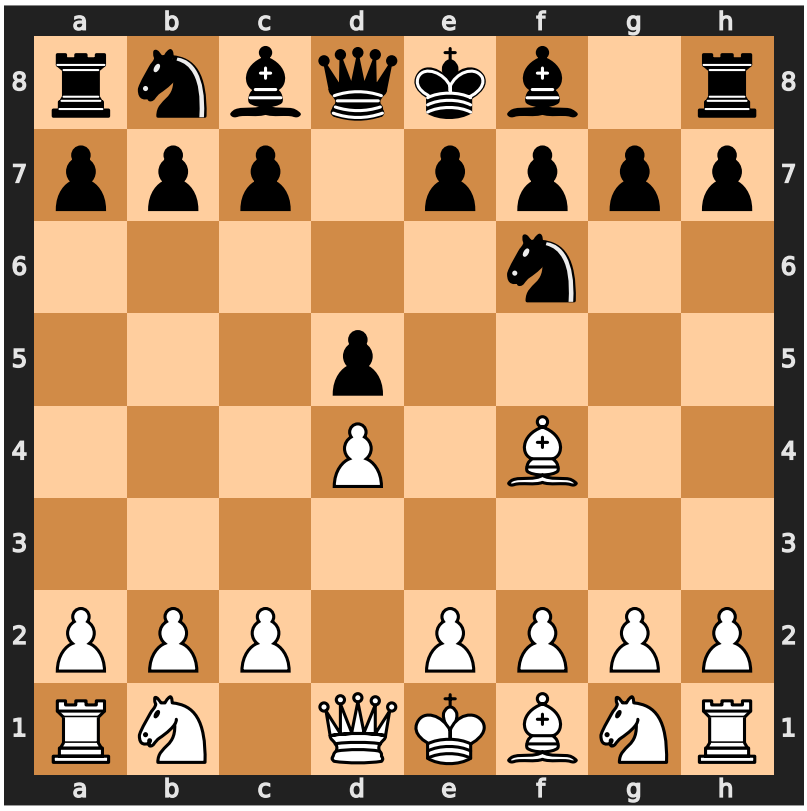

Figure 18.9: Chess Position

Task: What is White's next London System move? **Hint 1:** Support the d4 pawn. **Hint 2:** Open a diagonal for the light-squared bishop. **Hint 3:** The move is e3. **Solution: 3.e3.** This supports d4 and opens the f1-a6 diagonal for the bishop to develop to d3. The standard London continuation.

Exercise 8.3 **Position:** After 1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Bd6 5.Bg3 O-O 6.Bd3. White has played 6.Bd3. Black plays 6…c5. White to move.

Task: What pawn move completes the London pawn triangle? **Hint 1:** White needs to secure d4. **Hint 2:** The move supports d4 and prepares Qc2 or b4. **Hint 3:** c3 builds the pawn fortress. **Solution: 7.c3.** This creates the d4-e3-c3 pawn triangle. The center is solid. White can now develop Nbd2 and castle.

Exercise 8.4 **Position:** After 1.d4 Nf6 2.Bf4 g6 3.e3. Black plays 3…Bg7. White to move.

Task: What piece does White develop next in the London System? **Hint 1:** A knight needs to come out. **Hint 2:** Which knight square helps control the center and prepares castling? **Hint**

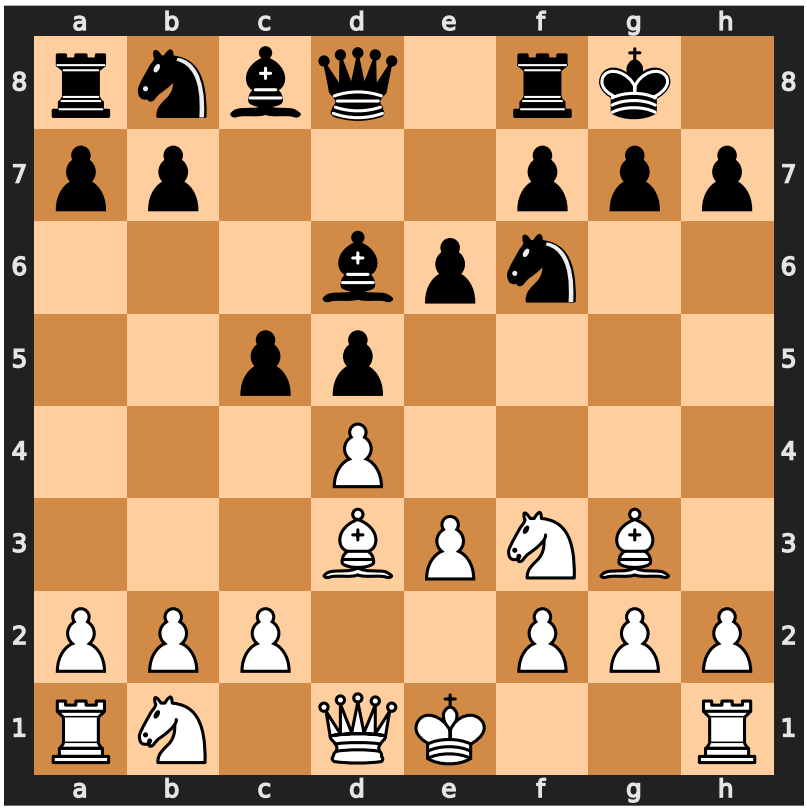

Figure 18.10: Chess Position

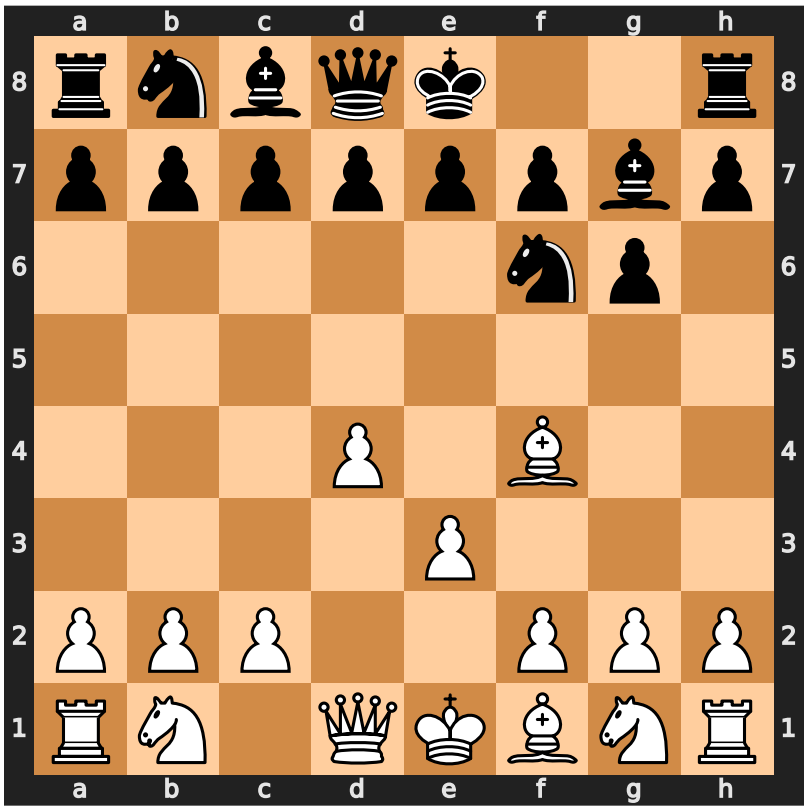

Figure 18.11: Chess Position

3: Nf3 is the standard developing move. **Solution: 4.Nf3.** Develops a knight toward the center, controls e5 and d4, and prepares kingside castling. Standard London System development.

Exercise 8.5 **Position:** After 1.d4 d5 2.Bf4 Nf6 3.e3 c5 4.c3 Nc6 5.Nf3. Black plays 5…Qb6. White to move.

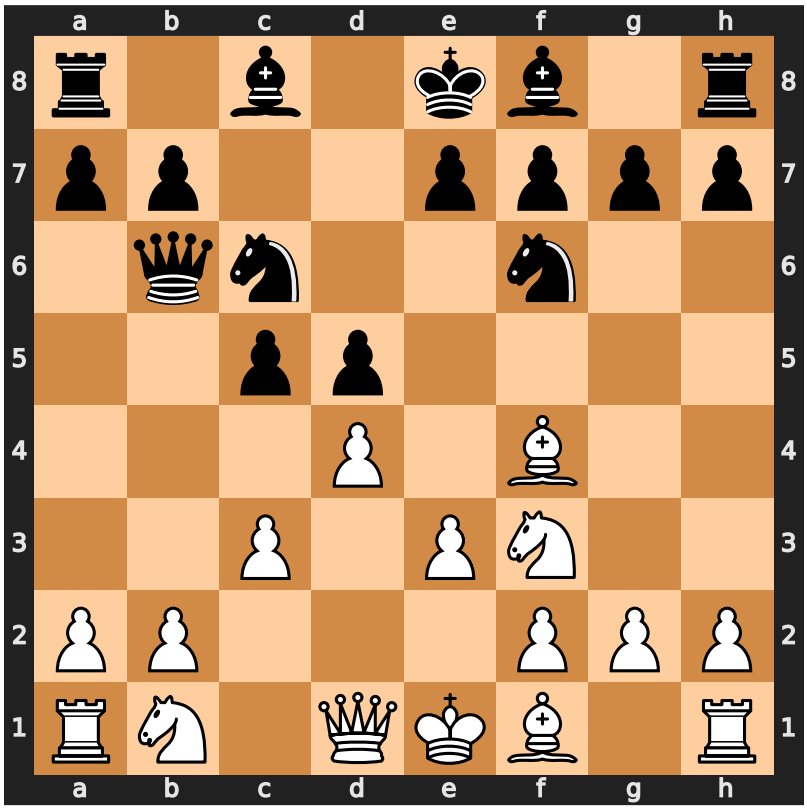

Figure 18.12: Chess Position

Task: Black threatens Qxb2. How does White continue development while handling the threat? **Hint 1:** Develop the knight and defend b2 at the same time. **Hint 2:** Which knight square protects the b-pawn? **Hint 3:** Nbd2 defends b2 (the queen protects it through d2) and develops a piece. **Solution: 6.Nbd2!** Develops the knight and protects the b2 pawn indirectly (if …Qxb2, Ra1 becomes active and Black's queen is trapped after Rb1). White continues with Bd3 and O-O next.

Exercise 8.6 **Position:** London System middlegame. White: Kg1, Qd1, Ra1, Rf1, Bd3, Bg3, Nf3, Nd2. Pawns on a2, b2, c3, d4, e3, f2, g2, h2. Black: Kg8, Qd8, Ra8, Rf8, Bc8, Bg7, Nf6, Nc6. Pawns on a7, b7, c7, d5, e6, f7, g6, h7.

Task: White has a fully developed London position. What is the best plan? **Hint 1:** White wants to open the center. **Hint 2:** The standard London break is to push a pawn to e4. **Hint 3:** Prepare e4 with Qe2, then Re1, then push e4. **Solution: 10.Qe2** preparing e4. After Qe2 and Re1, White can push e4 with full support. This is Plan 1 of the London System: the e3-e4 break. It opens the center and activates all of White's pieces.

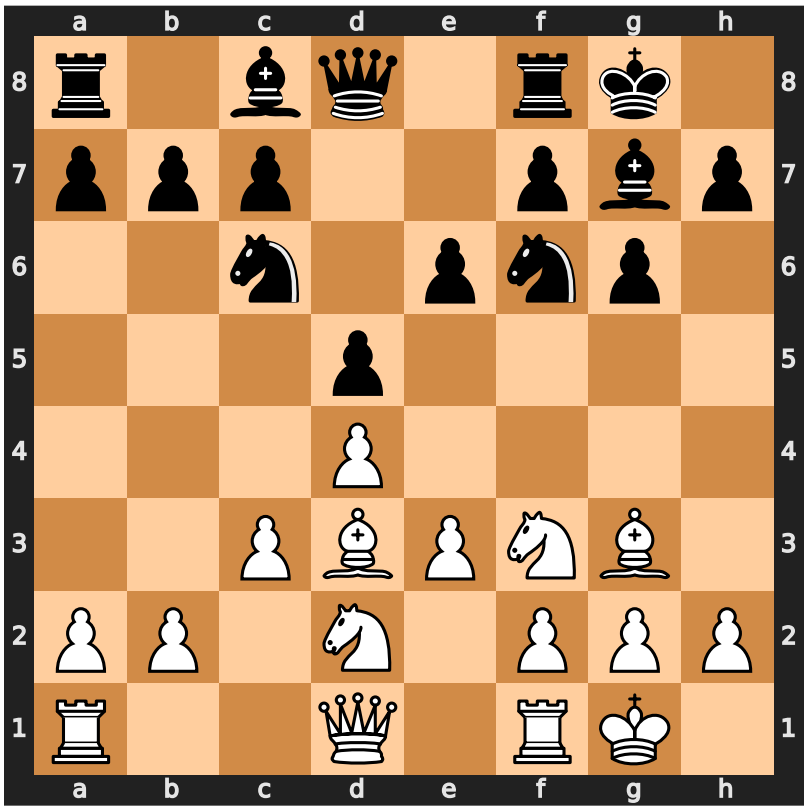

Figure 18.13: Chess Position

Exercise 8.7 **Position:** After 1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Bd6 5.Bg3 Bxg3 6.hxg3. Black to move.

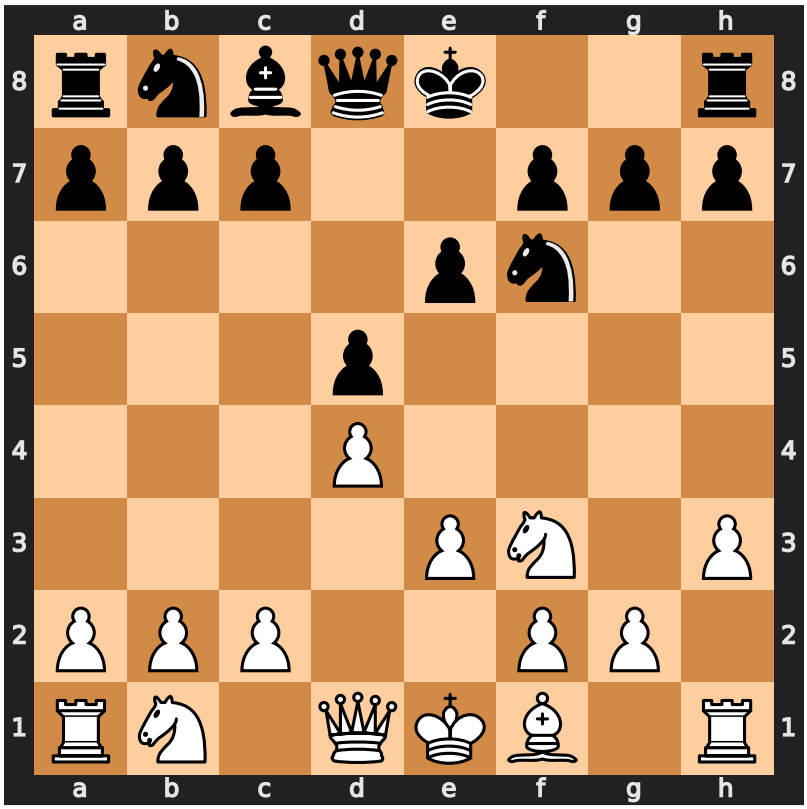

Figure 18.14: Chess Position

(Note: After 6.hxg3, White has pawns on g3 and open h-file.)

Task: Black traded the bishop with …Bxg3 and White recaptured hxg3. Is this good for White or Black? Why? **Hint 1:** Look at the h-file. **Hint 2:** Is the h-file now open for a rook? **Hint 3:** White's rook on h1 now has a clear path to h8. The doubled g-pawns look ugly but the open h-file is a weapon. **Solution:** This trade **favors White.** The open h-file gives White's rook a clear attacking lane toward the enemy king. White can later play Bd3, O-O (or even leave the king on e1 temporarily to keep the h-rook active), Qe2, and launch a kingside attack using the h-file. The doubled g-pawns are a small cosmetic problem; the open file is a large strategic advantage.

Exercise 8.8 **Position:** White has reached the ideal London setup. The position is solid. Black has played …e6, …Nf6, …Be7, …O-O, …c5, …Nc6, …b6, …Bb7. The center is closed.

Task: The queenside is becoming locked. What plan should White pursue? **Hint 1:** When the queenside is closed, where should you attack? **Hint 2:** Think about Plan 3: kingside attack. **Hint 3:** Start with Qe2 or Qf3, then consider Ne5 and h3/g4. **Solution:** White should attack on the kingside. Play **Ne5** (outpost in the center) and prepare a kingside attack with **Qf3** (or Qe2) followed by **h3** and **g4.** When the queenside is locked, the kingside is where the action happens.

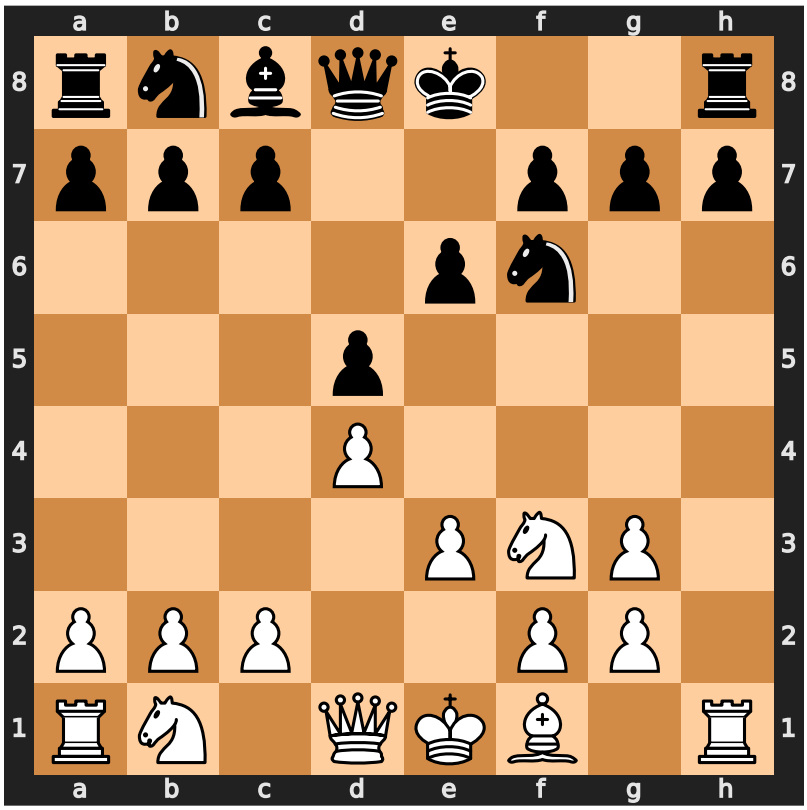

Figure 18.15: Chess Position

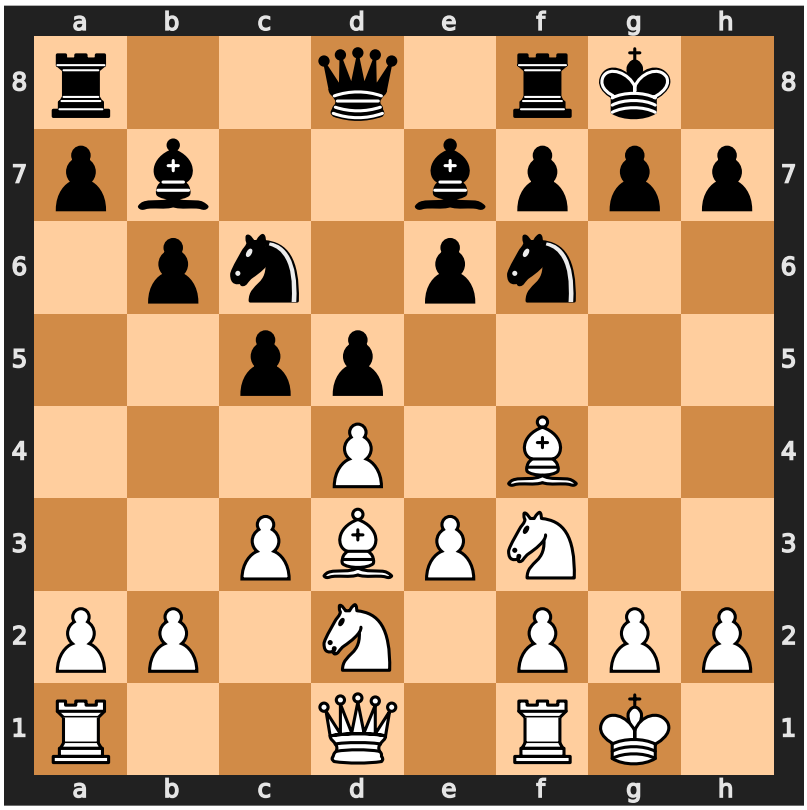

Figure 18.16: Chess Position

Exercise 8.9 **Position:** After 1.d4 Nf6 2.Bf4 d5 3.e3 Bf5. Black has developed the bishop to f5. White to move.

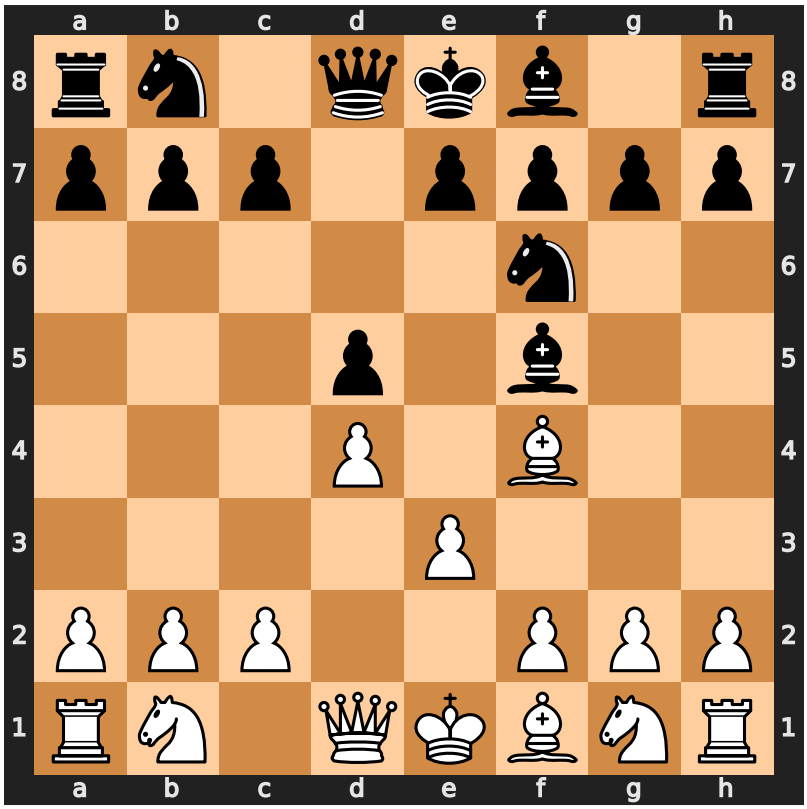

Figure 18.17: Chess Position

Task: Continue the London setup. What is White's next move? **Hint 1:** Develop a knight. **Hint 2:** The knight goes to its standard square. **Hint 3:** Nf3 is always correct here. **Solution: 4.Nf3.** Develop the knight, control the center, prepare castling. Black's …Bf5 does not change White's plan. Continue with Bd3 (offering a bishop trade or making Black move again), c3, Nbd2, O-O.

Exercise 8.10 **Position:** After 1.d4 d5 2.e3?? (mistake!) Now White wants to play Bf4 but the pawn on e3 blocks it.

Task: Why is 2.e3 a mistake in the London System? What should White have played instead? **Hint 1:** Look at the dark-squared bishop on c1. **Hint 2:** Can it reach f4 now? **Hint 3:** The e3 pawn blocks the bishop's path to f4. **Solution:** After **2.e3, the bishop on c1 is locked inside the pawn chain.** It cannot reach f4 because the e3 pawn blocks it. White should have played **2.Bf4** first, developing the bishop to the active f4 square BEFORE playing e3. This is the single most important move order rule in the London System.

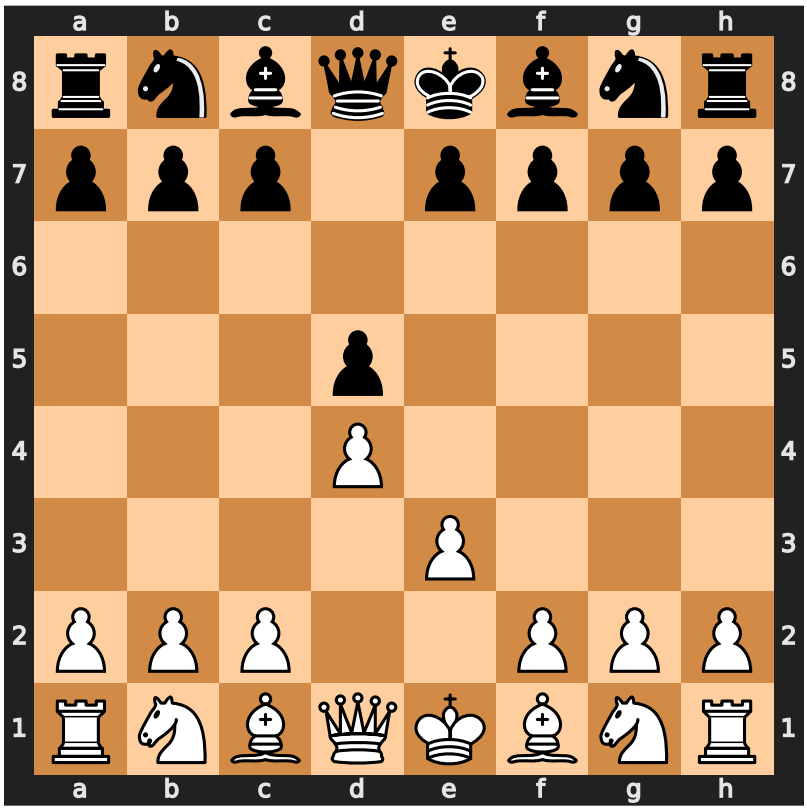

Figure 18.18: Chess Position

18.7.2 Section B: Pirc/Modern Responses (Exercises 8.11 to 8.18)

Exercise 8.11 **Position:** White has played 1.e4. You are Black. What is the Pirc/Modern first move?

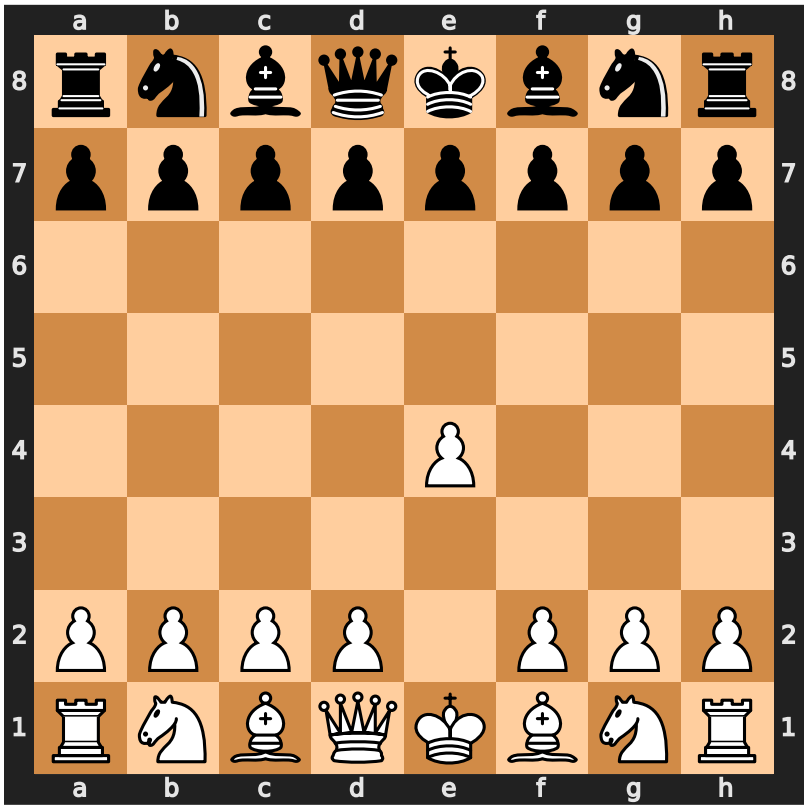

Figure 18.19: Chess Position

Task: Choose Black's first move in the Pirc/Modern Defense. **Hint 1:** Not …e5 (that is a different opening). **Hint 2:** A modest pawn move that prepares the whole system. **Hint 3:** d6 is the Pirc move. **Solution: 1...d6.** This prepares …Nf6 (attacking e4), keeps the center flexible, and allows the dark-squared bishop to develop later. It is the starting move of the Pirc Defense.

Exercise 8.12 **Position:** After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3. Black to move.

Task: What is Black's next move in the Pirc setup? **Hint 1:** The dark-squared bishop needs to come out. **Hint 2:** Where does the bishop go in the Pirc/Modern? **Hint 3:** Bg7. Fianchetto. **Solution: 4...Bg7!** The bishop goes to g7, completing the fianchetto. This is the most powerful piece in the Pirc/Modern. It controls the long diagonal (a1-h8) and pressures White's center.

Exercise 8.13 **Position:** After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O 6.O-O. Black to move.

Task: What is a good move for Black to prepare a central counter-strike? **Hint 1:** Think about supporting …e5. **Hint 2:** A knight needs to help. **Hint 3:** Nbd7 supports …e5. **Solution:**

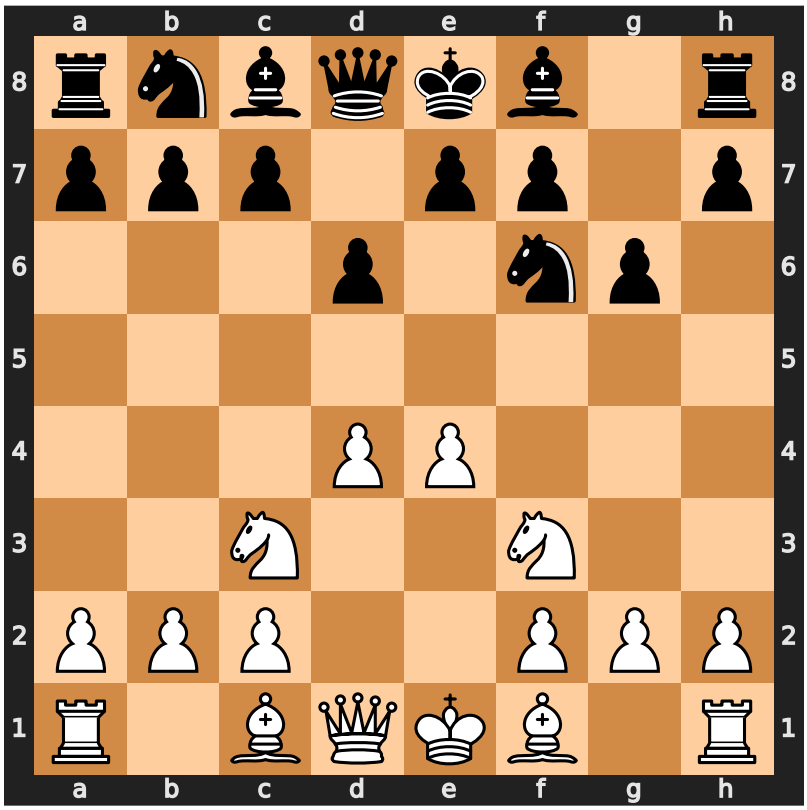

Figure 18.20: Chess Position

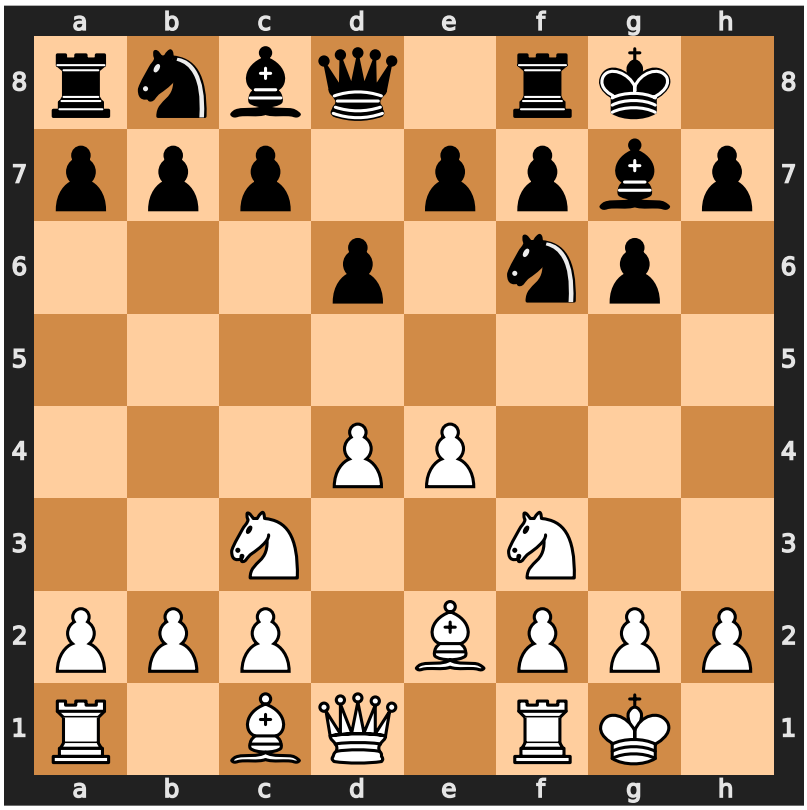

Figure 18.21: Chess Position

6...Nbd7. The knight develops to d7 where it supports the coming …e5 push. Black can also play …c6 first (preparing …b5 or …d5). Both are good. The key idea is to prepare the central break.

Exercise 8.14 **Position:** Pirc Defense. After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.f4. White has played the Austrian Attack. Black to move.

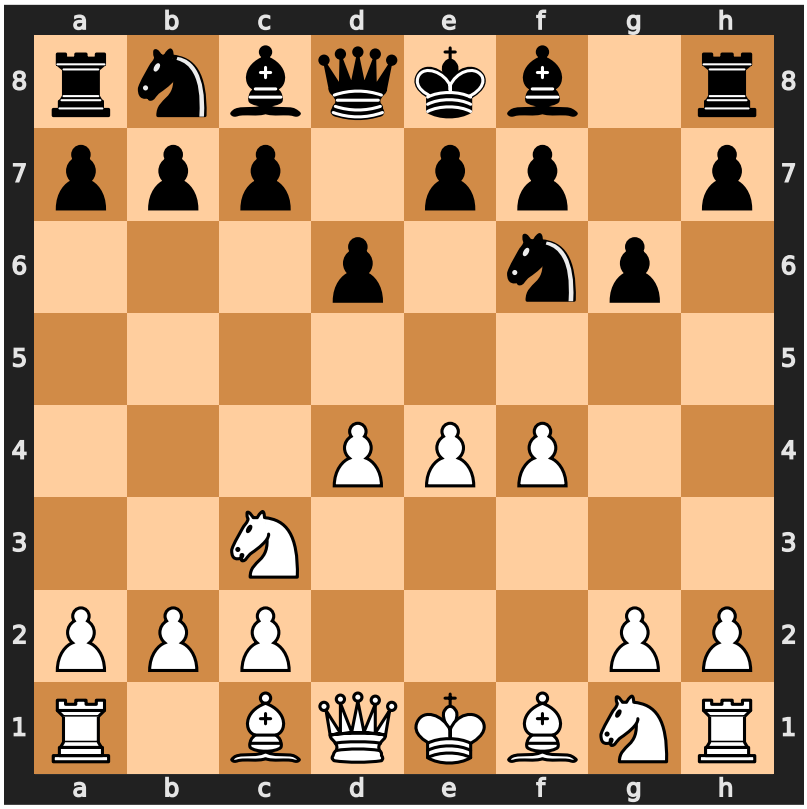

Figure 18.22: Chess Position

Task: What should Black play against the Austrian Attack? **Hint 1:** Continue with the Pirc setup. Do not panic. **Hint 2:** Fianchetto the bishop as planned. **Hint 3:** Bg7, then castle, then look for …c5 or …e5. **Solution: 4...Bg7.** Continue with the normal Pirc setup. After …O-O, Black can strike back with …c5 (targeting d4) or …e5 (challenging the center directly). The Austrian Attack is aggressive but leaves White's king less safe (the f-pawn has moved, weakening the king's position). Black has good counter-chances.

Exercise 8.15 **Position:** Pirc Defense. After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O 6.O-O Nbd7 7.e5?!

Task: White pushed e5 aggressively. How should Black respond? **Hint 1:** White's e5 pawn is attacking your knight. **Hint 2:** Take the pawn: …dxe5. **Hint 3:** After …dxe5 dxe5, Black plays …Ng4, attacking the e5 pawn and creating tactical chances. The g7 bishop becomes strong on the open diagonal. **Solution: 7...dxe5! 8.dxe5 Ng4.** Black opens the center and attacks the e5 pawn. The g7 bishop is now a monster on the long diagonal. White's e5 pawn is overextended and hard to defend. This is the "rubber band" in action: White pushed too far, and Black snaps back.

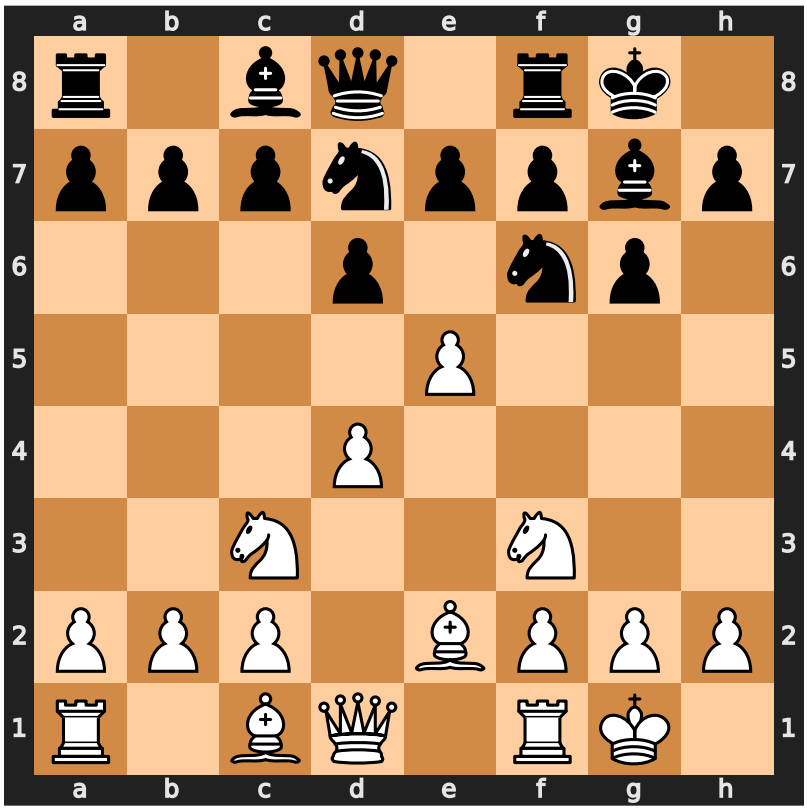

Figure 18.23: Chess Position

Exercise 8.16 **Position:** Pirc Defense middlegame. Black has: Kg8, Qd8, Ra8, Rf8, Bb7, Bg7, Nf6, Nd7. Pawns on a7, b6, c6, d6, f7, g6, h7. White has the standard e4/d4 center with pieces developed.

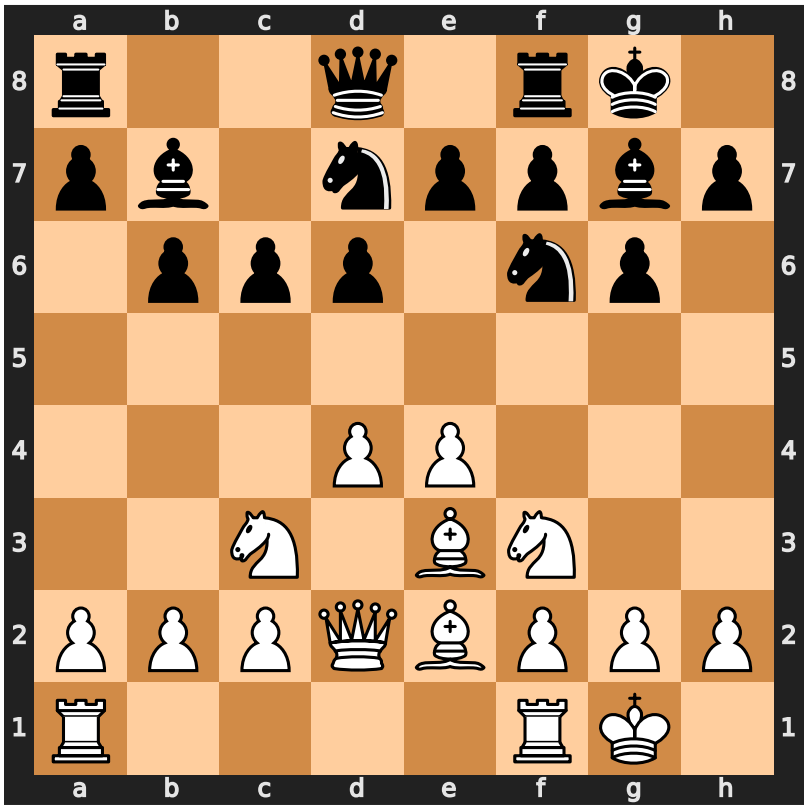

Figure 18.24: Chess Position

Task: Black is fully developed. What central break should Black play? **Hint 1:** Both …e5 and …c5 are options. **Hint 2:** With the bishop on b7 pressuring e4, which break creates more pressure? **Hint 3:** …e5 is the most direct challenge to White's center. **Solution: 9...e5!** This is the ideal moment to strike. Black is fully developed, the knight on d7 supports …e5, and the bishop on b7 adds pressure to e4. After …e5, the center opens and Black's pieces become very active, especially the g7 bishop.

Exercise 8.17 **Position:** After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O 6.O-O c6 7.a4 a5. White to move.

Task: Is Black's …c6 and …a5 setup reasonable? What is Black planning? **Hint 1:** …c6 supports the center. **Hint 2:** …a5 prevents b4 expansion. **Hint 3:** Black is preparing …b5 (if White does not play a4), or …d5 (challenging the center), or …Nbd7 followed by …e5. **Solution:** Yes, this is a reasonable Pirc setup. Black's **...c6** controls d5 and supports the center. **...a5** stops White from expanding with b4. Black's plan from here is to develop the knight to d7 and push **...e5** when ready. This is solid, patient play in the Pirc spirit.

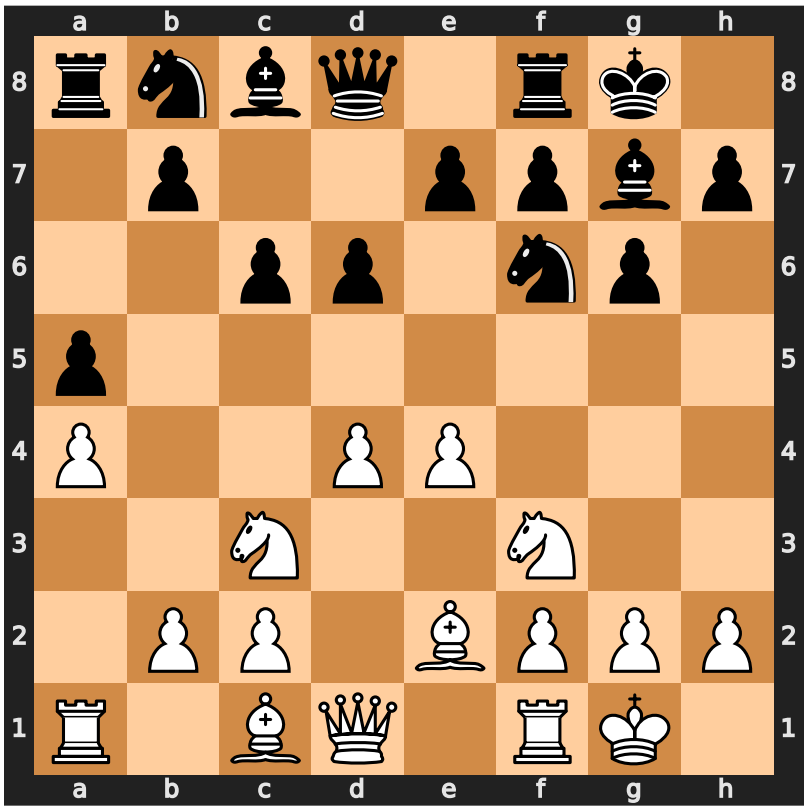

Figure 18.25: Chess Position

Exercise 8.18 **Position:** Pirc Defense. Black has played the setup perfectly. White has an Austrian Attack with f4, and the position is tense. After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.f4 Bg7 5.Nf3 O-O 6.Bd3 Nbd7:

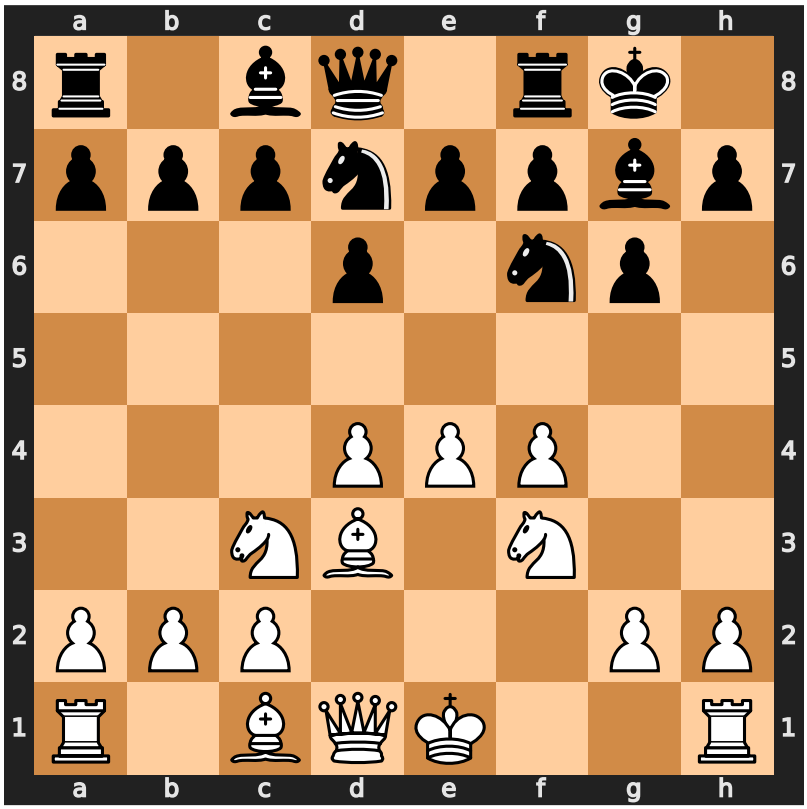

Figure 18.26: Chess Position

Task: White has not castled. How can Black exploit this? **Hint 1:** White's king is in the center. **Hint 2:** Opening the center is dangerous for the side that has not castled. **Hint 3:** …e5! opens the center immediately, punishing White for not castling. **Solution: 6...e5!** Opening the center while White's king is still on e1. After …e5, White must deal with the central tension before castling. If dxe5 dxe5 fxe5, Black plays …Ng4 with a strong attack. If White plays d5, Black gets …c6 with counterplay. The principle: **open the center when your opponent's king is uncastled.**

18.7.3 Section C: Find the Opening Mistake (Exercises 8.19 to 8.24)

Exercise 8.19 **Position:** After 1.d4 d5 2.e3 Nf6 3.Nf3 e6 4.Bd3 Bd6 5.O-O O-O.

Task: White wanted to play the London System but made a critical move order error. What went wrong? **Hint 1:** Look at the dark-squared bishop. **Hint 2:** Where is it? **Hint 3:** Still on c1. It never got to f4. **Solution:** White played **2.e3 before Bf4.** The bishop is now trapped behind the pawn chain on c1. It has no way to reach f4. White has a solid but passive position with a "bad" dark-squared bishop stuck inside the pawn structure. The fix: always play **Bf4 before e3** in the London System.

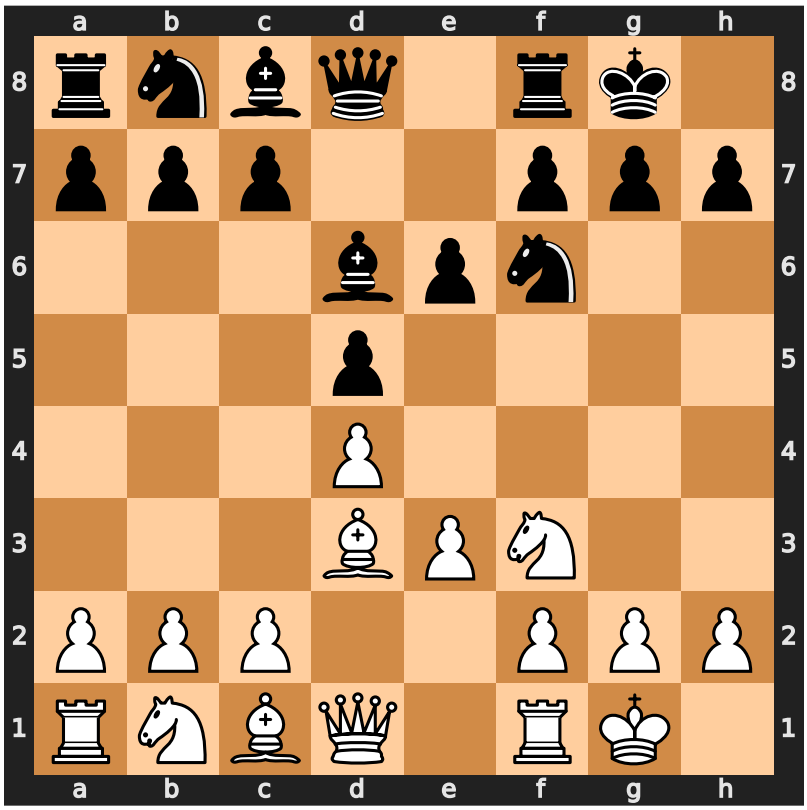

Figure 18.27: Chess Position

Exercise 8.20 **Position:** After 1.e4 d6 2.d4 e5?!

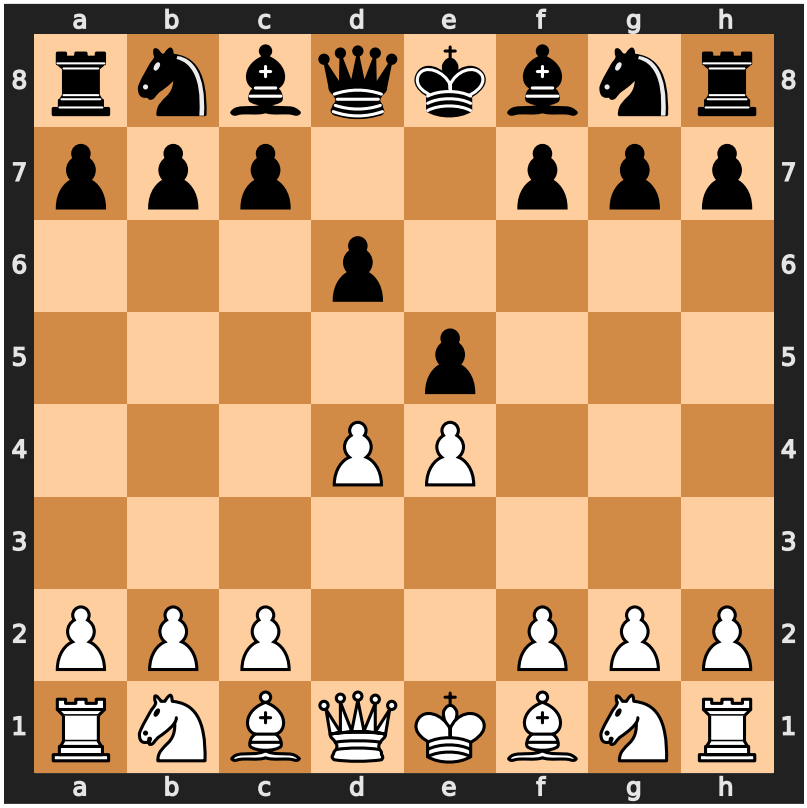

Figure 18.28: Chess Position

Task: Black played the Pirc move 1…d6 but then pushed 2…e5 immediately instead of 2…Nf6. What is wrong with this? **Hint 1:** Look at what happens after 3.dxe5. **Hint 2:** Can Black recapture easily? **Hint 3:** After 3.dxe5 dxe5, Black has lost a pawn center (e5 pawn is now on e5 but was d6, and d6 is gone). More importantly, Black's queen is exposed if 3.dxe5 dxe5 4.Qxd8+ Kxd8. Black loses castling rights. **Solution: 2...e5?!** is premature because after **3.dxe5 dxe5 4.Qxd8+ Kxd8**, Black has lost the right to castle. The correct Pirc move order is **2...Nf6** first (developing a piece and attacking e4), then …g6 and …Bg7. Only push …e5 after you are fully developed and castled.

Exercise 8.21 **Position:** London System. After 1.d4 d5 2.Bf4 c5 3.e3 cxd4 4.exd4 Nc6 5.c3 Nf6 6.Bd3 Bg4 7.Nf3 e6 8.Nbd2 Bd6 9.Bxd6 Qxd6 10.O-O O-O. Black to move.

Task: This position looks fine for both sides, but Black made a strategic error on move 4. What was it? **Hint 1:** Black traded pawns on d4. **Hint 2:** What did the trade accomplish for Black? **Hint 3:** By trading …cxd4, Black opened the c-file but also released the tension. White's center (d4 + c3) is now very solid. Black could have kept the tension with …Nc6 or …Nf6 first, keeping White guessing about whether …cxd4 is coming. **Solution:** Black's error was **3...cxd4**, releasing the central tension too early. In the London System, White is happy to recapture with exd4 because it creates a strong pawn center (d4 + c3). Black should have kept the tension longer with **3...Nf6** or **3...Nc6**, developing pieces while keeping White uncertain about when or if the trade will happen.

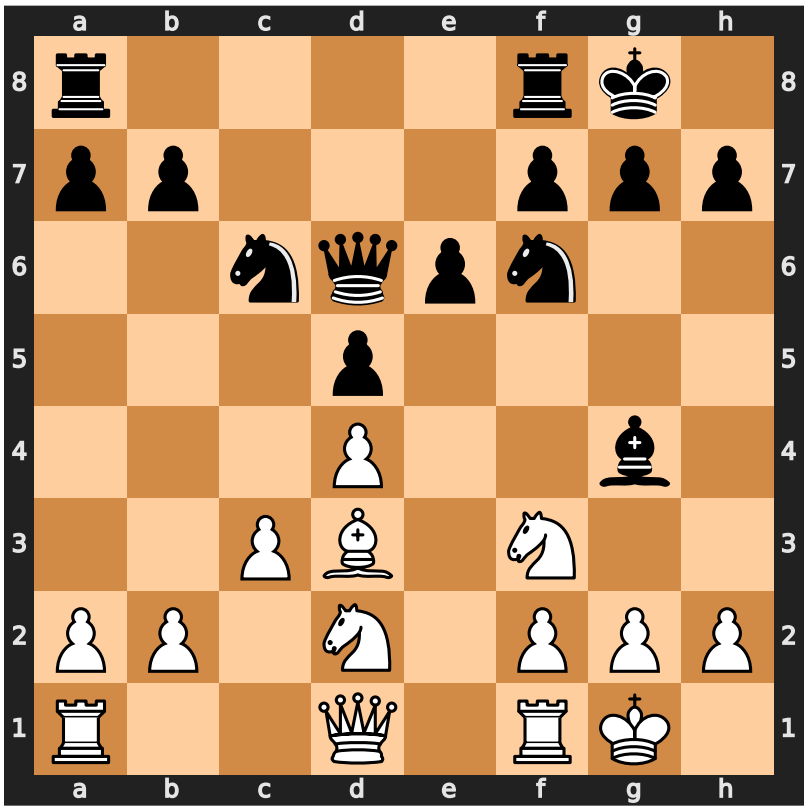

Figure 18.29: Chess Position

Exercise 8.22 **Position:** After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Bc4 O-O 6.O-O Bg4? 7.e5!

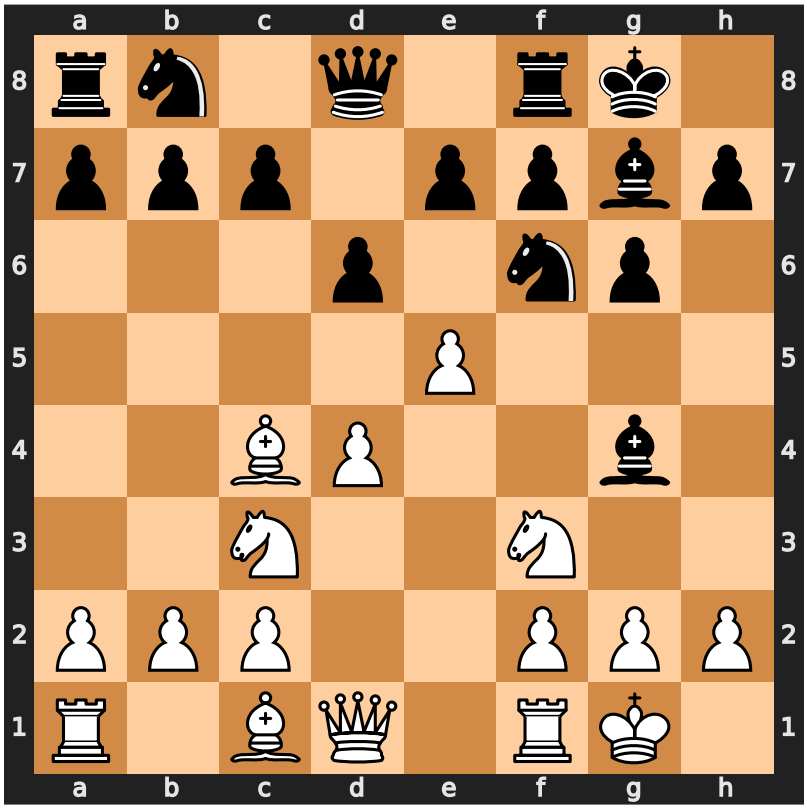

Figure 18.30: Chess Position

Task: Black played …Bg4 and White responded with e5. Why is Black in trouble? **Hint 1:** The knight on f6 is attacked by the e5 pawn. **Hint 2:** Where can the knight go? **Hint 3:** After …dxe5 dxe5, the knight must move, and White gains time. Black developed …Bg4 before completing the Pirc setup, and now the early e5 push punishes this. **Solution:** Black is in trouble because **e5 attacks the knight on f6** and forces an awkward retreat. After **7…dxe5 8.dxe5 Nd5 9.Nxd5**, White has opened the center while Black is underdeveloped. The mistake was **6…Bg4?** too early. Black should have played **6…c6** or **6…Nbd7** first, following the Pirc setup. Develop your minor pieces to their standard squares before getting creative.

Exercise 8.23 **Position:** London System. After 1.d4 d5 2.Bf4 Nf6 3.e3 Nh5?!

Task: Black played …Nh5, attacking the London bishop. Should White be worried? What is the best response? **Hint 1:** Where is Black's knight? **Hint 2:** Is the edge of the board a good place for a knight? **Hint 3:** The knight on h5 is far from the center and poorly placed. **Solution:** White should NOT be worried. Play **4.Bg5** or **4.Be5** to keep the bishop active. The knight on h5 is on the edge of the board ("A knight on the rim is dim") and will need multiple moves to return to a useful square. Black has spent two moves (…Nf6, …Nh5) just to try to trade one bishop. That is a waste of time. White can develop comfortably while Black's knight sits uselessly on h5.

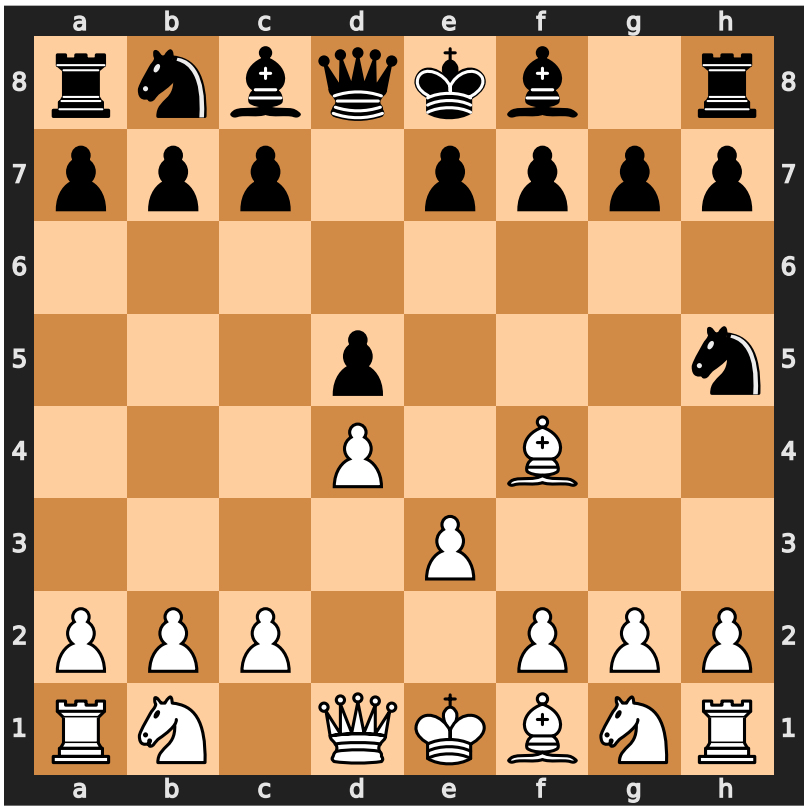

Figure 18.31: Chess Position

Exercise 8.24 **Position:** Pirc Defense. After 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2 O-O 6.O-O e5? 7.dxe5 dxe5 8.Qxd8 Rxd8 9.Nxe5.

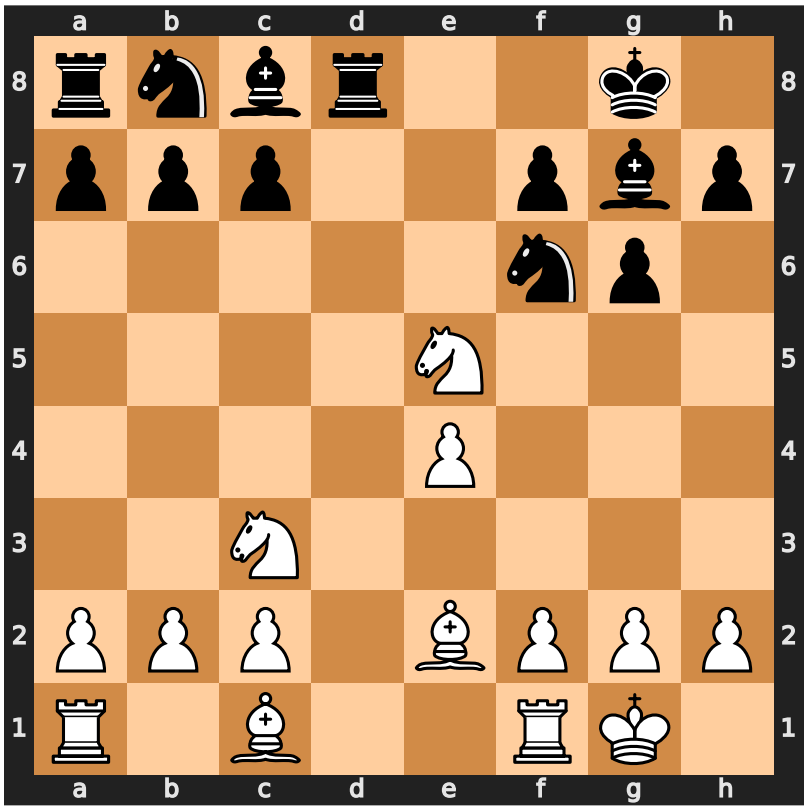

Figure 18.32: Chess Position

Task: Black pushed …e5 too early and lost a pawn. What went wrong? **Hint 1:** Black played …e5 before fully developing. **Hint 2:** After dxe5 dxe5, the d8 square was exposed for a queen trade. **Hint 3:** After the queen trade, Nxe5 wins a pawn because Black's e5 pawn is no longer defended. **Solution:** Black played **6...e5 too early**, before developing the queenside pieces. The correct Pirc approach is to play **6...Nbd7 first** (or 6…c6), then push …e5 when the position is ready. The premature …e5 allowed White to open the center, trade queens, and win a pawn with Nxe5. Remember the Pirc rule: **develop first, strike second.**

18.7.4 Section D: Find the Plan (Exercises 8.25 to 8.30)

Exercise 8.25 **Position:** London System middlegame. White: Kg1, Qe2, Ra1, Re1, Bd3, Bg3, Nf3, Nd2. Pawns on a2, b2, c3, d4, f2, g2, h2. The e-pawn is already gone (was traded or pushed). Black: Kg8, Qd8, Ra8, Rf8, Bc8, Bb4, Nc6, Nf6. Pawns on a7, b7, d5, e6, f7, g7, h7.

Task: White's London is fully set up and the queen is on e2. What is the best plan from here? **Hint 1:** The queen on e2 supports what pawn break? **Hint 2:** What is on e3 in a typical London? Nothing here because e-pawn already moved. But can you recreate the e4 break? **Hint 3:** Play e4! The queen on e2 and rook on e1 both support it. **Solution: 12.e4!** The standard London

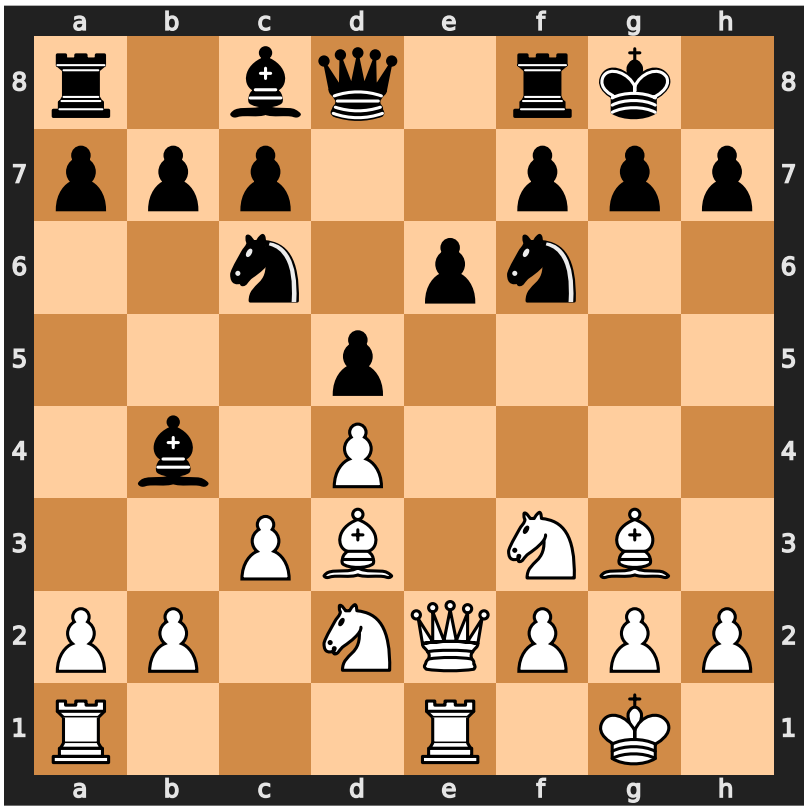

Figure 18.33: Chess Position

break. With the queen on e2 and rook on e1, the e4 push is fully prepared. After …dxe4 Nxe4, White's pieces are powerfully centralized. The bishop on d3, knight on e4, and queen on e2 all work together beautifully.

Exercise 8.26 **Position:** Pirc Defense middlegame. Black has completed the setup. White has played Be3, Qd2, and is threatening Bh6, trading Black's powerful g7 bishop.

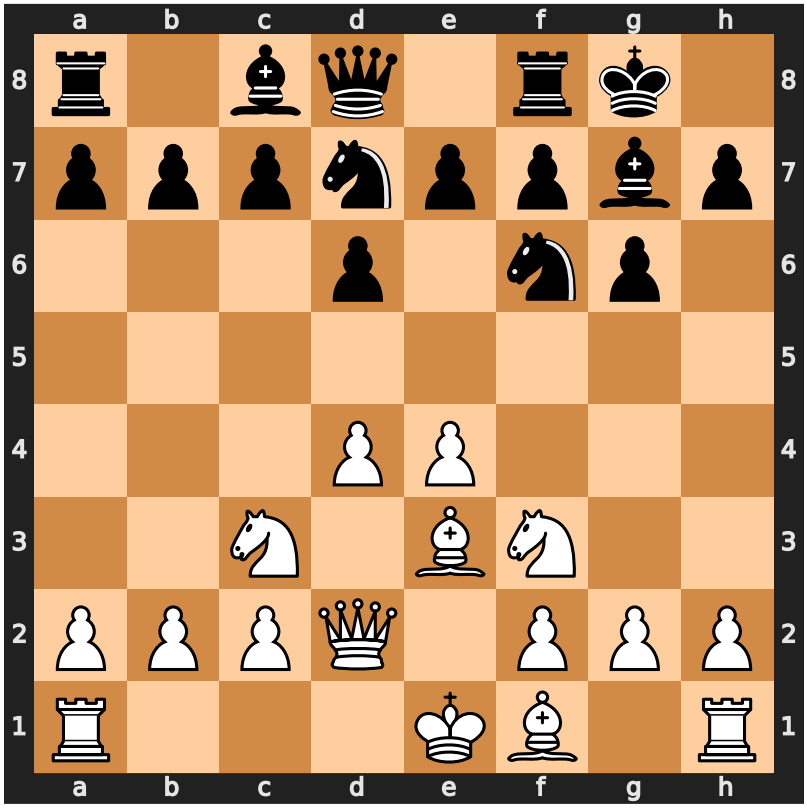

Figure 18.34: Chess Position

Task: White is threatening Bh6 to trade your g7 bishop. How do you prevent this? **Hint 1:** If Bh6 Bxh6 Qxh6, your best piece is gone. **Hint 2:** What move stops Bh6? **Hint 3:** …e5 immediately creates central tension. Or …c6 preparing …b5. But the direct answer to the Bh6 threat is …Ng4, forcing the bishop to move. **Solution: 7...e5!** is the best response. This strikes at the center immediately, creating problems for White. After …e5, White must deal with the central tension, and the Bh6 plan is sidelined. If 8.dxe5 dxe5, Black's position is active and the g7 bishop controls the long diagonal. Alternatively, **7...Ng4** also works tactically, hitting the Be3 and forcing a concession. The key lesson: the best defense is often a counter-attack in the center.

Exercise 8.27 **Position:** London System. White has played the full setup and Black has a solid position. No immediate tactics exist. What do you do?

Task: The position is quiet. No tactics are available. What is White's plan? **Hint 1:** Quiet positions require long-term plans. **Hint 2:** Consider queenside expansion. **Hint 3:** Plan 4:

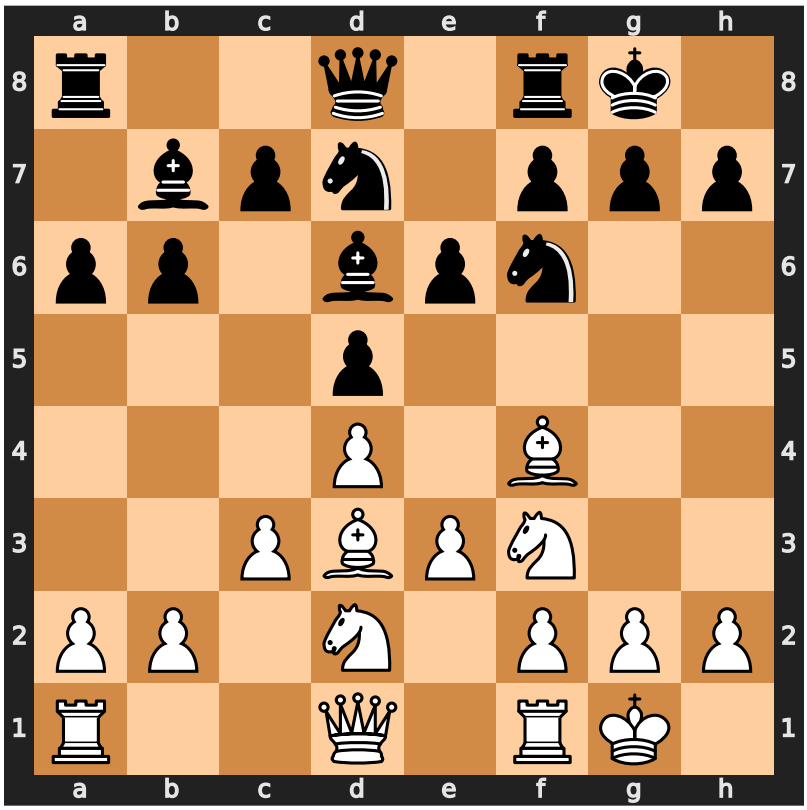

Figure 18.35: Chess Position

Push b4 and a4 to grab queenside space. **Solution:** In this quiet position, White should pursue **queenside expansion: b4, a4, Qb3.** The center is stable, and the kingside is closed. White pushes b4 (gaining space), a4 (more space), and Qb3 (pressuring b7 and d5). This creates a space advantage on the queenside while keeping the center secure. Not every game is about attacking the king. Sometimes the right plan is to grab space and squeeze.

Exercise 8.28 **Position:** Pirc Defense. Black is in the Austrian Attack. White has pushed f4, e5, and is attacking aggressively. Black needs to find counterplay.

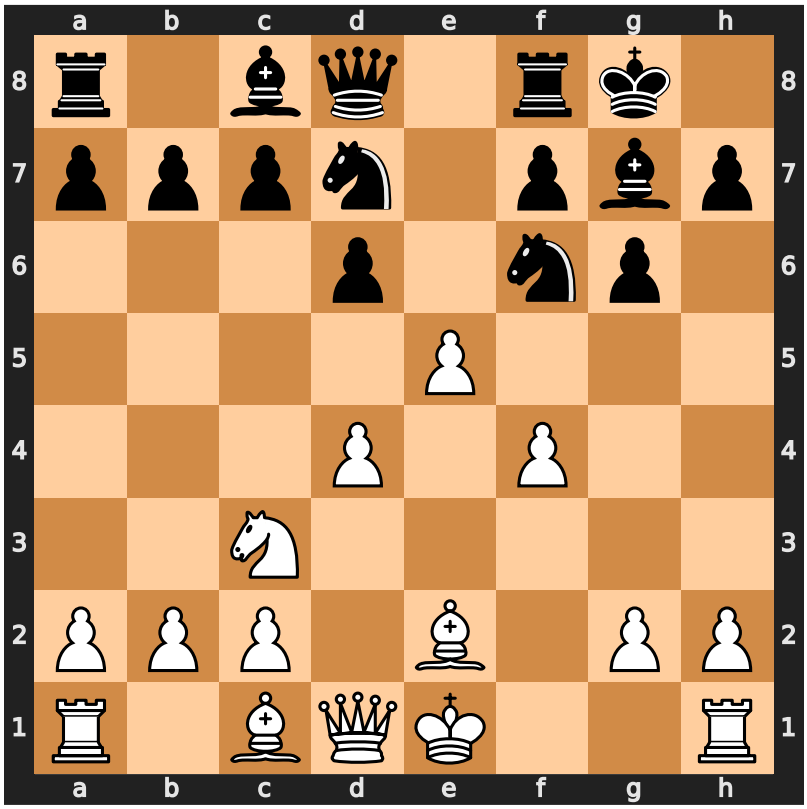

Figure 18.36: Chess Position

Task: White has pushed e5. Black needs to react. Find the best move. **Hint 1:** The e5 pawn is advancing. Attack it. **Hint 2:** …dxe5 opens the center. **Hint 3:** After …dxe5 fxe5 (or dxe5), Black can play …Ng4 or …c5, creating tactical chances. **Solution: 7...dxe5! 8.fxe5 Nd5!** Black trades in the center and places the knight on the powerful d5 square. From d5, the knight controls many squares and cannot be easily chased. Black will follow with …c5 to further challenge White's center. The position is now open, which favors Black's g7 bishop. This is the rubber band principle: White pushed too far, and Black's counterplay is strong.

Exercise 8.29 **Position:** London System. White has an established Ne5 outpost and strong piece placement. Black is cramped.

Task: White has a knight on e5 and all pieces well-placed. What is the best way to increase the pressure? **Hint 1:** White has a knight on e5 and a knight on d2. Can they work together? **Hint**

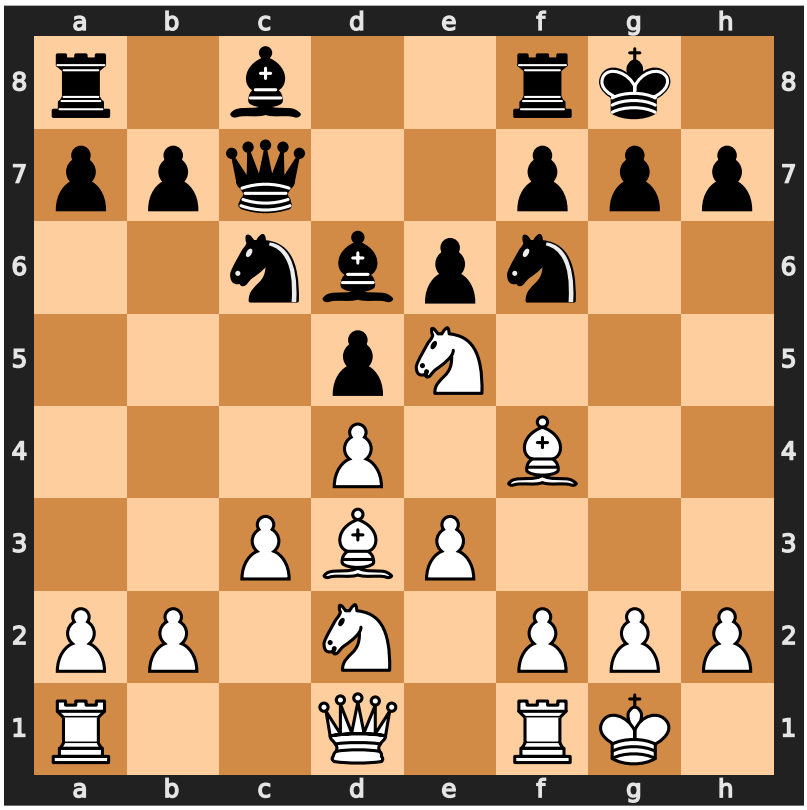

Figure 18.37: Chess Position

2: The knight on d2 can reroute to f3 (since the other knight left f3 for e5). **Hint 3:** With Ndf3, White has both knights actively placed. Then consider f3 and e4 to open the center. **Solution: 12.Ndf3!** followed by preparing **e4.** The knight relay is complete: the d2 knight comes to f3, replacing the knight that went to e5. Now White has maximum piece activity. The plan is to push e4 (breaking open the center) when the time is right, with all pieces supporting the break. This knight relay (Nf3 to e5, Nd2 to f3) is one of the most important London System techniques.

Exercise 8.30 **Position:** Pirc Defense. Black has played the setup perfectly and is ready to execute the …c5 break.

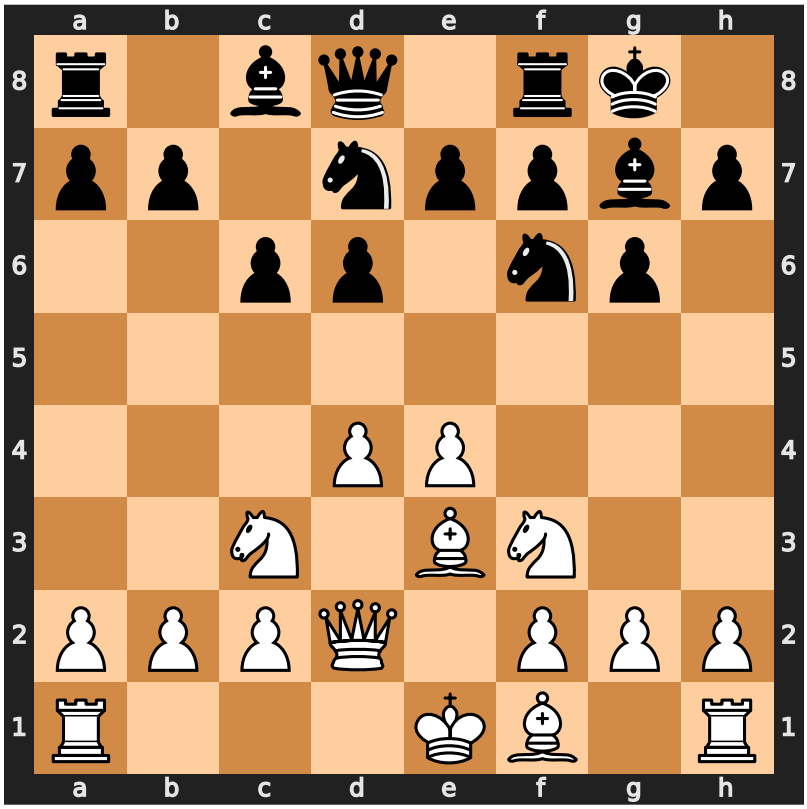

Figure 18.38: Chess Position

Task: Is now the right time for …c5? Evaluate the position and decide. **Hint 1:** Look at Black's development. Is everything in place? **Hint 2:** White has not castled yet. **Hint 3:** When your opponent has not castled, opening the center is powerful. **Solution: Yes, 7…c5! is excellent here.** White has not castled, so opening the center is dangerous for White. After …c5, if dxc5 dxc5, the center opens and White's king is exposed. If White plays d5, Black gets …e6 with counterplay against the d5 pawn. The timing is perfect because: (1) Black is fully developed, (2) White's king is still in the center, and (3) the g7 bishop will come alive on the open long diagonal. This is the Pirc at its best: patient development followed by a perfectly timed central strike.

You have completed all 30 exercises. That is serious work. If you got most of them right, you understand the London System and Pirc/Modern Defense at a deep level.

If some were tricky, go back and review the relevant section. There is no rush.

18.8 Key Takeaways

1. **A repertoire gives you a plan for every game.** You need one system as White and one as Black. Stop improvising from move 1.
2. **The London System (1.d4, 2.Bf4, 3.e3, 4.Nf3, 5.Bd3, 6.Nbd2, 7.c3, 8.O-O)** gives you a solid, principled setup that works against everything Black can throw at you. Always play **Bf4 before e3.**
3. **The Pirc/Modern Defense (1...d6, 2...Nf6, 3...g6, 4...Bg7, 5...O-O)** gives you a flexible, fighting system against 1.e4. The g7 bishop is your strongest piece. Wait to be fully developed before striking with …e5 or …c5.
4. **Understanding beats memorization.** Learn the IDEAS behind each move (why d4? why Bf4 before e3? why Bg7? why wait for …e5?). When you understand the plan, you can find the right move in positions you have never seen before.
5. **Both systems are scalable.** You will not outgrow them. The London and Pirc/Modern are played at the grandmaster level. They grow with you.

18.9 Practice Assignment

18.9.1 This Week:

1. **Play 5 games as White** using the London System. Follow the setup: 1.d4, 2.Bf4, 3.e3, 4.Nf3, 5.Bd3, 6.Nbd2, 7.c3, 8.O-O. After the setup, choose a plan (e4 break, Ne5 outpost, kingside attack, or queenside expansion) and pursue it.
2. **Play 5 games as Black against 1.e4** using the Pirc/Modern Defense. Follow the setup: 1…d6, 2…Nf6, 3…g6, 4…Bg7, 5…O-O. Wait until you are fully developed, then strike with …e5 or …c5.
3. **After each game, ask yourself these three questions:**
   - Did I follow the opening setup correctly?
   - Did I choose a plan and stick with it?
   - Where did I first feel unsure, and what should I have done?
4. **Write down one thing you learned** from each game. Just one sentence. After 10 games, read your notes. You will see patterns in your mistakes, and that is how you improve.

18.9.2 On a Board:

Set up the London System ideal position from memory (no looking!). Then set up the Pirc/Modern ideal position from memory. If you can do both without checking, you have internalized these systems.

18.9.3 With a Computer:

Load the five annotated games from this chapter into Lichess or Chess.com analysis. Play through them move by move. At each "Pause and look" point, stop and try to predict the next move before clicking.

18.10 Progress Check

Answer these questions honestly:

- ☐ Can I set up the London System from memory? (d4, Bf4, e3, Nf3, Bd3, Nbd2, c3, O-O)
- ☐ Do I understand why Bf4 must come before e3?
- ☐ Can I name at least two London System plans? (e4 break, Ne5, kingside attack, queenside expansion)
- ☐ Can I set up the Pirc/Modern Defense from memory? (d6, Nf6, g6, Bg7, O-O)
- ☐ Do I understand why the g7 bishop is so important?
- ☐ Do I know when to play …e5 and when to play …c5?
- ☐ Can I explain the "rubber band" principle?
- ☐ Did I solve at least 20 of the 30 exercises correctly?

If you checked 6 or more boxes: You are ready for Chapter 9. You have a real opening repertoire, and that puts you ahead of most players at your level.

If you checked fewer than 6: Review the sections you missed. Focus on the plans and ideas, not memorizing moves. Play a few more games with each system. You will get there.

Your estimated rating after completing this chapter: 800–1000. You now play the opening with a plan. That alone can gain you 100-200 rating points.

18.11 Rest Marker

You have completed Chapter 8.

This is a big one. You walked in without a repertoire, and you are walking out with three complete opening systems: the London System as White, the Pirc/Modern as Black against 1.e4, and a basic QGD against 1.d4.

That is not a small thing. Most players at your level are guessing in the opening. You are not guessing anymore. You have a plan. You have ideas. You know what your pieces want to do and why.

Go play some games. Feel the difference. When you sit down and play 1.d4, Bf4, e3 with confidence, you will know this chapter did its job.

Come back for Chapter 9 with fresh eyes and a full heart. The journey continues.

"Chess is like a language. The opening is saying hello. Now you know how to introduce yourself."

Chapter 19

Chapter 9: Basic Pawn Endgames: Opposition, Key Squares, Rule of the Square

Volume I: Foundations | Rating Range: Beginner (600–1000)

> *"In order to improve your game, you must study the endgame before everything else; for whereas the endings can be studied and mastered by themselves, the middle game and the opening must be studied in relation to the endgame."* – José Raúl Capablanca, Third World Chess Champion

---

19.1 What You'll Learn

- Why studying endgames FIRST is the fastest path to improvement
- How to win with King and Pawn against a lone King using **key squares**
- How **opposition** works and why the player who does NOT have to move holds the advantage
- How the **Rule of the Square** lets you instantly see whether a king can catch a runaway pawn
- How **pawn breakthroughs** let you sacrifice one pawn to promote another
- What **passed pawns**, **connected passed pawns**, and **outside passed pawns** are and why they win games
- The technique to convert a won pawn endgame into a new queen on the board

Pawn endgames are where chess becomes pure logic. No tricks. No flashy sacrifices. Just your king, your pawns, and your ability to calculate. If you master the patterns in this chapter, you will win dozens of games that other players at your level would draw or even lose. You will also learn to recognize when a trade of pieces leads to a winning pawn endgame, which gives you a powerful weapon in the middlegame.

Take your time with this chapter. Set up every position on your board. Move the pieces with your hands. Pawn endgames reward patience, and the knowledge you build here will last your entire

chess career.

19.2 Part 1: Why Study Endgames First?

Many chess teachers start with openings. They hand you a stack of variations to memorize. They show you the Italian Game, the Sicilian Defense, the Queen's Gambit. You memorize ten moves deep, play your opening perfectly, and then have no idea what to do when the smoke clears and you are left with a king and four pawns against a king and three pawns.

We take a different approach. **We start with endgames.** Here is why.

19.2.1 Reason 1: Fewer Pieces, Clearer Logic

When you have a full board of 32 pieces, the possibilities are overwhelming. But strip the position down to a king, a pawn, and the opponent's king, and suddenly you can SEE the logic of chess. You can trace every variation. You can understand WHY a move works, not just memorize THAT it works.

Endgames teach you how pieces actually behave. You learn that the king is a fighting piece, not a coward hiding behind pawns. You learn that a single pawn can be worth more than life itself if it reaches the other side of the board. These lessons change how you think about the entire game.

19.2.2 Reason 2: Endgame Knowledge Powers Your Middlegame

If you know that trading all the pieces leads to a won pawn endgame for you, then you know exactly what to do in the middlegame: trade everything. If you know that a particular pawn structure gives your opponent an outside passed pawn, you avoid that structure. Endgame knowledge tells you WHICH trades to make, WHICH pawns to keep, and WHICH positions to aim for.

A player who understands endgames sees the whole game differently. While your opponent is guessing, you are steering toward positions you already know how to win.

19.2.3 Reason 3: Capablanca Told Us So

José Raúl Capablanca was the Third World Chess Champion and one of the most naturally gifted players in history. He lost only 34 serious games in his entire career. His endgame technique was considered the finest ever seen. And his advice was simple and clear: study the endgame before everything else.

He was right. The endgame is where theory meets practice. Where knowledge beats talent. Where the player who has done the work wins the game.

19.2.4 Reason 4: Pawn Endgames Are Pure Calculation

In pawn endgames, there are no pieces to calculate complicated tactics with. No bishops firing across the board. No knights jumping to unexpected squares. Just kings and pawns. This means pawn endgames are decided by pure KNOWLEDGE and CALCULATION. If you know the patterns, you win. If you do not, you lose. There is no luck, no chaos, no bluffing. Just chess in its purest form.

That is why we start here. Learn these patterns, and you build a foundation that supports everything else.

Good stopping point. This was the "why." Now we get into the "how." Come back with your board ready.

19.3 Part 2: King and Pawn vs. King (The Most Important Endgame in Chess)

This is it. The single most important endgame you will ever study. King and one pawn against a lone king. Can you promote that pawn to a queen? Or will the enemy king park itself in front of the pawn and stop it dead?

This position appears in HUNDREDS of your games. Every time you trade down to a single pawn advantage, you need to know the answer. Every time your opponent has one last pawn and you need to stop it, you need to know the answer. Get this right, and you win games you had no business winning. Get it wrong, and you throw away games you should have won.

Let us start with the most basic question: what happens when a pawn tries to walk to the other side of the board?

19.3.1 The Pawn's Journey

A pawn starts its life on the second rank (for White) or the seventh rank (for Black). It wants to march all the way to the other side. If it reaches the eighth rank (for White) or the first rank (for Black), it promotes to a queen. A new queen on the board almost always means victory.

But the pawn cannot do this alone. It moves only one square at a time (after its optional two-square first move), and it cannot capture forward. If the enemy king stands in its path, the pawn is stuck. The pawn needs its own king to help clear the way.

This is the central drama of K+P vs K: your king fights the enemy king for control of the squares in front of the pawn, while the pawn inches forward behind its protector.

19.3.2 The Two Outcomes

Every K+P vs K position has one of two outcomes:

1. **The pawn promotes.** Your king clears the path, the pawn marches through, becomes a queen, and you win.
2. **The pawn is stopped.** The enemy king blocks the pawn, your king cannot push it aside, and the game is drawn.

How do you tell which outcome will happen? That is what key squares and opposition are for.

19.4 Part 3: Key Squares

Every pawn on the board has a set of **key squares** (some books call them "critical squares"). These are the magic squares for your king. If your king reaches one of these squares, the pawn WILL promote, no matter what the defender does.

Think of key squares as the finish line for your king, not your pawn. The pawn's finish line is the eighth rank. But the king's finish line is the key squares. Once your king crosses that line, the game is won.

19.4.1 Key Squares for a Pawn on the 5th Rank

When your pawn is on the 5th rank, the key squares are the **three squares that are two ranks ahead of the pawn.**

Set up your board: Place a White pawn on e5. The key squares are d7, e7, and f7. These are the three squares on the 7th rank directly ahead of and beside the pawn.

```
FEN: 8/8/8/4P3/8/8/8/4K3 w - - 0 1
```

If the White king can reach d7, e7, or f7, the pawn promotes. Period. No matter where the Black king is, no matter whose turn it is, the pawn will get through.

19.4.2 Key Squares for a Pawn on the 2nd, 3rd, or 4th Rank

When your pawn is on the 2nd, 3rd, or 4th rank, the key squares are the **three squares that are one rank ahead of the pawn.** But there is a catch: for pawns this far back, the key squares are actually TWO ranks ahead of the pawn.

Let me be precise. For any pawn that has NOT yet reached the 5th rank, the key squares are the three squares on the **6th rank** (for a White pawn) in the same neighborhood as the pawn.

Set up your board: Place a White pawn on e4. The key squares are d6, e6, and f6.

```
FEN: 8/8/8/8/4P3/8/8/4K3 w - - 0 1
```

Set up your board: Place a White pawn on e2. The key squares are STILL d6, e6, and f6. It does not matter where the pawn starts. For pawns on ranks 2 through 4, the key squares are always on the 6th rank.

```
FEN: 8/8/8/8/8/8/4P3/4K3 w - - 0 1
```

19.4.3 Why Do Key Squares Work?

When your king reaches a key square, it controls the critical squares in front of the pawn. The enemy king cannot block the pawn's path because your king is in the way. Your pawn marches up the board behind your king, and the enemy king gets shoved aside.

Set up your board: White king on e6, White pawn on e4, Black king on d8. White to move.

```
FEN: 3k4/8/4K3/8/4P3/8/8/8 w - - 0 1
```

The White king is on e6, one of the key squares. Watch what happens:

1.e5 Ke8 2.Kd6! (maintaining control) Kd8 3.e6 Ke8 4.e7 Kf7 5.Kd7 and the pawn promotes on the next move.

The White king arrived at the key square FIRST. That made all the difference. The pawn walked right through.

19.4.4 When the King Cannot Reach a Key Square

Set up your board: White king on e4, White pawn on e5, Black king on e7. Black to move.

`FEN: 8/4k3/8/4P3/4K3/8/8/8 b - - 0 1`

Here the White king is NOT on a key square. It is behind the pawn. The Black king stands directly in the pawn's path. Let us see what happens:

1…Ke6! (Black blocks the pawn) 2.Kd4 Kd7! 3.Kd5 Ke7 4.e6 Ke8! 5.Kd6 Kd8 6.e7+ Ke8 7.Ke6 stalemate! The game is drawn.

Even though White had a pawn, the king could not reach a key square. The Black king held its ground, and the game ended in stalemate.

The lesson: It is not enough to have an extra pawn. Your king must reach a key square to win. If the enemy king blocks the key squares, the game may be drawn.

19.4.5 Key Square Summary Table

Pawn on Rank	Key Squares
2nd rank (e.g., e2)	d6, e6, f6
3rd rank (e.g., e3)	d6, e6, f6
4th rank (e.g., e4)	d6, e6, f6
5th rank (e.g., e5)	d7, e7, f7
6th rank (e.g., e6)	d8, e8, f8

The pattern: for pawns on ranks 2–4, the key squares sit on the 6th rank. For pawns on the 5th rank, they jump to the 7th rank. For a pawn on the 6th rank, they are on the 8th rank (the promotion rank itself).

19.4.6 The Rook Pawn Exception

There is one important exception. **A rook pawn (a-pawn or h-pawn) cannot win if the defending king reaches the corner.**

Set up your board: White king on b6, White pawn on a5, Black king on a8.

`FEN: k7/8/1K6/P7/8/8/8/8 w - - 0 1`

White plays a6, and Black plays Kb8. White plays a7, and Black plays Ka8. White must play either Ka6 (stalemate) or Kc7, letting Black play Kxa7. Either way, it is a draw.

The rook pawn fails because the board's edge acts like a wall. The White king cannot get around the Black king because there are no squares to the left of the a-file. Remember this: **rook pawns**

are tricky. When the defending king reaches the corner, the extra pawn often cannot win.

Rest here if you need to. Key squares are a big concept. Let it settle, then come back for opposition.

19.5 Part 4: Opposition

Opposition is one of the most beautiful concepts in chess. It is simple to understand but takes practice to use well. And once you understand it, you will see it everywhere.

19.5.1 What Is Opposition?

Opposition means the two kings face each other with exactly one square between them. They can be on the same file (vertical opposition), the same rank (horizontal opposition), or even the same diagonal.

The critical rule: **The player who does NOT have to move has the opposition.**

Why? Because the player who MUST move has to step aside. Their king must leave the line, giving the other king access to the squares that were blocked.

Think of it like a standoff. Two kings stare each other down across one square. Whoever blinks first (moves first) loses the staring contest and has to step aside.

19.5.2 Direct Opposition

Direct opposition is the most common type. The kings face each other on the same file or rank with exactly one empty square between them.

Set up your board: White king on e4, Black king on e6. One empty square (e5) between them.

`FEN: 8/8/4k3/8/4K3/8/8/8 w - - 0 1`

If it is **White to move**, Black has the opposition. White must step aside: Kd4, Kf4, Kd5, or Kf5. No matter which way White goes, Black can maintain the block.

If it is **Black to move**, White has the opposition. Black must step aside, and White's king advances.

19.5.3 Why Opposition Matters in K+P vs K

Opposition determines whether the stronger side's king can reach a key square.

Set up your board: White king on e4, White pawn on e3, Black king on e6. White to move.

`FEN: 8/8/4k3/8/4K3/4P3/8/8 w - - 0 1`

White to move. Black has the opposition (kings face each other, Black does not have to move). What should White do?

If White plays Kd5, Black plays Kd7 (maintaining opposition). If White plays Kf5, Black plays Kf7. Black mirrors White's king and keeps it away from the key squares. If White pushes the pawn (e4), Black plays Ke5 and stands right in front of the pawn.

This position is drawn. White cannot break through because Black has the opposition.

Now change one thing. Same position, but **Black to move.**

```
FEN: 8/8/4k3/8/4K3/4P3/8/8 b - - 0 1
```

Now White has the opposition. Black must step aside.

1…Kd6 2.Kf5! (White sidesteps and advances) 2…Ke7 3.Ke5 (White reclaims the center) 3…Kd7 4.Kf6! (heading for a key square) 4…Ke8 5.Ke6 (key square reached!) and the pawn will promote.

Or if Black tries: 1…Kf6 2.Kd5! Ke7 3.Ke5 Kd7 4.Kf6 Ke8 5.Ke6 and again White reaches a key square.

Same position. Same pieces. Same pawn. The only difference is who has to move. That changes the result from a draw to a win. That is the power of opposition.

19.5.4 The Opposition Rule

Here is the rule in simple words:

When the two kings face each other with one empty square between them, the player who does NOT have to move has the opposition. Having the opposition usually means your king will advance, because the other king must step aside.

In K+P vs K: - If the attacking king has the opposition, it can reach a key square. The pawn promotes. **Win.** - If the defending king has the opposition, it can block the key squares. **Draw.**

19.5.5 How to Take the Opposition

Sometimes you can maneuver your king to TAKE the opposition. The trick is to move your king so that both kings end up facing each other with one square between them, and it is your OPPONENT's turn to move.

Set up your board: White king on d4, White pawn on e3, Black king on d7. White to move.

```
FEN: 3k4/8/8/8/3K4/4P3/8/8 w - - 0 1
```

White plays 1.Kd5! Now the kings face each other on the d-file with one square (d6) between them. It is Black's turn. Black has to step aside. White has the opposition.

1…Ke7 2.Ke5! (opposition again on the e-file!) 2…Kd7 3.Kf6! (sidestepping toward the key squares). White is winning.

The technique: advance your king toward the enemy king and try to arrive so that they face each other on your opponent's move.

19.5.6 Distant Opposition (A Preview)

There is a more advanced concept called **distant opposition.** This is when the two kings are on the same line but separated by 3 or 5 squares (an odd number). The player NOT to move

still has the advantage. Distant opposition can be converted into direct opposition through careful maneuvering.

We will not go deep into distant opposition in this chapter. For now, just know it exists. When you reach the 1200+ range, you will study it in detail. For now, mastering direct opposition gives you a massive advantage over nearly every opponent at your level.

Rest here. Opposition is subtle. Go back and set up each position again. Move the pieces. Switch sides. See what happens when Black has the opposition vs. when White has it. Feel the difference in your hands.

19.6 Part 5: The Rule of the Square

Here is a situation that comes up all the time: your opponent has a passed pawn racing toward promotion, and your king is the only piece that can stop it. Will your king get there in time?

You could calculate move by move: the pawn goes here, then here, then here, and my king goes here, here, here, here… That is five or six moves of calculation. Under time pressure, with the clock ticking, that is a lot to work out.

Or you could use the **Rule of the Square** and know the answer instantly.

19.6.1 How the Rule of the Square Works

Imagine the pawn is about to run. Draw an imaginary square from the pawn to its promotion square, extending sideways by the same number of squares.

Here is the method:

1. Count how many squares the pawn needs to reach the promotion rank. Include the square the pawn is on.
2. Draw a square using that number of squares on each side, with one corner on the pawn and one corner on the promotion square.
3. If the defending king can step INTO the square on its turn, the king catches the pawn.
4. If the defending king is OUTSIDE the square and cannot enter it, the pawn promotes.

That is it. No calculation needed. Just draw the square and check.

19.6.2 Example 1: The King Catches the Pawn

Set up your board: White pawn on a5 (no White king needed for this exercise). Black king on e7. It is Black's move.

```
FEN: 8/4k3/8/P7/8/8/8/8 b - - 0 1
```

The pawn is on a5 and wants to reach a8. That is 3 squares (a5 to a6 to a7 to a8). Draw a square: a5-a8-d8-d5. This is a 4x4 square (from a5 to d5 along the 5th rank, and from a5 to a8 along the a-file).

The Black king is on e7. Can it step into the square? The square's boundary on the 7th rank goes from a7 to d7. The king is on e7, which is ONE square outside the boundary. But it is Black's move! Black plays 1…Kd7 or 1…Kd6, stepping into the square.

Once the king is inside the square, it will catch the pawn. The king can always move diagonally toward the pawn's path and arrive in time.

Result: Black catches the pawn. Draw.

19.6.3 Example 2: The Pawn Escapes

Set up your board: White pawn on a5. Black king on f7. It is White's move.

```
FEN: 8/5k2/8/P7/8/8/8/8 w - - 0 1
```

Same square: a5-a8-d8-d5. The Black king is on f7, well outside the square. White pushes 1.a6. Now redraw the square for a pawn on a6: a6-a8-c8-c6. The Black king plays 1…Ke6, but that is still outside the new square. The pawn is faster.

White plays 2.a7. The square shrinks: a7-a8-b8-b7. The Black king is nowhere near it. 3.a8=Q. The pawn promotes.

Result: The pawn promotes. White wins.

19.6.4 Example 3: Watch Out for the First Move

Set up your board: White pawn on b2. Black king on h8. White to move.

```
FEN: 7k/8/8/8/8/8/1P6/4K3 w - - 0 1
```

The pawn is on b2 and wants to reach b8. That is 6 squares. Draw the square: b2-b8-h8-h2. The Black king is on h8, which is RIGHT on the corner of the square.

But wait. It is White's move. White plays 1.b4 (the pawn can advance two squares from its starting position). Now the pawn is on b4, and the square is b4-b8-f8-f4. The Black king is on h8, OUTSIDE the new square.

The two-square first move changes everything. **When a pawn is still on its starting rank, it gets a "bonus" square of distance because of the two-square advance.** The Rule of the Square still works, but you must account for the first move being worth two squares instead of one.

Practical tip: When the pawn is on rank 2 (or rank 7 for Black), draw the square as if the pawn is one square further advanced. That accounts for the two-square first move.

19.6.5 When the Rule Does NOT Work

The Rule of the Square assumes the pawn's path is clear. If there are pieces blocking the pawn's advance, or if the defending king has pieces helping it, the rule does not apply. It also does not account for checks, captures, or other tactics along the way.

Use the Rule of the Square for clean races between a pawn and a king. For positions with extra pieces on the board, you will need to calculate.

19.6.6 Practice the Rule

Set up random positions with one pawn and one king (on opposite sides). Draw the square. Check if the king is inside or outside. Then play it out move by move to verify. Do this ten times, and the Rule of the Square will become automatic.

Rest here. The Rule of the Square is a tool you will use for the rest of your chess life. Practice it until it is instant.

19.7 Part 6: Pawn Breakthroughs

Sometimes you face a position where your pawns seem blocked. Your opponent's pawns stand in the way, and neither side can advance. It looks like a dead draw.

But hidden inside some of these positions is a beautiful pattern called a **pawn breakthrough.** By sacrificing one pawn, you create a path for another pawn to sprint to the promotion square. The defender cannot stop both pawns at once, and one of them gets through.

Pawn breakthroughs are one of the most satisfying patterns in chess. They feel like magic the first time you see them.

19.7.1 The Classic Three vs. Three Breakthrough

Set up your board: White pawns on a5, b5, c5. Black pawns on a7, b7, c7. No kings on the board yet (we will add them later). White to move.

`FEN: 8/ppk5/8/PPP5/8/8/8/4K3 w - - 0 1`

(Place the Black king on c7 and the White king on e1 for a legal position, but focus on the pawns.)

Look at this position. Three White pawns vs. three Black pawns. Everything seems blocked. If White pushes a6, Black plays bxa6 and stops everything. Same with c6.

But watch this:

1.b6!

This is the breakthrough move. White sacrifices the b-pawn. Now Black has to choose:

Option A: 1...axb6 If Black captures with the a-pawn, White plays **2.c6!** Now if 2…bxc6, White plays 3.a6 and the a-pawn is a passed pawn that cannot be stopped. If 2…b6, White plays 3.c7 and the c-pawn promotes.

Option B: 1...cxb6 If Black captures with the c-pawn, White plays **2.a6!** Now if 2…bxa6, White plays 3.c6 and the c-pawn promotes. If 2…b6, then 3.a7 and the a-pawn promotes.

Option C: 1...b6 If Black pushes the b-pawn instead of capturing, White plays **2.c6!** Now 2…axb6 3.c7 promotes, or 2…a6 3.bxa6 and a6 will promote.

No matter what Black does, one of White's pawns gets through. The sacrifice of the b-pawn creates two passed pawns, and Black cannot stop both.

This is the pawn breakthrough. Sacrifice one, promote another. It is beautiful, logical, and completely forcing.

19.7.2 Counting Tempi

A **tempo** (plural: tempi) is one move, one unit of time. In pawn races, counting tempi tells you who gets there first.

When two pawns are racing to promote, count the moves each pawn needs:

- White pawn on a5 needs 3 moves to reach a8 (a5-a6-a7-a8).
- Black pawn on h4 needs 4 moves to reach h1 (h4-h3-h2-h1).

White gets there first by one tempo. That means White promotes first, gets a queen, and uses it to stop Black's pawn or deliver checkmate.

Counting tempi is essential in all pawn races. When both sides have passed pawns running toward promotion, the player who gets there first usually wins. Count the moves. One tempo can be the difference between winning and losing.

19.7.3 Breakthrough Conditions

Not every pawn formation allows a breakthrough. The classic breakthrough works when:

1. You have three connected pawns on the 5th rank.
2. Your opponent has three pawns on the 7th rank blocking yours.
3. No kings are close enough to interfere.

If the kings are involved, the position becomes more complex. But the idea remains the same: sacrifice one pawn to create two passers.

Look for breakthrough possibilities whenever you have three or more connected pawns facing your opponent's pawns. The pattern might be hiding in positions you thought were drawn.

Rest here. The breakthrough is a powerful concept. Set up the 3 vs. 3 position and play through all three options until you can do it without looking at the page.

19.8 Part 7: Passed Pawns

A **passed pawn** is a pawn with no enemy pawns blocking it or able to capture it on adjacent files. In other words, the pawn has a clear road to the promotion square. No enemy pawn stands in its way on the same file, and no enemy pawn can attack it from a neighboring file.

Passed pawns are the most important pawns on the board. The great teacher Aron Nimzowitsch put it perfectly: **"A passed pawn is a criminal that must be watched by the police."** The "police" are your opponent's pieces. If they stop watching the passed pawn for even one moment, it runs to the promotion square and becomes a queen.

19.8.1 How to Recognize a Passed Pawn

Set up your board: White pawns on a2, d5, f2. Black pawns on a7, e6, g7.

```
FEN: 8/p5p1/4p3/3P4/8/8/P4P2/4K3 w - - 0 1
```

Look at the White pawn on d5. Is it a passed pawn?

- Is there a Black pawn on the d-file ahead of it? No.
- Is there a Black pawn on the c-file that could capture it? No.

- Is there a Black pawn on the e-file that could capture it? Yes. The Black pawn on e6 captures diagonally forward (toward rank 1) to d5 or f5. So the Black pawn on e6 CAN capture the White pawn on d5.

That means the White d5 pawn is NOT a passed pawn. There is a Black pawn on an adjacent file (e6) that can capture it.

Here is a clean example.

Set up your board: White pawns on a2, d5, f2. Black pawns on a7, b6, g7.

`FEN: 8/p5p1/1p6/3P4/8/8/P4P2/4K3 w - - 0 1`

Now look at the White pawn on d5. No Black pawns on the c, d, or e files can stop it or capture it. The d5 pawn is a **passed pawn.** It has a clear road to d8.

19.8.2 Connected Passed Pawns

Connected passed pawns are two passed pawns on adjacent files. They protect each other as they advance. One pawn covers the square the other needs to reach. This makes them extremely powerful and very difficult to stop.

Set up your board: White pawns on c5 and d5. No Black pawns on the b, c, d, or e files.

`FEN: 8/6k1/8/2PP4/8/8/8/4K3 w - - 0 1`

These two pawns support each other. If you play d6, the c5 pawn covers d6 from behind. If you play c6, the d5 pawn covers c6. The defending king cannot capture one without letting the other advance. Connected passed pawns on the 5th rank or beyond are often unstoppable, even without help from the king.

The saying is: **"Connected passed pawns on the 6th rank beat a rook."** That is how powerful they are.

19.8.3 Protected Passed Pawn

A **protected passed pawn** is a passed pawn that is defended by another pawn. This pawn is especially strong because the opponent cannot simply capture it. The defending side must commit a piece to blockading it (standing in front of it to prevent its advance).

Set up your board: White pawns on c4 and d5. Black pawn on e6.

`FEN: 8/6k1/4p3/3P4/2P5/8/8/4K3 w - - 0 1`

In the previous example, the e6 pawn could capture d5, so the d5 pawn was not truly passed. Here is a cleaner example.

Set up your board: White pawns on c4 and d5. No Black pawns nearby.

`FEN: 8/6k1/8/3P4/2P5/8/8/4K3 w - - 0 1`

The d5 pawn is passed (no Black pawns on the c, d, or e files can stop it). The c4 pawn defends d5: if the opponent captures on d5, the c4 pawn recaptures. That is what makes it a "protected" passed pawn.

The key idea: a protected passed pawn ties down the opponent. They must keep a piece watching it at all times, which limits their options everywhere else on the board.

19.8.4 The Endgame Plan With Passed Pawns

Here is the basic plan when you have a passed pawn in a king and pawn endgame:

1. **Create a passed pawn** (through captures, breakthroughs, or pawn advances).
2. **Advance the passed pawn** toward the promotion square.
3. **Support it with your king.** The king walks alongside the pawn, clearing the path.
4. **Promote and win.** A new queen usually decides the game.

If the opponent must use their king to stop your passed pawn, your king is free to attack their pawns on the other side of the board. This leads us to the next concept: the outside passed pawn.

Rest here. Passed pawns are the engine of winning endgames. Make sure you can spot them before moving on.

19.9 Part 8: Outside Passed Pawns

An **outside passed pawn** is a passed pawn that is far away from the main group of pawns. It is on the "outside" of the position, away from the action.

Why is this valuable? Because the outside passed pawn acts as a **decoy.** When you push it toward promotion, the enemy king MUST leave the main battleground to stop it. While the enemy king runs across the board to deal with your outside passed pawn, YOUR king is free to gobble up the undefended enemy pawns.

It is a classic chess trick: threaten over HERE so you can win over THERE.

19.9.1 Classic Outside Passed Pawn Example

Set up your board: White king on e4, White pawns on a4, f2, g2. Black king on e6, Black pawns on f7, g7. White to move.

```
FEN: 8/5pp1/4k3/8/P3K3/8/5PP1/8 w - - 0 1
```

White has an outside passed pawn on a4. Both sides have two kingside pawns. The plan:

1. **Push the a-pawn.** White plays a5, a6, a7.
2. **The Black king must chase it.** Black has to run to the queenside to stop the a-pawn from promoting.
3. **The White king attacks the kingside pawns.** While the Black king is busy on the queenside, the White king marches to f7 and g7 and captures Black's pawns.
4. **White wins.** The White king eats the kingside pawns and then promotes one of its own kingside pawns (or helps the a-pawn promote if the Black king gives up the chase).

This is the power of the outside passed pawn: it draws the enemy king away from the main front, letting your king dominate.

19.9.2 How to Create an Outside Passed Pawn

Sometimes the outside passed pawn does not exist yet. You need to create it. Here are common methods:

1. **Trade pawns until one side is left with a pawn on the wing.** If you have pawns on both sides of the board and your opponent only has pawns on one side, you can create a passed pawn on the side where your opponent has no pawns.
2. **Sacrifice a pawn to create a passer.** Just like the breakthrough pattern, sometimes sacrificing a pawn leaves you with a dangerous outside passed pawn.
3. **Advance a pawn that your opponent must capture, leaving your other pawn as a passer.** The exact mechanism depends on the position, but the principle is: use pawn exchanges to create a distant passed pawn.

19.9.3 The Decoy Principle

Here is the key strategic idea. In a king and pawn endgame, the king is the strongest piece. Whoever's king is more active (closer to the action, controlling more squares) has the advantage. The outside passed pawn forces the enemy king to become PASSIVE (running to stop the pawn), while YOUR king becomes ACTIVE (attacking the remaining pawns).

This is one of the most important endgame concepts for beginners to understand. Look for opportunities to create an outside passed pawn whenever you enter a pawn endgame.

Rest here. You have now learned all the major concepts in basic pawn endgames. The next sections bring everything together with real games and exercises.

19.10 Part 9: Annotated Games and Demonstrations

19.10.1 Game 16: Capablanca vs. Bernstein, Moscow 1914

This game shows how a world-class player simplifies into a winning pawn endgame. Capablanca trades pieces at exactly the right moment, enters a pawn endgame with a structural advantage, and converts with clean technique. Watch how he uses every concept from this chapter: opposition, key squares, and the power of a passed pawn.

Set up your board with the starting position.

White: José Raúl Capablanca **Black:** Ossip Bernstein **Event:** Moscow 1914 **Result:** 1-0

We join the game at the critical moment where Capablanca steers into the endgame.

Teaching Position (from the game, simplified for instruction):

Rather than show the full opening and middlegame (which involve concepts beyond this chapter's scope), let us study the endgame position that arose.

Set up your board: White king on d4, White pawns on a2, b3, c4, f4, g3, h2. Black king on d6, Black pawns on a7, b6, c5, f5, g6, h7. White to move.

```
FEN: 8/p6p/1p1k2p1/2p2p2/2PK1P2/1P4P1/P6P/8 w - - 0 1
```

Understanding the position:

Count the pawns: six vs. six. Material is equal. But look closer. Black's pawn on c5 is fixed (it cannot advance because White's pawn on c4 blocks it). White has a potential outside passed pawn on the a-file if the b-pawns are exchanged. And White's king is more active, sitting in the center with options to go to either side.

Capablanca's plan is clear:

1. Create an outside passed pawn on the queenside.
2. Force the Black king to chase it.
3. Break through on the kingside with the White king.

1.a4!

Capablanca starts by advancing the a-pawn. This prepares a4-a5, which will challenge Black's b6 pawn. If Black exchanges on a5, White recaptures with bxa5, and then White can create a passed pawn on the a-file.

1...Ke6

Black brings the king toward the center, but Capablanca is already a step ahead.

2.a5!

Pushing forward. Black must react.

2...bxa5

Black captures. Now the pawn structure on the queenside has changed.

3.b4!

This is the key move. White offers an exchange of pawns. If 3…cxb4, then White plays 4.c5, and the c-pawn becomes a dangerous passed pawn. If 3…axb4, then 4.c5+ and the c-pawn charges forward.

3...cxb4

4.c5!

Now White has a passed pawn on c5. This pawn is the "criminal" that Black's king must watch. It will march to c6, c7, c8 if unattended.

4...Kd7 5.Kd5!

Capablanca's king takes the opposition (well, it takes the central key squares). The White king controls the critical squares in front of the c-pawn.

5...Kc7 6.Ke6

White ignores the queenside for a moment and switches to attack the kingside! This is the outside passed pawn concept in reverse: the c5 pawn already forces Black's king to stay near the queenside. White's king goes east to eat pawns.

6...Kxc5

Black finally takes the c-pawn, but now the White king is deep in Black's territory.

7.Kxf5 Kd4 8.Kxg6 Ke3 9.Kxh7

White has captured three kingside pawns. Now White's f and g pawns will race to promote, and Black's a and b pawns cannot keep up.

This game illustrates the complete process: create a structural advantage, simplify into a pawn endgame, use the outside passed pawn as a decoy, and then win on the other side of the board.

Key lessons from this game: - Trade pieces when you have a structural advantage in the endgame. - Use a passed pawn (or the threat of one) to tie down the enemy king. - Attack on the opposite side of the board from where the enemy king is busy. - Capablanca's endgame technique is a model to follow: simple, logical, and devastating.

19.10.2 Demonstration 2: The Rule of the Square in Action

This is a composed teaching position that shows how the Rule of the Square decides the game.

Set up your board: White king on h1, White pawn on a2. Black king on g8. White to move.

`FEN: 6k1/8/8/8/8/8/P7/7K w - - 0 1`

White's plan: push the a-pawn. Can the Black king catch it?

Step 1: Draw the square.

The pawn is on a2. It wants to reach a8. That is 6 squares. But the pawn gets a two-square first move, so count it as effectively being on a3. From a3 to a8 is 5 squares. The square is: a3-a8-f8-f3.

The Black king is on g8. Is it inside the square? The boundary runs from a8 to f8 along the 8th rank. The king is on g8, which is OUTSIDE the square (one square beyond f8).

But it is White's move. White plays 1.a4. Now the pawn is on a4. Redraw: a4-a8-e8-e4. Black plays 1…Kf7. Is the king inside? The boundary on the 7th rank runs from a7 to e7. The king is on f7, OUTSIDE the square.

White plays 2.a5. The pawn keeps running. Black plays 2…Ke6. Square from a5: a5-a8-d8-d5. King on e6 is outside. The pawn is going to promote.

3.a6 Kd7 (the a6 square is a6-a8-c8-c6; the king on d7 is outside it). The pawn promotes.

3…Kd6 4.a7 Kc7 5.a8=Q. The pawn promotes.

The Black king was too far away. The Rule of the Square showed this instantly at the start. No need to calculate all five moves.

Now change the Black king's starting square.

Set up your board: White king on h1, White pawn on a2. Black king on f7. White to move.

`FEN: 8/5k2/8/8/8/8/P7/7K w - - 0 1`

Same pawn, same White king. But the Black king is on f7 instead of g8.

Draw the square from a2 (with the first-move bonus, treat it as a3): a3-a8-f8-f3. The king is on f7. Is f7 inside the square? The square goes from f3 to f8 along the f-file. Yes! f7 is inside.

Even after 1.a4, the king enters the square. Black plays 1…Ke6, and the king is clearly inside the new square. The king will catch the pawn.

Result: Draw.

The difference between f7 and g8 is one square. One square decided the entire game. That is why the Rule of the Square is so valuable: it catches these close calls instantly.

19.10.3 Demonstration 3: The Pawn Breakthrough (Three vs. Three)

This demonstration shows the classic pawn breakthrough in full detail.

Set up your board: White king on e1, White pawns on a5, b5, c5. Black king on e8, Black pawns on a7, b7, c7. White to move.

```
FEN: 4k3/ppp5/8/PPP5/8/8/8/4K3 w - - 0 1
```

Both kings are far from the action. The pawns will decide this on their own.

The position looks drawn. Three White pawns face three Black pawns. If White pushes any pawn, Black captures. Nobody seems to make progress. But there is a breakthrough hiding in this position.

1.b6!!

The key sacrifice. White gives up the b-pawn.

Line A: 1...axb6

2.c6! bxc6 (forced, otherwise c7 promotes) 3.a6!

And now the a-pawn is a passed pawn with no Black pawns able to stop it. The a-pawn marches: a6-a7-a8=Q. Black cannot catch it because the Black king is too far away (check the Rule of the Square!).

Line B: 1...cxb6

2.a6! bxa6 (forced, otherwise a7 promotes) 3.c6!

Same idea, mirror image. The c-pawn runs free: c6-c7-c8=Q.

Line C: 1...b6

Black pushes instead of capturing. 2.c6! a6 3.bxa6 and the a-pawn promotes. Or 2…axb6 3.c7 and the c-pawn promotes.

Every line wins for White. The initial sacrifice of the b-pawn creates an unstoppable passed pawn. This is the pawn breakthrough in its purest form.

Practice this position until you can play it from memory. The 3 vs. 3 breakthrough comes up in real games more often than you might think.

Rest here. You have seen three complete demonstrations. Now it is time to test yourself with exercises.

19.11 Part 10: Exercises

Work through these exercises with a board in front of you. Try to solve each one BEFORE reading the hints. If you get stuck, read one hint at a time. The solutions are at the end.

19.11.1 Does the Pawn Promote? (K+P vs K, Key Squares)

Exercise 9.1 **Position:** White king on d5, White pawn on d4, Black king on d7. White to move.

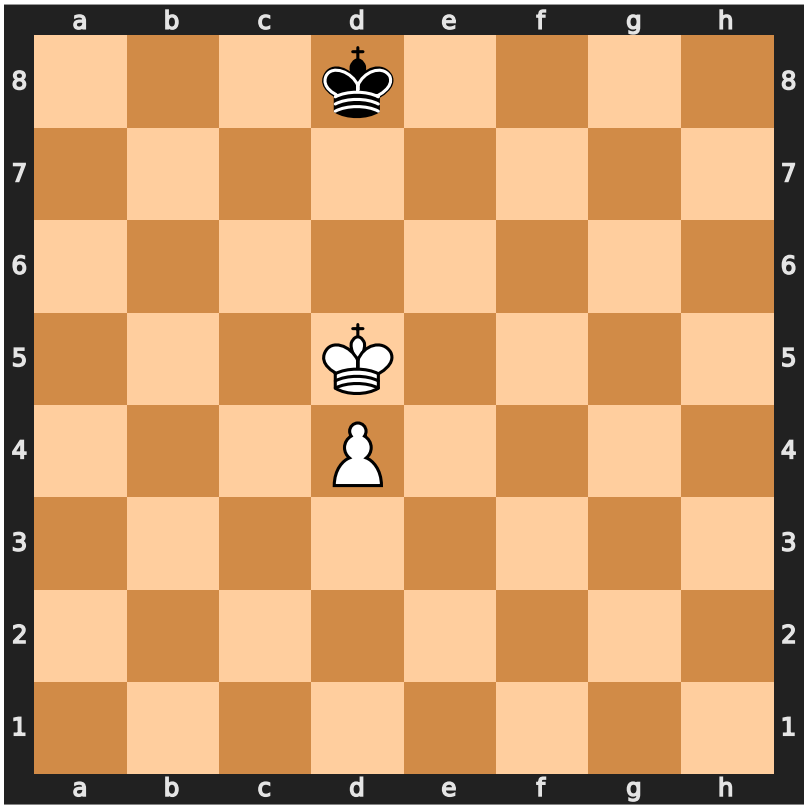

Figure 19.1: Chess Position

Task: Does the pawn promote? Play it out. **Hint 1:** Where are the key squares for a pawn on d4? **Hint 2:** The key squares are c6, d6, and e6. Is the White king on one of them? **Hint 3:** The White king is on d5, which is NOT a key square (it is on the 5th rank, but key squares for a d4 pawn are on the 6th rank). However, the king is very close. Think about opposition. **Solution:** 1.Ke5! (Not 1.d5? Kd7! and Black has the opposition, draw.) 1…Kc7 (or 1…Ke7 2.d5 and White's king reaches a key square) 2.Ke6! (key square reached!) 2…Kd8 3.d5 Kc7 4.Kd7 and the pawn promotes. **The pawn promotes.** The key was 1.Ke5!, taking the opposition and heading for the key squares.

Exercise 9.2 **Position:** White king on e6, White pawn on e5, Black king on e8. White to move.

Task: Does the pawn promote? **Hint 1:** The White king is on e6. The pawn is on e5. What are the key squares for a pawn on e5? **Hint 2:** Key squares for a 5th-rank pawn: d7, e7, f7. The

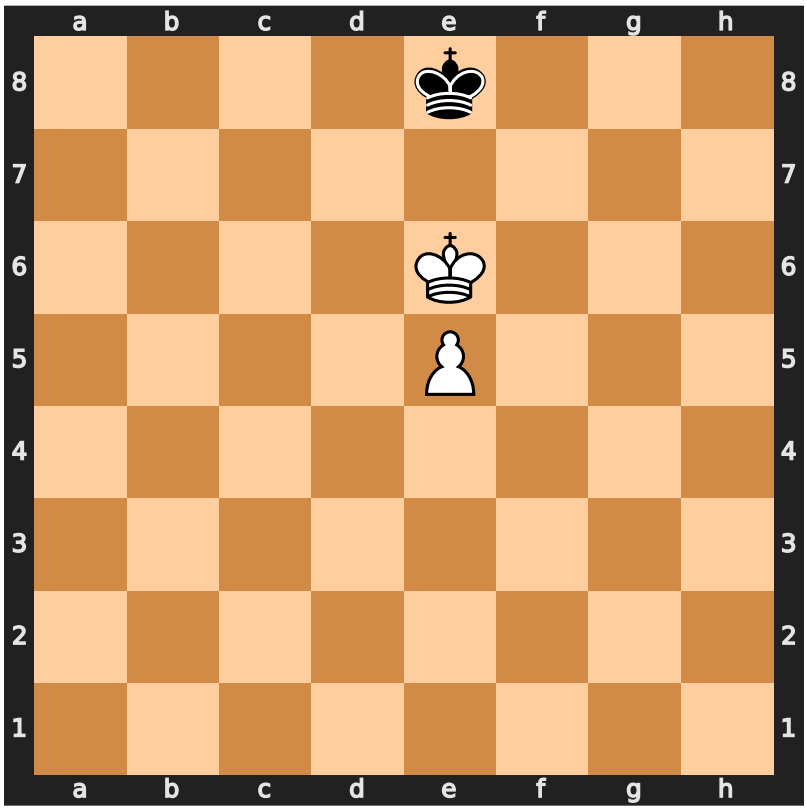

Figure 19.2: Chess Position

White king is on e6, not yet on a key square. **Hint 3:** White plays e6… but then what? Does the king reach a key square? **Solution:** 1.e6 (the only try, since Kd6 or Kf6 gives stalemate concerns later). Now after 1…Kf8 (or Kd8), White continues 2.Kd7 (or Kf7), reaching a key square. The pawn promotes. **Yes, the pawn promotes.** But note: 1.Kd6? is also winning since after 1…Kd8 2.e6 Ke8 3.e7 Kf7 4.Kd7, White promotes.

Exercise 9.3 **Position:** White king on e5, White pawn on e4, Black king on e7. White to move.

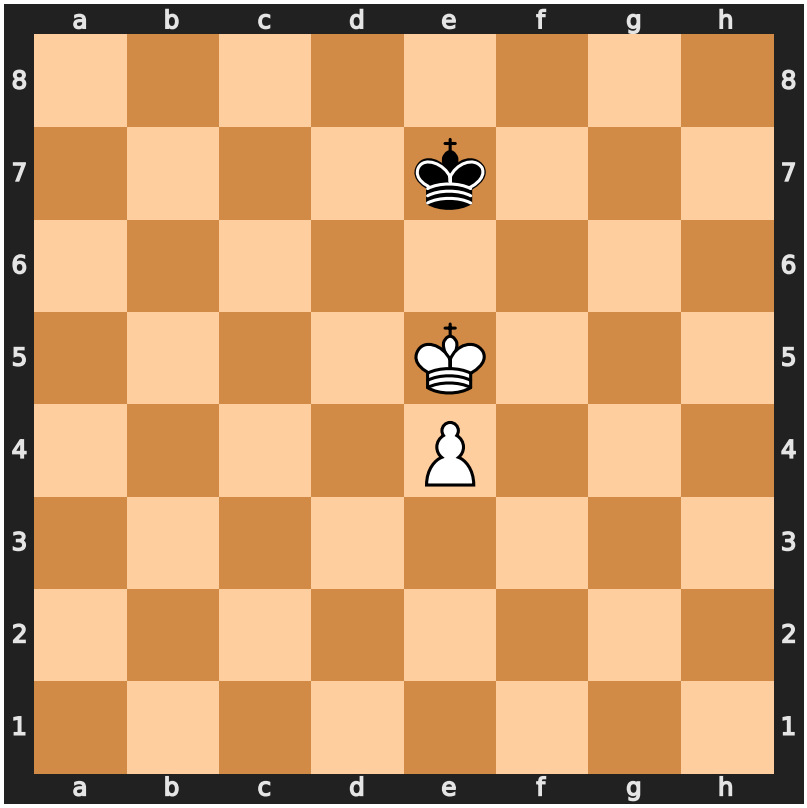

Figure 19.3: Chess Position

Task: Does the pawn promote? Who has the opposition? **Hint 1:** Kings face each other on the e-file with one square between them. Whose move is it? **Hint 2:** It is White's move, so BLACK has the opposition. **Hint 3:** White must step aside. Try Kd5 or Kf5. Can Black maintain the block? **Solution:** White has the move, so Black has the opposition. After 1.Kd5 Kd7! (Black takes the opposition again) 2.e5 Ke7 3.e6 Ke8! 4.Kd6 Kd8 5.e7+ Ke8 6.Ke6 stalemate! **Draw.** Black's opposition holds the position. The pawn does not promote.

Exercise 9.4 **Position:** White king on f6, White pawn on e5, Black king on e8. White to move.

Task: Does the pawn promote? **Hint 1:** Key squares for a pawn on e5: d7, e7, f7. **Hint 2:** Can the White king reach a key square on the next move? **Hint 3:** White plays Ke6 or e6. Which one wins? **Solution:** 1.Ke6! (takes the opposition) 1…Kd8 (or Kf8) 2.Kd7 (or Kf7), reaching a key square. The pawn promotes after e6, e7, e8=Q. **Yes, the pawn promotes.** Note that 1.e6? also

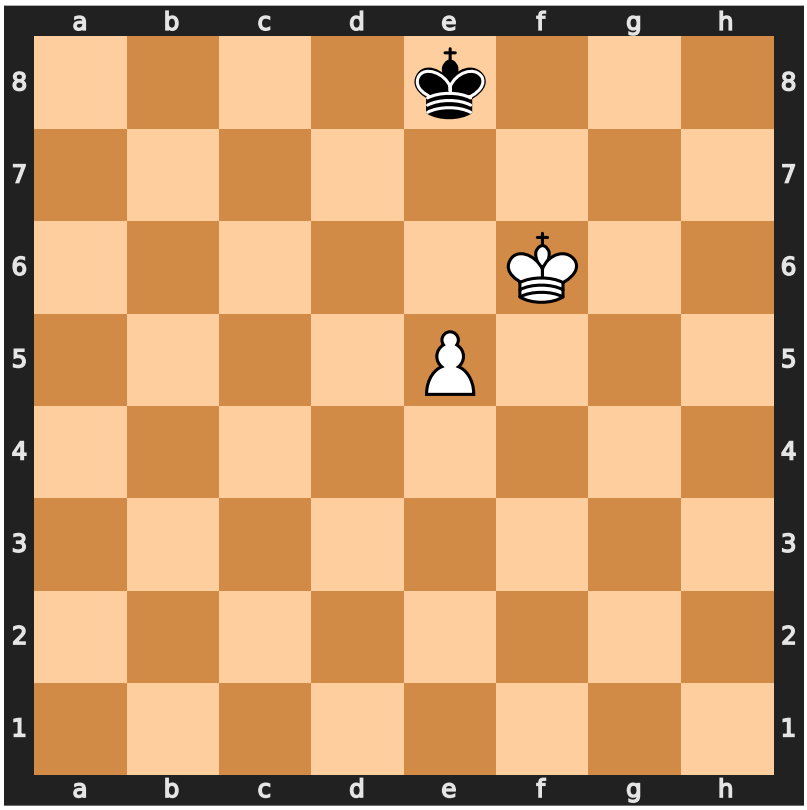

Figure 19.4: Chess Position

works: 1…Kf8 2.e7+ Ke8 3.Ke6 stalemate! That would be a draw! So 1.Ke6 is the correct move. **Always advance the king before the pawn when possible.**

Exercise 9.5 **Position:** White king on b5, White pawn on a5, Black king on a7. White to move.

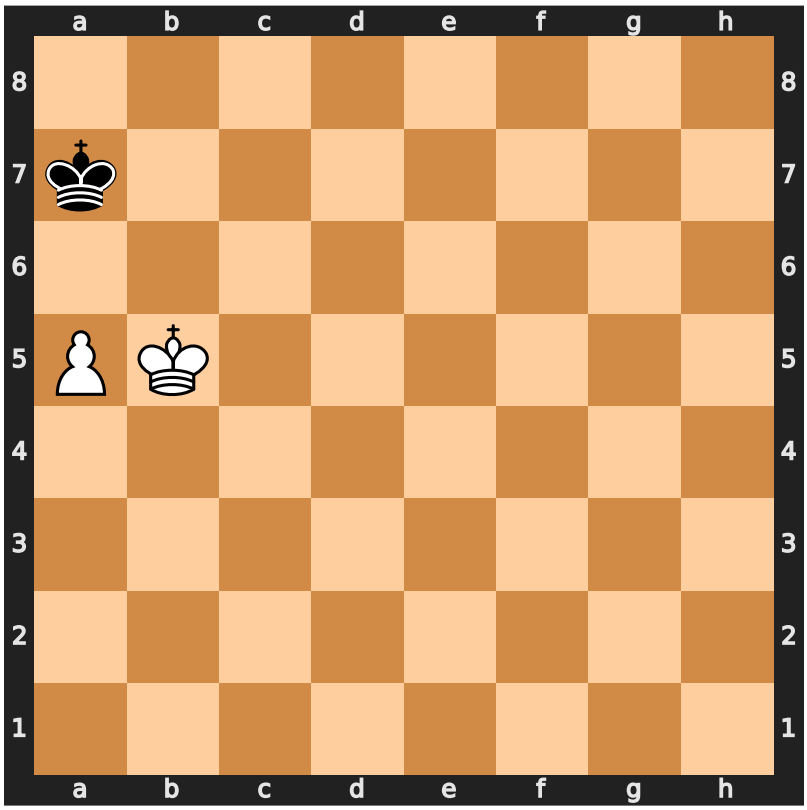

Figure 19.5: Chess Position

Task: Does the rook pawn promote? **Hint 1:** What is special about rook pawns? **Hint 2:** The a-file is the edge of the board. Can the White king outflank the Black king? **Hint 3:** White plays a6, Black plays Ka8. What happens next? **Solution:** 1.a6 Ka8! 2.Ka6 (anything else lets Black take the pawn) and it is stalemate! Or 2.Kb6 Kb8 3.a7+ Ka8 4.Ka6 stalemate again. **Draw.** Rook pawns with the defending king in front are drawn because the attacking king cannot outflank (the board edge blocks it).

Exercise 9.6 **Position:** White king on c4, White pawn on d4, Black king on d6. White to move.

Task: Does the pawn promote? Find the winning plan. **Hint 1:** Key squares for d4: c6, d6, e6. Black's king is on d6, one of the key squares! **Hint 2:** White needs to push Black off the key square. Can White use opposition? **Hint 3:** White plays Kd4… no, that is not legal (same square). Try Kc5 or Kd3. Which one helps? **Solution:** 1.Kc5! (threatening to go to c6 or d5) 1…Ke6 (if 1…Kd7, then 2.Kd5 and White controls the key squares) 2.Kc6! (White reaches a key square!) 2…Ke7 3.d5 Kd8 4.Kd6 Ke8 5.Ke6 Kd8 6.d6 Kc8 7.d7+ Kb8 (or Kd8) 8.Kd6 (or Ke7) and promotes. **The pawn promotes.**

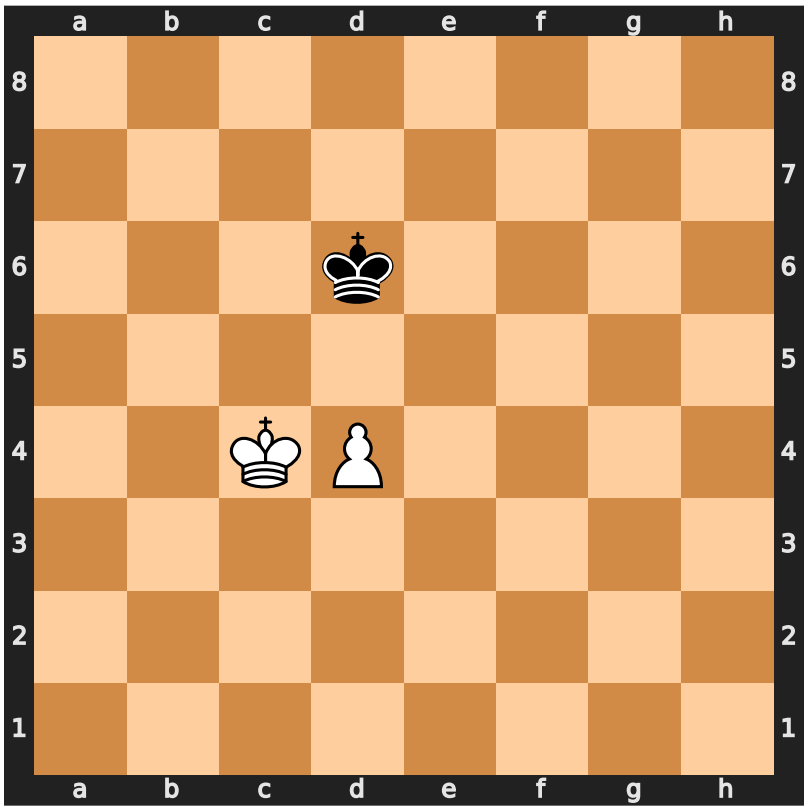

Figure 19.6: Chess Position

Exercise 9.7 **Position:** White king on e3, White pawn on d2, Black king on d5. Black to move.

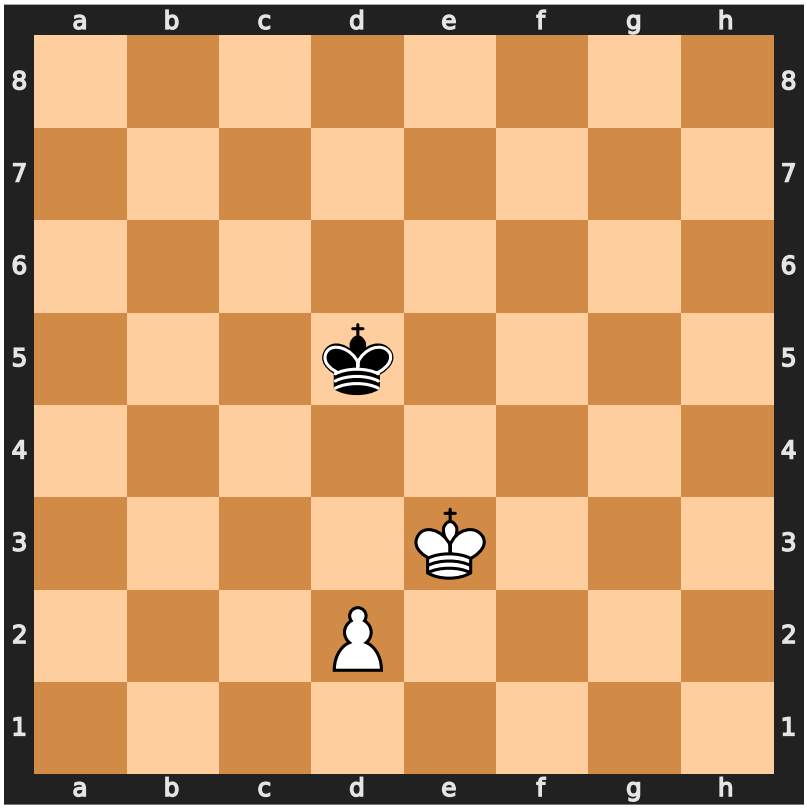

Figure 19.7: Chess Position

Task: Can Black stop the pawn from promoting? **Hint 1:** Key squares for d2: c6, d6, e6. Black is on d5, close but not ON a key square (from the defender's perspective, Black needs to reach d3 or the squares in front of the pawn). **Hint 2:** Actually, think about this from the attacker's side. Can White's king reach a key square? **Hint 3:** It is Black's move. Does Black have the opposition? **Solution:** 1…Ke5! (taking the opposition!) 2.d4+ Kd5! (opposition again!) 3.Kd3 Kd6! (Black stays in front) 4.Ke4 Ke6 (opposition) 5.d5+ Kd6 6.Kd4 Kd7! 7.Ke5 Ke7 (opposition!) 8.d6+ Kd7 9.Kd5 Kd8! 10.Ke6 Ke8 11.d7+ Kd8 12.Kd6 stalemate! **Draw.** Black's perfect opposition play stops the pawn.

Exercise 9.8 **Position:** White king on e1, White pawn on d5, Black king on d8. Black to move.

Task: Can Black stop the pawn? **Hint 1:** The pawn is on d5. Key squares: c7, d7, e7. Can the White king reach them before Black blocks? **Hint 2:** Black plays 1…Kd7, standing right in front of the pawn. Can White break through? **Hint 3:** After 1…Kd7, the White king is on e1, very far from the key squares. Count the moves. **Solution:** 1…Kd7! (standing in front of the pawn) 2.Kd2 Kd6 3.Kd3 Kd7! (waiting) 4.Ke4 Ke7! 5.Ke5 Kd7 6.d6 Kd8! 7.Ke6 Ke8 8.d7+ Kd8 9.Kd6 stalemate. **Draw.** The White king is too far away to support the pawn. Black blocks and holds.

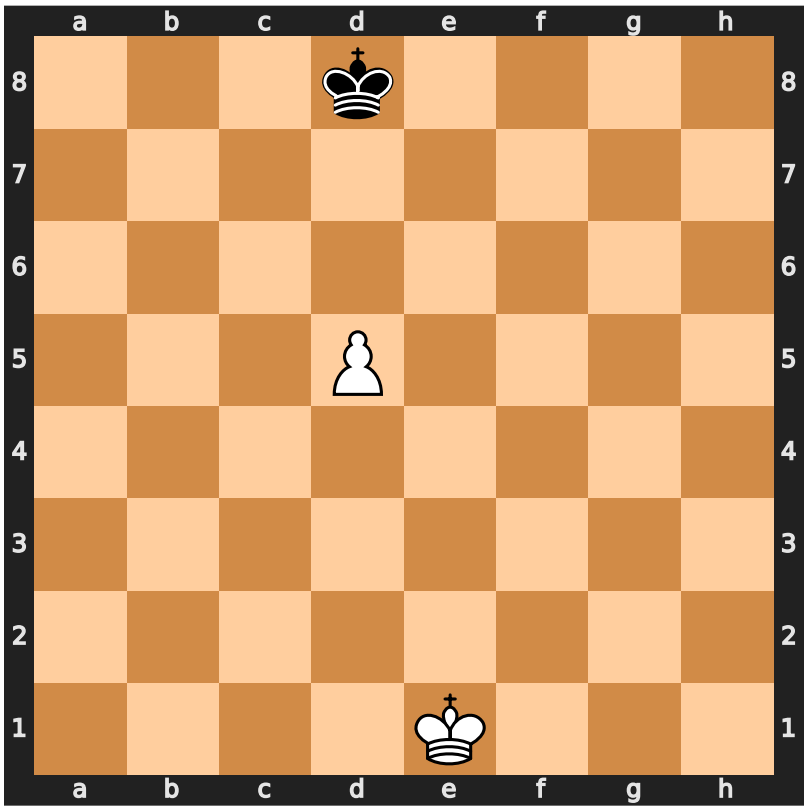

Figure 19.8: Chess Position

Exercise 9.9 **Position:** White king on c5, White pawn on b4, Black king on b7. White to move.

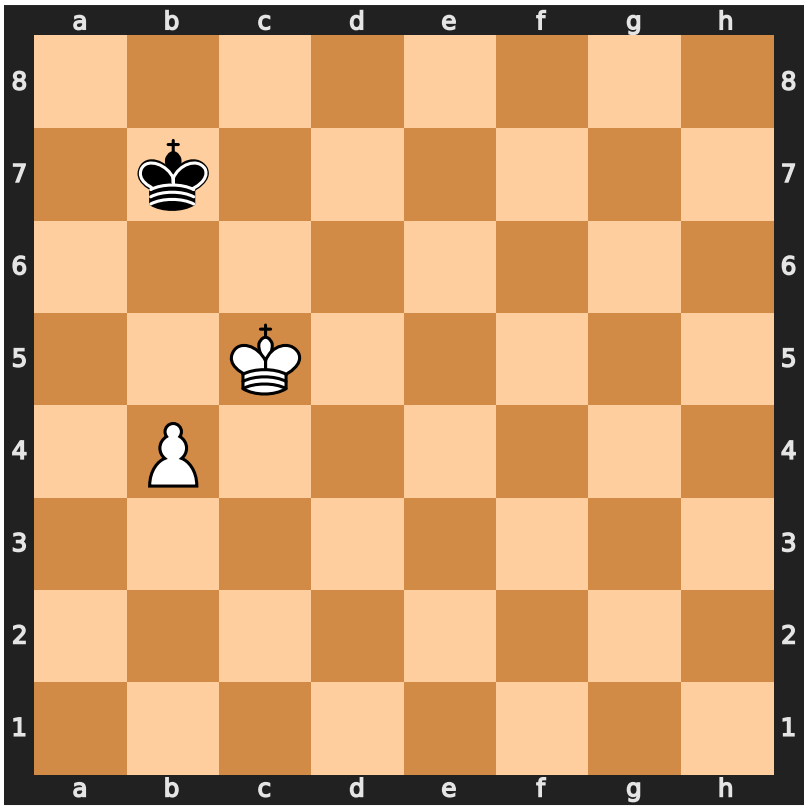

Figure 19.9: Chess Position

Task: Does the pawn promote? **Hint 1:** Key squares for b4: a6, b6, c6. **Hint 2:** Can the White king reach a key square? It is on c5, one move from c6. **Hint 3:** White plays 1.Kc6 or 1.Kb5. Which is better? **Solution:** 1.Kb5! (taking the opposition) 1…Kc7 (or 1…Ka7 2.Kc6 and the king reaches a key square) 2.Ka6! (key square reached) 2…Kb8 3.Kb6 Kc8 4.Ka7 Kc7 5.b5 Kc8 6.b6 Kd7 7.b7 and 8.b8=Q. **The pawn promotes.**

Exercise 9.10 **Position:** White king on g5, White pawn on h5, Black king on h7. White to move.

Task: Does the rook pawn promote? **Hint 1:** The h-pawn is a rook pawn. Remember the rook pawn exception. **Hint 2:** Key squares for h5: g7, h7, (no i7 since the board ends). The Black king is ON h7. **Hint 3:** Can White's king outflank? Or is the Black king stuck in front of the pawn near the corner? **Solution:** 1.h6 Kh8! 2.Kf6 (trying to reach g7) Kg8! 3.Kg6 Kh8 4.h7 stalemate! Or 3.Ke7 Kh7 4.Kf7 Kh8 5.Kg6 Kg8 6.h7+ Kh8 7.Kh6 stalemate! **Draw.** The rook pawn draws because the board edge prevents outflanking. The defending king hides in the corner.

Exercise 9.11 **Position:** White king on b1, White pawn on e4, Black king on e6. White to move.

Task: Can White win this position? **Hint 1:** The Black king is directly in front of the pawn. The

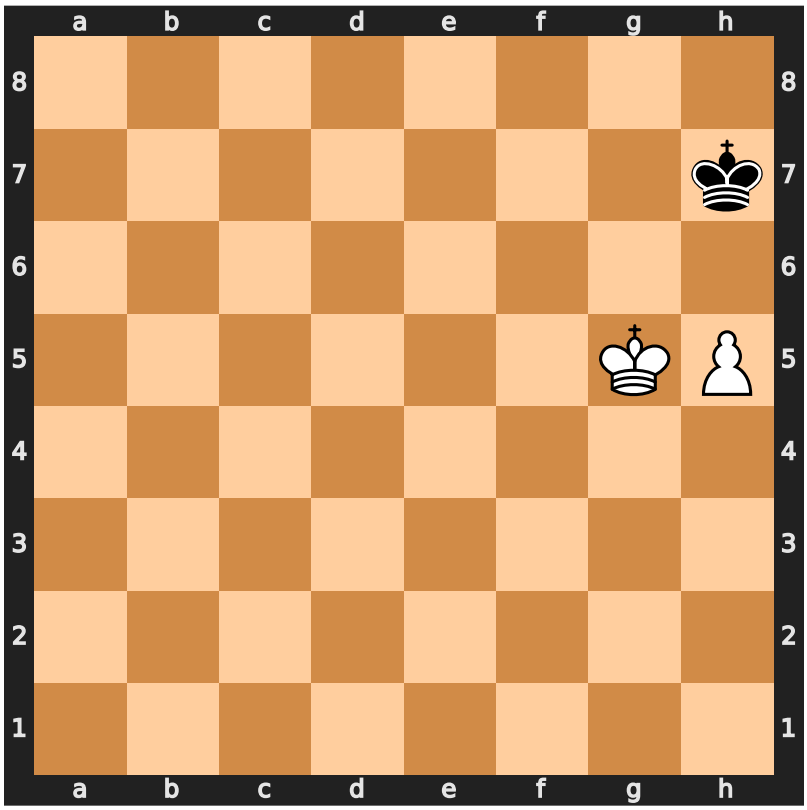

Figure 19.10: Chess Position

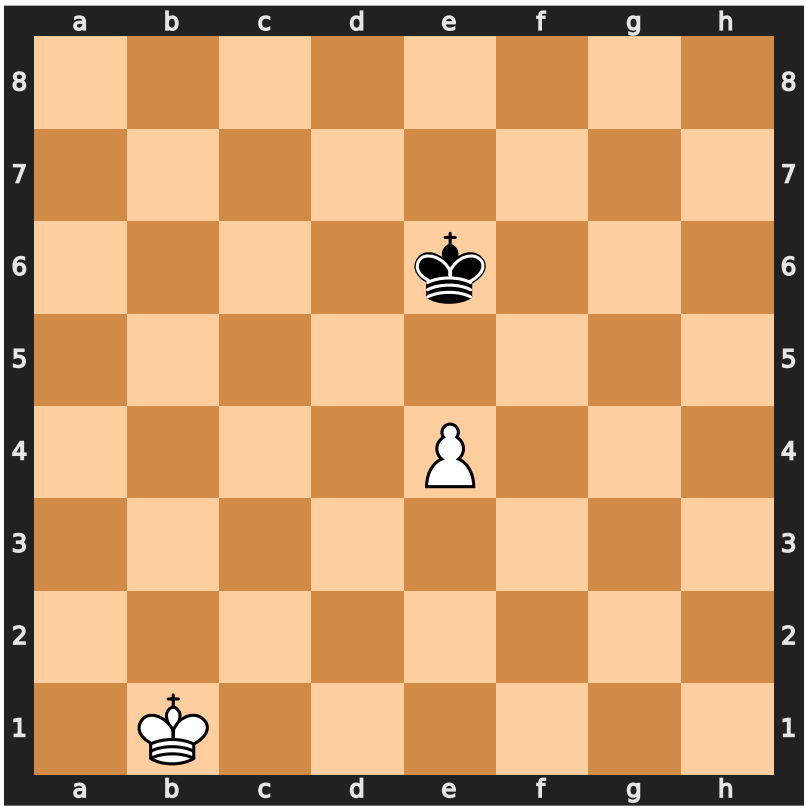

Figure 19.11: Chess Position

White king is far away on b1. **Hint 2:** Key squares for e4: d6, e6, f6. Black is ON e6, a key square (from the defense perspective, Black is blocking). **Hint 3:** Can the White king march from b1 to a key square before Black's king stops it? Count moves. **Solution:** White's king needs to reach d6, e6, or f6. From b1, that is about 5-6 moves (Kc2-Kd3-Ke3-Kd4… etc). But every time White's king approaches, Black's king maintains opposition. After 1.Kc2 Kd6! 2.Kd3 Kd5! Black has the opposition and blocks. White cannot break through. **Draw.** The defending king arrived at the key squares first and holds the opposition.

Exercise 9.12 **Position:** White king on d5, White pawn on c4, Black king on c7. White to move.

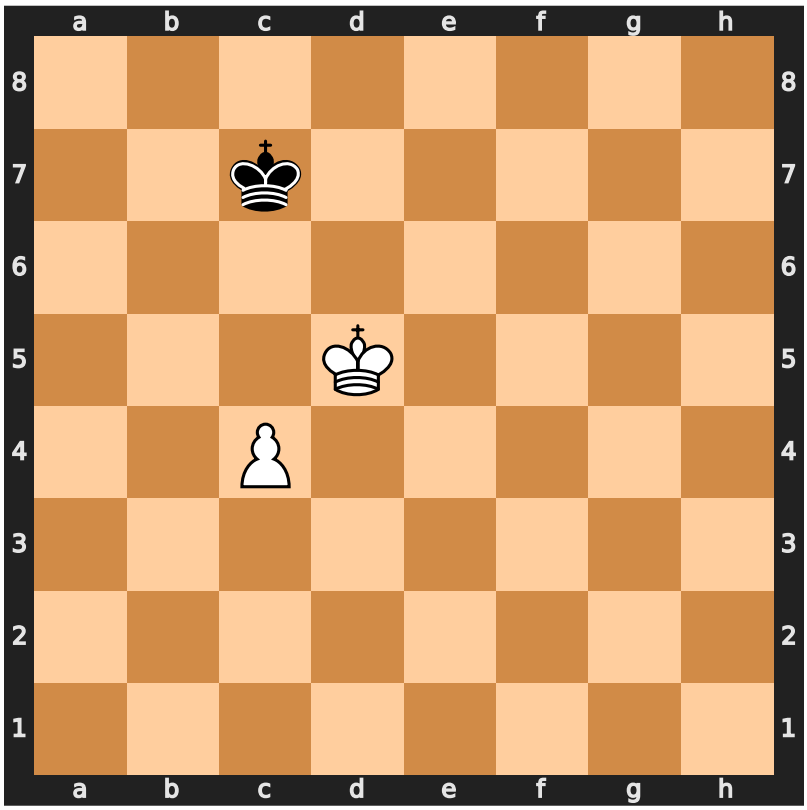

Figure 19.12: Chess Position

Task: Does the pawn promote? Find the best plan. **Hint 1:** Key squares for c4: b6, c6, d6. **Hint 2:** The White king is on d5. Can it reach a key square? **Hint 3:** 1.Kc5! puts the king one step from both b6 and c6. Then what does Black do? **Solution:** 1.Kc5! Kd7 (if 1…Kb7 2.Kd6! reaching a key square) 2.Kb6! (key square!) 2…Kd6 3.c5+ Kd7 4.Kb7 and the pawn promotes after c6, c7, c8=Q. **The pawn promotes.**

Exercise 9.13 **Position:** White king on f5, White pawn on f4, Black king on f7. White to move.

Task: Does the pawn promote? **Hint 1:** Kings face each other on the f-file with one square between them. **Hint 2:** It is White's move, so Black has the opposition. **Hint 3:** White must

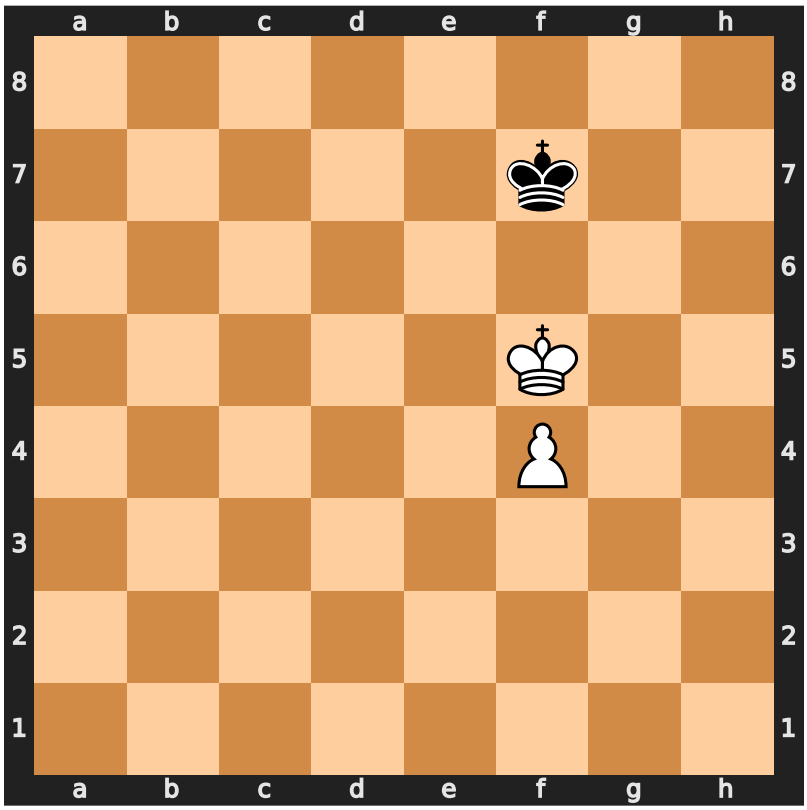

Figure 19.13: Chess Position

step aside. What happens after Ke5 or Kg5? **Solution:** White has the move, so Black has the opposition. 1.Ke5 Ke7! (maintaining opposition) 2.f5 Kf7! 3.f6 Kf8! 4.Ke6 Ke8 5.f7+ Kf8 6.Kf6 stalemate. **Draw.** Black's opposition holds.

Exercise 9.14 **Position:** White king on f5, White pawn on f4, Black king on f7. Black to move.

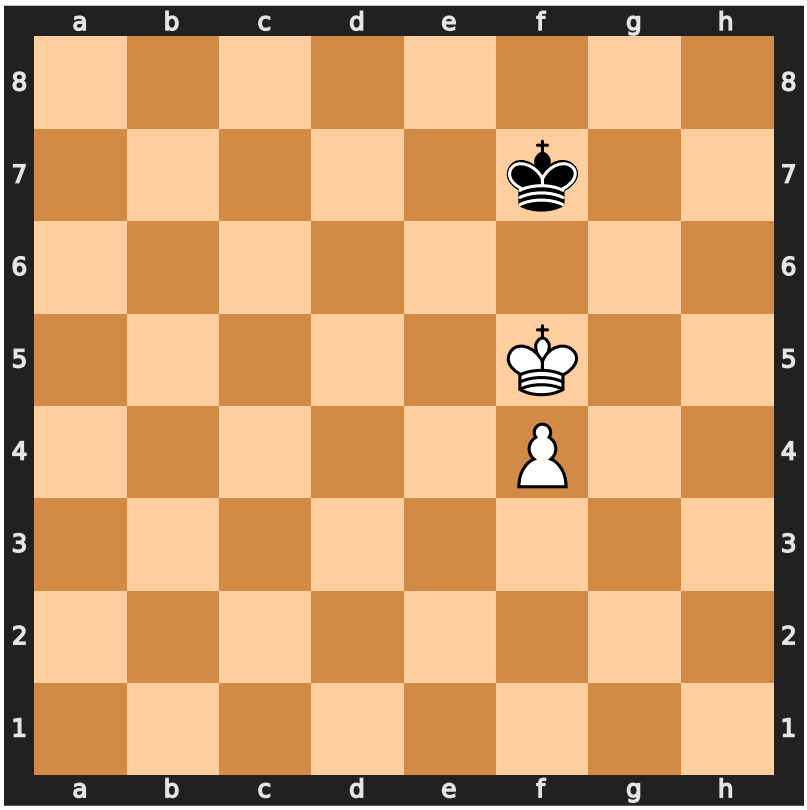

Figure 19.14: Chess Position

Task: Same position as 9.13, but Black to move. Does the pawn promote now? **Hint 1:** Now White has the opposition! **Hint 2:** Black must step aside. What happens after Ke7 or Kg7? **Hint 3:** After 1…Ke7 2.Kg6! (sidestepping to reach a key square). **Solution:** 1…Ke7 2.Kg6! Kf8 3.Kf6 Ke8 4.Kg7! Ke7 5.f5 Ke8 6.f6 Kd7 7.f7 and f8=Q. **The pawn promotes!** One move of difference (who moves first) changes the result from draw to win.

Exercise 9.15 **Position:** White king on a4, White pawn on a3, Black king on a6. Black to move.

Task: Does the rook pawn promote? **Hint 1:** White has the opposition (Black to move, kings face each other on the a-file). **Hint 2:** Normally, having the opposition means the attacker wins. But this is a rook pawn. **Hint 3:** Black plays Ka7 or Kb6. Does the corner save Black? **Solution:** 1…Kb6 2.Kb4 Ka6 3.Kc5 Ka5 4.a4 Ka6 5.Kb4 Kb6 6.a5+ Ka6 7.Ka4 Ka7 8.Kb5 Kb7 9.a6+ Ka7 10.Ka5 Ka8! 11.Kb6 Kb8 12.a7+ Ka8 13.Ka6 stalemate. **Draw!** Even with the opposition, the rook pawn cannot win because of the corner stalemate defense.

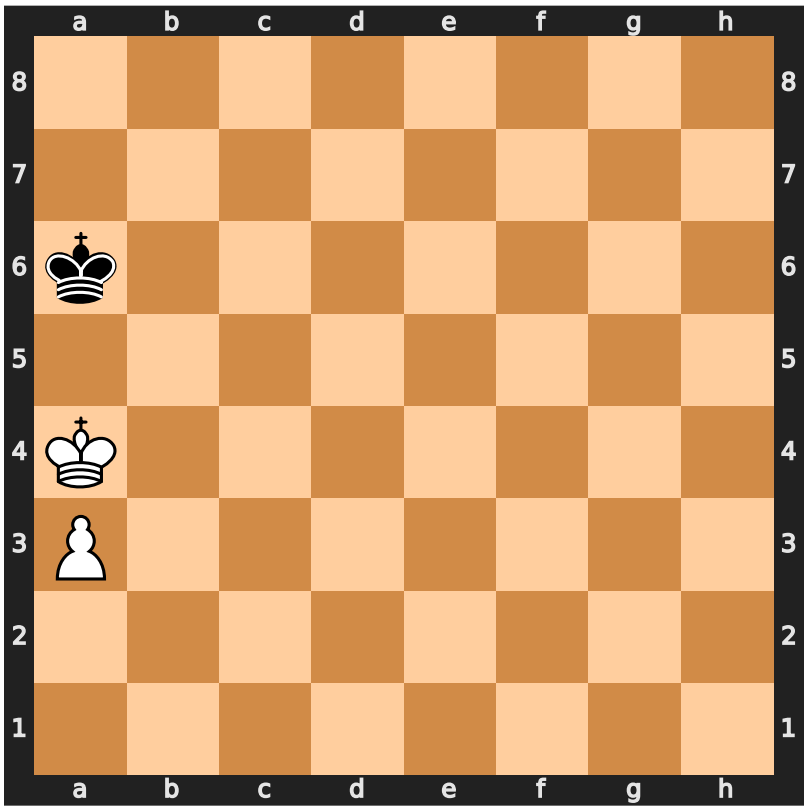

Figure 19.15: Chess Position

19.11.2 Who Has the Opposition?

Exercise 9.16 **Position:** White king on d4, Black king on d6. White to move.

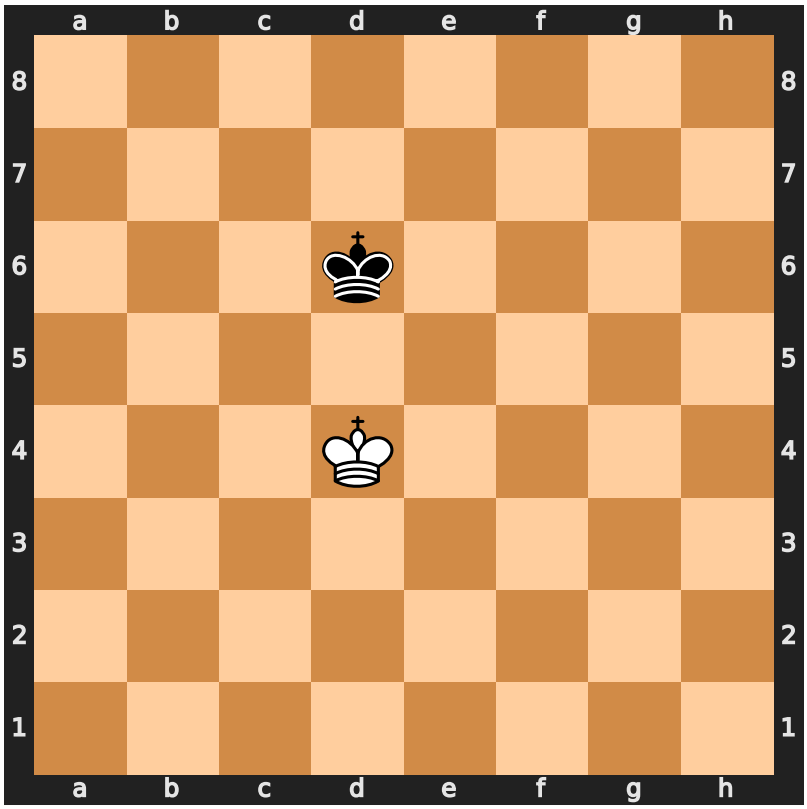

Figure 19.16: Chess Position

Task: Who has the opposition? **Hint 1:** Kings face each other on the d-file, one square apart (d5 is between them). **Solution: Black has the opposition** (White must move). White must step aside.

Exercise 9.17 **Position:** White king on e3, Black king on e5. Black to move.

Task: Who has the opposition? **Solution: White has the opposition** (Black must move). Black must step aside.

Exercise 9.18 **Position:** White king on c1, Black king on c3. White to move.

Task: Who has the opposition? **Solution: Black has the opposition** (White must move).

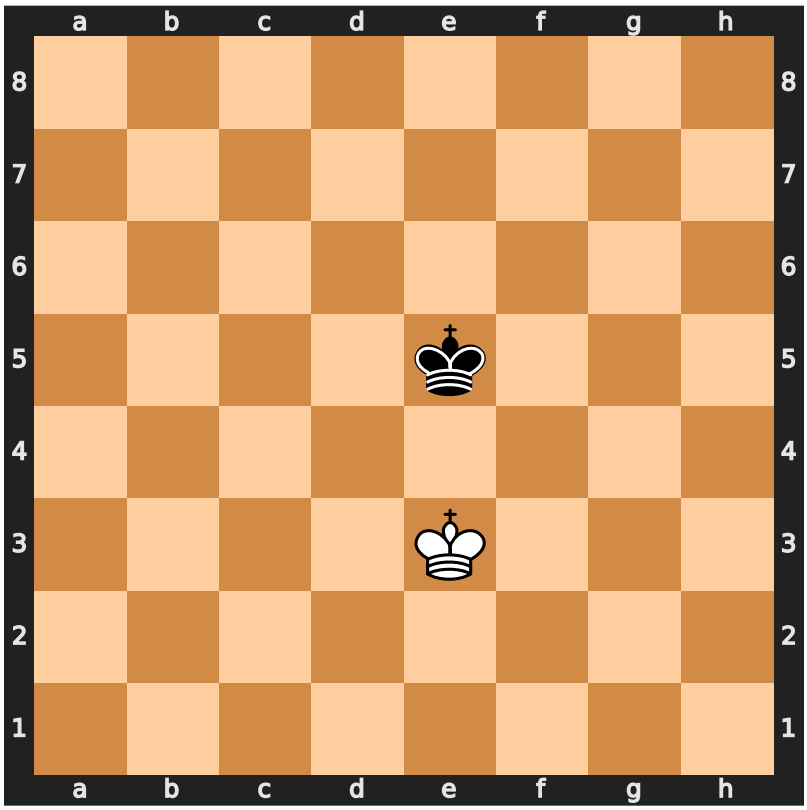

Figure 19.17: Chess Position

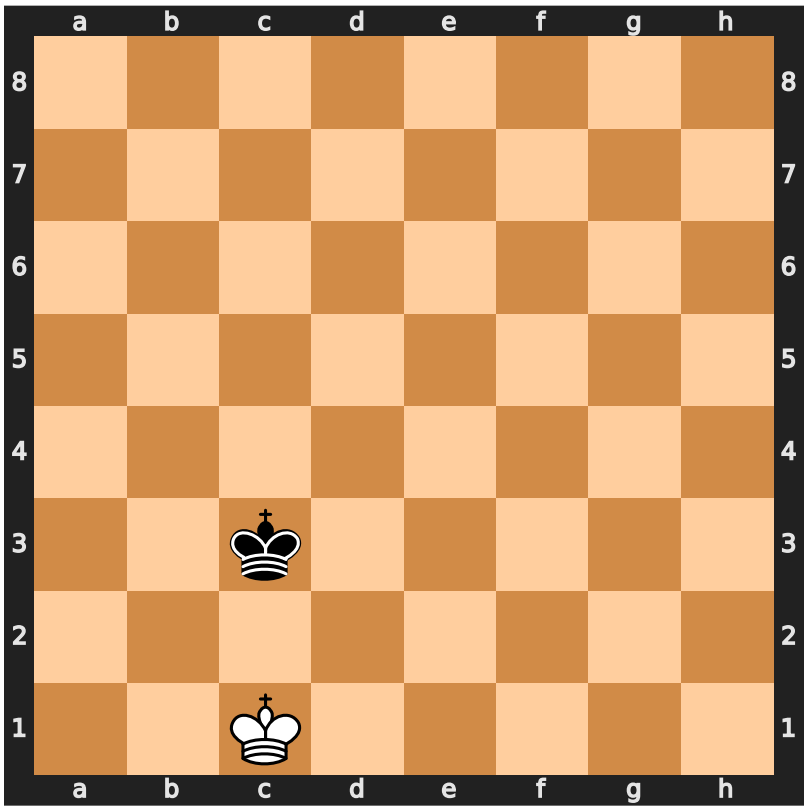

Figure 19.18: Chess Position

Exercise 9.19 **Position:** White king on d3, White pawn on e3, Black king on d5. White to move.

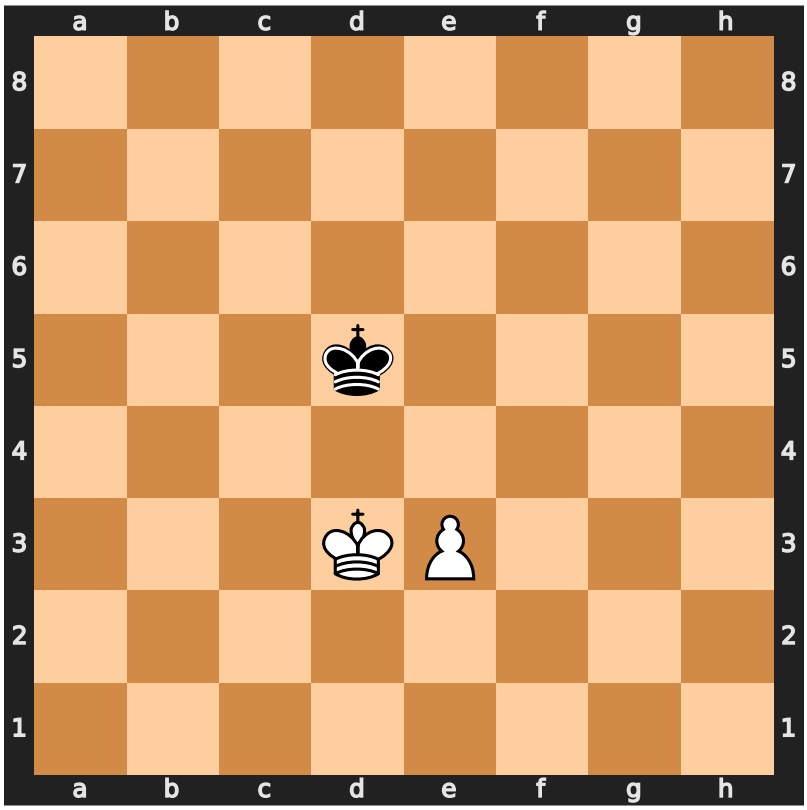

Figure 19.19: Chess Position

Task: Who has the opposition? Can White win? **Hint 1:** Kings face each other on the d-file. White must move. **Hint 2:** Black has the opposition. But White has an extra tempo with the pawn! **Hint 3:** White plays e4+! Does this change the opposition? **Solution:** Black has the opposition, but White plays **1.e4+!** After 1…Kd6! 2.Ke3 Ke5 and Black regains the opposition. The pawn push did not change the situation. **Draw** with best play from Black.

Exercise 9.20 **Position:** White king on e4, Black king on c4. White to move.

Task: Who has the opposition? (They are on the same rank.) **Hint 1:** The kings are on the same rank (4th rank), separated by one square (d4). **Solution: Black has the opposition** (White must move). This is horizontal opposition.

Exercise 9.21 **Position:** White king on d1, Black king on d5. White to move.

Task: Who has the opposition? (Hint: count the squares between the kings.) **Hint 1:** The kings are on the d-file, separated by d2, d3, d4 (three squares between them). **Hint 2:** This is "distant opposition." With an odd number of squares between kings on the same line, the player NOT to move has it. **Solution: Black has the distant opposition** (White must move, 3 squares between = odd number).

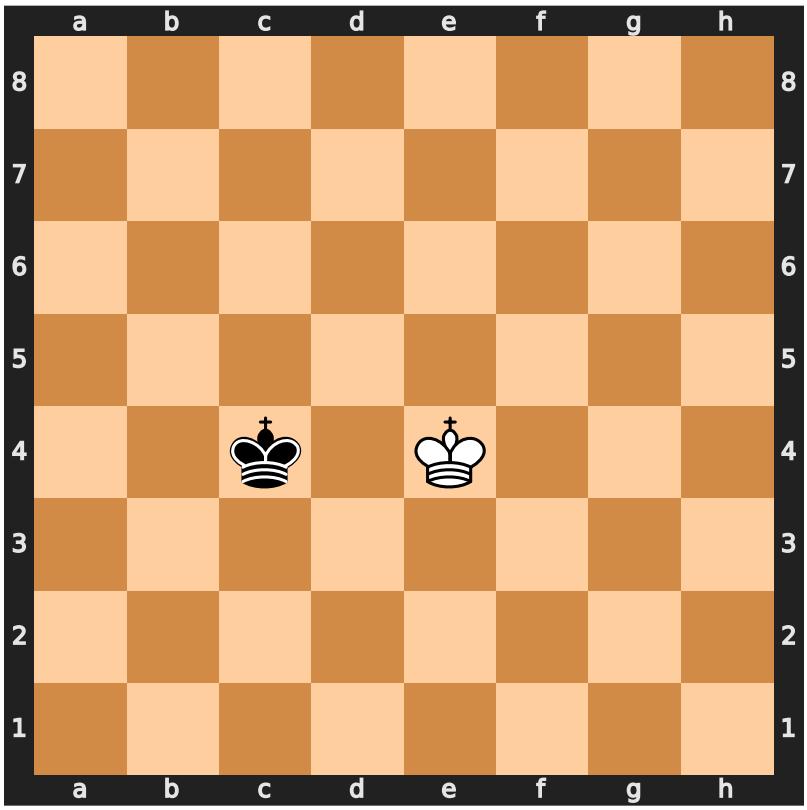

Figure 19.20: Chess Position

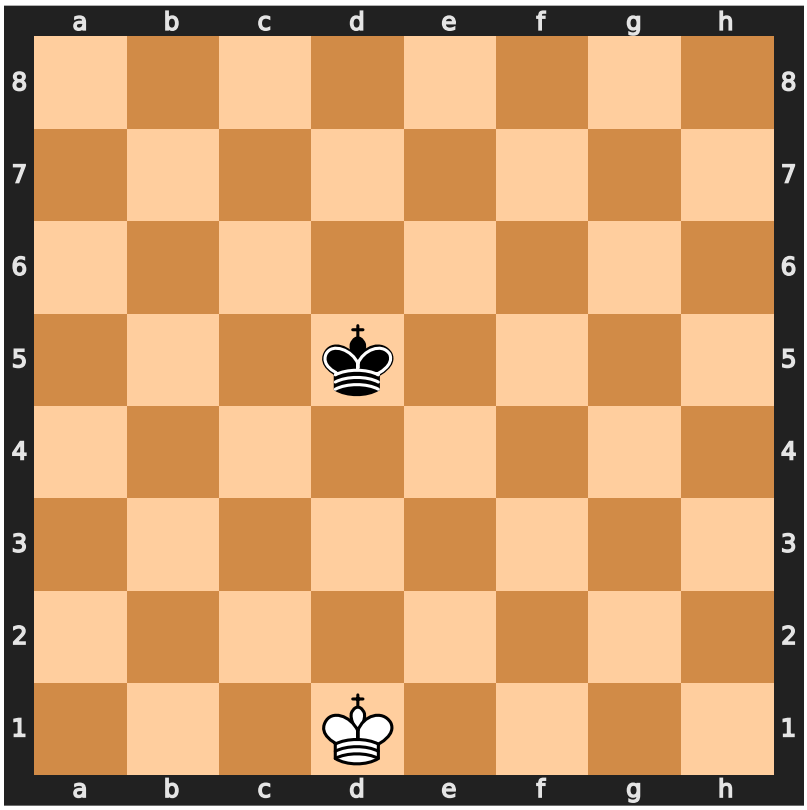

Figure 19.21: Chess Position

Exercise 9.22 **Position:** White king on e5, Black king on g5. White to move.

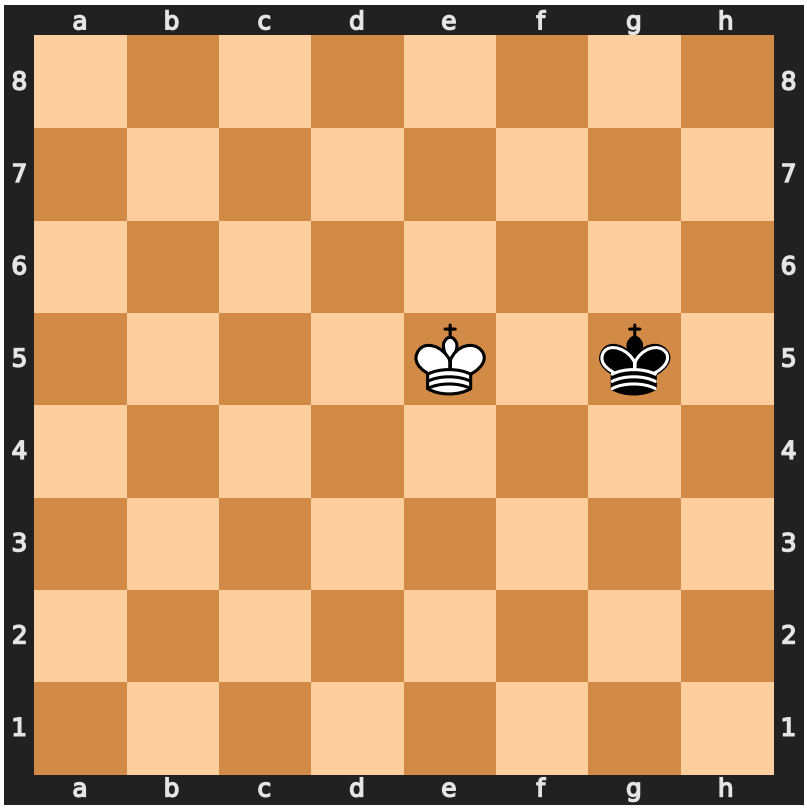

Figure 19.22: Chess Position

Task: Who has the opposition? **Hint 1:** The kings are on the same rank (5th rank), one square apart (f5 between them). **Solution: Black has the opposition** (White must move). Horizontal opposition.

Exercise 9.23 **Position:** White king on d4, White pawn on e4, Black king on e6. White to move.

Task: Black has the opposition. Can White use the pawn to gain the opposition? **Hint 1:** White does not have the opposition (White must move). But the pawn on e4 gives White a tempo move. **Hint 2:** Try 1.e5 or 1.Kc5. One of them works. **Hint 3:** 1.Kc5! attacks from the side, forcing Black to respond. **Solution:** 1.Kc5! Kd7 (Black must respond to the flank attack) 2.Kd5! (opposition regained!) 2…Ke7 3.Kc6! (key square!) Ke6 4.e5 Ke7 5.Kd5 Kd7 6.e6+ Ke7 7.Kf6! Ke8 8.e7 Kd7 9.Kf7 and promotes. **Win.** The outflanking maneuver Kc5-Kd5 breaks the opposition.

Exercise 9.24 **Position:** White king on f3, Black king on f5. Black to move.

Task: Who has the opposition? If you added a White pawn on e2, would White win? **Solution:** White has the opposition (Black must move). With a White pawn on e2, White would win: Black

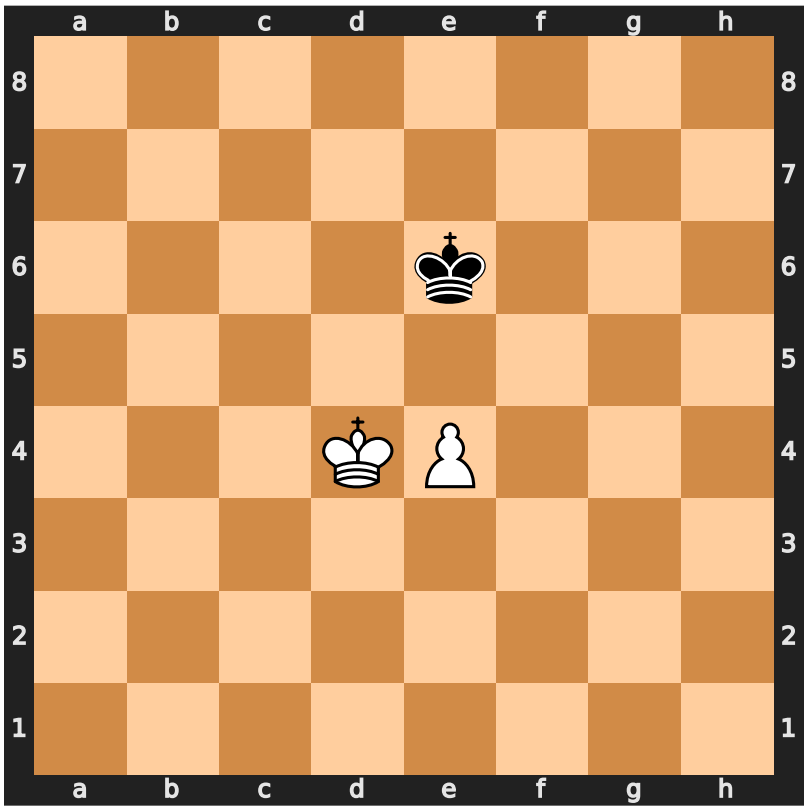

Figure 19.23: Chess Position

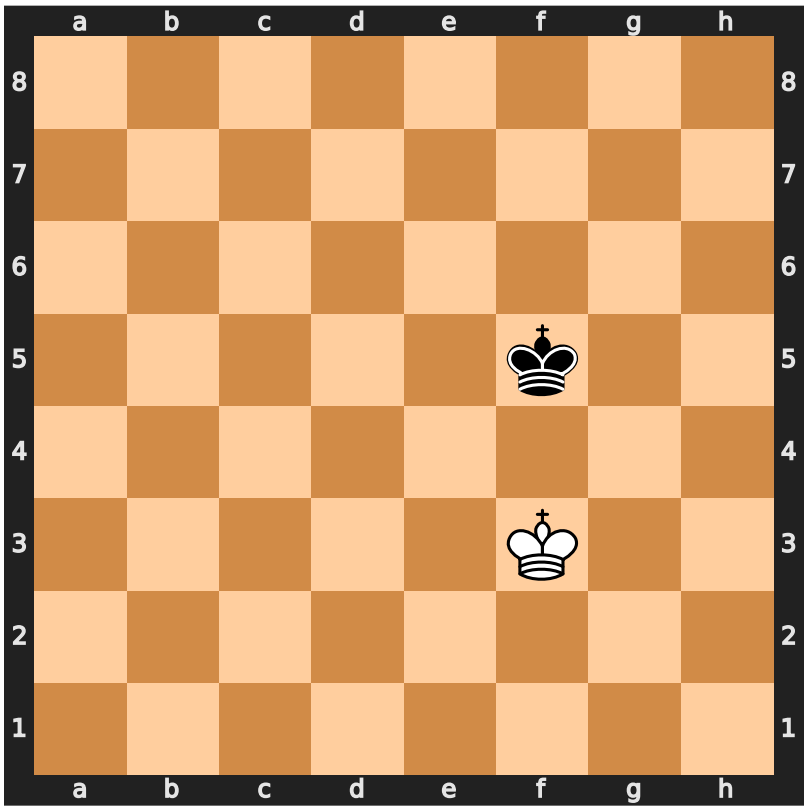

Figure 19.24: Chess Position

must step aside, White's king advances toward the key squares, and the pawn supports the king. **White wins with the pawn.**

Exercise 9.25 **Position:** White king on g2, Black king on g4. Black to move.

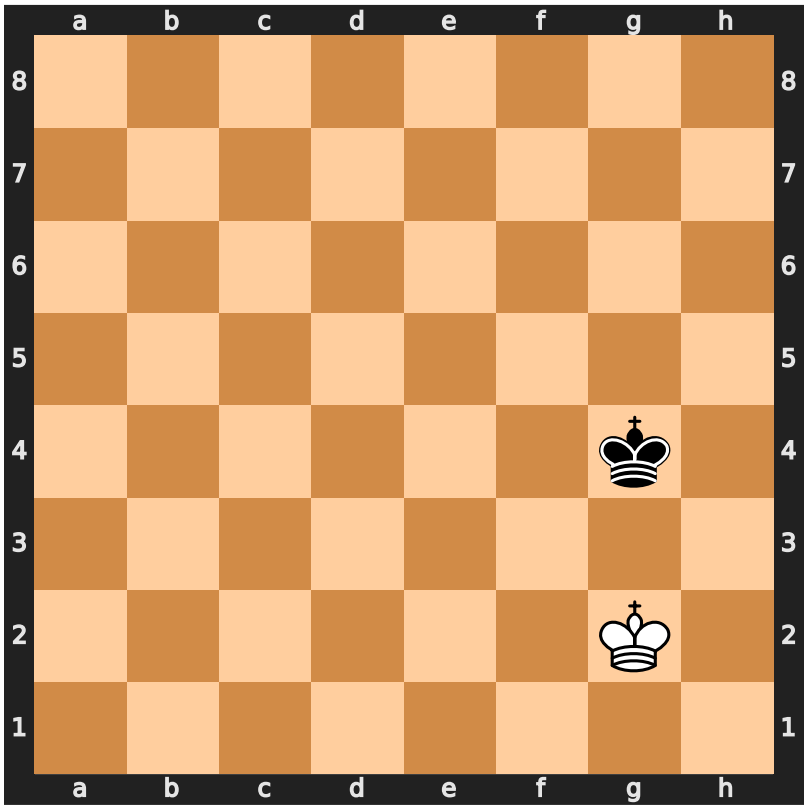

Figure 19.25: Chess Position

Task: Who has the opposition? **Solution: White has the opposition** (Black must move). Kings on the g-file, one square apart.

19.11.3 Rule of the Square: Does the King Catch the Pawn?

Exercise 9.26 **Position:** White pawn on c5 (no White king). Black king on g7. Black to move.

Task: Does the Black king catch the pawn? **Hint 1:** Draw the square: c5-c8-f8-f5. **Hint 2:** The Black king is on g7, outside the square. **Hint 3:** But it is Black's move! Black plays Kf6 or Kf7. Is that inside the square? **Solution:** The square is c5-c8-f8-f5. The Black king on g7 is outside, but it is Black's move. Black plays 1…Kf7 or 1…Kf6, stepping inside the square. **The king catches the pawn. Draw.**

Exercise 9.27 **Position:** White pawn on b4 (no White king). Black king on g8. White to move.

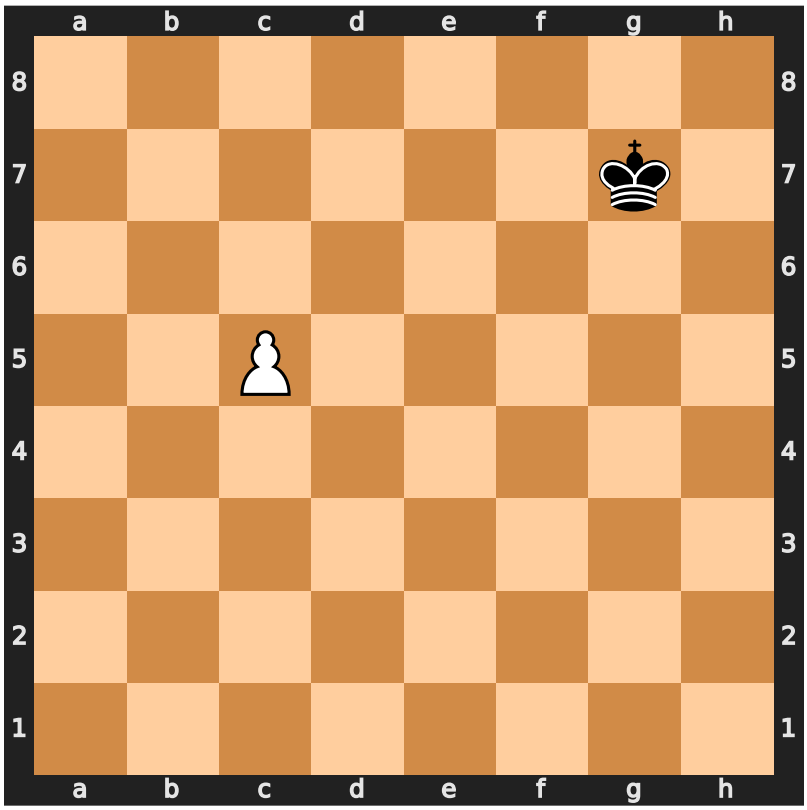

Figure 19.26: Chess Position

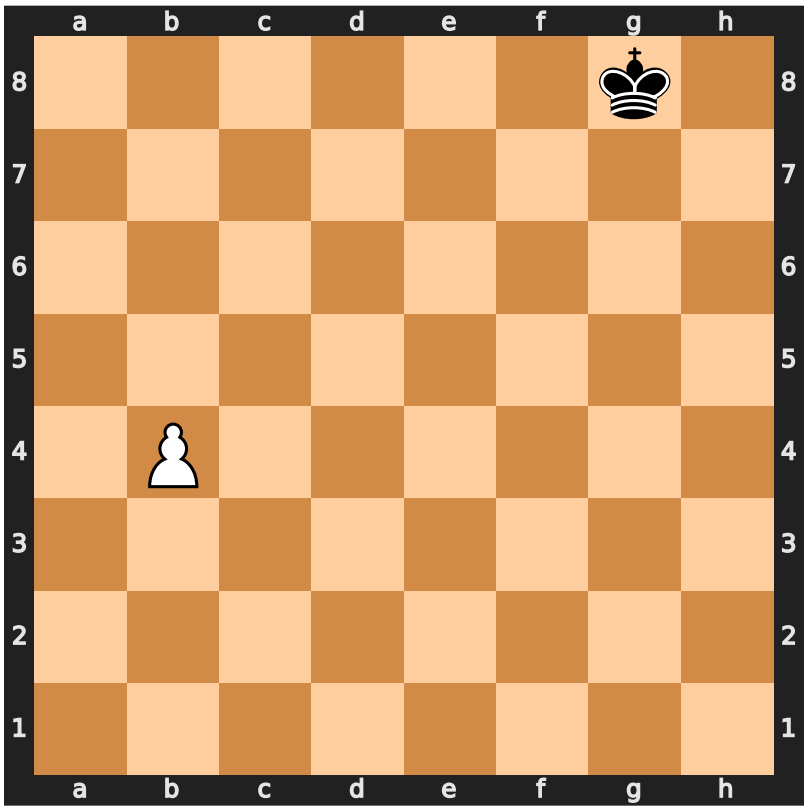

Figure 19.27: Chess Position

Task: White pushes the pawn. Does the Black king catch it? **Hint 1:** Pawn on b4, needs 4 moves to promote (b5, b6, b7, b8). Square: b4-b8-f8-f4. **Hint 2:** Black king on g8 is outside the square. **Solution:** 1.b5 and the square is b5-b8-e8-e5. Black king on g8 is still outside. **The pawn promotes.** The king is too far away.

Exercise 9.28 **Position:** White pawn on e5 (no White king). Black king on a8. Black to move.

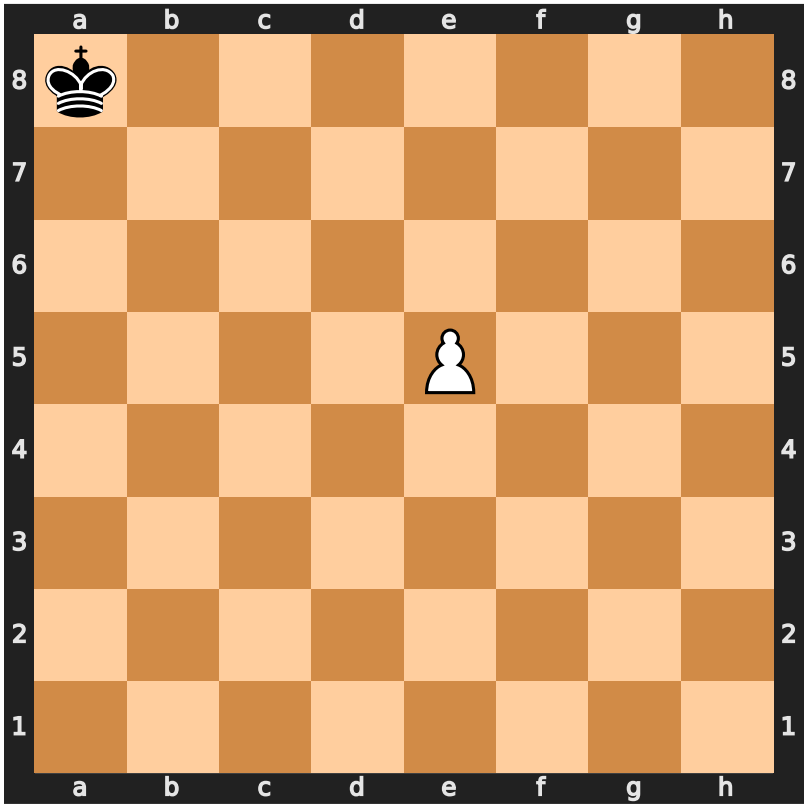

Figure 19.28: Chess Position

Task: Does the Black king catch the pawn? **Hint 1:** Draw the square from e5 to e8. The square extends 3 squares sideways toward the defending king. **Hint 2:** The square is drawn as a geometric square from the pawn to the promotion square. From e5 to e8 is 3 squares, so the square extends 3 squares sideways: e5-e8-b8-b5 (toward the king on a8). **Hint 3:** The king is on a8, just outside this square. But it is Black's move, so the king gets one step closer before the pawn advances. **Solution:** 1…Kb7 (entering the square). After 2.e6 Kc6 3.e7 Kd7! The king reaches d7 and stops the pawn on e7. **The king catches the pawn! Draw.**

Exercise 9.29 **Position:** White pawn on h5 (no White king). Black king on d8. Black to move.

Task: Does the Black king catch the h-pawn? **Hint 1:** Square from h5: h5-h8. That is 3 squares. Square: h5-h8-e8-e5. **Hint 2:** Black king on d8. Is d8 inside the square? The boundary is e8 on the 8th rank. d8 is one square outside. **Hint 3:** But it is Black's move! Black plays 1…Ke7, entering the square (e7 is inside e5-e8-h8-h5). **Solution:** 1…Ke7! Stepping inside the square. The king will now track the pawn diagonally and catch it. **The king catches the pawn. Draw.**

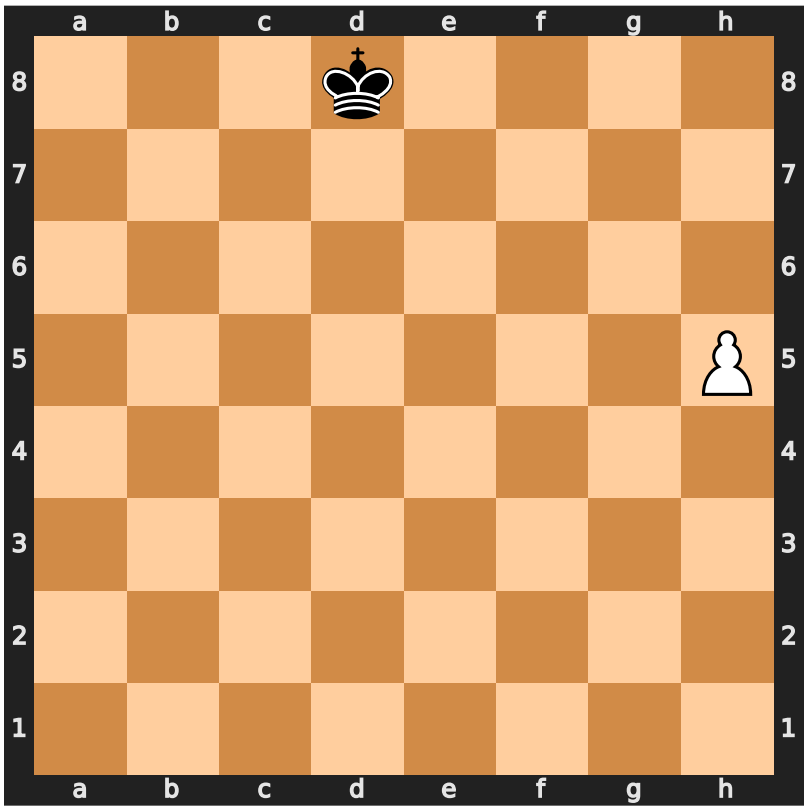

Figure 19.29: Chess Position

Exercise 9.30 **Position:** White pawn on a2 (no White king). Black king on h6. White to move.

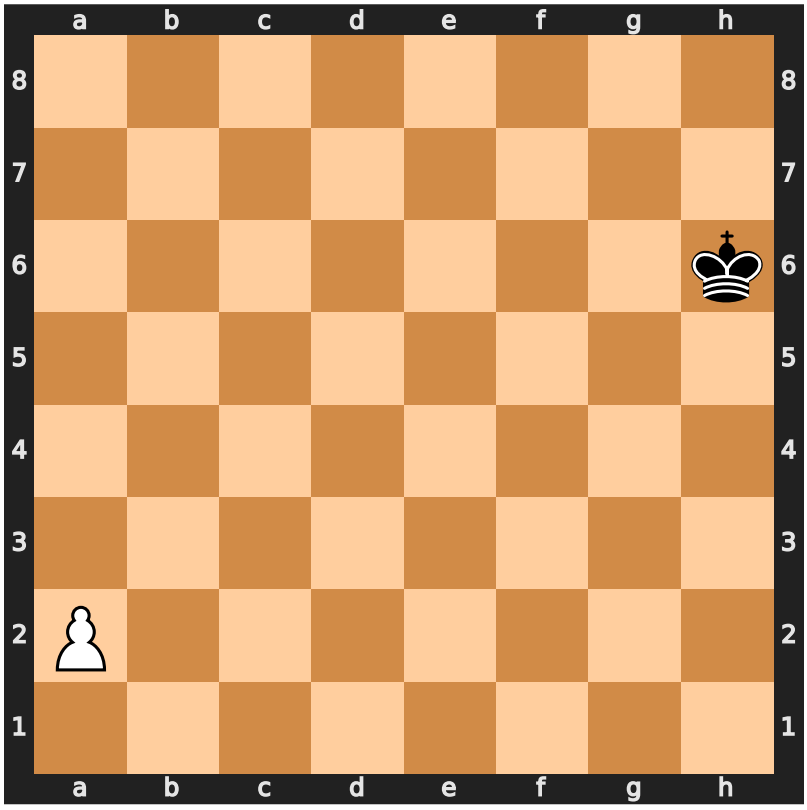

Figure 19.30: Chess Position

Task: White plays a4 (two-square advance). Does the Black king catch the pawn? **Hint 1:** After a4, treat the pawn as on a4. Square: a4-a8-e8-e4. **Hint 2:** The Black king is on h6, way outside the square. **Solution:** 1.a4 and the Black king is on h6, far outside the square (e4-e8 boundary). The pawn promotes easily. **The pawn promotes.**

Exercise 9.31 **Position:** White pawn on d6 (no White king). Black king on a3. Black to move.

Task: Does the Black king catch the pawn? **Hint 1:** Square from d6: d6-d8 is 2 squares. Square: d6-d8-f8-f6 (or b8-b6 toward the king). **Hint 2:** Toward the king: d6-d8-b8-b6. The king is on a3, far outside. **Solution:** The king on a3 is nowhere near the square. **The pawn promotes.**

Exercise 9.32 **Position:** White pawn on g2 (no White king). Black king on c6. White to move.

Task: White plays g4. Does the Black king catch the pawn? **Hint 1:** After g4, the pawn is on g4. Square: g4-g8-c8-c4. **Hint 2:** The Black king is on c6. Is c6 inside the square? The square boundary runs from c4 to c8 along the c-file. c6 is between c4 and c8. YES, the king is inside! **Solution:** 1.g4 and the Black king is on c6, inside the square (c4-c8 boundary). The king catches

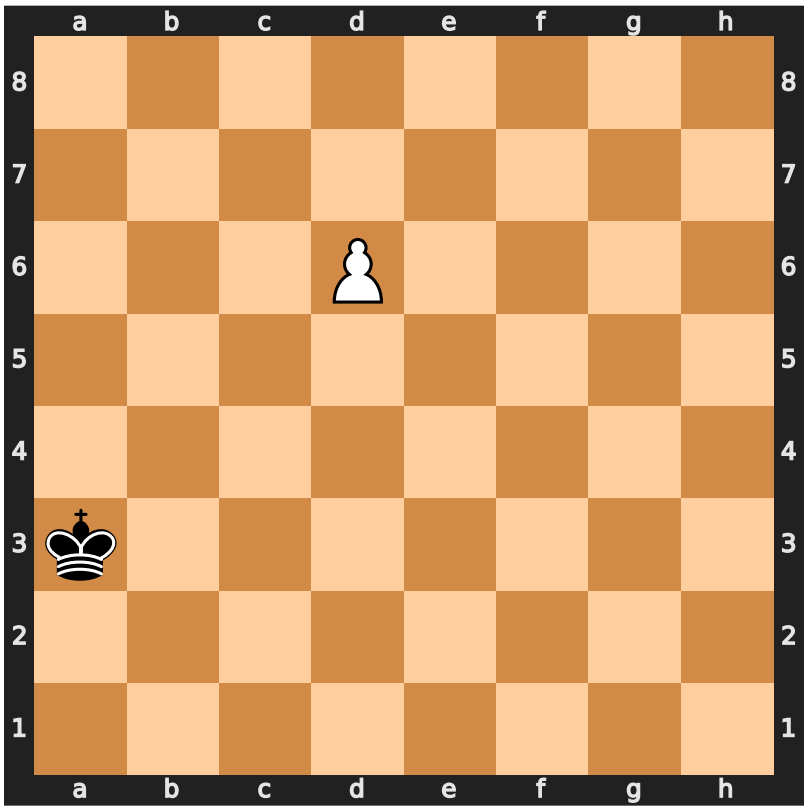

Figure 19.31: Chess Position

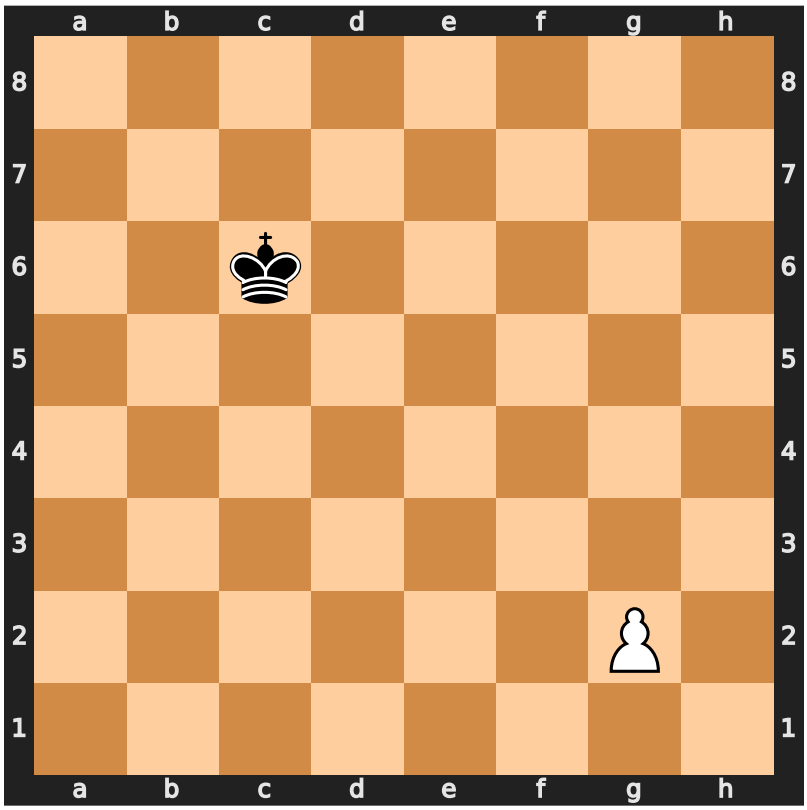

Figure 19.32: Chess Position

the pawn. **Draw.** But note: if it were 1.g3 instead (not the two-square advance), the square from g3 would be g3-g8-b8-b3. The king on c6 is inside. Same result: draw.

Exercise 9.33 **Position:** White pawn on f2 (no White king). Black king on a7. White to move.

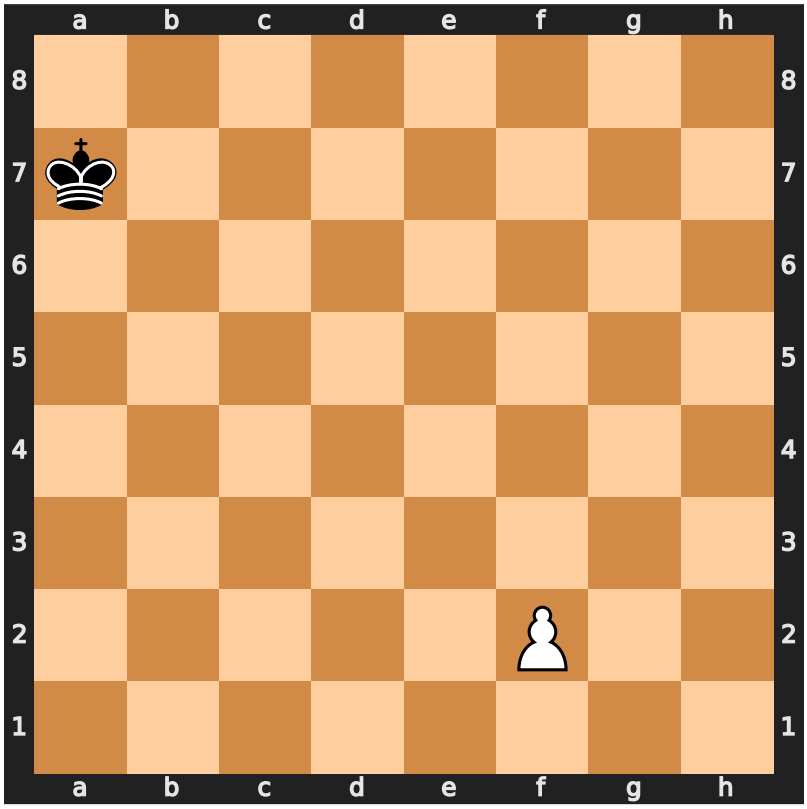

Figure 19.33: Chess Position

Task: White plays f4. Does the Black king catch the pawn? **Hint 1:** After f4, square: f4-f8-b8-b4. **Hint 2:** The king is on a7, outside the b-file boundary. **Solution:** The king on a7 is outside the square (b8 is the closest corner, and a7 is one file beyond). **The pawn promotes.**

Exercise 9.34 **Position:** White pawn on e2 (no White king). Black king on b5. White to move.

Task: White plays e4. Does the Black king catch the pawn? **Hint 1:** After e4, the pawn is on e4. Square: e4-e8-a8-a4. **Hint 2:** The king is on b5. Is it inside the square a4-a8-e8-e4? The boundary on the 5th rank runs from a5 to e5. b5 is between a5 and e5. YES, the king is inside! **Solution:** 1.e4 and the Black king on b5 is inside the square. The king catches the pawn. **Draw.**

Exercise 9.35 **Position:** White pawn on d5 (no White king). Black king on h8. Black to move.

Task: Does the Black king catch the pawn? **Hint 1:** Square from d5: d5-d8. 3 squares. Square: d5-d8-g8-g5. **Hint 2:** The king is on h8, one square outside g8. **Hint 3:** It is Black's move. Black

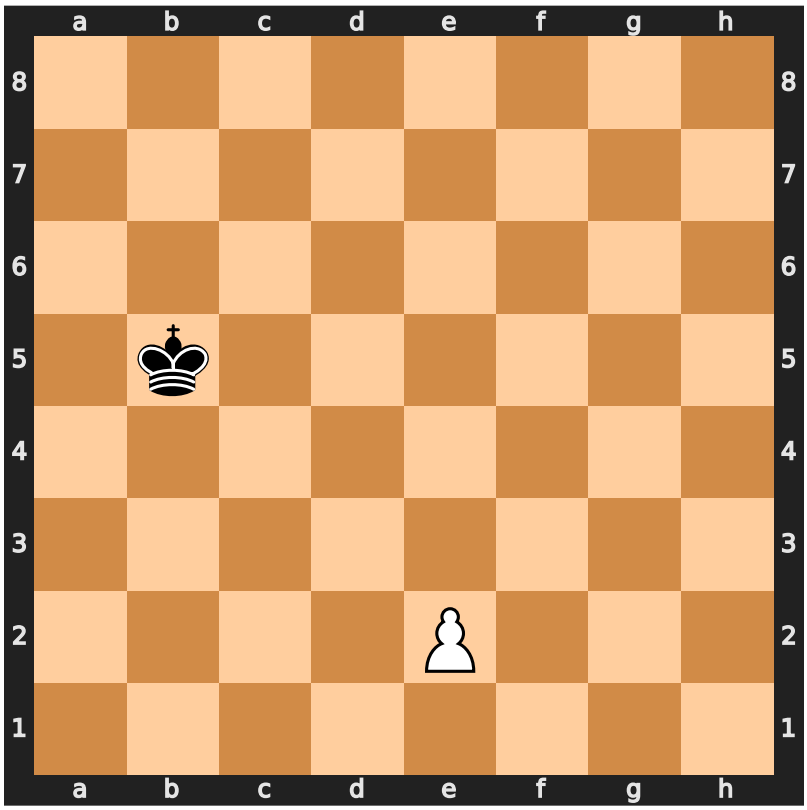

Figure 19.34: Chess Position

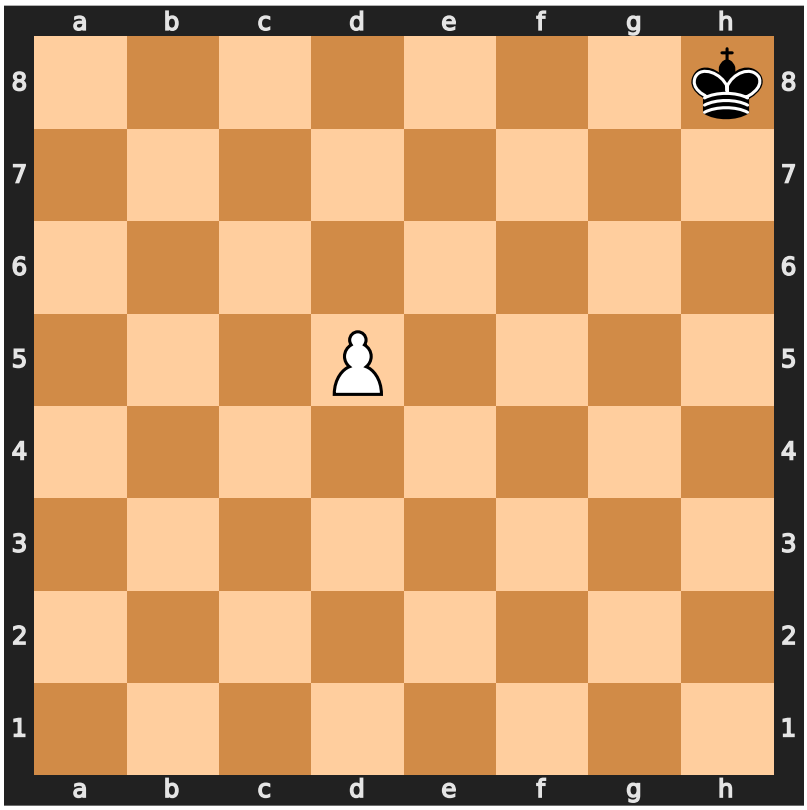

Figure 19.35: Chess Position

plays Kg7. Is g7 inside the square? **Solution:** 1…Kg7. The square boundary includes g5-g8. g7 is inside! **The king catches the pawn. Draw.**

19.11.4 Find the Pawn Breakthrough

Exercise 9.36 **Position:** White pawns on a5, b5, c5. Black pawns on a7, b7, c7. White to move.

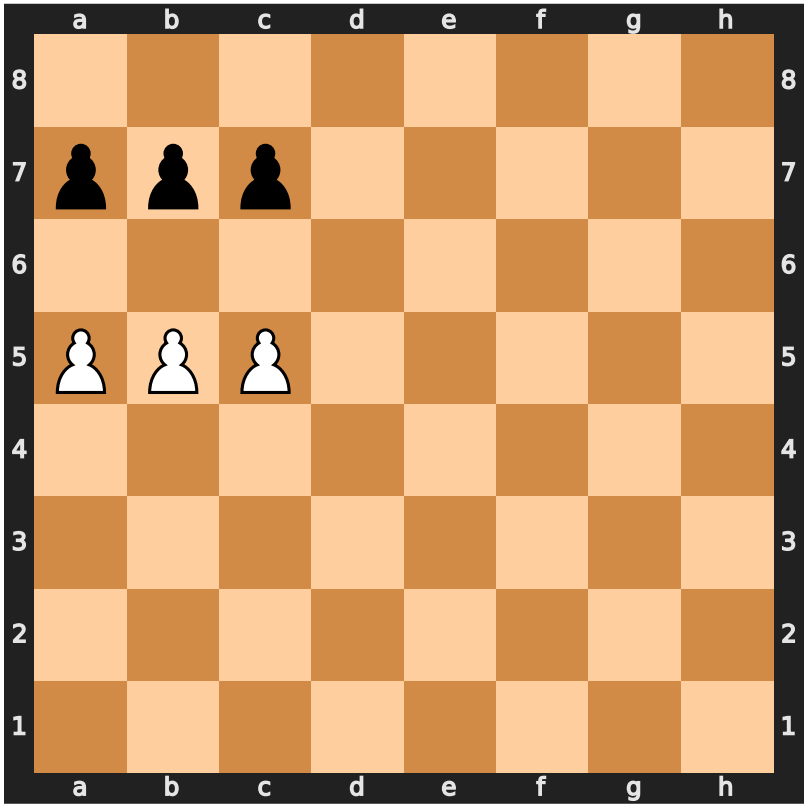

Figure 19.36: Chess Position

Task: Find the breakthrough. Which pawn do you sacrifice? **Hint 1:** Which pawn, if sacrificed, creates problems on both sides? **Hint 2:** The middle pawn! **Solution: 1.b6!** After 1…axb6 2.c6! bxc6 3.a6 promotes. After 1…cxb6 2.a6! bxa6 3.c6 promotes. The middle pawn sacrifice is the key.

Exercise 9.37 **Position:** White pawns on f5, g5, h5. Black pawns on f7, g7, h7. White to move.

Task: Find the breakthrough. **Hint 1:** Same idea as 9.36, just on the kingside. **Solution: 1.g6!** After 1…fxg6 2.h6! gxh6 3.f6 promotes. After 1…hxg6 2.f6! gxf6 3.h6 promotes. Mirror image of the classic breakthrough.

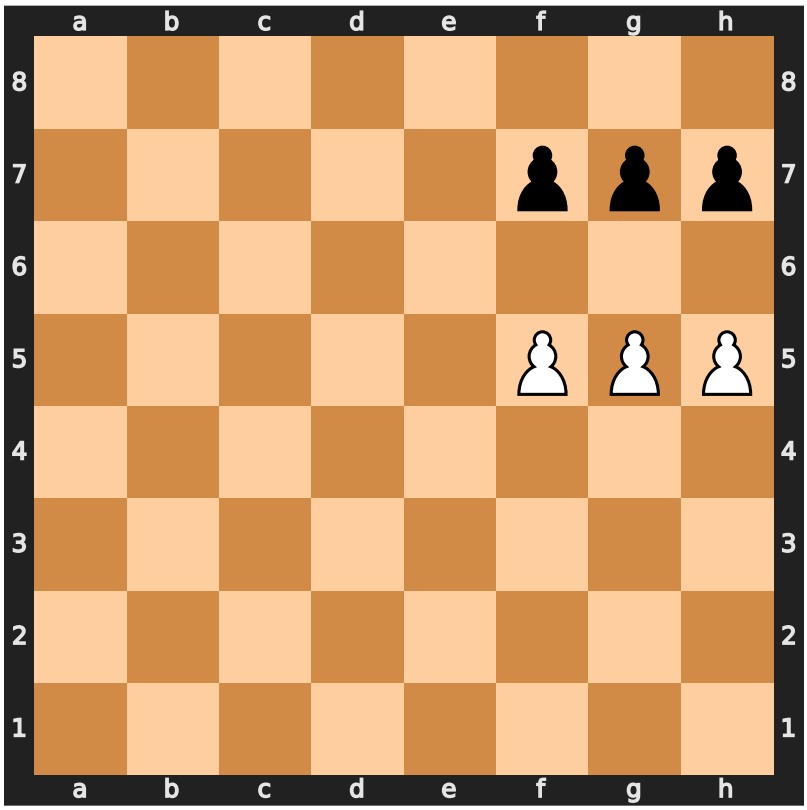

Figure 19.37: Chess Position

Exercise 9.38 **Position:** White pawns on a4, b4, c4. Black pawns on a5, b6, c5. White to move.

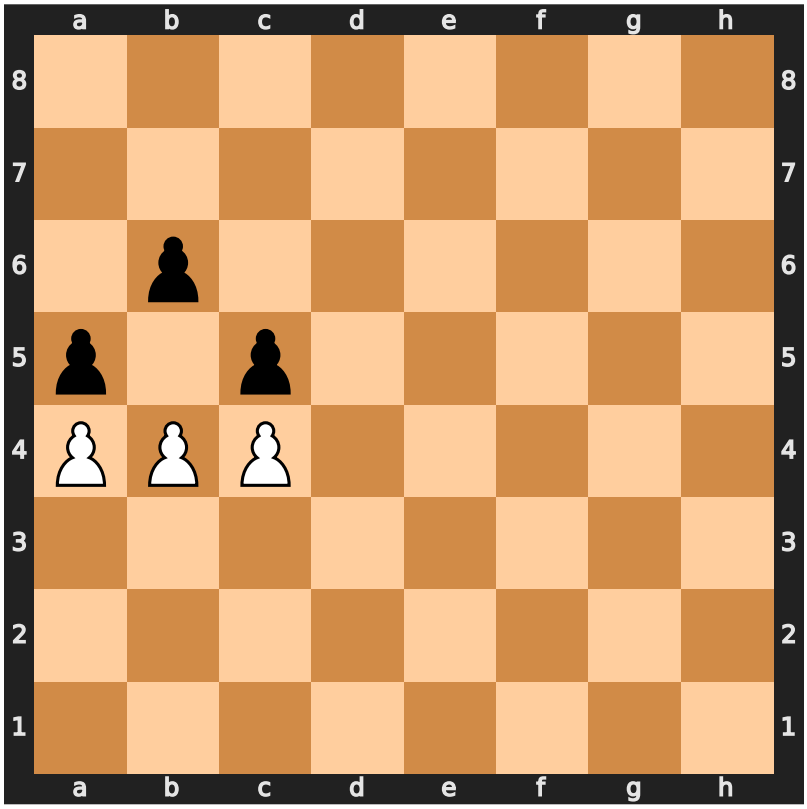

Figure 19.38: Chess Position

Task: Is there a breakthrough? **Hint 1:** Look at b4. Can White play b5? **Hint 2:** 1.b5! axb4 (or cxb4) and then what? **Hint 3:** After 1.b5, none of Black's pawns can capture it. What does that mean? **Solution:** This pawn structure does not allow a clean breakthrough. The pawns are not in the classic symmetric formation. **No breakthrough exists.** This exercise shows that not every 3 vs. 3 pawn structure allows a breakthrough — the pawns must be positioned symmetrically (like 5th rank vs. 7th rank) for the classic pattern to work.

Here is a revised position that DOES work.

Revised Position: White pawns on a5, b5, c5. Black pawns on a7, b6, c7. White to move.

`FEN: 8/p1p5/1p6/PPP5/8/8/8/8 w - - 0 1`

Solution: 1.c6! Black cannot capture: b6 only captures diagonally forward (toward rank 5), not backward to c6. And c7 is blocked from advancing to c6. So 1.c6 creates an immediate passed pawn. After 1…bxa5 2.c7 and the pawn promotes. **1.c6! wins.**

Exercise 9.39 **Position:** White pawns on b5, c5, d5. Black pawns on b7, c7, d6. White to move.

Task: Find the winning pawn advance. **Hint 1:** Black's d6 pawn blocks the d5 pawn. The c7 and b7 pawns block the c5 and b5 pawns (sort of). **Hint 2:** Try 1.c6! breaking open the position.

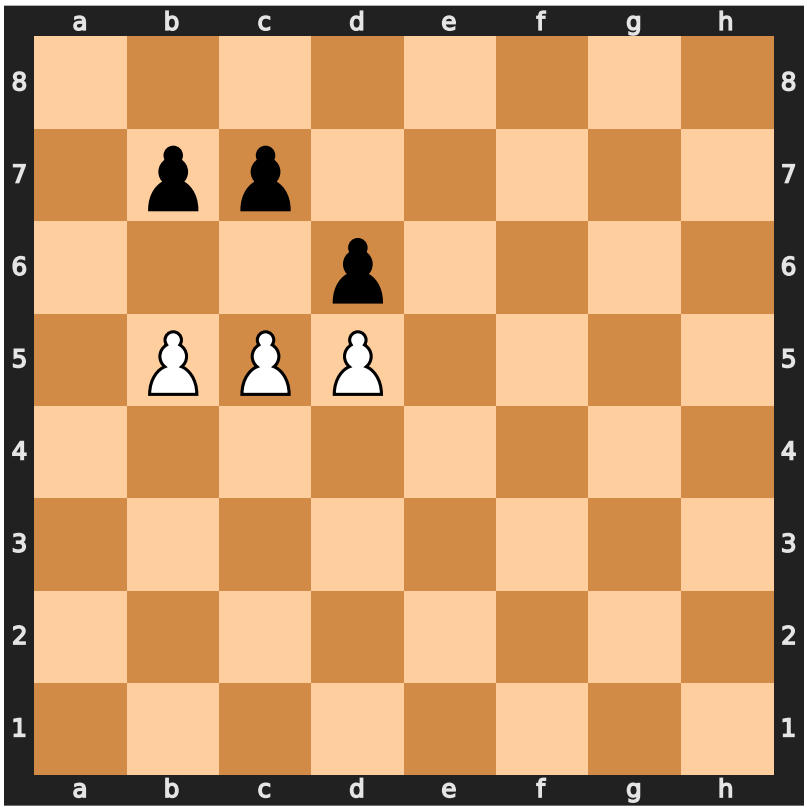

Figure 19.39: Chess Position

Solution: 1.c6! bxc6 (if 1…b6 2.d6! cxd6 3.c7 promotes) 2.bxc6! and now the c6 pawn threatens c7. Black plays 2…d5 (no other useful moves), but the c-pawn is already too far advanced. After appropriate play, the c-pawn or the d-pawn will promote. **White wins.**

Exercise 9.40 **Position:** White pawns on a5, b5, c4. Black pawns on a7, b7, c7. White to move.

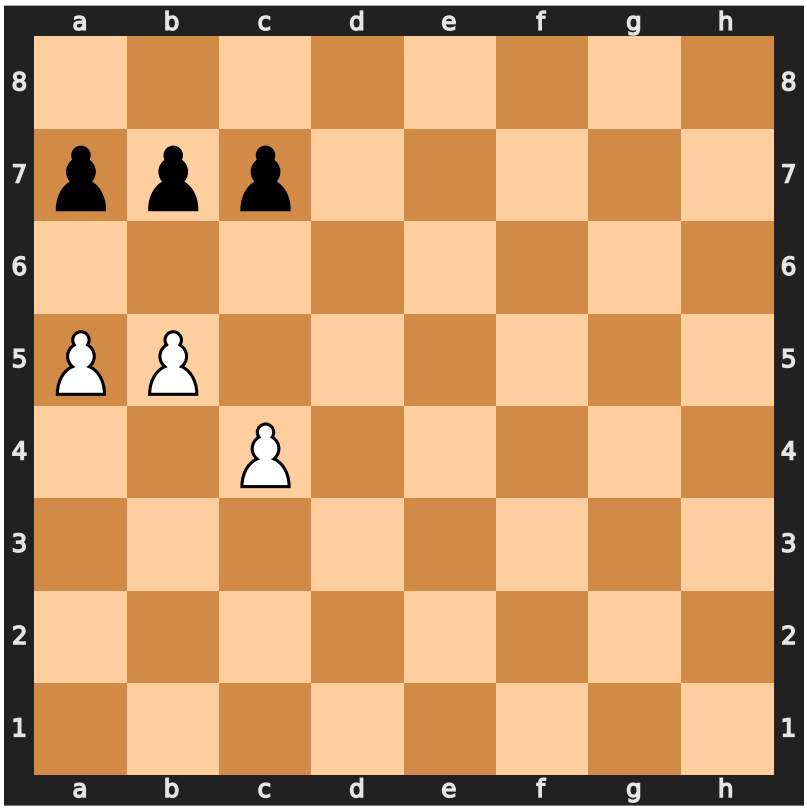

Figure 19.40: Chess Position

Task: Can White break through? **Hint 1:** The pawns are not all on the 5th rank. Can White still break through? **Hint 2:** Try 1.b6! axb6 (or cxb6) and then 2.c5 or 2.a6. **Solution:** 1.b6! cxb6 (c7 captures b6 diagonally) 2.a6! bxa6 (b7 captures a6 diagonally) 3.c5! and the c-pawn is a passed pawn heading to c8. If instead 1.b6! axb6 2.c5! and White breaks through similarly. **Yes, White breaks through.**

Exercise 9.41 **Position:** White pawns on e5, f5, g5. Black pawns on e7, f7, g6. White to move.

Task: Find the breakthrough. **Hint 1:** Black's g6 pawn blocks the g5 pawn. But what about f5 and e5? **Hint 2:** 1.f6! breaks things open. **Solution:** 1.f6! This works on both captures. If 1…gxf5 2.fxe7 and the e-pawn promotes. If 1…exf6 2.e6! fxe6 3.gxf6 and the f-pawn marches to f7, f8=Q (Black's g6 pawn cannot capture it since pawns only capture diagonally forward). **1.f6! wins.**

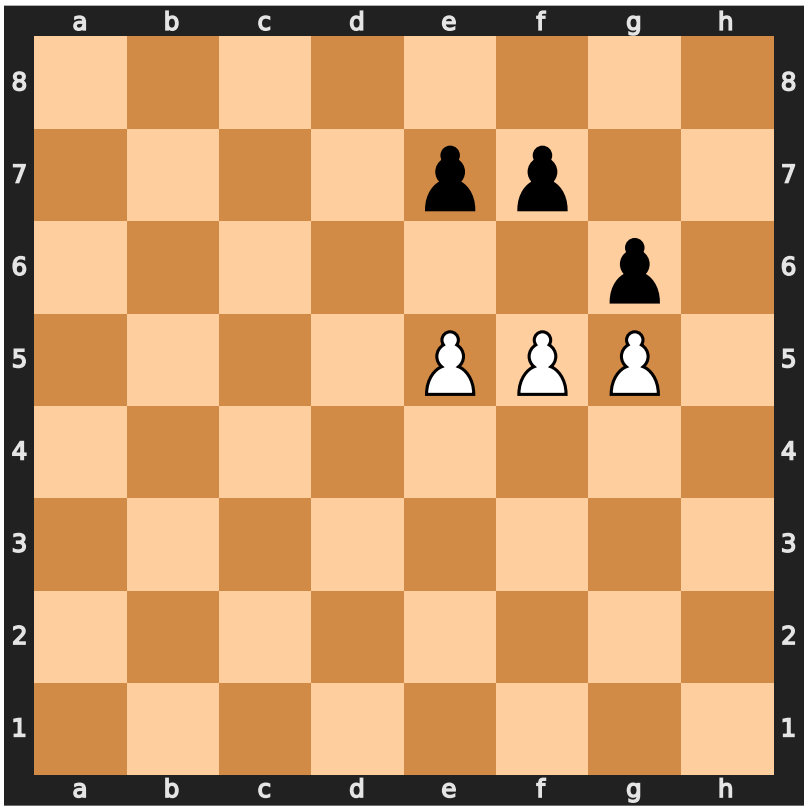

Figure 19.41: Chess Position

Exercise 9.42 **Position:** White pawns on a5, b5, c5. Black pawns on a6, b7, c7. White to move.

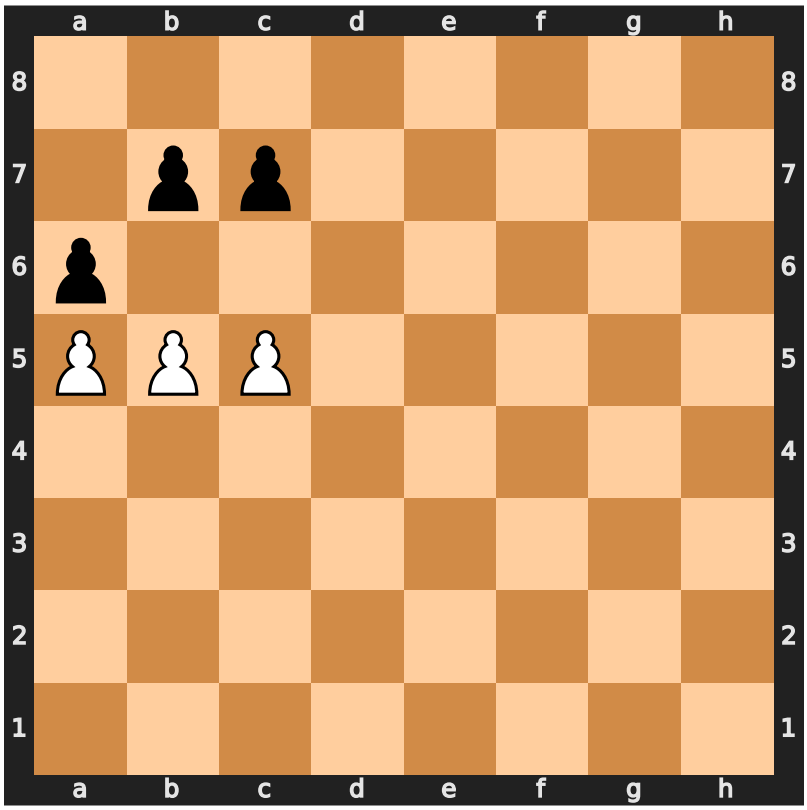

Figure 19.42: Chess Position

Task: Can White break through? (This one is tricky.) **Hint 1:** Black's a6 pawn blocks the a5 pawn. The b7 and c7 pawns are further back. **Hint 2:** Try 1.b6! cxb6 and then what? **Hint 3:** After 1.b6 cxb6, play 2.c6! bxc6 3.bxc6 and the c-pawn is on the 6th rank as a passed pawn. **Solution:** 1.b6! cxb6 (if 1…axb5 2.bxc7 promotes) 2.c6! bxc6 (forced) 3.bxc6! and the c6 pawn will promote: c7, c8=Q. Black cannot stop it (a6 is stuck on a6, and there are no other Black pawns in the way). **White wins with the breakthrough.**

Exercise 9.43 **Position:** White pawns on a4, b4, c4. Black pawns on a6, b5, c6. White to move.

Task: Is there a breakthrough? **Hint 1:** The b-pawns are locked (b4 vs b5). But what about a4 and c4? **Hint 2:** Try 1.a5! threatening to capture on a6 or push further. **Solution:** 1.c5! bxc4 (b5 captures c4 diagonally). Now White has a4 and the b-pawns are locked with a5 vs a6. After 2.a5, the a-pawn is blocked by a6. **No clean breakthrough exists.** The pawns are not in the classic symmetric formation, and Black's structure is solid enough to hold. **Draw with best play.**

Exercise 9.44 **Position:** White pawns on d5, e5, f5. Black pawns on d7, e7, f7. White to move.

Task: Find the breakthrough. **Solution: 1.e6!** The classic middle-pawn sacrifice. After 1…fxe6

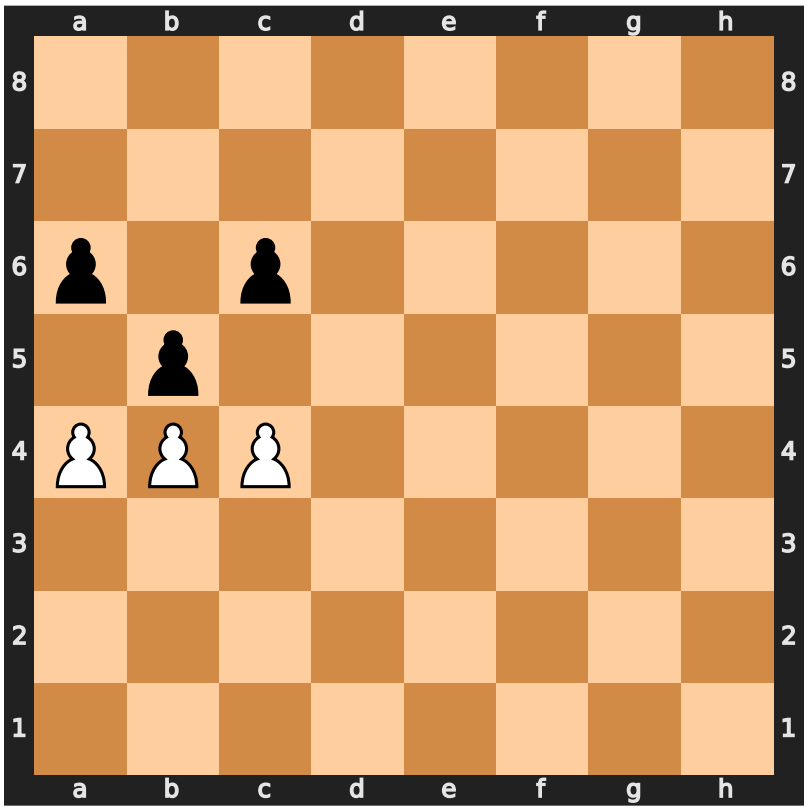

Figure 19.43: Chess Position

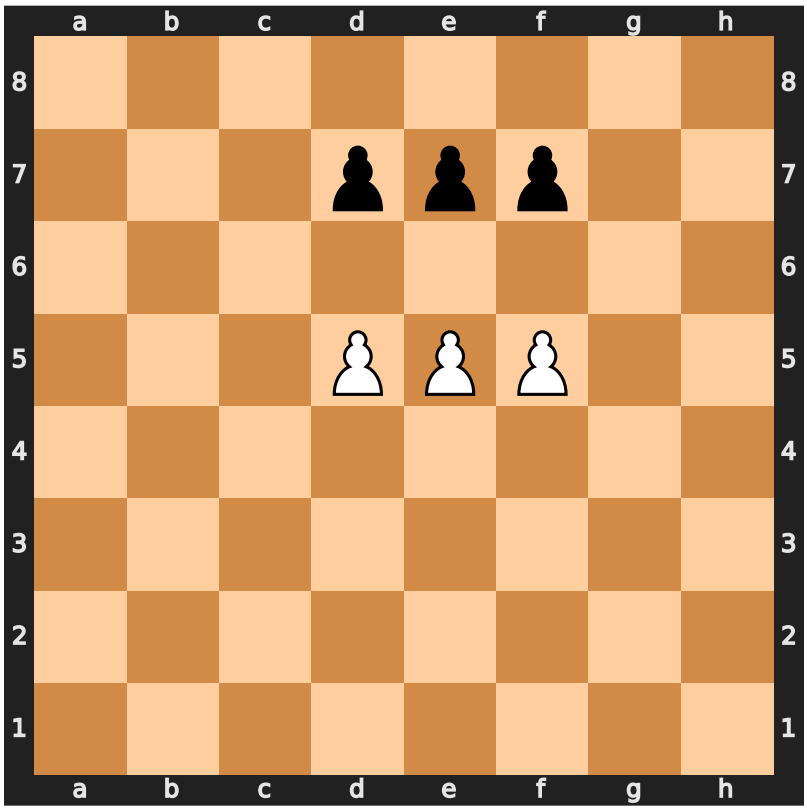

Figure 19.44: Chess Position

2.f6! exf6 3.d6 promotes (or 3.d6 and nothing stops it). After 1…dxe6 2.d6! exd6 (or cxd6) 3.f6 promotes. **White wins.**

Exercise 9.45 **Position:** White pawns on b5, c5, d5. Black pawns on b7, c6, d7. White to move.

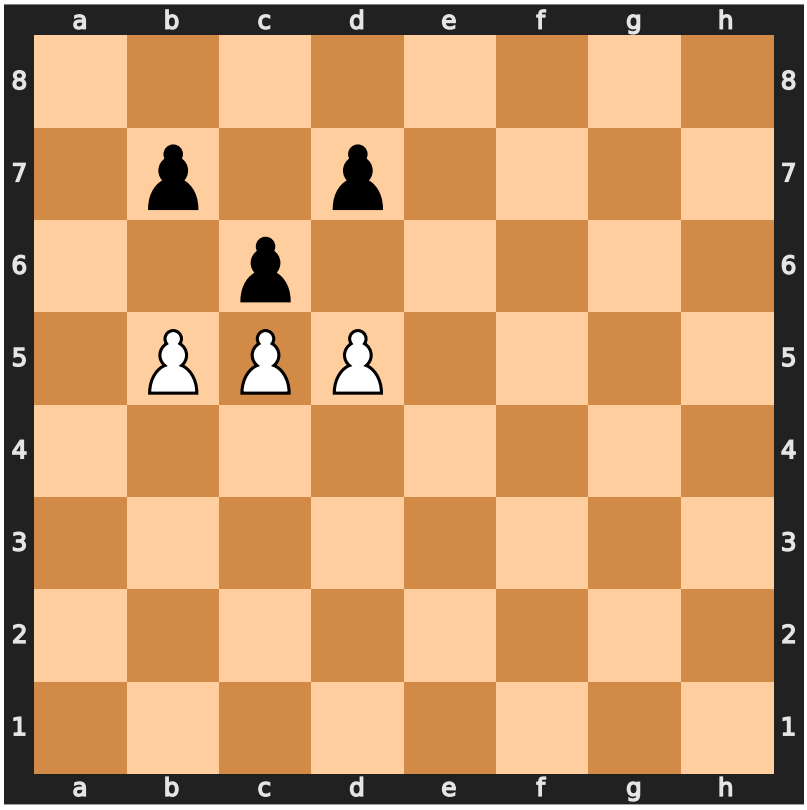

Figure 19.45: Chess Position

Task: Can White break through? **Hint 1:** The c-pawns are locked (c5 vs c6). Try breaking on the side. **Hint 2:** 1.d6! threatens to advance further. **Solution:** 1.d6! This is the breakthrough. The key: Black's c6 pawn captures diagonally forward (toward rank 5), so it can reach b5 or d5 but NOT d6. And Black's d7 pawn cannot advance to d6 because the White pawn blocks it. So the d6 pawn is unstoppable on its own. Black tries 1…b6 (the only attempt). 2.cxb6 cxb5 3.b7! and the pawn promotes. **White wins.**

19.11.5 Win This K+P vs K Position (Full Technique)

Exercise 9.46 **Position:** White king on d6, White pawn on d5, Black king on d8. White to move.

Task: Win this position. Give the full sequence of moves. **Solution:** 1.d6 (wait, the key is king first). Actually: 1.Ke6! Ke8 (or Kc8) 2.d6 Kd8 3.d7 Kc7 4.Ke7 and d8=Q. Or after 1.Ke6 Kc8

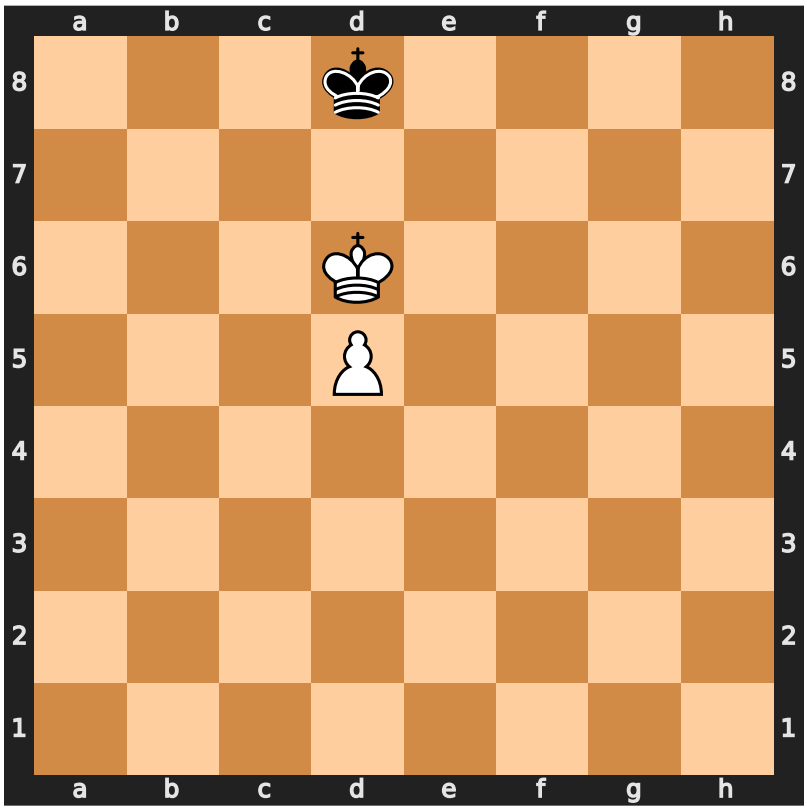

Figure 19.46: Chess Position

2.Ke7 Kc7 3.d6+ Kc8 4.d7+ Kc7 5.d8=Q+. **White wins.**

Exercise 9.47 **Position:** White king on e6, White pawn on d4, Black king on f8. White to move.

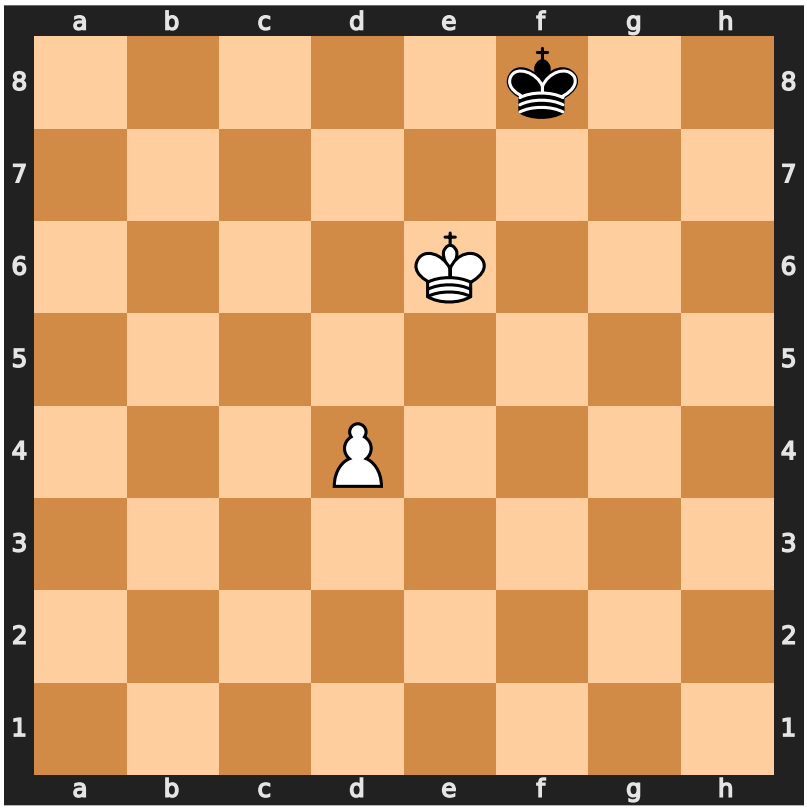

Figure 19.47: Chess Position

Task: Win this position. The king is already on a key square! **Solution:** The White king is on e6, a key square for the d4 pawn. 1.d5 Kg8 (or Ke8) 2.Kd7 (or Kf6) heading toward the promotion square. The pawn is escorted all the way. For instance: 1.d5 Ke8 2.d6 Kf8 3.d7 Kf7 4.Kd6! (or d8=Q? Let's check: 4.d8=Q works too since the king is on f7 and the queen on d8 wins easily.) **White wins.**

Exercise 9.48 **Position:** White king on c3, White pawn on d3, Black king on d5. Black to move.

Task: White wants to promote the pawn. Can Black stop it? **Hint 1:** It is Black's move. Can Black take the opposition? **Hint 2:** 1...Kd6! heads back toward the pawn. Can Black reach the key defensive squares? **Solution:** 1...Kd6! (heading back toward the pawn) 2.Kc4 Kc6! (opposition!) 3.d4 Kd6 (staying in front of the pawn) 4.d5 Kd7! 5.Kc5 Kc7 (opposition!) 6.d6+ Kd7 7.Kd5 Kd8! 8.Ke6 Ke8 9.d7+ Kd8 10.Kd6 stalemate. **Draw.** Black's opposition holds.

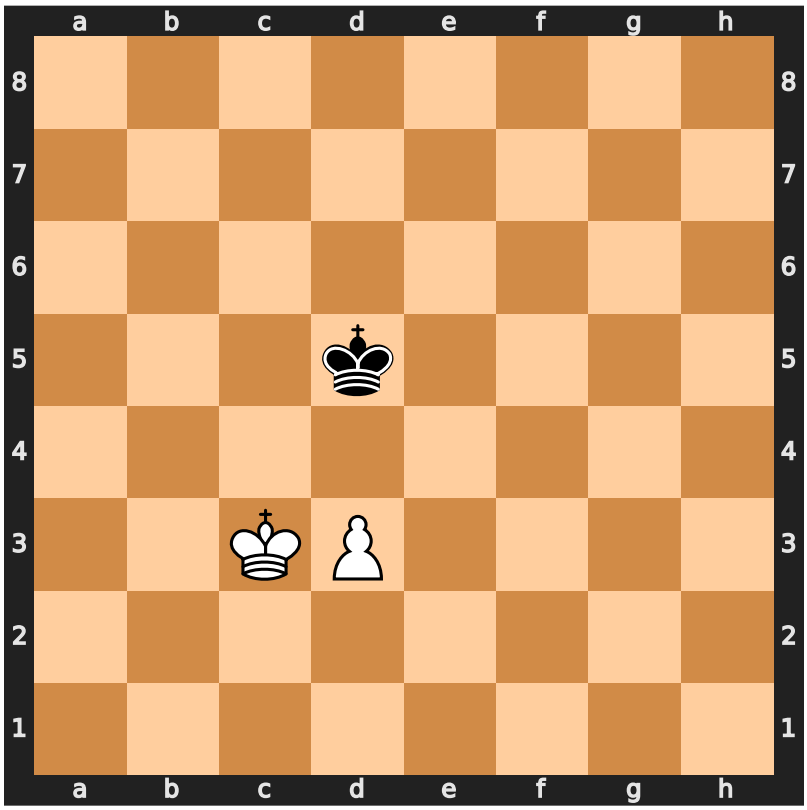

Figure 19.48: Chess Position

Exercise 9.49 **Position:** White king on f4, White pawn on e4, Black king on e6. White to move.

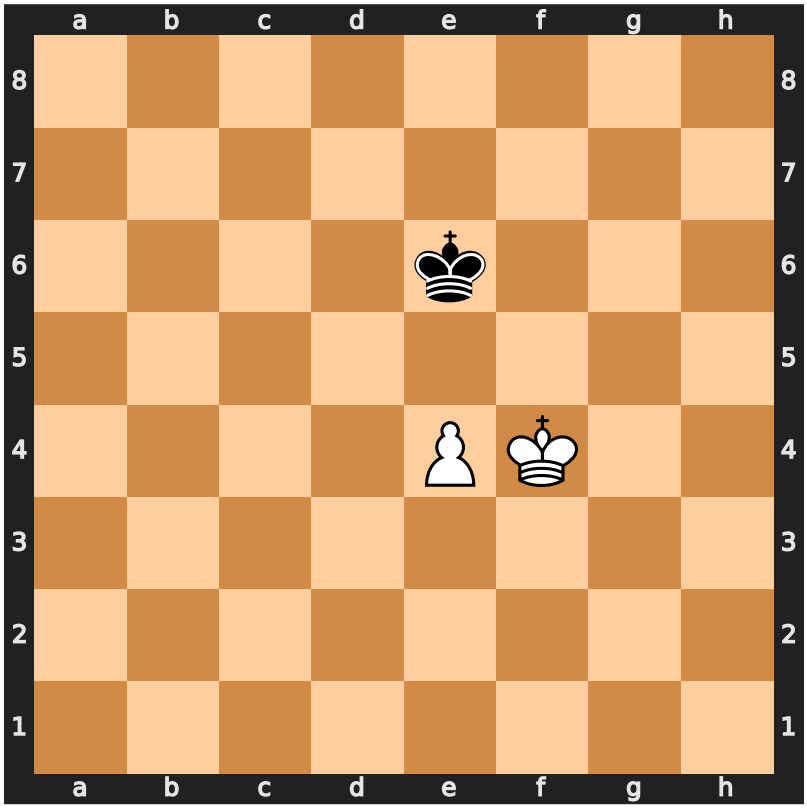

Figure 19.49: Chess Position

Task: Win this position. **Hint 1:** White's king is on f4, next to the pawn. Can White reach a key square? **Hint 2:** Key squares for e4: d6, e6, f6. Black is on e6! **Hint 3:** White needs to push Black off the key square. Try 1.Kf5 or 1.Ke5. **Solution:** 1.Kf5! (threatening Kf6, a key square) 1…Kd6 (or Ke7, which also works: 1…Ke7 2.Ke5 Kd7 3.Kf6 Ke8 4.Ke6 Kd8 5.e5 Kc7 6.Kf7… this is getting complex). After 1.Kf5 Kd6 2.Kf6! (key square reached!) 2…Kd7 3.e5 Ke8 4.Ke6 Kd8 5.Kf7 Kd7 6.e6+ Kd8 7.e7+ Kd7 8.e8=Q+. **White wins.**

Exercise 9.50 **Position:** White king on b4, White pawn on c2, Black king on c6. White to move.

Task: Win this position. **Hint 1:** Key squares for c2: b6, c6, d6 (on the 6th rank). Black is already ON c6. **Hint 2:** White needs to push Black off. Try 1.Kc4 (taking opposition!). **Solution:** 1.Kc4! (opposition! c5 between the kings, Black to move) 1…Kd6 2.Kb5! (heading for b6, a key square) 2…Kc7 3.Kc5 Kb7 4.Kd6! (key square, using the other side) 4…Kc8 5.c4 Kb7 6.c5 Kc8 7.Kc6 (opposition) 7…Kb8 8.Kd7 Ka7 9.c6 Kb8 10.c7+ Ka7 11.c8=Q. **White wins.**

Exercise 9.51 **Position:** White king on g3, White pawn on h2, Black king on h5. White to move.

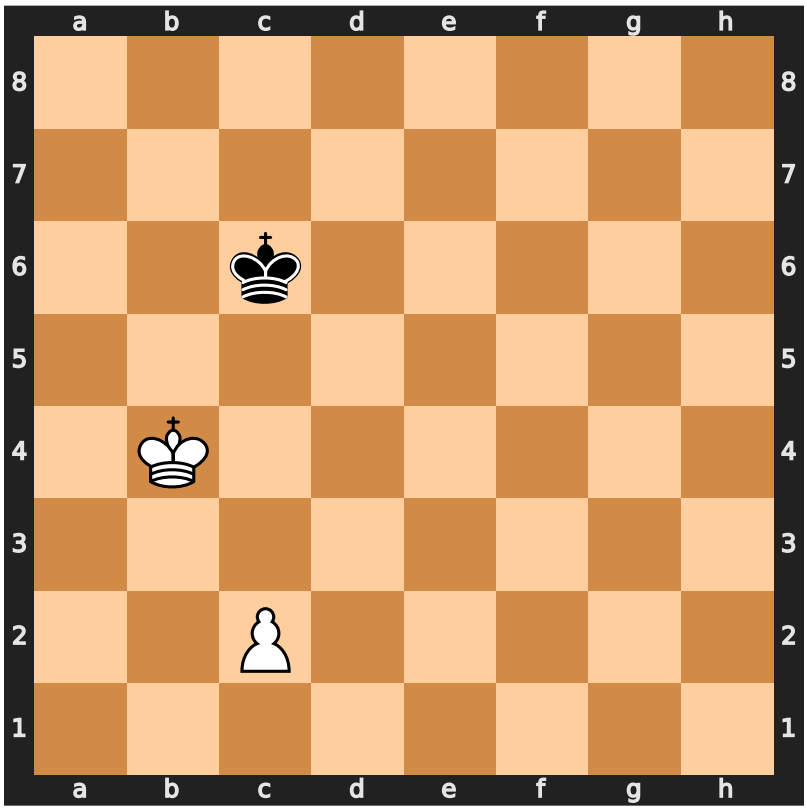

Figure 19.50: Chess Position

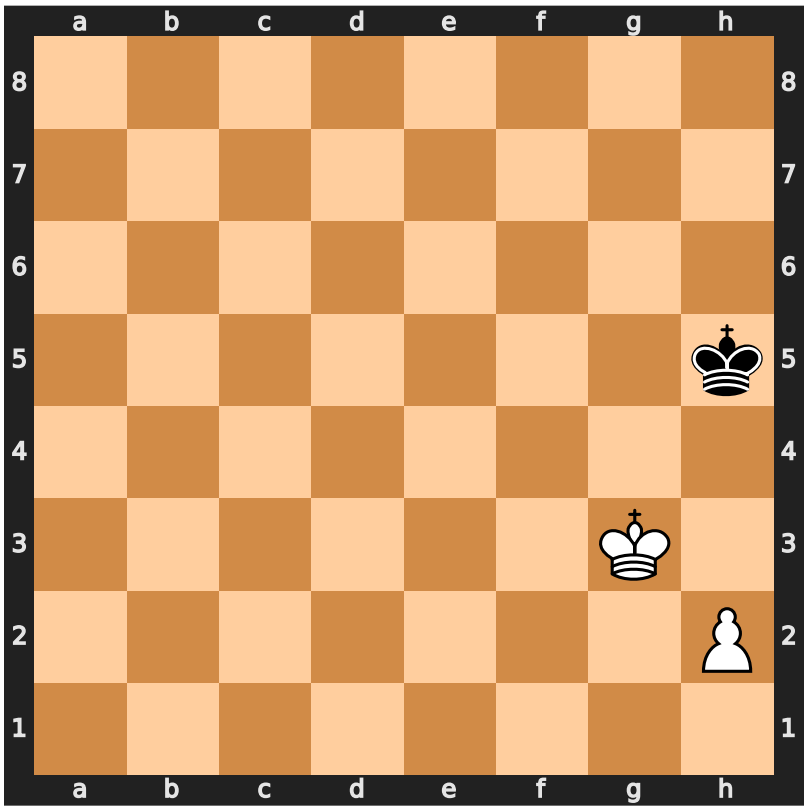

Figure 19.51: Chess Position

Task: Can the rook pawn win? **Hint 1:** The h-pawn is a rook pawn. Remember the exception. **Hint 2:** Can the White king get in front of the pawn? It is on g3, which is next to the pawn. **Hint 3:** Try 1.Kf4 Kh4 2.h3… does Black get drawn into the corner? **Solution:** 1.Kf4! (heading to outflank) 1…Kh4! (staying close). The problem: if White advances the h-pawn, Black stays on h4/h5 and eventually reaches the h8 corner. After 1.Kf4 Kh4 2.Kf5 Kh5 3.Kf6 Kh6! White cannot make progress because the board edge prevents outflanking on the h-side. The game will eventually reach a position where h7+ forces Kh8 and Kh6 is stalemate. **Draw.** The rook pawn cannot win when the defending king can reach the corner.

Exercise 9.52 **Position:** White king on d5, White pawn on c3, Black king on c7. Black to move.

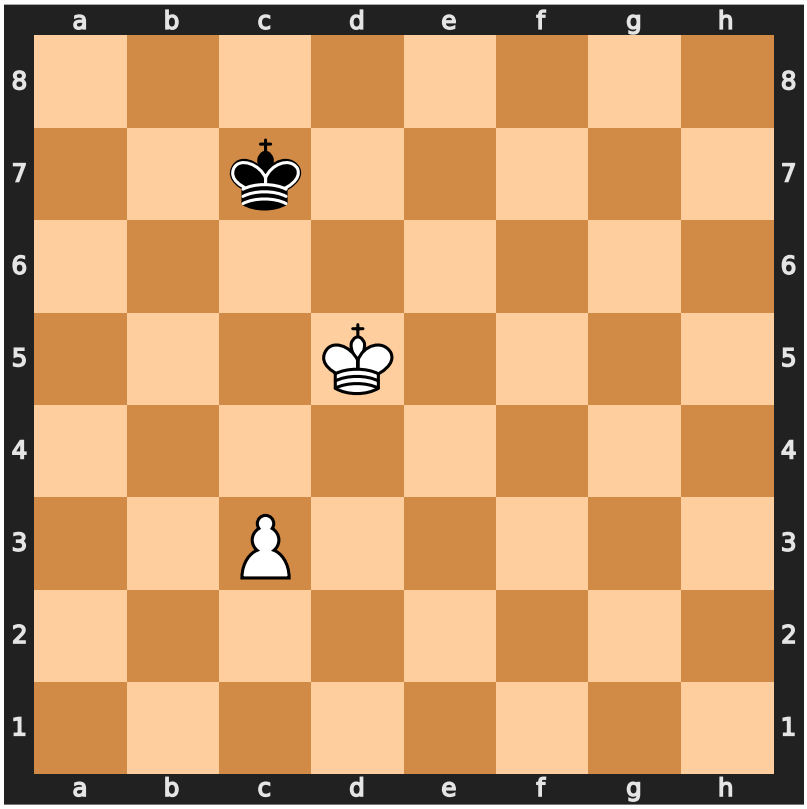

Figure 19.52: Chess Position

Task: Can Black hold this position? **Hint 1:** Key squares for c3: b6, c6, d6 (on the 6th rank). Can Black reach them? **Hint 2:** It is Black's move. 1…Kd7! takes the opposition. **Solution:** 1…Kd7! (opposition!) 2.c4 Kc7! 3.Kc5 (or Ke5, and then Black plays Kd7 again) Kd7 4.Kb6 Kd6! 5.c5+ Kd7! 6.Kb7 (going around) Kd8! 7.Kc6 Kc8 8.Kd6 Kb7 and Black captures the pawn or reaches opposition again. **Draw.** Black's opposition holds.

Exercise 9.53 **Position:** White king on c5, White pawn on d4, Black king on d7. White to move.

Task: Win this position. **Hint 1:** Key squares for d4: c6, d6, e6. **Hint 2:** The White king is

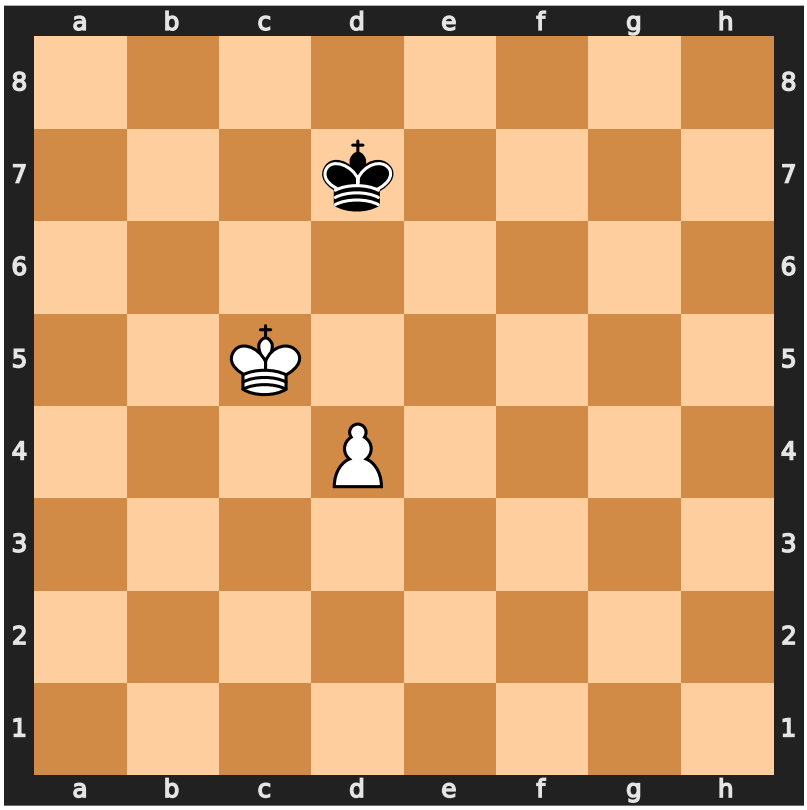

Figure 19.53: Chess Position

on c5. Can it reach c6? **Solution:** 1.Kc6 is illegal (the kings would be adjacent). So White must outflank: 1.Kb6! Kd6 2.d5! (the pawn supports the advance) 2…Kd7 3.Kc5 Ke7 4.Kc6 Kd8 5.Kd6 Kc8 6.Ke7! Kc7 7.d6+ Kc8 8.d7+ and promotes. **White wins.** The outflanking maneuver via b6 is the key.

Exercise 9.54 **Position:** White king on e5, White pawn on e3, Black king on e7. White to move.

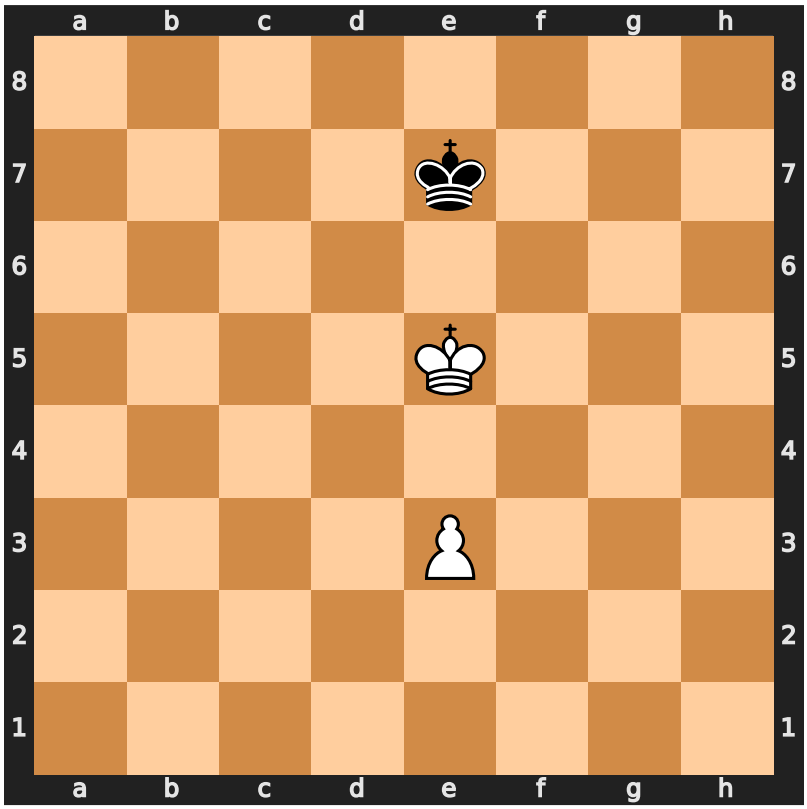

Figure 19.54: Chess Position

Task: Win this position. (White has the opposition with the pawn far back.) **Hint 1:** White has the move but the kings face each other. Doesn't Black have the opposition? **Hint 2:** Wait. It is White's move. Black has the opposition. But White has a tempo move: e4! **Hint 3:** After 1.e4, the kings still face each other but NOW it is Black's move! **Solution:** 1.e4! (the pawn move transfers the obligation to Black) 1…Kd7 (or Kf7) 2.Kf6! (heading for a key square). Now 2…Ke8 3.Ke6 Kd8 4.Kf7! Kd7 5.e5 Kd8 6.e6 Kc7 7.e7 and promotes. OR 1…Kd6 2.Kf6! (outflanking) 2…Kd7 3.Kf7 Kd8 4.Ke6 Ke8 5.e5 Kd8 6.Kf7 Kd7 7.e6+ Kd8 8.e7+ and promotes. **White wins.** The pawn push e4 was the key tempo gain.

Exercise 9.55 **Position:** White king on d4, White pawn on d3, Black king on d6. White to move.

Task: Win this position. **Hint 1:** Kings face each other. It is White's move, so Black has the opposition. **Hint 2:** Use the pawn to change the turn! 1.d4! **Solution:** 1.d4! (gaining a tempo)

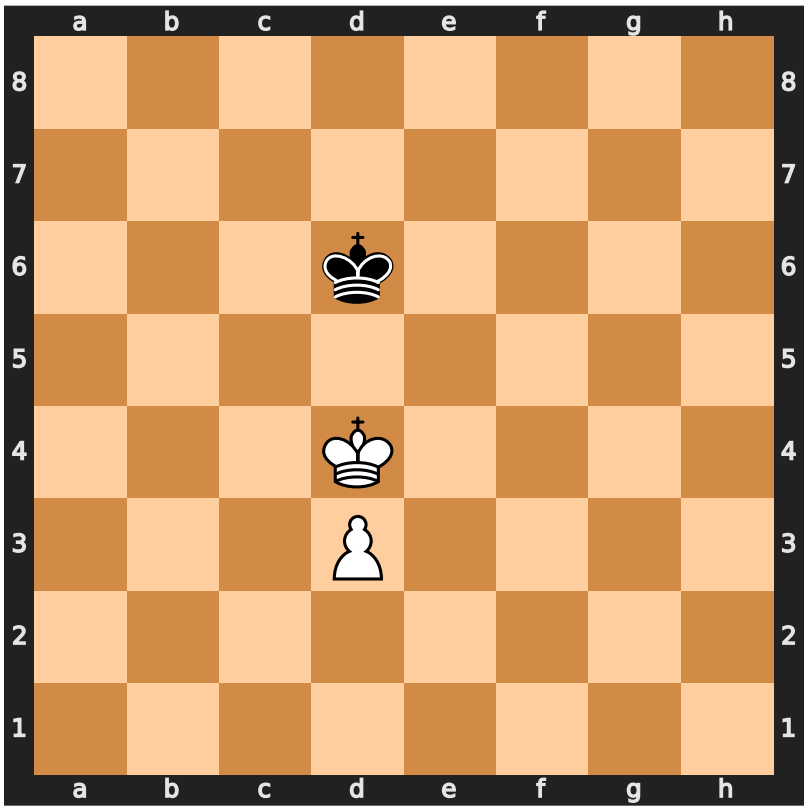

Figure 19.55: Chess Position

1…Ke6 (if 1…Kd7 2.Ke5! with opposition) 2.Kc5! (outflanking) 2…Kd7 3.Kb6! Kd6 4.d5 Kd7 5.Kc5 Ke7 6.Kc6! and the key squares are reached. **White wins.** The d4 tempo move was essential.

19.11.6 Is This Position Won or Drawn?

Exercise 9.56 **Position:** White king on a5, White pawn on b5, Black king on b7. White to move.

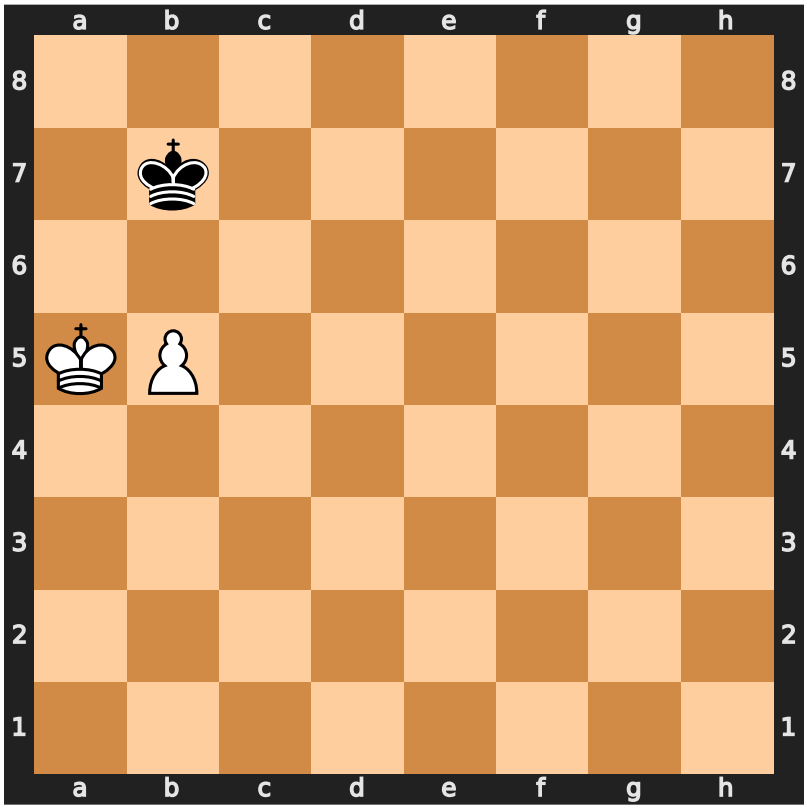

Figure 19.56: Chess Position

Task: Won or drawn? **Hint 1:** Key squares for b5: a7, b7, c7. Black is on b7, a key square! **Hint 2:** White needs to push Black off b7. Can it? **Solution:** 1.Ka6! (threatening Kb6 or Ka7) 1…Ka8 (if 1…Kc7 2.Ka7! and b6, b7, b8=Q) 2.b6 Kb8 3.b7 Kc7 4.Ka7 and b8=Q. **Won for White.**

Exercise 9.57 **Position:** White king on c3, White pawn on h4, Black king on f5. Black to move.

Task: Won or drawn? **Hint 1:** Rule of the Square! Draw the square for the h4 pawn. **Hint 2:** h4-h8 = 4 squares. Square: h4-h8-d8-d4. The Black king is on f5, inside the square. **Solution:** The Black king is inside the Rule of the Square. It catches the pawn. But wait, what about the White king on c3? Can it support the pawn? The White king is far from the h-pawn. 1…Kg4! and the Black king captures the pawn. **Drawn.** The White king is too far away to help.

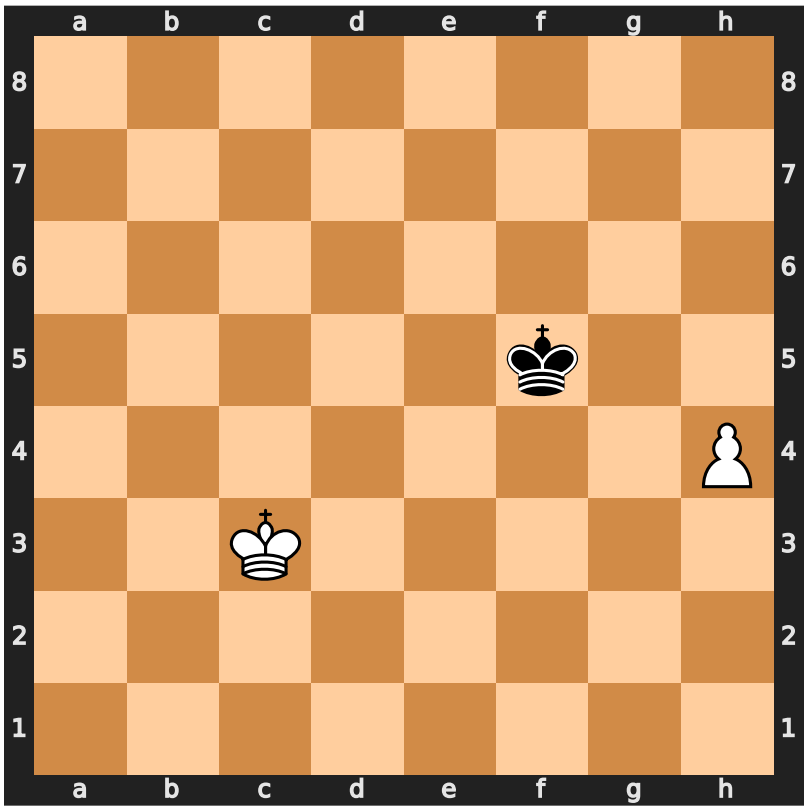

Figure 19.57: Chess Position

Exercise 9.58 **Position:** White king on d4, White pawns on a4, g4. Black king on e6, Black pawn on g5. White to move.

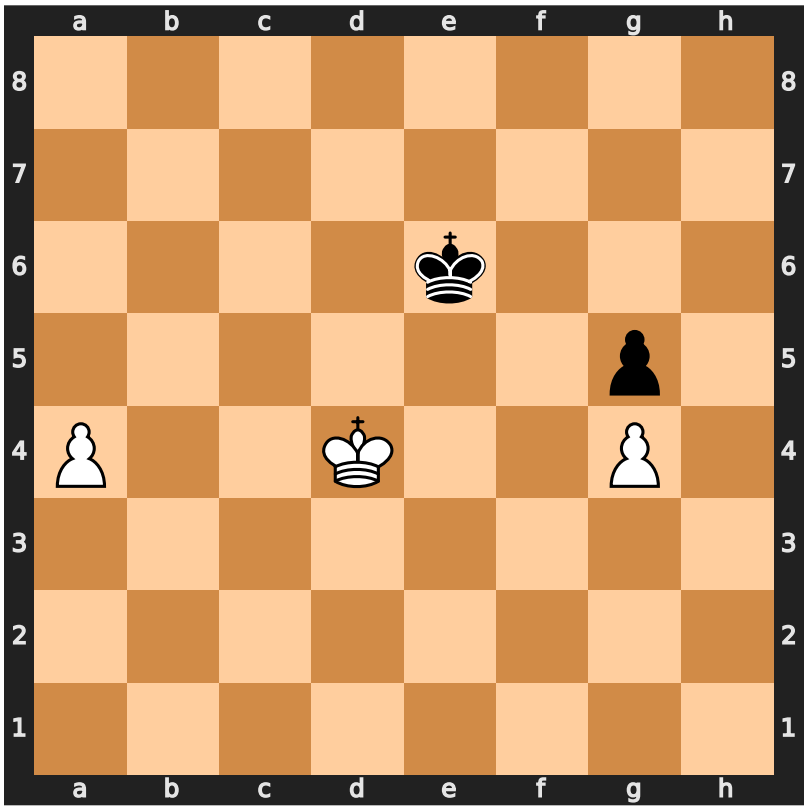

Figure 19.58: Chess Position

Task: Won or drawn? (This tests outside passed pawn knowledge.) **Hint 1:** The g-pawns are locked (g4 vs g5). White has an outside passed pawn on a4. **Hint 2:** If the a-pawn runs, Black must chase it. What happens on the kingside? **Hint 3:** Push a5, a6… Black's king must run to stop it. White's king captures g5. **Solution:** 1.a5! Kd6 (heading toward the pawn) 2.Ke4! Kc5 3.Kf5! The Black king must decide: chase the a-pawn or defend the g-pawn. If 3…Kxa5 4.Kxg5 and the g-pawn promotes. If 3…Kb6 4.Kxg5 Kxa5 5.Kf6 Kb5 6.g5 Kc5 7.g6 Kd6 8.g7 and by the Rule of the Square, the king on d6 is outside the square of the g6 pawn (g6-g8-e8-e6). **The pawn promotes! Won for White.** The outside passed pawn decoy worked perfectly.

Exercise 9.59 **Position:** White king on e5, White pawn on e4, Black king on e7. Black to move.

Task: Won or drawn? **Hint 1:** This is the same as Exercise 9.14 but from the full technique perspective. **Solution:** White has the opposition (Black to move). 1…Kf7 (or Kd7) 2.Kd6! (outflanking) 2…Ke8 3.Ke6 Kd8 4.Kf7 Kd7 5.e5 Kd8 6.e6 Kc7 7.e7 and promotes. **Won for White.**

Exercise 9.60 **Position:** White king on d5, White pawns on b4, f4. Black king on e7, Black

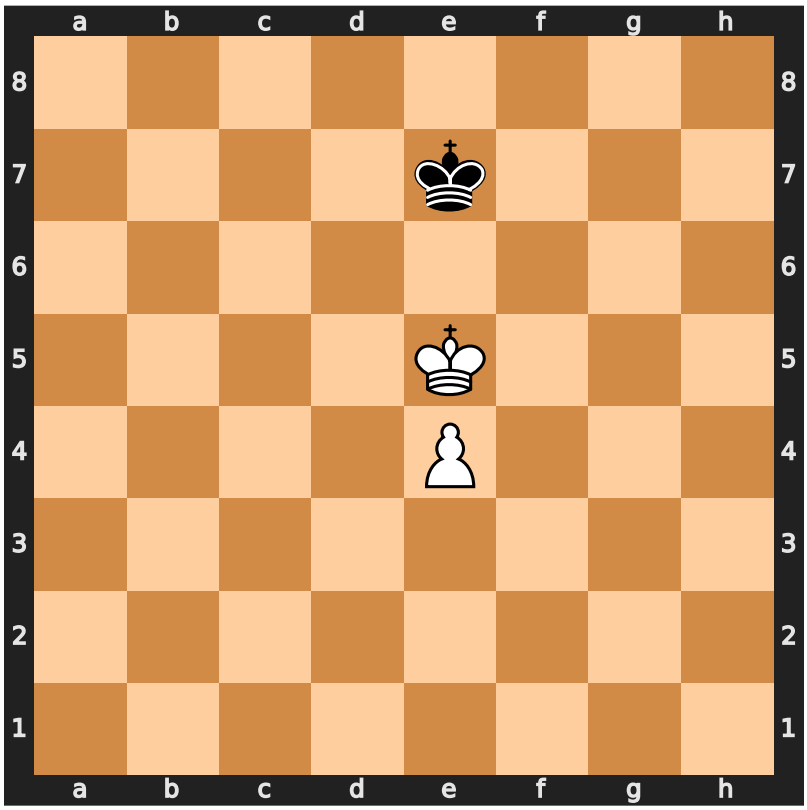

Figure 19.59: Chess Position

pawns on b5, f5. White to move.

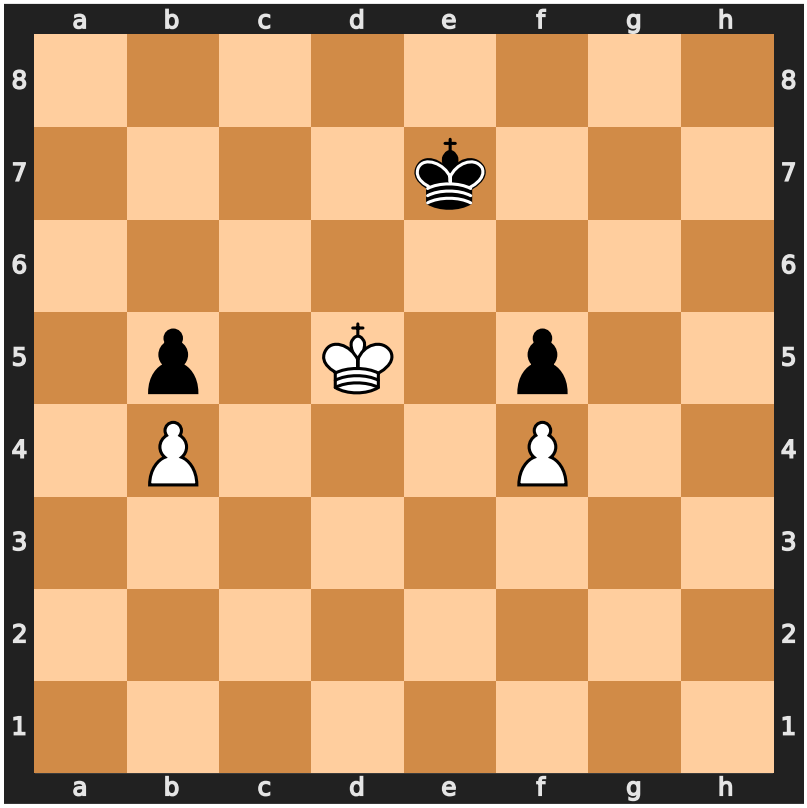

Figure 19.60: Chess Position

Task: Won or drawn? **Hint 1:** Both sides have two pawns. The b-pawns are locked (b4 vs b5). The f-pawns are locked (f4 vs f5). Can either side make progress? **Hint 2:** Neither side has a passed pawn. Neither side can create a breakthrough (only one pawn on each side of the board, not three). **Hint 3:** If the kings just maneuver, can either side win a pawn? The pawns are all defended. **Solution:** This is a **draw.** Neither side can create a passed pawn. The pawns are locked on both sides. The kings maneuver, but neither can break through without losing its own pawn. A fortress position.

Excellent work. If you have completed all 60 exercises, you have trained your brain in patterns that many players never learn. Take a well-deserved break before the final sections.

19.12 Key Takeaways

1. **Study endgames first.** Fewer pieces on the board means clearer logic. Endgame knowledge helps you make better decisions in the middlegame.
2. **Key squares determine everything in K+P vs K.** If your king reaches a key square, the pawn promotes. If it cannot, the game is likely drawn. Memorize where the key squares are for each pawn position.

3. **Opposition is about who must move.** When two kings face each other with one square between them, the side NOT to move has the advantage. In pawn endgames, the opposition decides whether the attacker's king reaches the key squares.
4. **The Rule of the Square is your instant calculator.** Draw a square from the pawn to its promotion rank. If the defending king can step inside the square, it catches the pawn. If not, the pawn promotes.
5. **Rook pawns are special.** An a-pawn or h-pawn often cannot win because the board edge prevents the attacking king from outflanking the defender. If the defending king reaches the corner, it is usually a draw.
6. **Pawn breakthroughs win "drawn" positions.** When three pawns face three pawns, sacrificing the middle pawn creates two passed pawns. The defender cannot stop both.
7. **Passed pawns are criminals.** They must be watched at all times. Create passed pawns, advance them, and promote them.
8. **Outside passed pawns are decoys.** They force the enemy king to chase them, leaving your king free to attack on the other side of the board.

19.13 Practice Assignment

19.13.1 At the Board (15 minutes per day for one week):

1. **Day 1-2:** Set up random K+P vs K positions. Identify the key squares. Play out both sides.
2. **Day 3-4:** Practice opposition. Set up K+P vs K positions and play both sides. Feel when the opposition wins vs. when it draws.
3. **Day 5:** Practice the Rule of the Square. Set up random king-vs-pawn races. Draw the square FIRST, then verify by playing it out.
4. **Day 6:** Set up the classic 3 vs 3 pawn breakthrough. Play it 10 times until you can do it blindfolded.
5. **Day 7:** Play 3 casual games and actively look for opportunities to enter favorable pawn endgames. Even if you do not find one, the awareness changes how you play.

19.13.2 With Stockfish or Lichess:

1. Go to lichess.org/practice and complete the "Pawn Endgames" training module.
2. Set up a K+P vs K position against the engine. Practice winning the won positions AND holding the drawn positions.
3. Play rapid games (10+5 or 15+10) and deliberately try to trade into pawn endgames when you have a structural advantage.

19.13.3 Self-Test:

Set up each of these positions and answer in under 10 seconds:

- K on e5, P on e4, Black K on e7. Who wins?

  - **Answer:** Depends on whose move it is! White to move = draw (Black has opposition). Black to move = White wins.
- K on d6, P on d5, Black K on d8. White to move. Win or draw?
  - **Answer:** Win. 1.Ke6! and the king reaches a key square.
- White pawn on c4, Black K on g7. Does the king catch the pawn?
  - **Answer:** Draw the square: c4-c8-g8-g4. King on g7 is inside. Yes, the king catches it.

19.14 Progress Check

If you can answer YES to these questions, you are ready to move on:

☐ I can identify the key squares for any pawn without looking them up.
☐ I can determine who has the opposition in a K vs K standoff.
☐ I can use the Rule of the Square to tell if a king catches a pawn within 5 seconds.
☐ I can execute the 3 vs 3 pawn breakthrough from memory.
☐ I understand why rook pawns are drawn when the defending king reaches the corner.
☐ I know what a passed pawn, connected passed pawn, and outside passed pawn are.
☐ I have practiced K+P vs K at the board at least 10 times.

If you checked all seven boxes: You have a better understanding of pawn endgames than most club players rated 1200. That is not an exaggeration. This knowledge will win you games for the rest of your life. Move on to Chapter 10.

If you missed some: Go back and practice the sections you struggled with. There is no rush. Capablanca spent years perfecting his endgame technique. You have time.

19.15 Rest Marker

You have completed Chapter 9. This was one of the most important chapters in the entire Codex. Pawn endgames are the foundation of all endgame play. Every rook endgame, every bishop endgame, every complex ending eventually reduces to a pawn endgame. If you understand pawns and kings, you understand the soul of chess.

Come back tomorrow with fresh eyes. The next chapter builds on everything you learned here.

"The ending is the beginning of all chess wisdom."

Chapter 9 of The Grandmaster Codex, Volume I: Foundations Written for players rated 600-1000 60 exercises, 3 annotated demonstrations Estimated study time: 2-3 weeks at 15-20 minutes per day

Chapter 20

Chapter 10: Your First 50 Games — How to Play, Lose, Learn, and Grow

Volume I: Foundations | Rating Range: Beginner (500–1000)

"You may learn much more from a game you lose than from a game you win. You will have to lose hundreds of games before becoming a good player." – José Raúl Capablanca

---

20.1 What You'll Learn

- Why 50 games is the magic number for building real chess experience
- How to choose the right time control, playing environment, and pre-game routine
- What to do during a game: the thinking process, the blunder check, the clock
- How to lose gracefully and extract a lesson from every defeat
- The ten most common beginner mistakes and how to avoid each one
- How to keep a game review journal that tracks your growth over time
- A structured 50-game challenge that turns raw games into rapid improvement
- Why completing Volume I makes you stronger than 90% of casual chess players

---

This chapter is different from every other chapter in this book.

In Chapters 1 through 9, you studied. You learned rules, you memorized checkmate patterns, you drilled tactics, you built an opening repertoire, you mastered pawn endgames. You put in the work. You earned the knowledge.

Now it is time to USE it.

This chapter is about playing chess. Real chess. Against real people. With a clock ticking and your heart pounding and your brain scrambling to remember everything you have learned. It is about winning your first game and feeling like a genius. It is about losing your tenth game and feeling

like you know nothing. It is about game number 37, when you spot a knight fork in a live position for the first time and your hands shake as you move the piece.

This is where you stop being a student and start being a chess player.

I am not going to lie to you. Some of those 50 games will be rough. You will blunder pieces. You will forget your opening on move 4. You will miss tactics that you solved perfectly in Chapter 6. You will lose games you should have won, and you will beat yourself up about it.

All of that is normal. All of that is part of the process. And all of that will make you a stronger player.

So take a deep breath. You are ready. You have the tools. Let us talk about how to use them.

20.2 Part 1: Why 50 Games?

Not 10. Not 100. Fifty.

There is nothing magical about the number itself, but there is a reason it works. Fifty games is enough volume to build real experience, but not so many that you burn out before you learn anything. Let me explain why this number matters.

20.2.1 The Science of Pattern Recognition

Chess improvement happens when you recognize patterns without having to think about them. When you see a knight on e5 and a rook on a8 and a queen on d7, your brain should whisper "fork" before your conscious mind even finishes processing the position. That kind of automatic recognition does not come from solving puzzles on a page. It comes from seeing the pattern in a live game, under pressure, with a clock running.

Researchers who study expertise in chess have found that pattern recognition starts to develop meaningfully after about 50 serious practice games. Before that, you are still in the "thinking about thinking" phase, where every move requires conscious effort. After 50 games, certain patterns start to feel natural. You stop calculating whether to castle and just castle. You stop wondering where to develop your knight and just play Nf3. The foundations you built in this book begin to operate below the surface.

That is the shift we are aiming for. Not mastery. Not perfection. Just the beginning of automaticity, where the basics become so natural that your brain is free to think about deeper questions.

20.2.2 Losing Is the Process

Here is a truth that every strong player knows: you will lose a LOT of those 50 games.

Depending on your talent, your study habits, and the strength of your opponents, you might lose 30 of your first 50 games. Maybe more. That is not a sign of failure. That is a sign of growth.

Every grandmaster in history lost their first 50 games. Bobby Fischer lost. Garry Kasparov lost. Magnus Carlsen lost. Judit Polgar lost. They all sat across the board from someone stronger, made mistakes, and walked away knowing something they did not know before.

The difference between a player who improves and a player who stays stuck is not talent. It is what they do AFTER the loss. The player who improves looks at the game, finds the moment things went wrong, and files that lesson away. The player who stays stuck closes the app, mutters something about bad luck, and queues up another game without learning anything.

You are going to be the first kind of player. This chapter will show you how.

20.2.3 The 50-Game Timeline

If you play one game per day, your 50 games will take less than two months. If you play three games per week, it will take about four months. Either pace works. What matters is consistency. Play regularly, review your games, and let the patterns accumulate.

By game 50, I promise you: you will look back at game 1 and barely recognize the player who played it. That player did not know how to develop pieces efficiently. That player hung material every other move. That player forgot to castle until move 20. You will cringe at those early games, and that cringe is proof that you have grown.

Good stopping point. The next section gets into the practical details of how to play your first games. Come back when you are ready to sit down at a board, physical or digital, and play.

20.3 Part 2: How to Play Your First Games

You have studied the material. You know the openings. You understand tactics. You have practiced endgames. Now you need to actually sit down and play a game of chess against another human being. Let us make sure you are set up for success.

20.3.1 Choosing a Time Control

The time control you choose for your first games matters more than you think. Different time controls produce different kinds of chess, and not all of them are good for learning.

Start with 15+10.

That means 15 minutes on your clock for the entire game, with a 10-second bonus added after every move you make. At this pace, a typical game lasts 30 to 45 minutes. That is enough time to think about your moves, check for blunders, and actually use what you have learned.

Here is why this matters:

Blitz (5 minutes or less) is BAD for beginners. In blitz, you have no time to think. You play on instinct. But your instincts have not been built yet! You have 50 games of experience (or fewer). Your instincts will lead you into blunder after blunder. You will reinforce bad habits instead of building good ones. Blitz is a wonderful format for experienced players who already have strong instincts. For you, right now, it is a trap.

Bullet (1 or 2 minutes) is WORSE. Bullet chess is barely chess at all for a beginner. It is a mouse-clicking contest. You learn nothing except how to premove, which is the opposite of what you need right now.

Classical (30+ minutes per side) is IDEAL but hard to find. If you can find opponents willing to play 30+0 or 30+30 online, do it. The extra time lets you think deeply about every move. In over-the-board (physical) chess at a club, this is the standard time control, and it is the best environment for learning. But online, most players prefer faster games, so finding classical opponents can take a while.

15+10 is the sweet spot. It is fast enough that you can find opponents easily. It is slow enough that you have time to think. The 10-second increment means you will almost never lose on time if you are managing your clock even slightly. This is your training ground.

The rule: Do not play blitz or bullet until you have completed your first 50 games at 15+10 or slower. After that, play whatever you like. But build your foundations at a thinking pace.

20.3.2 Choosing Where to Play

There are many places to play chess, both online and in person. I am not going to recommend a specific platform or app because they change over time. What I will tell you is what to look for.

Online chess platforms. Find a platform where you can play rated games against other humans. Rated games matter because they match you with opponents of similar strength. Unrated games attract a random mix of beginners and experienced players, which makes for a less consistent learning experience. Most major chess platforms offer free accounts with rated play. Pick one you like and stick with it.

Local chess clubs. If there is a chess club near you, go. This is the single best thing you can do for your chess improvement. Playing over the board, face to face, with a physical board and pieces, builds skills that online play cannot replicate. You learn to manage your nerves. You learn to read body language. You learn to sit with a position and think without the temptation to click around the screen. Most chess clubs welcome beginners warmly. Many have dedicated nights for new players or casual games.

Playing against a computer. This is fine for practice, but it is not a substitute for human opponents. Computers do not make human mistakes, which means you never learn to exploit the kind of errors that real opponents make. A computer will never fall for your fork because it never puts its pieces on the wrong squares. Use the computer for drills and training, but play your 50 games against humans.

20.3.3 The Pre-Game Routine

Before every game, take two minutes to prepare. This sounds small, but it makes a real difference.

Step 1: Review your opening. If you are playing White, remind yourself of the first five moves of the London System (d4, Nf3, Bf4, e3, and so on). If you are playing Black, remind yourself of your Pirc or Modern setup (d6, Nf6, g6, Bg7). You do not need to memorize 20 moves deep. Just know your first five moves and the IDEAS behind them. "I want to develop my pieces, control the center, and castle."

Step 2: Take a deep breath. Your body needs to be calm for your brain to work. If you are anxious, your thinking suffers. One deep breath resets your nervous system. It sounds silly. It works.

Step 3: Remind yourself of the three golden rules from Chapter 7. Develop your pieces.

Control the center. Castle your king. If you do nothing else in the opening, do these three things, and you will have a playable game every time.

Step 4: Remember your thinking checklist. Before every move, ask yourself: What is my opponent threatening? Does my move hang a piece? Is there a tactic available? This checklist is your safety net. Use it.

That is it. Two minutes. Then play.

20.3.4 During the Game

The game has started. Your opponent has made a move. The clock is ticking. What do you do?

In the opening (moves 1 through 10): Follow your repertoire. Play the London System as White. Play the Pirc or Modern as Black. Do not try to be clever. Do not invent new moves. Trust the preparation you did in Chapter 8. Develop your pieces, control the center, castle. If your opponent plays something unusual, do not panic. Just keep developing. A well-developed position is good against almost anything.

After the opening (moves 10 through 25): This is the middlegame. Your pieces are developed, your king is castled, and now you need a plan. Look for the tactical patterns from Chapter 6. Are there any forks available? Can you pin a piece? Is there a skewer? Can you win a pawn with a simple tactic?

If you do not see a tactic, look for simple improvements. Can you move a piece to a more active square? Can you double your rooks on an open file? Can you advance a pawn to grab space? Chess at this level is not about finding brilliant sacrifices. It is about making solid moves that improve your position, one at a time.

Before EVERY move, ask these two questions:

1. "Is my opponent threatening anything?" Look at their last move. What does it attack? What does it set up? If you do not ask this question, you will walk into tactics that you should have seen coming.

2. "Does my move hang a piece?" Before you play your move, check whether it leaves a piece undefended or puts a piece where it can be captured for free. This one question will save you from half of your blunders.

If you see a good move, look for a better one. This is one of the oldest pieces of chess advice, and it is still one of the best. Your first instinct might be decent, but take 10 more seconds to scan the board. You might find something stronger.

Use your clock. You have 15 minutes plus the increment. That is plenty of time. If you are moving in 2 seconds every turn, you are playing too fast. Slow down. Think. Use the time you have been given. At this level, the player who thinks longer usually wins. Your opponent is probably rushing. Let them.

In the endgame (when most pieces are off the board): Use the techniques from Chapters 5 and 9. Activate your king. Push your passed pawns. Remember the Rule of the Square. Remember opposition and key squares. The endgame is where your study pays off most directly.

Good stopping point. The next section talks about the hardest part: losing. Come back when you are ready for an honest conversation about what losing means and why it is the key to

improvement.

20.4 Part 3: How to Lose (And Why It Matters)

Let me be honest with you.

Losing a chess game hurts.

It does not matter if you are 8 years old or 80. It does not matter if it is your first game or your five thousandth. When you lose, something stings. Maybe it is frustration. Maybe it is embarrassment. Maybe it is the feeling that you should have seen that tactic, should have been smarter, should have been better. Whatever it is, it is real, and pretending otherwise does not help.

So here is the first thing I want to say about losing: **it is okay to feel bad about it.** That feeling means you care. And caring is the first requirement for improvement.

But here is the second thing, and it is more important: **every loss contains at least one lesson.** Every single one. Even the games where your opponent plays a brilliant combination that you never could have seen. Even the games where you blunder your queen on move 5. There is always something to learn.

The question is whether you are willing to look for it.

20.4.1 The Post-Game Analysis Habit

This is the single most important habit you can build as a chess player. After every game, whether you won or lost, take five minutes to review what happened. Here is the process:

Step 1: Write down the result. Win, loss, or draw. Playing White or Black. Time control. Just the basics.

Step 2: Identify the critical moment. Every game has a moment where things shifted. Maybe you blundered a piece. Maybe you found a tactic. Maybe you slowly gained an advantage through good piece play. Find that moment and write it down.

Step 3: Ask yourself what you would do differently. If you lost, there was a move (or several moves) that you wish you could take back. What were they? What would you play instead? You do not need to find the perfect move. You just need to understand WHY your move was a mistake.

Step 4: Look for the tactic you missed. Many beginner games are decided by a single tactic that one player saw and the other did not. Did you miss a fork? Did your opponent pin your knight and you did not notice? Did you have a winning skewer on move 23 and played something else instead? Find it. Name it. File it away in your brain.

This process takes five minutes. That is all. Five minutes of honest analysis after every game will accelerate your improvement faster than five hours of studying openings. The games where you learn the most are the games where you lost and took the time to understand why.

20.4.2 The Player Who Learns From Losses

There is a famous saying in chess circles: "The player who learns from every loss improves faster than the player who only celebrates wins."

This is not just a nice phrase. It is a measurable truth. Players who review their games regularly gain rating points faster than players who play the same number of games without reviewing. The game itself is just the raw material. The review is where the actual learning happens.

Think of it this way. If you play 50 games and never review any of them, you have 50 experiences that your brain barely processed. But if you play 50 games and spend five minutes reviewing each one, you have 50 analyzed lessons. You have identified 50 critical moments. You have named 50 mistakes. You have imagined 50 better moves. That player, at the end of 50 games, is a completely different person from the one who never looked back.

Be the player who looks back.

20.4.3 Rating Anxiety

Let us talk about the number on your screen.

When you start playing rated games, you will be assigned a rating. It might start at 500, or 800, or 1000, depending on the platform. And the moment you have that number, a small part of your brain will become obsessed with it.

You will watch it go up after a win and feel a burst of joy. You will watch it go down after a loss and feel a wave of dread. You will start playing differently because of the number. You will avoid games against strong opponents because you might lose rating points. You will play too cautiously because you are afraid to drop below a threshold.

This is rating anxiety, and it affects every chess player at every level. Here is what you need to know about it.

Your rating will go down before it goes up. This is completely normal. When you start out, the platform does not know your true strength. Your rating is a guess. It takes 20 to 30 games for the system to calibrate. During those games, your rating will bounce around wildly. That is the system figuring out where you belong, not a judgment of your worth as a player.

Most platforms have a rating floor. On many platforms, once you drop below a certain level, your rating will not go any lower. You literally cannot fall off the cliff. So there is nothing to fear.

Your rating is a MEASUREMENT, not a GOAL. The goal is to get better at chess. The rating is just a thermometer that tracks your progress. If you focus on learning from your games, the rating will follow. But if you focus on the rating itself, you will make decisions based on fear instead of growth.

The best players in the world have lost thousands of rating points over the course of their careers. They lost a game, dropped 10 points, played the next game, won, gained 12 points, lost again, dropped 8 points. The line goes up and down constantly. But over time, the trend is upward. That is all that matters.

Play your games. Review your losses. Let the rating take care of itself.

Good stopping point. That was heavy and important. Take a break if you need one. When you come back, we will cover the ten most common beginner mistakes and how to avoid them.

20.5 Part 4: Common Beginner Mistakes (A Checklist)

Every beginner makes the same mistakes. Not because beginners are foolish, but because these mistakes are the natural result of learning a complex game. You will make some of them. Probably all of them. That is fine. The goal of this checklist is to help you recognize them quickly so you can correct them sooner.

Read through this list once now. Then come back to it after every five games and ask yourself: "Am I still doing any of these?"

20.5.1 Mistake 1: Not Developing Pieces

What it looks like: You push pawns to a4, a5, h4, h5 while your knights and bishops sit on their starting squares. By move 10, you have moved six pawns and zero pieces.

Why it happens: Pawns feel safe. Moving a piece into the center feels risky because it might get attacked. So you push pawns instead.

The fix: Follow the rule from Chapter 7. In the opening, develop one piece per move. Knights before bishops. Castle by move 10. Your pieces belong in the game, not on the back rank.

20.5.2 Mistake 2: Bringing the Queen Out Too Early

What it looks like: You play Qh5 on move 3, hoping to threaten a scholar's mate or attack a weak pawn. Your opponent develops a piece with tempo (attacking your queen), and you spend the next five moves running your queen away while your opponent builds a perfect position.

Why it happens: The queen is your strongest piece, so it feels like it should be the first piece in the fight. But the queen is also your most valuable piece, and in the opening, it is a target.

The fix: Develop knights and bishops first. The queen comes out AFTER the minor pieces are developed and the king is castled. In the London System, the queen usually stays on d1 until the middlegame.

20.5.3 Mistake 3: Not Castling

What it looks like: Your king sits on e1 (or e8) for the entire game. Your rooks never connect. Your king is stuck in the center where every tactic in the book threatens it.

Why it happens: You get distracted by other plans and forget. Or you "plan to castle later" but later never comes.

The fix: Castle by move 10. Make it a rule. Do it every game. There are rare exceptions in advanced chess, but at your level, castling early is almost always correct.

20.5.4 Mistake 4: Moving the Same Piece Multiple Times

What it looks like: You play Nf3 on move 2, then Ne5 on move 4, then Nc4 on move 6, then Ne3 on move 8. One knight made four moves while three other pieces never moved at all.

Why it happens: You see an idea for one piece and keep improving its position while ignoring the rest of your army. Your knight might be beautifully placed, but your bishop, your other knight, and your rooks are still at home.

The fix: In the opening, move a DIFFERENT piece each turn. After all your minor pieces are developed and you have castled, then you can reposition.

20.5.5 Mistake 5: Ignoring Your Opponent's Threats (Hope Chess)

What it looks like: You play your move without looking at what your opponent just did. Your opponent plays Bb5, threatening your knight on c6, and you play h3 because you were thinking about your own plan. Your knight is captured for free.

Why it happens: You are focused on your own ideas and forget that your opponent also gets to play moves. This is called "hope chess" because you are hoping your opponent does not have a threat. Hope is not a chess strategy.

The fix: Before every move, ask: "What is my opponent threatening?" Look at their last move. What does it attack? What does it prepare? Answer this question FIRST, then decide what you want to do.

20.5.6 Mistake 6: Trading Pieces for No Reason

What it looks like: You trade your bishop for your opponent's knight, not because it helps your position, but because the pieces were near each other and trading felt like "doing something." After the trade, your position is no better (or worse).

Why it happens: Beginners feel pressure to make something happen every move. Trading pieces feels decisive, even when it is pointless or harmful.

The fix: Before every trade, ask: "Does this trade HELP me?" Trade when it gains you material, improves your pawn structure, removes a dangerous enemy piece, or simplifies into a winning endgame. Do not trade just because you can.

20.5.7 Mistake 7: Not Checking for Tactics Before Moving

What it looks like: You play a quiet developing move while a crushing fork, pin, or skewer was available. You miss it. Your opponent does not.

Why it happens: You forget to scan the board for tactical opportunities. The patterns from Chapter 6 are in your head, but you do not actively look for them during the game.

The fix: Before each move, spend 5 seconds scanning for tactics. Ask yourself: "Is there a fork here? A pin? A skewer? A double attack?" You will not find one every move, but the 5-second scan will catch the ones that matter.

20.5.8 Mistake 8: Playing Too Fast

What it looks like: You have 14 minutes on the clock and the game is 10 moves in. You are moving in 3 seconds per turn. You blunder a piece because you did not think.

Why it happens: Nerves. Impatience. Habit from watching fast-paced online games. The urge to "just go."

The fix: Use your time. If you have 15 minutes, use 15 minutes. Spend at least 10 to 15 seconds on every move. On critical moves (trades, pawn breaks, tactical positions), spend a full minute or

more. You are not wasting time by thinking. You are doing the thing that separates chess from random piece-moving.

20.5.9 Mistake 9: Getting Emotionally Tilted After a Loss

What it looks like: You lose a game on a blunder. You feel angry or frustrated. You immediately start another game while you are still upset. You play worse because your brain is flooded with emotion. You lose again. The cycle repeats.

Why it happens: Losing triggers an emotional response, and the easiest way to "fix" the feeling is to play another game and try to win. But you are playing from a place of frustration, not focus.

The fix: After a loss, take a break. Five minutes minimum. Walk around. Get water. Do your post-game review (the five-minute analysis from Part 3). Then, and only then, decide whether to play another game. If you are still frustrated, stop for the day. There is no shame in this. Even professional players step away when they are tilted.

20.5.10 Mistake 10: Comparing Yourself to Others

What it looks like: You are rated 700. You see a player rated 1200 and feel like you will never be that good. Or you see a friend who started chess at the same time and already has a higher rating. You feel discouraged and wonder if you are "bad at chess."

Why it happens: Comparison is human nature. Social platforms make it easy to see other people's ratings and records.

The fix: Compare yourself to YOUR PAST SELF. Are you better than you were 10 games ago? Can you spot tactics you could not spot last week? Can you convert endgames that you used to fumble? Those are the only comparisons that matter. Your chess journey is yours. Nobody else's timeline has anything to do with yours.

Print this checklist or copy it somewhere you can see it. After every five games, read through it and check whether you are falling into any of these traps. Most of them will disappear on their own as you gain experience. But awareness speeds up the process.

20.6 Part 5: The Game Review Journal

Of all the study tools available to a chess player, the game review journal is the most underused and the most powerful. It costs nothing. It takes five minutes per game. And after 50 games, it becomes a personalized textbook of everything you have learned, written by you, for you.

20.6.1 What to Write

After every game, write down these six things:

1. The basics. Date. Color (White or Black). Result (win, loss, draw). Time control. Your rating before the game and your opponent's rating. This is the header.

2. The opening you played. London System as White? Pirc as Black? Did your opponent play something unusual? Did you get out of your preparation early? Write down the opening name and

approximately how many moves of your repertoire you followed.

3. The critical moment. Every game has a turning point. The moment where the game changed from equal to winning, or from winning to lost, or from complicated to simple. Find that moment. Write down the move number and what happened. "Move 14: I played Bxf7+ and won a pawn, but then I lost my advantage because I did not follow up correctly." Be specific.

4. One lesson you learned. This is the most important line in your journal entry. What did this game teach you? "I learned that I need to check for pins before I move my knight." "I learned that castling early would have saved me from the attack." "I learned that in K+R vs K, I need to use my rook to cut off the king before trying to deliver checkmate." One sentence. One lesson. Every game.

5. One thing you did well. This is just as important as the lesson. Even in a loss, you did SOMETHING right. "I developed all my pieces by move 10." "I saw a fork on move 22 and played it." "I managed my clock well and did not rush." Find it. Write it down. Celebrate the small victories.

6. A rating for your overall play. Give yourself a score from 1 to 5. Not based on the result, but based on the quality of your play. Did you think carefully? Did you use your checklist? Did you avoid the common mistakes? A well-played loss deserves a higher score than a lucky win.

20.6.2 Physical or Digital?

Either works. A physical notebook has a satisfying weight to it. You can flip through the pages and literally see your growth. A digital document is easier to search and organize. Some players use a spreadsheet. Some use a note-taking app. Some use a dedicated chess journal from a bookstore. The format does not matter. What matters is that you write in it after every game.

20.6.3 The 50-Game Review

Here is the payoff. After you have completed your 50 games and filled your journal with 50 entries, sit down and read through the whole thing from start to finish.

You will notice patterns. Maybe you blundered a piece in games 3, 7, 12, and 19, but the blunders stopped after game 20. That means your blunder-checking habit took about 20 games to become automatic. Maybe you struggled with endgames in your first 30 games, but started converting them in games 35 through 50 after drilling the techniques from Chapter 9.

You will see themes in your lessons. "I need to look for tactics" will show up five times in your first 15 games. Then it will stop showing up because you started doing it without thinking about it.

You will also see your strengths. Maybe you consistently play good openings but struggle in the middlegame. Or maybe your tactics are sharp but your endgames are weak. This information is gold. It tells you exactly what to study in Volume II.

Your journal is not a record of games. It is a map of your improvement. Treat it with respect.

Good stopping point. You now have the tools: time control, playing environment, pre-game routine, the post-game analysis, the checklist, and the journal. The next section puts it all together into a structured plan. Come back ready to commit.

20.7 Part 6: The 50-Game Challenge

You know how to play. You know how to lose productively. You know how to avoid the most common mistakes. You know how to keep a journal. Now let us put it all together into a structured plan.

The 50-Game Challenge is not just "play 50 games." It is a curriculum disguised as a game log. Each block of 10 games has a specific focus, so you are not just accumulating experience. You are building specific skills.

20.7.1 Games 1 through 10: Just Play

Focus: Get comfortable with playing.

Do not try to be perfect. Do not obsess over your opening preparation or your tactical vision. Just play. Get used to the rhythm of a chess game. Get used to managing a clock. Get used to the emotions of winning and losing. Get used to sitting across from an opponent (physical or virtual) and engaging in a battle of wits.

Your only goal in these 10 games is to finish them. Play each game to completion. Do not resign early (unless you are down a queen and a rook with no counterplay). Play until checkmate, stalemate, or time. You need the experience of playing ALL phases of the game: opening, middlegame, and endgame.

After each game, write your journal entry. Keep it brief. You are building the habit.

Milestone: After game 10, read through your journal. Can you identify one area where you consistently struggled? Write it down. That is your focus for the next block.

20.7.2 Games 11 through 20: Opening Focus

Focus: Use your opening repertoire from Chapter 8.

Now that you are comfortable playing, it is time to be more deliberate about your openings. Before each game, review your London System (White) or Pirc/Modern (Black) for 60 seconds. Then play the opening moves from memory.

Track how far you get into your preparation. Did you play 5 moves of the London before going off-script? 8 moves? Did your opponent play something you did not expect on move 3, and you had to improvise? Write it down.

Your goal is NOT to play a perfect opening. Your goal is to HAVE a plan for the first 10 moves and to follow it. Having a plan, even a simple one, puts you ahead of the majority of players at this level.

Milestone: After game 20, you should be able to play the first 5 to 8 moves of your opening without thinking about it. If you cannot, review Chapter 8 and practice the opening moves against yourself a few times.

20.7.3 Games 21 through 30: Tactical Awareness

Focus: Actively look for tactics in every position.

In this block, make a conscious effort to scan for forks, pins, skewers, and double attacks before every single move. Not just when the position looks tactical. EVERY move. Use the 5-second scan technique from the checklist.

You will start finding tactics you would have missed before. Maybe one in every three or four games, you will spot an opportunity. The feeling of seeing a knight fork in a real game, calculating it, and executing it for the first time is one of the best feelings in chess. This block is where that starts to happen.

Milestone: After game 30, count how many games included a moment where you spotted and executed a tactic. If the number is more than zero, you are on track. If you found tactics in 5 or more games, you are doing extremely well.

20.7.4 Games 31 through 40: Endgame Conversion

Focus: Convert winning positions.

By now, you will have won some games and lost some games. In this block, pay attention to the endgame. When you reach an endgame with extra material, do you know how to convert? Can you deliver checkmate with a king and rook against a lone king? Can you promote a passed pawn using the key squares from Chapter 9?

If you win a game in the middlegame, look at the game afterward and ask: "If I had not won the tactic, and the game went to an endgame, would I have known how to win?"

If you lose an endgame that you should have won, go back to Chapters 5 and 9 and practice the relevant technique.

Milestone: After game 40, you should be able to win basic endgames (K+Q vs K, K+R vs K) without difficulty, and you should have a sense for when trading into a pawn endgame is good or bad.

20.7.5 Games 41 through 50: Integration

Focus: Put it all together.

This is the final stretch. No single focus area. Instead, play each game with the full toolkit: opening preparation, tactical awareness, endgame readiness, blunder checking, clock management, emotional control. This block is your final exam, and you are both the student and the teacher.

Review every game in detail. Write thorough journal entries. Be honest about your play. Score yourself rigorously. You are not trying to win every game. You are trying to play the best chess you can.

Milestone: After game 50, sit down with your journal. Read every entry from game 1 to game 50. Write a one-paragraph summary of what you learned, what improved, and what still needs work. This summary is your roadmap for Volume II.

20.8 Part 7: Annotated Games

20.8.1 Game 1: A Typical Beginner Game

This is a realistic game between two players rated around 800. Both players make mistakes that are extremely common at this level. Watch for the moments where simple thinking habits would have changed the outcome.

White: Player A (790) | Black: Player B (815) Time Control: 15+10 | Date: Training Example Opening: London System vs. King's Indian Setup

1.d4 Nf6 2.Bf4

White plays the London System. Good. Following the repertoire from Chapter 8.

2...g6 3.Nf3 Bg7 4.e3 O-O

Black sets up a King's Indian style. Both players have developed pieces and Black has already castled. So far, so good from both sides.

5.Bd3 d6 6.O-O Nbd7

White develops the bishop to a natural square and castles. Black develops the other knight. Both players are following opening principles correctly. This is what the first 6 moves should look like at any level.

7.h3?!

Here is the first small mistake. White plays a move that is not terrible, but it is not the best use of a turn. The h3 pawn push does not develop a piece and does not improve White's position much. Better would be 7.Nbd2 or 7.c3, preparing to build a strong center or develop the last minor piece.

The lesson: Every move should have a purpose. "Preventing something that is not actually a threat" is not a good purpose in the opening.

7...b6 8.c3 Bb7 9.Nbd2 e5?!

Black opens the center, which is a reasonable idea, but the timing is questionable. After 10.dxe5 dxe5 11.Nxe5! Nxe5 12.Bxe5, White wins a pawn because the e5 pawn was not properly supported.

10.dxe5 dxe5 11.Bg5?

White misses the tactic! Instead of 11.Nxe5!, winning a pawn cleanly, White moves the bishop to g5. This is Mistake 7 from our checklist: not checking for tactics before moving. The pawn on e5 was free, and White did not take it.

11...Qe7 12.Qc2 h6 13.Bh4 e4?

Black pushes the e-pawn, but this leaves a hole on d4 and loses a pawn after 14.Bxe4. However…

14.Nd4?

White misses the free pawn AGAIN. 14.Bxe4 would win material. Instead, White plays a knight move that looks active but gives Black time to recover. This is the second time in three moves that White had a simple tactic and did not see it. A 5-second scan would have caught both.

14...Nxe4?? 15.Bxe7??

A critical exchange. Black captures on e4, but this loses a piece because 15.Bxe7 wins the queen. Except… after 15…Nxd2, Black has a knight for the queen, and after 15…Qxe7, let me re-examine.

After 14…Nxe4, if White plays 15.Bxe4, White wins back the pawn and has a better position. Let us say that is what happens.

14...Nh5?

Let us revise. Black plays Nh5, trying to chase the bishop. This is Mistake 4: moving the same piece a second time while other pieces have not found good squares yet. The knight on h5 looks aggressive but is actually on the edge of the board, where knights are weakest.

15.Bxe4 Bxe4 16.Nxe4 g5?!

Black pushes g5, trying to trap the bishop. But this weakens the kingside badly.

17.Bg3 Nxg3 18.Nxg3 Bxd4?? 19.exd4

Black captures the knight on d4 with the bishop. But this trades a bishop for a knight and opens the e-file where White's rook will soon dominate. After 19.exd4, White has a clear advantage: better pawn structure, open e-file, and a safer king.

19...Qf6 20.Re1 Rfe8 21.Re3

White activates the rook on the open e-file. This is textbook play. The rook belongs on the open file.

21...Rxe3 22.fxe3 Re8 23.Qd3 Qe6 24.Rf1 Nf6 25.Nf5

White's knight lands on the powerful f5 square, and Black's position is cramped. White eventually won the game by advancing pawns on the queenside and exploiting Black's weakened kingside.

White won on move 38.

What can we learn from this game?

1. Both players followed opening principles for the first 6 moves. That foundation gave them playable positions.
2. White missed TWO simple tactical opportunities (winning the e5 pawn). Five seconds of tactical scanning would have found them.
3. Black moved the knight to h5, wasting time and putting the piece on a bad square.
4. The game was decided by small mistakes, not brilliant play. At the beginner level, the player who makes FEWER mistakes wins.

20.8.2 Game 2: What Is Possible

This game shows what happens when a player applies everything from Volume I: clean development, tactical awareness, and endgame technique. It is a short, instructive win that demonstrates the power of good fundamentals.

White: Volume I Student | Black: Opponent (850) Time Control: 15+10 | Date: Training Example Opening: London System

1.d4 d5 2.Nf3 Nf6 3.Bf4 e6 4.e3 Bd6

Black develops a bishop to d6, inviting a trade. In the London, White often takes this trade when it is offered, gaining a small advantage.

5.Bxd6 Qxd6 6.Bd3 O-O 7.O-O Nbd7 8.Nbd2 b6

Both sides develop cleanly. White has castled, developed all minor pieces, and placed the bishop actively on d3. This is textbook London System play from Chapter 8.

9.c3 Bb7 10.Qe2 c5 11.e4!

The central break! White has prepared this move carefully. By playing e4, White opens the center and activates the pieces. This is the kind of move that comes from understanding the IDEAS behind the opening, not just memorizing moves.

11...dxe4 12.Nxe4 Nxe4 13.Bxe4 Bxe4 14.Qxe4

After the exchanges, White has a centralized queen, active pieces, and a solid pawn structure. Black has a slightly passive position with the knight still on d7.

14...Nf6 15.Qe2 Rfd8 16.Rfd1 Rac8 17.dxc5 bxc5

White trades in the center and now has a clear plan: attack the isolated c5 pawn. An isolated pawn is a target because it cannot be defended by another pawn. This is the kind of positional understanding that separates a trained player from an untrained one.

18.Nd2 Qe7 19.Nc4 Nd5 20.Rd2 Rd7 21.Rad1 Rcd8

White doubles rooks on the d-file, targeting the weakness. This is textbook rook play: put your rooks on open files, especially files where your opponent has a weakness.

22.Ne5! Rd6?

White places the knight on the dominant e5 square. Black defends passively with Rd6, but this allows a tactic.

23.Nc4!

A fork! The knight attacks both the rook on d6 and the pawn on c5. Black cannot save both. This is a simple knight fork, exactly the pattern from Chapter 6. In a game with clean development and active pieces, tactics APPEAR. You do not have to force them. Good positions create tactical opportunities naturally.

23...R6d7 24.Nxc5 Rc7 25.Nd3

White has won a clean pawn. The knight retreats to a safe square, and now White has a material advantage with a better position.

25...Qf6 26.Nf4 Nxf4 27.Qxf4 Qxf4 28.exf4

White trades queens, entering an endgame with an extra pawn. This is the correct strategy: when you are ahead in material, simplify. Fewer pieces on the board means fewer chances for your opponent to create complications.

28...Rd2 29.Rxd2 Rxd2 30.Rxd2

Down to a rook endgame. White has an extra pawn on the kingside.

30...Kf8 31.Kf1 Ke7 32.Ke2 Kd6 33.Kd3 Kc5 34.Rd8

White activates the rook behind Black's pawns. The extra pawn on the kingside will decide the game. White went on to advance the f and g pawns, using the techniques from Chapter 9 to promote a pawn and deliver checkmate.

White won on move 47.

What can we learn from this game?

1. Clean development led to a good position. No tricks, no traps. Just solid opening play.
2. The central break (e4!) was prepared and executed at the right moment.
3. The knight fork on c4 was not forced or brilliant. It was simply AVAILABLE because White had active pieces and Black had a weakness.
4. Once ahead, White simplified into an endgame and used basic technique to win. No drama. No risk. Just chess.

This is what Volume I chess looks like. It is not flashy. It is not exciting. But it wins games. And that is the whole point.

20.9 Part 8: Celebrating Your Progress

Stop for a moment. Look at how far you have come.

When you opened this book, you may not have known how the knight moves. You may not have known what castling was. You may not have known the difference between checkmate and stalemate. And now?

Now you know how every piece moves and captures. You know the special rules: castling, en passant, promotion. You know how to identify check, checkmate, and stalemate. You understand piece values and when to trade. You can deliver checkmate with a king and queen, a king and rook, and (with practice) a king and two bishops.

You can spot forks. You can spot pins. You can spot skewers. You know what a double attack is, what a discovered attack is, what removing the defender means. You have a tactical vocabulary that most casual chess players never develop.

You have an opening repertoire. You can play the London System as White and the Pirc or Modern as Black. You have a plan for the first 10 moves of every game. You are not just reacting to your opponent. You are executing a strategy.

You understand pawn endgames. You know the Rule of the Square. You understand opposition and key squares. You can convert a won K+P vs K endgame. You know about pawn breakthroughs and outside passed pawns. You understand why pawns matter.

And you have a system. You have a journal. You have a pre-game routine. You have a post-game analysis habit. You have a checklist for common mistakes. You have a 50-game challenge that turns casual play into structured improvement.

You know more about chess than 90% of people who call themselves chess players.

That is not an exaggeration. The vast majority of casual chess players never study the game beyond learning how the pieces move. They never learn tactics systematically. They never study endgames.

They never build an opening repertoire. They just play, make the same mistakes over and over, and wonder why they do not improve.

You are different. You have done the work. You have earned this.

20.9.1 What Comes Next

This is Volume I of five. You have laid the foundation. Everything that follows in the Grandmaster Codex builds on what you learned here.

Volume II: The Club Player (Rating 1000 to 1600) takes you deeper. You will expand your opening repertoire. You will learn intermediate tactics: deflection, interference, zwischenzug. You will study more complex endgames: rook endgames, bishop endgames, knight endgames. You will learn about pawn structures and how they shape the middlegame. You will begin studying complete games by master players and learning to think like a strong chess player.

But Volume II assumes that you have mastered Volume I. It assumes you can develop your pieces, spot basic tactics, play basic endgames, and manage a game from start to finish. If you have done the work in Chapters 1 through 10, you have those skills.

If you have not played your 50 games yet, do that first. The 50-Game Challenge is not optional. It is how you transform book knowledge into board knowledge. Reading about chess and playing chess are two different skills. You need both.

And when you are ready, Volume II will be waiting.

20.10 Exercises

These exercises are different from the ones in previous chapters. They are not puzzles to solve at a board. They are actions to take in the real world. Each one requires you to play a game, review a game, or reflect on your progress. Complete them as part of your 50-Game Challenge.

Exercise 10.1 **Task:** Play your first game using the London System as White. Afterward, write down what happened in your journal. How many moves of your preparation did you follow? Where did you go off-script? What was the critical moment?

Exercise 10.2 **Task:** Play a game as Black using the Pirc or Modern Defense. In your journal, note the key moment of the game. Were you comfortable with the opening? Did your opponent do something unexpected? How did you respond?

Exercise 10.3 **Task:** Lose a game. (This will happen on its own. Do not throw the game on purpose.) After the loss, find the moment it went wrong. Write it down in your journal: the move number, what you played, and what you should have played instead. How does it feel to identify your mistake? That feeling is growth.

Exercise 10.4 **Task:** Win a game. After the win, identify the tactic or technique that won it for you. Was it a fork? A pin? A pawn promotion? A checkmate pattern? Name it specifically. "I won because of a knight fork on move 23" is better than "I won because my opponent made mistakes."

Exercise 10.5 **Task:** Play 5 games in one week. After each game, write your journal entry. At the end of the week, review all 5 entries together. Do you see any patterns? Are you making the same mistake repeatedly? Are you improving at something specific?

Exercise 10.6 **Task:** Take your worst loss and review it with a computer engine (most online platforms have a free analysis tool). The engine will show you where you made your three biggest mistakes. Write them down. For each mistake, write what the engine recommended instead and WHY that move was better.

Exercise 10.7 **Task:** Go through your recent games and find one where you missed a fork, pin, or skewer. Set up the position on a board. Look at it. Can you see the tactic now? What was different about seeing it during the game versus seeing it afterward? What can you do to spot it faster next time?

Exercise 10.8 **Task:** Play a game where your single focus is NOT hanging pieces. Before every move, check: "Does this move leave any of my pieces undefended?" Track how many pieces you hang during the game. Your goal is zero.

Exercise 10.9 **Task:** Play a game and try to castle before move 10. Check your clock: what move did you castle on? If you castled by move 8, excellent. If you castled on move 12 or later, ask yourself what delayed you and whether those other moves were really more important than king safety.

Exercise 10.10 **Task:** Take a game that you won and ask yourself: "Could I have won faster?" Review it with an engine. Were there moments where you had a winning tactic but played a slower move instead? How many moves did the game last? Could good technique have ended it 10 moves sooner?

Exercise 10.11 **Task:** Play 3 games against opponents who are rated at least 100 points above you. You will probably lose most (or all) of these games. After each loss, identify one thing your opponent did that you can learn from. What did they do that you would not have thought of? Write it in your journal.

Exercise 10.12 **Task:** Complete 20 online tactical puzzles on a chess platform. Note your puzzle rating after you finish. Puzzles train your pattern recognition in a focused way. Come back in two weeks and do 20 more. Did your puzzle rating go up?

Exercise 10.13 **Task:** Set up a K+R vs K position on your board with the pieces in random starting positions. Practice delivering checkmate using the technique from Chapter 5. Do this 5 times. Time yourself. Can you do it in under 30 moves? Under 20?

Exercise 10.14 **Task:** Play a game where you consciously look for tactics on EVERY SINGLE MOVE. Not just when the position looks sharp. Every move. Before you play, spend 5 seconds scanning for forks, pins, and skewers. In your journal, note whether you found any. Even if you found zero, the habit of scanning is the goal.

Exercise 10.15 **Task:** Write a one-page reflection titled "What I Have Learned About Chess in Volume I." This is not a test. There are no wrong answers. Write about what surprised you, what challenged you, what excited you, and what you want to learn next. This page is for you. Keep it with your journal.

20.11 Key Takeaways

1. **Fifty games is the sweet spot for building real experience.** After 50 serious games, patterns start to feel automatic. Your opening moves come naturally. Your blunder-checking habit becomes reflexive. Your tactical eye sharpens.

2. **Play at a thinking pace.** Start with 15+10 or slower. Blitz and bullet are fun but terrible for learning at the beginner stage. You need time to apply your knowledge during the game, not just after it.

3. **Every loss contains a lesson.** The five-minute post-game analysis is the single most powerful habit you can build. Find the critical moment, identify the mistake, write down the lesson.

4. **Your rating is a thermometer, not a trophy.** It measures your progress, but obsessing over it leads to anxious, fearful play. Focus on learning. The rating follows.

5. **Keep a game review journal.** Six lines per game. Date, color, result, opening, critical moment, lesson learned, something you did well. After 50 games, this journal becomes a personalized blueprint for your improvement.

6. **Avoid the ten common mistakes.** Develop pieces, castle early, do not bring the queen out too soon, check for threats before every move, use your time, and never play another game while you are emotionally tilted.

7. **The 50-Game Challenge gives your practice structure.** Games 1-10 build comfort. Games 11-20 build opening skill. Games 21-30 build tactical awareness. Games 31-40 build endgame technique. Games 41-50 integrate everything.

20.12 Practice Assignment

20.12.1 Your Immediate Next Step:

Play your first rated game. Right now. Today. Not tomorrow. Not "when you feel ready." You are ready. You have read nine chapters of chess instruction. You know more than enough to sit down and play.

Set up a 15+10 game against a human opponent, either online or at a chess club. Follow your pre-game routine. Play the London System or the Pirc. Use your thinking checklist. When the game is over, write your first journal entry.

Then play another one tomorrow.

20.12.2 Your Weekly Routine:

- Play 3 to 5 rated games per week at 15+10 or slower
- Write a journal entry after every game (5 minutes)
- Complete 10 to 20 online tactical puzzles per week
- Practice one basic endgame position per week (K+Q vs K, K+R vs K, K+P vs K)
- Reread one section of Volume I per week to keep the material fresh

20.12.3 Your 50-Game Goal:

Complete all 50 games within 2 to 4 months. Follow the structured plan from Part 6. After game 50, review your entire journal and write your one-page reflection.

When you finish, you will be ready for Volume II.

20.13 Progress Check

If you can answer YES to these questions, you have completed Volume I:

☐ I can play the London System as White from memory (first 5 to 8 moves).
☐ I can play the Pirc or Modern as Black from memory.
☐ I can spot forks, pins, and skewers in live game positions.
☐ I can deliver checkmate with K+Q vs K and K+R vs K.
☐ I understand opposition, key squares, and the Rule of the Square.
☐ I have a pre-game routine that I follow before every game.
☐ I use the "threat check" and "blunder check" before every move.
☐ I have a game review journal with at least 10 entries.
☐ I have completed (or committed to completing) the 50-Game Challenge.
☐ I know what I want to improve and what to study in Volume II.

If you checked all ten boxes: You are no longer a beginner. You are a chess player with a foundation, a system, and a plan. Volume II awaits you.

If you missed some: Go back to the relevant chapters and practice. There is no deadline. There is no exam. Chess is a lifelong pursuit, and the only person you need to be better than is the person you were yesterday.

20.14 Rest Marker

20.15 Volume I Complete!

Congratulations.

You have finished *The Grandmaster Codex, Volume I: Foundations.*

Take a moment to appreciate what you have accomplished. You started with nothing but curiosity. Maybe you knew the rules. Maybe you did not. It does not matter. You sat down, you opened this book, and you did the work. Chapter by chapter, diagram by diagram, exercise by exercise, you built a foundation that will support your chess for the rest of your life.

You learned the board, the pieces, and the rules. You learned about check, checkmate, and stalemate. You mastered castling, en passant, and pawn promotion. You learned piece values and how to trade with purpose. You practiced delivering checkmate with the fundamental mating patterns. You armed yourself with the six tactical weapons that decide most chess games. You studied opening principles and built a personal opening repertoire. You drilled pawn endgames until opposition and key squares felt like second nature.

And in this chapter, you took the hardest step of all: you sat down across from another human being and played a game. You risked losing. You risked looking foolish. You risked caring about something and struggling with it. And you did it anyway.

That takes courage. Real courage. And if nobody else says it, let me say it now: **I am proud of you.**

The road ahead is long and beautiful. Volume II will take you from a foundation player to a club player. Volume III will sharpen you into a tournament fighter. Volume IV will forge you into an expert. And Volume V, someday, will teach you to think like a grandmaster.

But every single step of that journey rests on what you learned here, in Volume I. The fundamentals. The basics. The things that never stop being important, no matter how high your rating climbs.

So go play your 50 games. Fill your journal. Learn from every loss. Celebrate every win. And when you are ready, open Volume II.

The board is set. The pieces are waiting. It is your move.

"The game of chess is not merely an idle amusement. Several very valuable qualities of the mind, useful in the course of human life, are to be acquired or strengthened by it." – Benjamin Franklin

---

Chapter 10 of The Grandmaster Codex, Volume I: Foundations Written for players rated 500-1000 15 exercises, 2 annotated games Estimated study time: Ongoing (complete alongside the 50-Game Challenge)

Chapter 21

Appendix

21.1 Volume I: Foundations

"The notation of the game is the memory of chess." – Siegbert Tarrasch

---

This appendix contains three sections to support everything you have learned in Volume I. **Appendix A** teaches you to read and write chess notation so you can follow any game in any book. **Appendix B** walks you through setting up the board correctly every time. **Appendix C** is a glossary of every chess term used in this volume, with references back to the chapters where each concept is explained.

Keep this appendix bookmarked. You will come back to it often, especially as you begin reading games from other sources. Once algebraic notation becomes second nature, you will be able to read any chess game ever recorded, from a game played in 1851 to one played yesterday.

Chapter 22

Appendix A: Algebraic Notation Guide

22.1 The Language of Chess

Chess has its own written language. It is called **algebraic notation**, and it is the standard system used worldwide to record and share chess games. Every chess book, every website, every tournament scoresheet uses this system. Once you learn it, you can read any chess game ever played.

The good news: it takes about fifteen minutes to learn. The system is simple, logical, and consistent. If you can read a map grid, you can read chess notation.

22.1.1 The Grid: Files and Ranks

Look at your chessboard from White's side. The board is an 8 by 8 grid. Every square on that grid has a unique name made of two characters: a letter and a number.

Files are the columns running from your side of the board to your opponent's side. They are labeled **a** through **h**, from left to right (from White's perspective).

Ranks are the rows running from left to right across the board. They are numbered **1** through **8**, from bottom to top (from White's perspective).

Put the letter and the number together, and you have the name of a square.

- **a1** is the bottom-left corner (from White's view)
- **h1** is the bottom-right corner
- **a8** is the top-left corner
- **h8** is the top-right corner
- **e4** is the e-file, 4th rank (a central square)
- **d5** is the d-file, 5th rank (another central square)

Key point: The letter always comes first, always lowercase. The number always comes second. It is always **e4**, never **4e** or **E4**.

When White sets up to play, the square **a1** is in the bottom-left corner and **h8** is in the top-right corner. This orientation never changes. Even when you are reading about a position from Black's point of view, the square names stay the same. The a1 square is always the a1 square.

22.1.2 The Center

The four squares in the middle of the board are **d4**, **d5**, **e4**, and **e5**. These are the most important squares in chess. You will see these square names constantly throughout this book and every other chess book you ever read. Controlling the center is one of the core principles of the game (see Chapter 7).

22.2 Piece Symbols

Each piece has a single-letter abbreviation used in notation:

Symbol	Piece
K	King
Q	Queen
R	Rook
B	Bishop
N	Knight
(none)	Pawn

Why N for Knight? Because K is already taken by the King. So the Knight gets **N**, the second letter of its name. You will get used to this quickly.

Why no letter for Pawns? Pawns are the most common piece in chess. To keep notation short, pawn moves use only the destination square with no letter prefix. When you see a move like **e4**, that is a pawn move. When you see **Nf3**, that is a Knight move. The presence or absence of a capital letter tells you which is which.

22.3 Reading Moves

Here is the complete system for reading chess moves. Each entry shows the notation and what it means:

22.3.1 Basic Moves

- **Nf3** = A Knight moves to the f3 square.
- **Bb5** = A Bishop moves to the b5 square.
- **Qd1** = The Queen moves to d1.
- **Ke2** = The King moves to e2.
- **Rd1** = A Rook moves to d1.
- **e4** = A pawn moves to e4.

- **d5** = A pawn moves to d5.

The pattern is always the same: piece letter (if not a pawn) followed by the destination square.

22.3.2 Captures

When a piece captures an opponent's piece, an **x** appears between the piece and the square:

- **Bxe5** = A Bishop captures whatever is on e5.
- **Nxd4** = A Knight captures on d4.
- **Qxf7** = The Queen captures on f7.

For pawn captures, you write the file the pawn came from, then x, then the destination:

- **exd5** = A pawn on the e-file captures on d5.
- **fxg6** = A pawn on the f-file captures on g6.

22.3.3 Castling

Castling has its own special notation:

- **O-O** = Kingside castling (the King moves two squares toward the h-file Rook).
- **O-O-O** = Queenside castling (the King moves two squares toward the a-file Rook).

These use the letter O, not the number zero. See Chapter 3 for the complete rules on castling.

22.3.4 Check and Checkmate

- **+** at the end of a move means **check** (the King is attacked).
- **#** at the end of a move means **checkmate** (the game is over).

Examples: - **Bb5+** = Bishop moves to b5, giving check. - **Qxf7#** = Queen captures on f7, delivering checkmate.

22.3.5 Pawn Promotion

When a pawn reaches the last rank and promotes, you write the destination square, an equals sign, and the new piece:

- **e8=Q** = A pawn moves to e8 and becomes a Queen.
- **a1=R** = A pawn moves to a1 and becomes a Rook.
- **g8=N+** = A pawn moves to g8, promotes to a Knight, and gives check.

Promotion is covered in detail in Chapter 3.

22.3.6 Move Annotations

Chess writers use symbols to comment on the quality of a move:

Symbol	Meaning
!	Good move
!!	Brilliant move
?	Mistake

Symbol	Meaning
??	Blunder
!?	Interesting move (possibly good, worth considering)
?!	Dubious move (probably not the best, but has some point)

When you see **Nf3!** in a book, the author is telling you that Nf3 is a strong move. When you see **Qh5??**, the author is warning you that this Queen move is a terrible blunder.

These symbols are opinions, not rules. Different authors may annotate the same move differently. But the symbols give you a quick way to understand what the writer thinks about each move.

22.4 Reading a Game Score

A full chess game is written as a numbered list of moves. White's move comes first, then Black's move, separated by a space.

Here is a real, complete game. This is one of the most famous games in chess history: the Scholar's Mate.

```
1.e4 e5
2.Bc4 Nc6
3.Qh5 Nf6??
4.Qxf7#
```

Let's read it move by move:

1. **1.e4** = White's first move. A pawn moves to e4.
2. **e5** = Black's first move. A pawn moves to e5.
3. **2.Bc4** = White's second move. A Bishop moves to c4.
4. **Nc6** = Black's second move. A Knight moves to c6.
5. **3.Qh5** = White's third move. The Queen moves to h5.
6. **Nf6??** = Black's third move. A Knight moves to f6. The **??** tells you this is a blunder.
7. **4.Qxf7#** = White's fourth move. The Queen captures on f7, and it is checkmate.

Set this game up on your board and play through it. You will see exactly how Scholar's Mate works. (This trap is discussed in Chapter 7, along with how to avoid falling for it.)

When a game ends, the result is written at the end:

- **1-0** means White won.
- **0-1** means Black won.
- **1/2-1/2** means the game was a draw.

So the full score of the game above would end with **1-0**.

22.4.1 Partial Moves

Sometimes you will see only Black's move written with three dots:

15...Nf6 means "Black's 15th move was Nf6." The three dots indicate that White's move has been skipped or discussed separately.

22.5 Disambiguation

Sometimes two identical pieces can move to the same square. When this happens, you need extra information to show which piece moved.

Example: Suppose White has Knights on b1 and f3, and both could move to d2. Just writing **Nd2** would be confusing. Which Knight moved?

The solution: add the file letter of the piece that moved.

- **Nbd2** = The Knight from the b-file moves to d2.
- **Nfd2** = The Knight from the f-file moves to d2.

If the pieces are on the same file but different ranks, you use the rank number instead:

- **N1f3** = The Knight from the 1st rank moves to f3.
- **N4f3** = The Knight from the 4th rank moves to f3.

In very rare cases, you might need both the file and the rank to be clear (such as with three Queens on the board after multiple promotions), but this almost never happens in real games.

22.6 FEN Notation: A Brief Introduction

Throughout this book, you will see lines like this beneath diagram positions:

This is called **FEN** (Forsyth-Edwards Notation). It is a way to describe any chess position in a single line of text. You do not need to learn FEN to read this book. Every position in this book is described in plain language and has "Set up your board" instructions.

However, FEN is extremely useful if you play chess online or use chess software. You can copy a FEN string into almost any chess website or app, and it will instantly set up the exact position on your screen. This lets you follow along digitally and explore variations with an engine.

How FEN works (briefly):

A FEN string has six parts, separated by spaces:

1. **Piece placement** = The position of every piece on the board, described rank by rank from the 8th rank (top) to the 1st rank (bottom). Uppercase letters are White pieces, lowercase letters are Black pieces. Numbers represent consecutive empty squares. Slashes separate ranks.
2. **Active color** = Either **w** (White to move) or **b** (Black to move).
3. **Castling availability** = Which sides can still castle. **K** = White kingside, **Q** = White queenside, **k** = Black kingside, **q** = Black queenside. A dash means no one can castle.
4. **En passant target** = If a pawn just moved two squares, this is the square behind it (the en passant capture square). A dash means no en passant is possible.

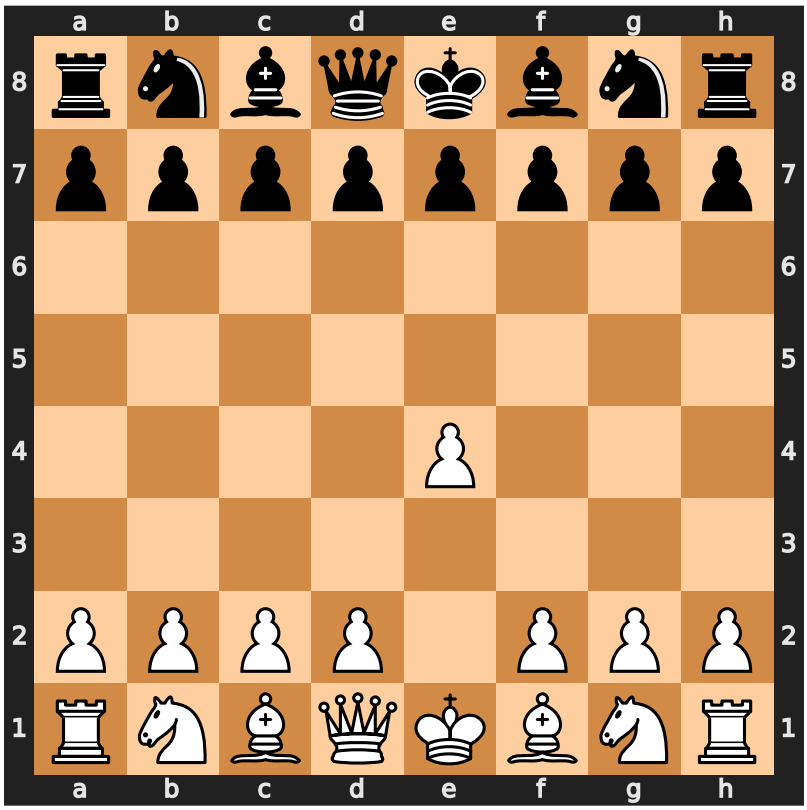

Figure 22.1: Chess Position

5. **Halfmove clock** = The number of moves since the last pawn move or capture (used for the 50-move draw rule).
6. **Fullmove number** = The current move number, starting at 1.

If you want to explore FEN further, any chess website will have a board editor that can generate and read FEN strings. For now, just know that the FEN lines in this book are there to help you set up positions digitally, and you can safely ignore them if you prefer to use a physical board.

Rest Marker. You now know how to read chess notation. The rest of this appendix covers board setup and the glossary. Take a break if you need one.

Chapter 23

Appendix B: Board Setup Guide

23.1 Setting Up the Board

Before you can play, you need to set up the board correctly. This section walks you through the entire process, step by step. If you have never set up a chessboard before, follow these instructions with your board in front of you. If you have set up a board before but are not 100% sure you are doing it right, follow along anyway. Getting the setup wrong is one of the most common mistakes beginners make, and it leads to confusion that can last for years.

23.1.1 The One Rule You Must Remember

Light square in the bottom-right corner.

Look at your board. The squares alternate between light and dark colors. When you sit down to play, the square in the bottom-right corner (closest to your right hand) must be a **light-colored square**.

An easy way to remember this: **"White on right."** The light (white) square goes on your right side. This rule applies no matter which color you are playing.

If the board is turned the wrong way, all the piece positions will be mirrored, and the queen will end up on the wrong color. So always check this first.

23.2 Step-by-Step Setup

Follow these seven steps with your board in front of you.

23.2.1 Step 1: Orient the Board

Place the board between you and your opponent (or between you and an imaginary opponent if you are studying alone). Make sure the **light square is in your bottom-right corner**. White on right.

23.2.2 Step 2: Place the Rooks

Rooks go in the four corners.

- White Rooks on **a1** and **h1** (the corner squares of your first rank).
- Black Rooks on **a8** and **h8** (the corner squares of Black's first rank).

Rooks look like castle towers. Corners for the castles. Easy to remember.

23.2.3 Step 3: Place the Knights

Knights go next to the Rooks.

- White Knights on **b1** and **g1**.
- Black Knights on **b8** and **g8**.

Knights look like horses. They stand right next to the corner towers.

23.2.4 Step 4: Place the Bishops

Bishops go next to the Knights.

- White Bishops on **c1** and **f1**.
- Black Bishops on **c8** and **f8**.

Bishops have a pointed top (like a mitre, the hat a bishop wears). They take the next spots inward.

23.2.5 Step 5: Place the Queen

Here is the rule that prevents the most common setup mistake:

The Queen goes on her own color.

- The White Queen goes on **d1**, which is a **light square**. White Queen on a white square.
- The Black Queen goes on **d8**, which is a **dark square**. Black Queen on a dark square.

If your Queen is not on her matching color, something is wrong. Check your board orientation (Step 1). "The queen gets her own color" is the phrase that will save you every time.

23.2.6 Step 6: Place the King

The King takes the one remaining square in the back row.

- White King on **e1**.
- Black King on **e8**.

The King and Queen stand side by side in the center of the back rank. The King is usually the tallest piece on the board, with a cross or a rounded top.

23.2.7 Step 7: Place the Pawns

Line up all eight Pawns on the rank directly in front of your other pieces.

- White Pawns fill the entire 2nd rank: **a2, b2, c2, d2, e2, f2, g2, h2**.
- Black Pawns fill the entire 7th rank: **a7, b7, c7, d7, e7, f7, g7, h7**.

Pawns are the smallest pieces. They form a wall of soldiers in front of your army.

23.3 The Finished Board

When setup is complete, your board should look like this:

Black's side (8th rank): Rook, Knight, Bishop, Queen, King, Bishop, Knight, Rook **Black's Pawns (7th rank):** Eight pawns in a row *(Empty ranks 3 through 6)* **White's Pawns (2nd rank):** Eight pawns in a row **White's side (1st rank):** Rook, Knight, Bishop, Queen, King, Bishop, Knight, Rook

FEN for the starting position: `rnbqkbnr/pppppppp/8/8/8/8/PPPPPPPP/RNBQKBNR w KQkq - 0 1`

23.4 Memory Trick

If you need a quick way to remember the piece order, here is a sentence:

"Rooks in corners, Knights hop next, Bishops angle in, Queen on her color, King fills the gap, Pawns stand guard."

Say it out loud a few times. Set up the board while saying it. After three or four times, you will never forget the order again.

23.5 Common Setup Mistakes

Mistake 1: Board is turned the wrong way. If the dark square is in your bottom-right corner, the board is backwards. Rotate it 90 degrees. White on right.

Mistake 2: King and Queen are swapped. If the White Queen is on a dark square, she is on the wrong side. Remember: Queen on her own color.

Mistake 3: Bishops and Knights are swapped. The Knights go next to the Rooks (in the corners). Knights are the jumpers; they like being near the edges where they can leap over the pawn wall.

Mistake 4: Rooks are not in the corners. If nothing else, remember this: Rooks are tower-shaped pieces that live in the corners, like guard towers on a castle wall.

Rest Marker. Board setup is complete. The glossary follows. Use it as a reference whenever you encounter an unfamiliar term.

Chapter 24

Appendix C: Glossary

All chess terms used in Volume I, listed alphabetically. Each entry includes a brief definition and a reference to the chapter where the concept is covered in detail.

Back rank The 1st rank for White and the 8th rank for Black. The row where the King, Queen, Rooks, Bishops, and Knights start the game. A "back rank mate" occurs when a Rook or Queen delivers checkmate on the opponent's back rank, and the King is trapped by its own pawns. See Chapter 2.

Bishop pair Having both of your Bishops on the board while your opponent has lost one or both of theirs. Because one Bishop controls light squares and the other controls dark squares, the pair together can cover the entire board. The Bishop pair is a small but real advantage, especially in open positions with few pawns blocking the diagonals. See Chapter 4.

Blunder A very bad move that loses significant material or the game itself. In notation, a blunder is marked with **??**. Everyone blunders, from beginners to World Champions. The goal is not to never blunder but to blunder less often as you improve. See Chapter 6.

Breakthrough A pawn advance that sacrifices one or more pawns to force a remaining pawn through to promotion. In pawn endgames, breakthroughs can turn a drawn-looking position into a win. The key is recognizing when the sacrifice creates a passed pawn that the opponent's King cannot catch. See Chapter 9.

Capture Removing an opponent's piece from the board by moving your piece to its square. Your piece replaces the captured piece on that square. In notation, captures are indicated with an **x** (for example, Bxe5). See Chapter 1.

Castling A special move involving the King and one of the Rooks. The King moves two squares toward the Rook, and the Rook jumps over the King to the square on the other side. **Kingside castling** (O-O) moves the King toward the h-file. **Queenside castling** (O-O-O) moves the King toward the a-file. Castling can only be done if neither the King nor the Rook has moved, the squares between them are empty, the King is not in check, and the King does not pass through or land on a square attacked by an enemy piece. See Chapter 3.

Center The four squares in the middle of the board: d4, d5, e4, and e5. Controlling the center gives your pieces more mobility and more options. Most opening strategies revolve around fighting for control of these squares. See Chapter 7.

Check An attack on the King. When your King is in check, you must deal with it immediately. You can move the King, block the check with another piece, or capture the attacking piece. You cannot ignore check or make a different move. In notation, check is marked with +. See Chapter 2.

Checkmate A position in which the King is in check and there is no legal way to escape. Checkmate ends the game immediately. The player who delivers checkmate wins. In notation, checkmate is marked with #. See Chapter 2.

Connected pawns Two or more pawns of the same color on neighboring files that can protect each other as they advance. Connected pawns are stronger than isolated pawns because they support each other. Connected passed pawns (passed pawns on neighboring files) are especially powerful in endgames. See Chapter 9.

Decoy A tactic that lures an opponent's piece to a specific square, usually a bad one. By forcing a piece to move to a particular location, you set up a follow-up tactic like a fork, pin, or checkmate. Decoys work because the opponent has no choice: the lured piece must go where you want it. See Chapter 6.

Deflection A tactic that forces a defending piece to leave its post, abandoning whatever it was protecting. Once the defender moves away, the target it was guarding becomes vulnerable. Deflection is closely related to removing the defender, but specifically involves forcing the defender to move rather than capturing it. See Chapter 6.

Development Moving your pieces from their starting squares to active squares where they control important parts of the board. In the opening, rapid development is one of the most important goals. A piece that is still on its starting square is not contributing to the fight. A piece that has been developed to an active square is working for you. See Chapter 7.

Diagonal A line of squares running from one corner of the board to the other at an angle. Bishops and Queens move along diagonals. For example, the a1-h8 diagonal runs from the bottom-left to the top-right corner. See Chapter 1.

Discovered attack A tactic in which one piece moves out of the way, revealing an attack from a piece behind it. The piece that moves may also deliver its own threat, creating a double attack. Discovered attacks are powerful because the opponent must deal with two threats at once. See Chapter 6.

Discovered check A special type of discovered attack in which the revealed attack is a check on the King. Because the opponent must deal with the check, the piece that moved is free to go anywhere, including capturing an unprotected piece. Discovered checks are among the most dangerous tactics in chess. See Chapter 6.

Double attack Any move that creates two threats at the same time. Forks are a type of double attack, but the term also covers situations where one piece attacks an enemy piece while simultaneously threatening something else (like a mating square). The power of double attacks is that the opponent can only deal with one threat per move. See Chapter 6.

Double check A discovered check in which both the moving piece and the revealed piece give

check at the same time. The only way to escape double check is to move the King. You cannot block or capture your way out of double check because there are two checking pieces. See Chapter 6.

Doubled pawns Two pawns of the same color on the same file, usually created when a pawn captures and lands on a file that already has a friendly pawn. Doubled pawns are generally a weakness because they cannot protect each other and are harder to advance. However, doubled pawns are not always bad; sometimes the open file created by the capture is worth the structural weakness. See Chapter 4.

Draw A game that ends without a winner. Draws can happen by stalemate, agreement between the players, threefold repetition (the same position occurs three times), the 50-move rule (50 consecutive moves with no pawn move and no capture), or insufficient material (neither player has enough pieces to checkmate). See Chapter 2.

En passant A special pawn capture that can occur when an opponent's pawn moves two squares forward from its starting position and lands beside your pawn. You may capture it "in passing" by moving your pawn diagonally to the square the opponent's pawn passed through. En passant must be played on the very next move or the right is lost. See Chapter 3.

Endgame The final phase of the game, when most pieces have been traded and only a few remain on the board. Endgames often come down to King and pawn play. Knowing basic endgame technique, like opposition, key squares, and the Rule of the Square, is essential for converting advantages into wins. See Chapter 9.

Exchange, the Winning a Rook for a minor piece (a Bishop or Knight). When you trade your Bishop or Knight for your opponent's Rook, you have "won the Exchange." The Exchange is worth about 2 points of material advantage. This term specifically refers to the Rook-for-minor-piece trade, not just any trade of pieces. See Chapter 4.

FEN (Forsyth-Edwards Notation) A standard way to describe any chess position in a single line of text. FEN includes information about piece placement, whose turn it is, castling rights, en passant possibilities, and the move count. Used throughout this book to let readers set up positions on digital boards. See Appendix A.

Fianchetto Developing a Bishop to b2, g2 (for White) or b7, g7 (for Black) by first moving the pawn on the b- or g-file one square forward. The Bishop sits on the long diagonal, controlling the center from a distance. The Pirc Defense uses a fianchetto with …g6 and …Bg7. See Chapter 8.

File A vertical column of eight squares on the chessboard, labeled **a** through **h**. Rooks and Queens are especially powerful on open files (files with no pawns). See Chapter 1.

Fork A tactic in which one piece attacks two or more enemy pieces at the same time. The attacker threatens multiple targets, and the defender can only save one. Knight forks are the most common type, but every piece can deliver a fork. See Chapter 6.

Gambit An opening in which one side sacrifices material (usually a pawn) to gain another advantage, such as faster development, control of the center, or an attack on the opponent's King. A gambit is a calculated risk, not a random sacrifice. See Chapter 7.

Hanging piece A piece that is undefended and can be captured for free. Leaving a piece "hanging" means it has no protection. Spotting hanging pieces (both yours and your opponent's) is one of the most important skills at the beginner level. See Chapter 6.

Hypermodern A school of chess thought from the early 20th century that argued you do not have to occupy the center with pawns to control it. Instead, hypermodern players control the center from a distance using pieces, especially fianchettoed Bishops. The Pirc Defense is a hypermodern opening. See Chapter 8.

Initiative Having the ability to create threats and force your opponent to react. The player with the initiative is "calling the shots," while the opponent must spend moves defending. Gaining the initiative through rapid development and central control is a key opening goal. See Chapter 7.

Isolated pawn A pawn with no friendly pawns on either neighboring file. Because it has no pawn neighbors to protect it, an isolated pawn must be defended by pieces. Isolated pawns are a structural weakness, though they can sometimes be offset by active piece play. See Chapter 4.

Key squares In King and Pawn endgames, the squares that the attacking King must reach to guarantee promotion of a pawn. If the King reaches a key square, the pawn will promote regardless of what the defending side does. Key squares depend on the pawn's position and are essential knowledge for converting endgame advantages. See Chapter 9.

King safety The concept of keeping your King protected from attack, especially during the opening and middlegame. Castling is the primary method of achieving King safety, as it tucks the King behind a wall of pawns and connects the Rooks. A King that stays in the center too long is vulnerable to tactical attacks. See Chapter 7.

Kingside The right half of the board from White's perspective: the e, f, g, and h files. The Kingside is where White's King typically castles (O-O). See Chapter 1.

Legal's Mate A classic checkmate pattern in which a piece is sacrificed (usually the Queen) to set up a quick checkmate with minor pieces. Named after the French player Sire de Legal. It exploits an opponent who captures the offered Queen without noticing the mate threat behind it. See Chapter 6.

London System A solid, reliable opening system for White that begins with 1.d4 and 2.Bf4 (or 2.Nf3 followed by Bf4). White develops the dark-squared Bishop to f4 before playing e3, creating a sturdy pawn structure and safe King position. The London System can be played against almost any Black setup, making it ideal as a first opening repertoire. See Chapter 8.

Material The total value of pieces on the board. A player who has more material (more pieces or more valuable pieces) has a material advantage. Standard piece values: Pawn = 1, Knight = 3, Bishop = 3, Rook = 5, Queen = 9. The King is not counted because it cannot be captured. See Chapter 4.

Middlegame The phase of the game between the opening and the endgame, when most pieces are still on the board and active battles are taking place. Plans, tactics, and positional maneuvering all play a role in the middlegame. No clear line separates the opening from the middlegame; the transition happens gradually as pieces are developed and plans are formed. See Chapter 7.

Notation (algebraic) The standard system for recording chess moves. Each square is identified by a letter (a-h) and number (1-8). Piece symbols (K, Q, R, B, N) are combined with square names to record moves. See Appendix A for the full guide.

Opening The first phase of the game, typically the first 10 to 15 moves. The main goals of the opening are to develop pieces, control the center, and get the King to safety through castling. See Chapter 7.

Opposition A critical concept in King and Pawn endgames. Two Kings are "in opposition" when they stand on the same file or rank with one empty square between them. The player who does NOT have to move holds the opposition, which is an advantage because it forces the other King to give way. Opposition often determines whether a pawn endgame is won or drawn. See Chapter 9.

Overloaded piece A piece that is trying to do two jobs at once and cannot handle both. If a Rook is simultaneously protecting a pawn and guarding against a back rank mate, it is overloaded. By attacking one of the things it protects, you force it to abandon the other. See Chapter 6.

Passed pawn A pawn with no opposing pawns in front of it on the same file or on either neighboring file. A passed pawn has a clear path to promotion and must be stopped by pieces rather than pawns. Passed pawns become increasingly dangerous as more pieces are traded, because there are fewer pieces available to stop them. See Chapter 9.

Pin (absolute and relative) A tactic in which a piece attacks an opponent's piece that cannot (or should not) move because doing so would expose a more valuable piece behind it. An **absolute pin** involves the King: the pinned piece literally cannot move because doing so would put the King in check, which is illegal. A **relative pin** involves a piece other than the King: the pinned piece can legally move, but doing so would lose the more valuable piece behind it. See Chapter 6.

Pirc Defense A hypermodern opening for Black that begins with 1…d6, followed by …Nf6 and …g6. Black allows White to build a pawn center, then attacks it from the flanks using a fianchettoed Bishop on g7. The Pirc is a flexible and durable defense that avoids heavy memorization. See Chapter 8.

Promotion When a pawn reaches the 8th rank (for White) or the 1st rank (for Black), it must be replaced by a Queen, Rook, Bishop, or Knight of the same color. This is called promotion. Most players promote to a Queen because it is the most powerful piece, but promoting to another piece (underpromotion) is sometimes the best choice. See Chapter 3.

Queenside The left half of the board from White's perspective: the a, b, c, and d files. The Queenside is where the Queen starts and where queenside castling (O-O-O) sends the King. See Chapter 1.

Rank A horizontal row of eight squares on the chessboard, numbered **1** through **8** from White's side. White's pieces start on the 1st and 2nd ranks. Black's pieces start on the 7th and 8th ranks. See Chapter 1.

Removing the defender A tactic in which you capture or drive away a piece that is protecting a key target. Once the defender is gone, the target it was guarding becomes free to attack or capture. Removing the defender is often the necessary first step before a fork, pin, or mating attack can succeed. See Chapter 6.

Repertoire A set of openings that a player uses regularly as both White and Black. Having a repertoire means you do not have to figure out what to play from scratch every game. You have studied specific openings and know the key ideas, plans, and typical middlegame positions. A beginner's repertoire should be simple and based on understanding rather than memorization. See Chapter 8.

Resignation Conceding the game before checkmate occurs. Players resign when they believe their position is hopeless and continued play would only delay an inevitable loss. You are never required to resign; you can always play on until checkmate. However, resigning a clearly lost position is considered polite in competitive chess. See Chapter 2.

Rule of the Square A visual shortcut for determining whether a King can catch a runaway pawn. Draw an imaginary square from the pawn to its promotion square, then extend it sideways. If the defending King can step inside the square on its move, it can catch the pawn. If it cannot, the pawn will promote. This technique saves you from having to calculate every move. See Chapter 9.

Sacrifice Voluntarily giving up material (a pawn, piece, or even the Queen) in exchange for a non-material advantage, such as a mating attack, a strong initiative, or a favorable position. Sacrifices can be speculative (risky) or sound (objectively correct). Learning when a sacrifice works and when it does not is a skill that improves with experience. See Chapters 6 and 7.

Scholar's Mate A four-move checkmate pattern: 1.e4 e5 2.Bc4 Nc6 3.Qh5 Nf6?? 4.Qxf7#. White aims the Queen and Bishop at the weak f7 pawn, delivering mate on the fourth move. Scholar's Mate only works if Black makes a specific mistake. It is easily prevented by …g6 or …Qe7. Learn it to avoid falling for it, not to rely on it. See Chapter 7.

Skewer A tactic that is the reverse of a pin. A piece attacks a valuable target, and when that target moves out of the way, a second piece behind it is captured. For example, a Bishop might check the King, and when the King moves, the Bishop captures a Rook behind it. Skewers require the two targets to be lined up on the same rank, file, or diagonal. See Chapter 6.

Smothered mate A checkmate delivered by a Knight in which the King is surrounded (smothered) by its own pieces and cannot escape. The most common smothered mate happens on the back rank when the King is boxed in by its own Rook and pawns. Smothered mates are rare in games but spectacular when they occur. See Chapter 5.

Stalemate A position in which the player whose turn it is has no legal moves and their King is NOT in check. Stalemate is a draw, not a loss. Even if one player has a massive material advantage, the game is drawn if the other player is stalemated. Avoiding accidental stalemate when you are winning is an important skill. See Chapter 2.

Tempo A unit of time in chess, measured in moves. "Gaining a tempo" means making a useful move while forcing your opponent to waste a move (for example, developing a piece with an attack that forces the opponent's piece to retreat). "Losing a tempo" means wasting a move without accomplishing anything useful. Controlling the tempo is closely related to having the initiative. See Chapter 7.

Trade Exchanging pieces of equal value with your opponent. For example, trading a Knight for a Knight or a Rook for a Rook. Trades simplify the position by reducing the total number of pieces on the board. Whether a trade is good or bad depends on the position. Generally, you should trade pieces when you have a material advantage (to simplify toward a winning endgame) and avoid trades when you are behind in material. See Chapter 4.

Underpromotion Promoting a pawn to a piece other than a Queen (to a Rook, Bishop, or Knight). Underpromotion is rare but occasionally necessary. The most common reason is promoting to a Knight to deliver a check or fork that a Queen could not. Sometimes promoting to a Rook instead of a Queen is necessary to avoid stalemate. See Chapter 3.

Zugzwang A German word meaning "compulsion to move." A position in which any move a player makes will worsen their position, but they are forced to move because passing is not allowed in chess. Zugzwang occurs most often in endgames, particularly King and Pawn endings. If your opponent is in zugzwang, every possible move they make will hurt their position. It is one of the

most elegant ideas in chess. A full treatment of zugzwang appears in Volume II, but the concept is introduced through opposition in Chapter 9.

Chapter 25

25.2 Recommended Reading for Beginners

You have just completed Volume I. The books below are companions to what you have learned, and each one will strengthen a specific part of your game. They are listed in the order we recommend reading them.

1. Irving Chernev — *Logical Chess: Move by Move* (1957)

Every move in every game is explained. No other book does this. When you finish Volume I and want to see how strong players think through entire games, this is the place to start. Chernev writes clearly and never talks down to his reader. The games are old, but the thinking is permanent.

2. José Raúl Capablanca — *Chess Fundamentals* (1921)

Written by the third World Champion, this book teaches chess the way Capablanca played: with crystal clarity and no wasted moves. Over a hundred years old and still recommended by every serious coach. If you liked the endgame-first approach of Volume I, you will love this book.

3. László Polgár — *Chess: 5334 Problems, Combinations, and Games* (1994)

The father of the Polgár sisters built this massive puzzle collection to train his daughters, all of whom became among the strongest women players in history. Start with the mate-in-one puzzles and work your way through. Repetition is how tactical patterns become permanent.

4. Fred Reinfeld — *1001 Brilliant Ways to Checkmate* (1955)

Pure tactical training. Every puzzle is a forced checkmate. Work through these with a physical board and no peeking at the answers. By the time you finish, you will see checkmate patterns in your sleep.

5. Dan Heisman — *Everyone's Second Chess Book* (2000)

This book addresses the thinking habits that separate beginners from improving players: how to use your clock, how to avoid blunders, and how to study effectively. It fills in the practical gaps that most instructional books skip.

6. John Nunn — *Learn Chess Tactics* (2004)

A clean, well-organized introduction to tactical motifs with carefully graded exercises. Nunn is a Grandmaster and a mathematician, and his writing reflects both: precise, logical, and efficient.

Rest Marker. You have finished the Appendix and all of Volume I: Foundations.

25.3 What Comes Next

You now have all the tools you need to play chess with understanding. You know the rules (Chapters 1 through 3), the values and trading principles (Chapter 4), the basic checkmates (Chapter 5), the core tactical patterns (Chapter 6), the opening principles (Chapter 7), a complete opening repertoire (Chapter 8), and the essential pawn endgames (Chapter 9). You know how to read notation, set up a board, and look up any term you have forgotten.

Volume II: **The Club Player** picks up where Volume I leaves off. It covers intermediate tactics, positional chess foundations, deeper opening theory, more complex endgames, and the thinking habits that separate improving players from those who stay stuck. If you have worked through Volume I carefully, played games, and solved the exercises, you are ready.

Set up your board. Play a game. Come back to Volume II when you are hungry for more.

End of Volume I: Foundations

Chapter 26

THE GRANDMASTER CODEX

26.1 Volume II: The Club Player

26.1.1 Rating 1000 → 1600

Chapter 27

Welcome Back

"Every chess master was once a beginner." — Irving Chernev

27.1 You Are Here

```
VOLUME I:   Foundations          (0 → 1000)       Complete
VOLUME II:  The Club Player      (1000 → 1600)    YOU ARE HERE
VOLUME III: The Tournament Fighter (1600 → 2200)  Ahead
VOLUME IV:  The Expert           (2200 → 2400)    Ahead
VOLUME V:   The Final Push       (2400 → 2500+)   Ahead
```

You finished Volume I.

That is not a small thing. Most people who pick up a chess book put it down before the end of Chapter 3. You didn't. You stayed. You learned the rules, practiced checkmates, studied your first openings, and played your first real games. You pushed through the hard parts, and that tells us something about you.

You are the kind of person who finishes what they start.

If you have worked through Volume I with a board in front of you, you can already beat most casual players. Not because you memorized tricks, but because you understand how the game works. That puts you ahead of millions of people who play chess without ever studying it.

Now it is time to get serious.

27.2 Where You've Been

Volume I gave you the foundation. Here is what you built:

The Board and the Pieces. You know how every piece moves, captures, and works with other pieces. You know what each piece is worth and when trading makes sense.

Check, Checkmate, and Stalemate. You can deliver checkmate with a king and queen, a king and rook, and even the tricky king and two bishops. You know the difference between checkmate and stalemate, and you know why that difference matters.

Special Moves. Castling, en passant, and pawn promotion are second nature to you. You know the rules and you know the reasons behind the rules.

Elementary Tactics. Forks, pins, skewers, and double attacks. You can spot these patterns when they appear on the board. You may not find them every time in a real game (nobody does), but you know what to look for.

Opening Principles. Develop your pieces. Control the center. Get your king to safety. You know the three golden rules, and you have started building good habits in the first ten moves.

Your First Repertoire. You have played the London System as White and the Pirc/Modern as Black. You know the basic ideas, the early moves, and the plans that go with each system.

Basic Pawn Endgames. Opposition, key squares, and the Rule of the Square. You can win a won king-and-pawn endgame and hold a drawn one.

Your First Games. You played, you lost, you learned. That cycle is the engine of all improvement. You have started it, and it never stops.

That is a real foundation. Be proud of it. Everything in this volume builds on what you already know.

27.3 Where You're Going

Volume II takes you from "I know how to play chess" to "I know how to *win* at chess."

Here is what is coming:

The 30 Essential Tactical Patterns (Chapter 11). In Volume I, you learned four basic tactics. Now you learn thirty. Discovered attacks, deflections, decoys, interference, overloaded pieces, back-rank mates, and more. These are the patterns that win games at the club level. By the end of this chapter, you will see combinations that are invisible to you right now.

Calculation Training (Chapter 12). Seeing a tactic is one step. Calculating it to the end is another. You will learn Alexander Kotov's method for finding candidate moves and analyzing them without getting lost. This chapter will change how you think at the board.

Pawn Structures (Chapter 13). Pawns are the skeleton of your position. Isolated pawns, doubled pawns, passed pawns, pawn chains, pawn islands. You will learn what each structure means and how to play with and against it.

Piece Activity and Coordination (Chapter 14). A rook on an open file is strong. A rook behind a passed pawn is stronger. A rook behind a passed pawn supported by a bishop on the long diagonal is devastating. This chapter teaches you how to make your pieces work together.

The Center (Chapter 15). When should you occupy the center with pawns? When should you control it with pieces? When should you let your opponent have it and attack from the sides? The answers depend on the position, and this chapter teaches you how to read it.

King Safety and the Art of Attack (Chapter 16). How to attack a castled king. How to attack an uncastled king. When to sacrifice material for the attack and when to pull back. This is one of the most exciting chapters in the book, and one of the most important.

Repertoire Deep Dives (Chapters 17-18). Your London System and Pirc/Modern get a major upgrade. You also add the King's Indian Attack as White and the King's Indian Defense as Black. By the end of these chapters, you will have a complete, solid repertoire for both colors.

Essential Rook Endgames (Chapter 19). The Lucena position. The Philidor position. The building of a bridge. Rook endgames happen more than any other type, and the players who know these positions win the games that the players who don't will draw or lose.

Planning in the Middlegame (Chapter 20). Tactics win pieces. Plans win games. You will learn how to look at a position, identify what both sides want, and form a plan that moves toward a win. This is where chess stops being a series of moves and becomes a story.

Annotated Master Games (Chapter 21). Ten games from Paul Morphy, Bobby Fischer, and José Raúl Capablanca, annotated move by move. These three players share a gift for clear, instructive chess. Their games will teach you more than any textbook can.

Common Mistakes and How to Fix Them (Chapter 22). The blunders, bad habits, and thinking errors that keep players stuck between 1000 and 1600. You will recognize your own mistakes here, and you will learn how to stop making them.

This is a lot. That is on purpose. Volume II is the longest and most dense volume in the Codex, because the jump from 1000 to 1600 is where the most growth happens. Take it one chapter at a time.

27.4 Readiness Self-Check

Before you begin, let's make sure you are ready. Answer these ten questions honestly, without a board or any help. Write your answers down. Check them against the answer key at the end.

If you get 7 or more correct, you are ready for Volume II. Turn the page and let's go.

If you get 4 to 6 correct, review the relevant chapters in Volume I first. Each answer tells you which chapter to revisit.

If you get fewer than 4 correct, spend more time with Volume I. There is no rush. The book will wait for you.

Question 1 (Tactics) White has a knight on d5. Black has a king on e8 and a rook on a8. The knight can move to c7. What tactic is this, and why is it effective?

Question 2 (Tactics) White has a bishop on g5 and Black has a queen on d8 with a king on e8. The bishop attacks the queen, and the queen cannot move without exposing the king. What is this tactic called?

Question 3 (Tactics) White has a rook on a1 and Black has a bishop on a5 and a king on a8. The rook can attack the bishop, and if the bishop moves, the rook captures the king (checkmate).

What tactic is this?

Question 4 (Checkmate Patterns) You have a king on f6 and a queen on g1. The enemy king is on h8 with no other pieces on the board. Describe how you deliver checkmate.

Question 5 (Opening Principles) Name the three golden rules of opening play that Volume I taught you.

Question 6 (Opening Principles) In the London System, what is White's first plan after developing the dark-squared bishop to f4? What does White typically do with the c-pawn and the e-pawn?

Question 7 (Notation) Write the following sequence in standard algebraic notation: White moves the knight from g1 to f3, then Black moves the pawn from d7 to d5, then White moves the pawn from c2 to c4. What is the name of this opening idea by White?

Question 8 (Basic Endgame) You have a king on e5 and a pawn on e4. Your opponent has a lone king on e7. It is your move. Can you promote the pawn? What concept determines the answer?

Question 9 (Piece Values) Your opponent offers to trade their bishop for your rook. Should you accept? Why or why not?

Question 10 (Basic Checkmates) You have a king on c1 and a rook on h1. The enemy king is on a3 with no other pieces. Describe the method for forcing checkmate with king and rook versus king.

27.4.1 Answer Key

Answer 1: This is a **fork**. The knight on c7 attacks both the king on e8 and the rook on a8 at the same time. The king must move, and the knight captures the rook. Forks work because one piece attacks two targets, and the opponent can only save one. *(Review: Volume I, Chapter 6)*

Answer 2: This is a **pin**. The bishop on g5 attacks the queen, but the queen cannot move because it would expose the king to check. The queen is "pinned" to the king. A pin against the king is called an absolute pin because it is illegal to move the pinned piece. *(Review: Volume I, Chapter 6)*

Answer 3: This is a **skewer**. The rook attacks the king first (the more valuable piece), and when the king moves out of check, the rook captures the bishop behind it. A skewer is like a pin in reverse: the more valuable piece is in front. *(Review: Volume I, Chapter 6)*

Answer 4: Qg7 is checkmate. The queen on g7 controls g8, g7, h8, h7, h6, and f8. The king on h8 has no escape squares. *(Note: If you found a different mating sequence that also works, that counts.) (Review: Volume I, Chapter 5)*

Answer 5: The three golden rules are: **(1)** Develop your pieces (bring knights and bishops into the game early), **(2)** Control the center (especially the e4, d4, e5, d5 squares), **(3)** Get your king to safety (castle early). *(Review: Volume I, Chapter 7)*

Answer 6: After Bf4, White's typical plan is to play e3 (supporting the d4 pawn and opening the f1-bishop's diagonal), develop the knights to f3 and d2, and play c4 at the right moment to challenge the center. The London System is built on a solid pawn triangle: d4, e3, c3 (or c4). *(Review: Volume I, Chapter 8)*

Answer 7: 1. Nf3 d5 2. c4. This is the Réti Opening idea, where White delays occupying the center with pawns and instead challenges Black's d5 pawn with c4. *(Review: Volume I, Appendix V1 and Chapter 7)*

Answer 8: This depends on **opposition**. With the move and your king on e5 facing the enemy king on e7, you have the opposition. You push the enemy king back with Ke5 (you're already there), then advance. With correct play and the opposition, you can escort the pawn to promotion. The key idea is: the king must lead the pawn, not follow it. *(Review: Volume I, Chapter 9)*

Answer 9: No. A rook is worth 5 points and a bishop is worth 3 points. Trading your rook for their bishop loses 2 points of material. This is called "losing the exchange." Only accept this trade if you gain something else in return (a strong attack, a passed pawn, or a major positional advantage). *(Review: Volume I, Chapter 4)*

Answer 10: The method is called **the box technique** (or "shrinking the box"). Use your rook to cut off ranks or files, restricting the enemy king to a smaller and smaller area of the board. Use your own king to support the rook. Push the enemy king to the edge of the board, then deliver checkmate with the rook along the edge while your king controls the escape squares. *(Review: Volume I, Chapter 5)*

27.4.2 How Did You Do?

Score	Verdict
9-10	You are more than ready. Volume II might even feel easy at first. Enjoy that feeling.
7-8	You are ready. Some of the finer details may need a quick refresher, but you have the foundation. Go ahead.
4-6	Almost ready. Revisit the chapters listed next to the questions you missed. A few days of review will make all the difference.
0-3	Stay with Volume I for now. There is absolutely no shame in this. Every hour you spend on foundations pays dividends later.

27.5 If You're Not Ready

There is no shame in reviewing.

We mean that. This is not something we say to be polite. It is a fact about how chess improvement works. The players who go back and strengthen their foundations progress *faster* than the players who rush ahead with gaps in their knowledge.

If you scored below 7, here is what to do:

1. Look at the questions you got wrong.

2. Find the chapter references in the answer key.
3. Go back to those chapters and work through them again with a board in front of you.
4. Redo the exercises for those chapters.
5. Take the self-check again.

This process might take a weekend. It might take a week. It does not matter how long it takes. What matters is that when you begin Volume II, the foundation is solid.

Think of it this way: a house built on rock survives the storm. A house built on sand does not. Your chess is the same. The time you spend now saves you months of frustration later.

Come back when you are ready. We will be right here.

27.6 How to Use This Volume

27.6.1 Time Commitment

Volume II is designed for 6 to 12 months of study. That is not a typo. Real chess improvement takes time, and the skills in this volume need practice to absorb.

If you study three to five hours per week, expect to finish in about 12 months. If you study more, you can finish faster. But faster is not always better. Understanding beats speed every time.

Some chapters will click right away. Others will take weeks of practice before you feel comfortable. Both of these are normal. Your brain is rewiring itself to see patterns that used to be invisible. That process cannot be rushed.

27.6.2 The Physical Board

Use a real chess board and pieces whenever possible.

This is not nostalgia. This is science. When you move physical pieces with your hands, your brain encodes the positions differently than when you watch them on a screen. The motor memory combines with the visual memory to create stronger, longer-lasting pattern recognition.

Set up the position. Play through the moves. Reset and try again. Every time you touch a piece, you learn a little more.

27.6.3 Three Modes of Study

This volume supports three ways of working through the material. Choose the one that fits your life, or mix and match.

Mode 1: Print + Board. Read the book. Set up each position on your physical board. Play through the annotated games. Solve the exercises by staring at the board, not by glancing at the answer key. This is the slowest method and the most effective.

Mode 2: PGN + Software. Every position in this volume includes a FEN string. Load these into your chess software to follow along. This is useful for checking your ideas against the analysis. Best combined with Mode 1.

Mode 3: Online Study. All annotated games are available as study links (see the appendix at the end of this volume). You can follow along on your phone, tablet, or computer. This is the most flexible method, but be honest with yourself: are you studying, or are you scrolling?

The best approach combines all three. Read the chapter with a board. Load tricky positions into software. Review annotated games online when you are away from your board. Each mode reinforces the others.

27.6.4 Exercise Tiers

Every chapter has exercises at four difficulty levels:

- **Warmup.** These get you started. They test basic understanding of the chapter's topic. If you find these hard, re-read the theory section.
- **Essential.** This is the core work. Complete every Essential exercise. These are the problems that build real skill.
- **Practice.** Harder problems that push your limits. You should attempt all of them, but do not worry if you miss some.
- **Mastery.** The toughest problems in the volume. Some will take 20 to 30 minutes. These are here for the readers who want to go deep. If you can solve most of these, you are already approaching 1600.

Attempt every problem before checking the answer. Even a wrong attempt teaches you more than reading the solution. Write down your answer first. Then compare. That gap between what you thought and what was correct is where learning lives.

27.6.5 Your Notebook

Keep a notebook beside your board. For every exercise, write: 1. Your first idea. 2. The variations you calculated. 3. The answer you chose and why. 4. The correct answer (after checking). 5. What you missed, if anything.

This habit will serve you for the rest of your chess life. The players who write things down remember them. The players who don't repeat the same mistakes.

27.7 Rating Milestones

Here is what to expect as you work through this volume. These are estimates. Your actual progress depends on how much you play, how much you study, and how honestly you analyze your games.

Rating Range	What It Means	Where You Are in This Volume
1000-1100	You know the basics. You still blunder pieces sometimes, but you understand why.	Chapters 11-12

Rating Range	What It Means	Where You Are in This Volume
1100-1200	You spot simple tactics in your games. You have a plan in the opening. Your endgames are improving.	Chapters 13-15
1200-1400	You are a real club player. You can beat most casual opponents. Your games have a structure: opening, middlegame, endgame. You are starting to think ahead.	Chapters 16-19
1400-1600	You are strong. You calculate short combinations. You understand pawn structures. You have a repertoire. People ask you for chess advice.	Chapters 20-22

A note about rating plateaus. You will get stuck. Everyone does. You will play 50 games at 1200 and wonder why you cannot break through. Then one day a pattern clicks, or a concept finally makes sense, and you jump 100 points in a week.

This is normal. The plateau is not a wall. It is your brain processing everything you have studied. Trust the work. The breakthrough is coming.

27.8 Volume II Milestone Rewards

Milestone	Achievement
Complete Chapter 14	"Active Force" - Your pieces work together
Complete 300 exercises	"Pattern Hunter" - You see what others miss
Complete Chapter 22	"Club Champion" - You have the skills of a 1600-rated player
Complete all 620 exercises	"The Complete Club Player" - Volume II mastered

Keep track of your progress. Cross off chapters as you finish them. Count your exercises. These small markers of progress matter. They tell your brain that the work is paying off, and they give you something to celebrate along the way.

27.9 Before You Turn the Page

You have come further than most people ever will. The fact that you are holding this book, that you finished Volume I, that you are ready to go deeper… that says something about you.

This volume will challenge you. There will be chapters that make your head spin and exercises that make you want to throw the board across the room. That is not a sign of failure. That is a sign of growth. Every Grandmaster has felt exactly what you are about to feel.

When it gets hard, remember this: the position always looks more complicated than it is. Break it down. One piece at a time. One move at a time. The answer is there. You just have to find it.

Let's find it together.

Rest here if you need to. Get a glass of water. Set up your board. When you are ready, Chapter 11 begins. The thirty essential tactical patterns are waiting for you, and they are going to change the way you see chess.

Volume II: The Club Player — Chapters 11-22 Target Rating: 1000 → 1600 Pages: ~550 | Exercises: 620 | Annotated Games: 60

Chapter 28

THE GRANDMASTER CODEX

28.1 Volume II: The Club Player

28.1.1 Chapter 11: The 30 Essential Tactical Patterns

Rating Range: 1000 - 1600 Pages: 60 | Exercises: 150 | Annotated Games: 5

"Chess is 99% tactics." - Richard Teichmann

28.2 What You'll Learn

- **30 tactical patterns** organized into 6 learnable groups of 5
- How to recognize each pattern in your own games, not just in puzzles
- The thinking process behind every combination: see the signal, find the move
- How to chain simple tactics into powerful multi-move combinations
- 150 exercises to train your pattern recognition until it becomes automatic

---

28.3 Before We Begin

In Volume I, Chapter 6, you learned the basics: forks, pins, skewers, and double attacks. You can spot them in simple positions. That is a real skill, and you should be proud of it.

But here is what separates a beginner from a club player: **depth**.

A beginner sees a fork when it is sitting right there on the board. A club player sees a fork that is *three moves away* and builds a sequence to make it happen. A beginner sees a pin. A club player sees how to *create* a pin, how to *exploit* a pin, and how to *break* a pin.

This chapter teaches you 30 patterns that appear in real games at every level of chess. Grandmasters use these same patterns. The difference is not what they know. It is how quickly they recognize it and how deeply they calculate around it.

You do not need to learn all 30 in one sitting. Each group of 5 takes about 15 to 25 minutes to read. Work at your own pace. Come back tomorrow. Come back next week. The patterns will be here when you return.

One rule: Set up a physical board for every position. Moving the pieces with your hands builds the patterns into your brain in a way that staring at a screen never will.

Let us begin.

Chapter 29

GROUP 1: FORCING PATTERNS

Estimated study time: 15-20 minutes

Forcing moves are the backbone of tactical chess. A forcing move is any move that limits your opponent's options: a check, a capture, or a serious threat. When you play forcing moves, you control the conversation. Your opponent must respond to *your* ideas instead of pursuing their own.

The five patterns in this group all involve forcing your opponent into difficult choices.

29.1 Pattern 1: Double Attack (Advanced)

Definition: A double attack is a single move that creates two threats at once. Your opponent can only deal with one of them.

You learned basic forks in Volume I. Now we go further. A double attack does not have to be a knight fork. *Any* piece can create a double attack, including pawns. The key: you threaten two things and your opponent cannot save both.

Set up your board:

White: Kg1, Qe4, Re1, Nf3, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d5, f7, g7, h7

White to play.

The sequence:

1. White's queen is on e4. The d5 pawn is attacked. But look deeper: what squares can the queen reach that attack two things at once?
2. White plays **Qb7!** The queen attacks the rook on a8 AND the pawn on b7 AND the bishop on c8. Black cannot save everything. If the rook moves to protect b7, the bishop on c8 is still hanging.
3. The queen found a square where it threatened multiple targets simultaneously.

Why it works: Double attacks work because chess allows only one move per turn. If you create two threats, your opponent must choose which one to address. The other threat goes through.

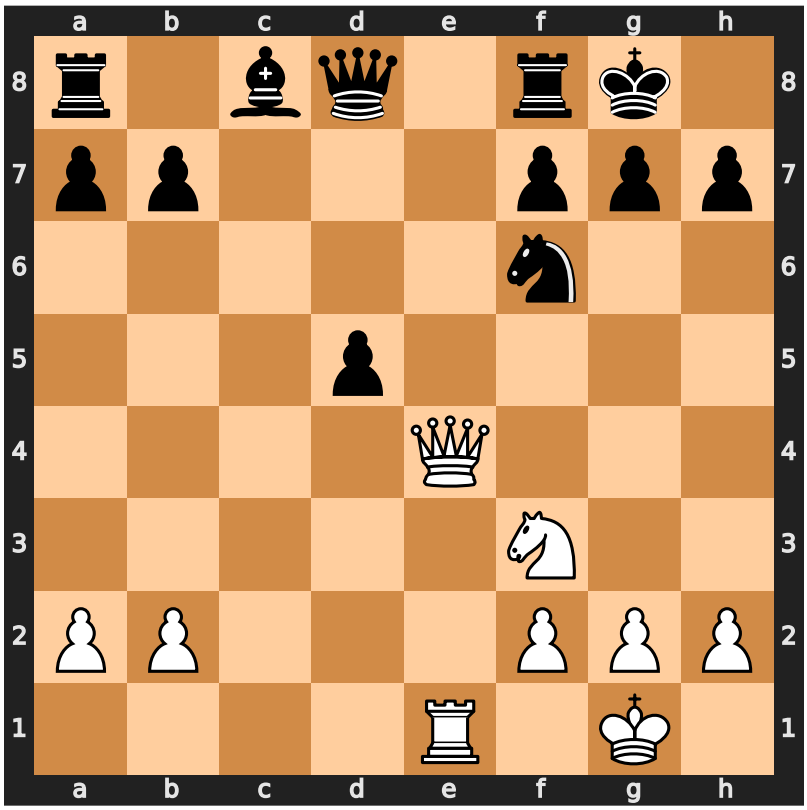

Figure 29.1: Chess Position

Common situations where this arises: - A queen move that attacks a loose piece AND threatens checkmate - A pawn advance that attacks two pieces standing side by side - After a trade, the recapturing piece lands on a square that creates a new threat - A bishop reposition that simultaneously targets two diagonals

The Advanced Difference: In Volume I, you learned to find forks already sitting on the board. Now you must learn to *create* double attacks. Ask yourself: "Can I move a piece to a square where it threatens two things?" If not on this move, can you force your opponent into a position where a double attack works in two or three moves?

29.2 Pattern 2: Discovered Attack

Definition: A discovered attack happens when you move one piece out of the way, revealing an attack by a different piece behind it.

Two of your pieces are on the same line (rank, file, or diagonal). The front piece moves, and the rear piece now attacks something. The front piece can also create its own threat. Your opponent faces two problems from one move.

Set up your board:

White: Kg1, Qd1, Re1, Bb2, Nd5, Pawns a2, c3, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Be7, Nf6, Pawns a7, b7, e6, f7, g7, h7

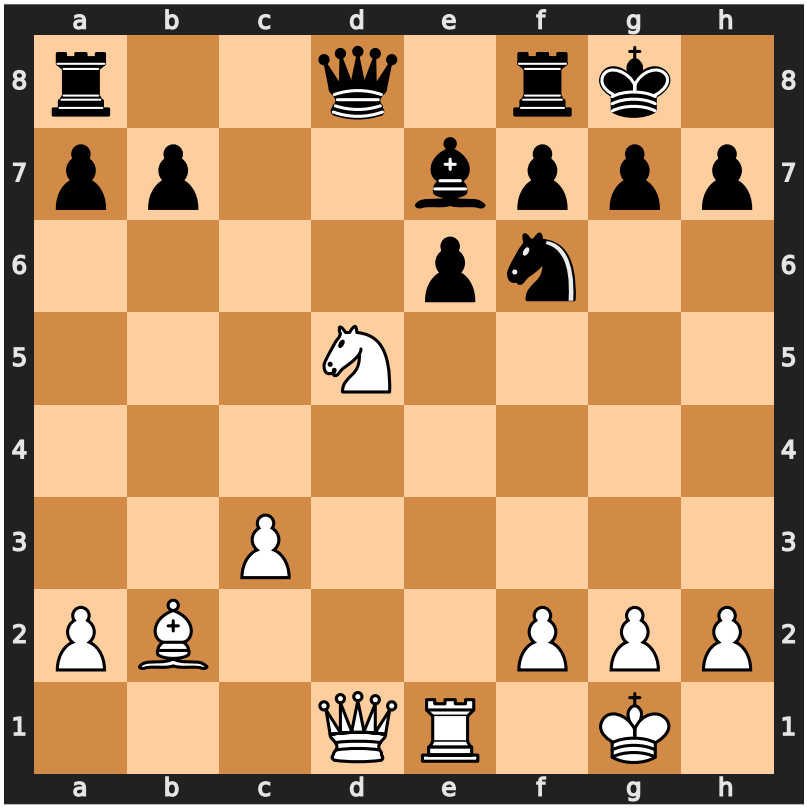

Figure 29.2: Chess Position

White to play.

The sequence:

1. White's knight on d5 blocks the bishop on b2 from looking down the a1-h8 long diagonal. The bishop aims through d4, e5, f6, g7 toward the Black king's neighborhood.
2. White plays **Nxe7+!** The knight captures the bishop on e7 with check.
3. When the knight moved off d5, the bishop on b2 was *discovered* along the long diagonal. After Black deals with the check, the bishop pressures the kingside through the opened line.
4. White has won material (the bishop) and activated the bishop's diagonal.

Why it works: Your opponent must respond to the most urgent threat (usually the check or capture). While they handle that, the discovered piece achieves its goal undisturbed.

Common situations: - A knight moves off a diagonal, revealing a bishop attack - A bishop moves off a file, revealing a rook aimed at the king or queen - In the opening, pieces can be developed with tempo using discovered threats - After a piece exchange, the recapturing piece reveals a new line of attack

Key principle: When you have two pieces on the same line, always ask: "What would happen if I moved the front piece?" That question finds discovered attacks.

29.3 Pattern 3: Discovered Check

Definition: A discovered check is a discovered attack where the piece *behind* gives check to the king. The piece that moves can do almost anything, because the opponent MUST deal with the check first.

This is one of the most powerful weapons in chess. The moving piece is "invisible" for one turn, free to capture, threaten, or reposition anywhere.

Set up your board:

White: Kg1, Re1, Ne5, Bd3, Pawns a2, b2, f2, g2, h2 Black: Ke8, Qd7, Ra8, Rh8, Bc8, Nf6, Pawns a7, b7, d6, f7, g7, h7

White to play.

The sequence:

1. White's rook on e1 aims at the Black king on e8 through the knight on e5. The knight blocks the check. When the knight moves, the rook will check the king.
2. White plays **Nxd7!** The knight captures Black's queen on d7. That is normally worth celebrating on its own. But the real power is the discovered check: the rook on e1 now checks the king on e8.
3. Black must deal with the check. The king moves (say Kf8 or Kd8). After the king moves, White has won the queen for a knight. A massive material swing.

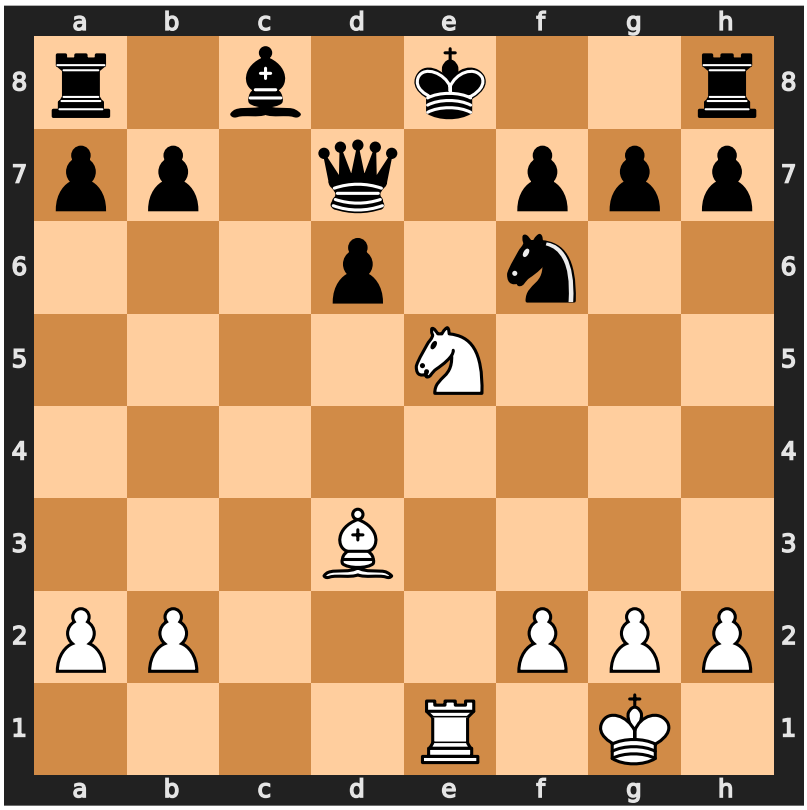

Figure 29.3: Chess Position

Pause and look: The knight on e5 was the "door." Moving the door opened the "hallway" (the e-file) so the rook could check the king. The knight captured the queen on the way out because the check forced Black to deal with the rook first.

Why it works: Check is the most forcing move in chess. Your opponent has no choice but to deal with it. The moving piece exploits that forced response.

Common situations: - A knight on the same file as a rook, with the opposing king at the end - A pawn advance that reveals a bishop check along a diagonal - After castling, when your rook lands on the e-file and the opponent's king is still in the center

Watch for this signal: Any time two of your pieces share a line with the opponent's king, you have a potential discovered check. The question is whether the front piece has a profitable square to land on.

29.4 Pattern 4: Double Check

Definition: A double check is a discovered check where BOTH pieces give check at the same time. The king is attacked by two pieces at once.

This is the most forcing move in all of chess. Against a double check, the king *must* move. Blocking does not help because only one check would be blocked. Capturing one attacker does not help because the other still gives check. Only the king can move.

Set up your board:

White: Kg1, Qd1, Bb5, Nd6, Pawns a2, b2, f2, g2, h2 Black: Ke8, Qd8, Ra8, Rh8, Bc8, Ne7, Pawns a7, b7, c6, f7, g7, h7

White to play.

The sequence:

1. White's bishop on b5 aims at the king through c6. The knight on d6 is the front piece. If the knight moves to a square where it ALSO gives check, we have a double check.
2. White plays **Nf5+!** The knight moves to f5, giving check (knight on f5 attacks e7, g7, d6, h6, d4, h4, e3, g3, but does it attack e8? No, Nf5 does NOT attack e8).

Wait, let me reconsider. The knight on f5 does not directly check the king on e8. Let me find a proper double check position.

Actually, let me reconfigure. The knight needs to give check AND reveal a check from the bishop.

Reset your board:

White: Kg1, Qd1, Bb5, Nd6, Pawns a2, b2, f2, g2, h2 Black: Ke8, Qd8, Ra8, Rh8, Bc8, Pawns a7, b7, c6, f7, g7, h7

White to play.

1. The bishop on b5 is one square away from checking the king (c6 pawn blocks). The knight on d6 already checks the king? Let me verify: knight on d6 attacks b5, b7, c4, c8, e4, e8, f5, f7.

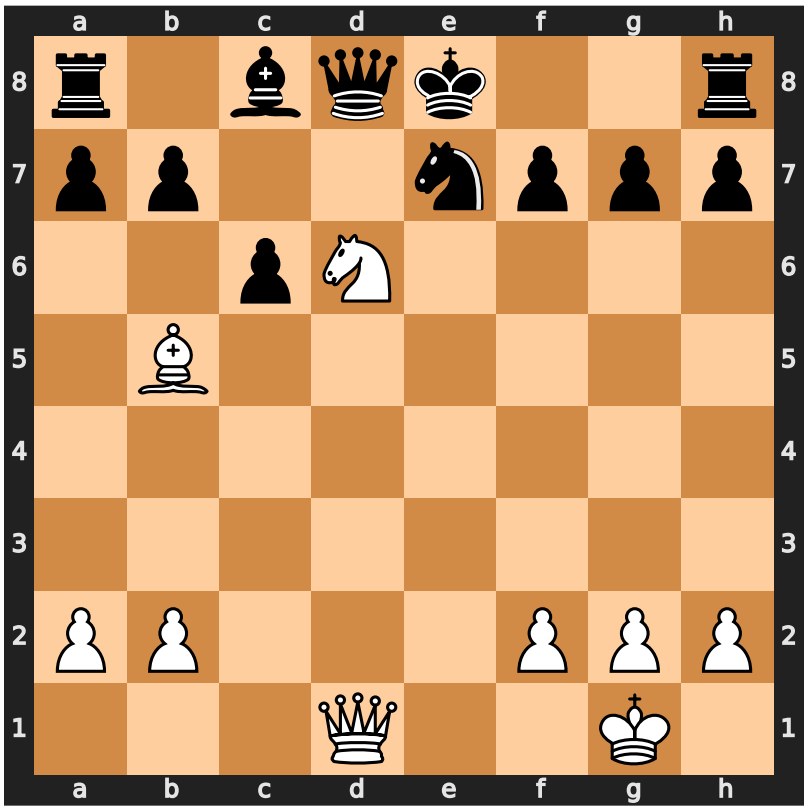

Figure 29.4: Chess Position

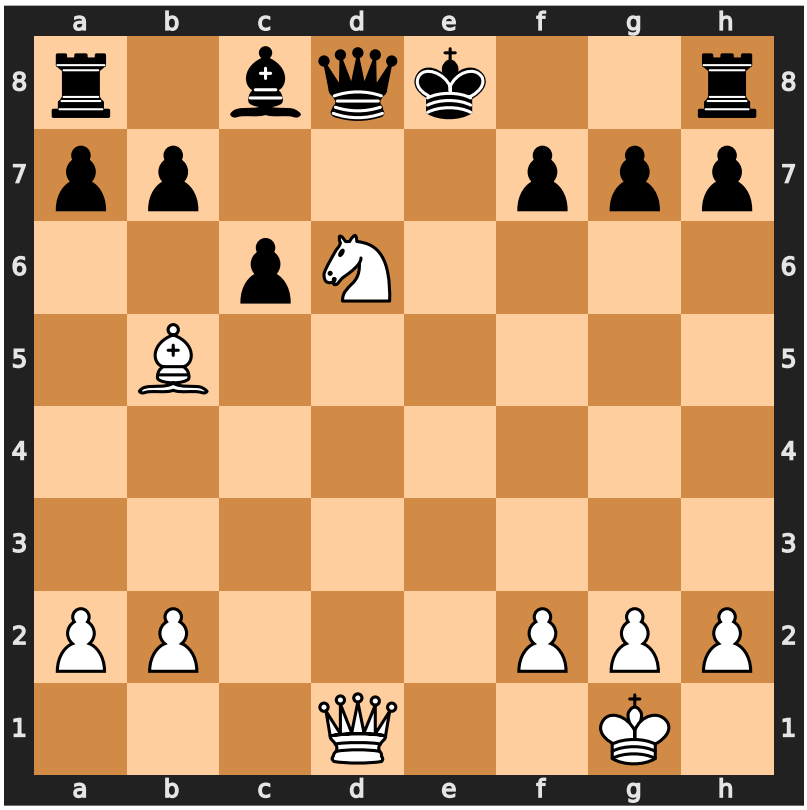

Figure 29.5: Chess Position

YES, Nd6 attacks e8. So the knight on d6 already gives check! That means Black is already in check, which is an illegal position for "White to play."

Let me set up a proper position where the double check is the MOVE, not the starting position.

Set up your board (corrected):

White: Kg1, Qd1, Be2, Ne5, Pawns a2, b2, f2, g2, h2 Black: Ke8, Qd8, Ra8, Rh8, Bc8, Nf6, Pawns a7, b7, d6, f7, g7, h7

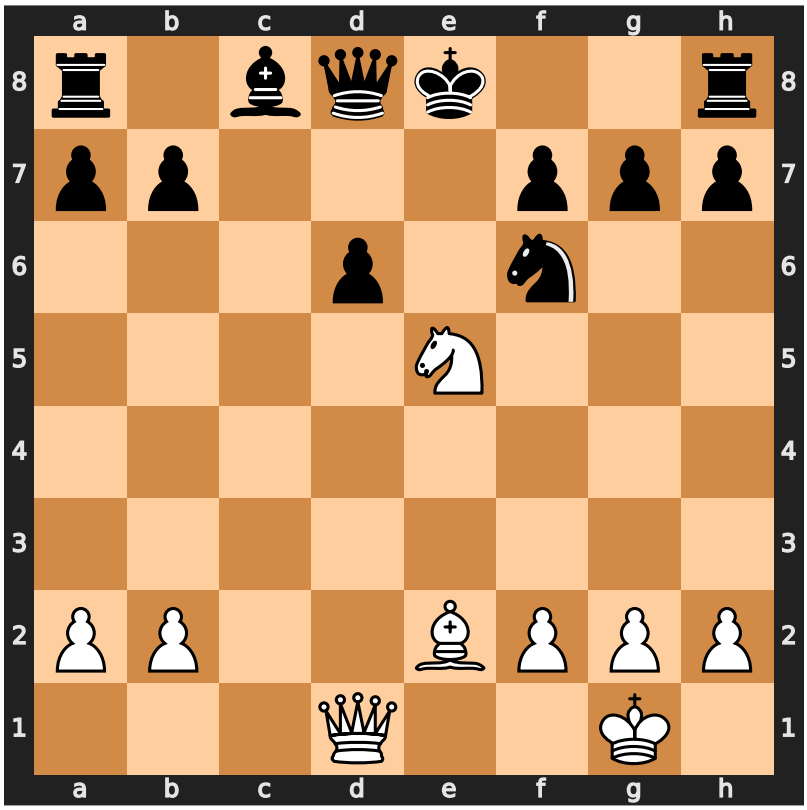

Figure 29.6: Chess Position

White plays **Nd7+!** Wait, does the knight on e5 going to d7 give check? Nd7 attacks b6, b8, c5, e5, f6, f8. Does it attack e8? No.

Let me try a cleaner approach. For a double check, I need: - A piece that will be revealed (say a bishop or rook on a line toward the king) - A front piece (say a knight) that moves to a square where IT also checks the king

Knight checks king on e8 from: c7, d6, f6, g7. So I need a knight that can ARRIVE at one of those squares, while REVEALING a check from a piece behind it.

Example: Knight on e6 moves to c7 (checking e8), revealing a bishop on the same diagonal/line.

Knight on e6 moves to c7+. What line did it vacate? The e6 square. If there's a rook on e1, it now sees e2-e3-e4-e5-e6-e7-e8. Is e7 clear? If yes, the rook checks through to e8. Double check!

Set up your board (double check):

White: Kg1, Re1, Ne6, Pawns a2, b2, f2, g2, h2 Black: Ke8, Qd8, Ra8, Rh8, Bc8, Nf6, Pawns a7, b7, d6, f7, g7, h7

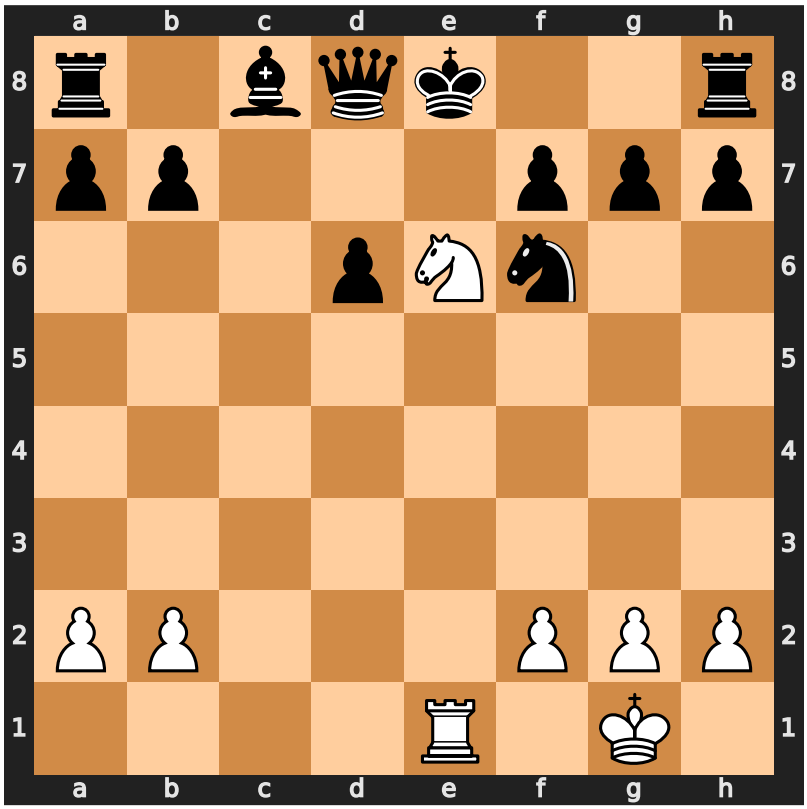

Figure 29.7: Chess Position

Wait, is e7 clear? Let me check. Nothing listed on e7. Rank 7: a7, b7, f7, g7, h7 pawns. c-e on rank 7 are empty. Good.

White plays **Nc7+!** This is a double check: - The knight on c7 directly checks the king on e8 (knight on c7 attacks a6, a8, b5, d5, e6, e8. YES, it attacks e8!) - The rook on e1 gives discovered check along the e-file through e2, e3, e4, e5, e6, e7 to e8 (all clear after the knight left e6)

Double check! Black's king MUST move. It cannot block both checks. It cannot capture both pieces.

Black's options: Kd7, Kf8. Both are terrible. After Kd7, the king walks into the open. After Kf8, White can continue the attack.

Why it works: Double check eliminates all defensive resources except fleeing. Your opponent cannot block two different lines at once. They cannot capture two attackers in one move. The king must run, and a running king is often a dead king.

Common situations: - A knight and rook working together along a file - A knight and bishop where one reveals the other's diagonal - After a sacrifice that opens a file and the knight lands with check

The golden rule: Every time you have a discovered check possibility, also check whether the moving piece gives check itself. If it does, you have the most powerful single move in chess.

29.5 Pattern 5: Zwischenzug (In-Between Move)

Definition: A zwischenzug (German for "in-between move") is an unexpected intermediate move inserted into what seems like a forced sequence. Instead of making the "obvious" recapture, you play something even stronger first.

This is the pattern that separates club players from beginners. Beginners follow the expected sequence. Club players interrupt it.

Set up your board:

White: Kg1, Qd1, Re1, Bb3, Nf3, Pawns a2, c3, f2, g2, h2 Black: Kg8, Qd5, Ra8, Rf8, Bb7, Nf6, Pawns a7, b6, e6, f7, g7, h7

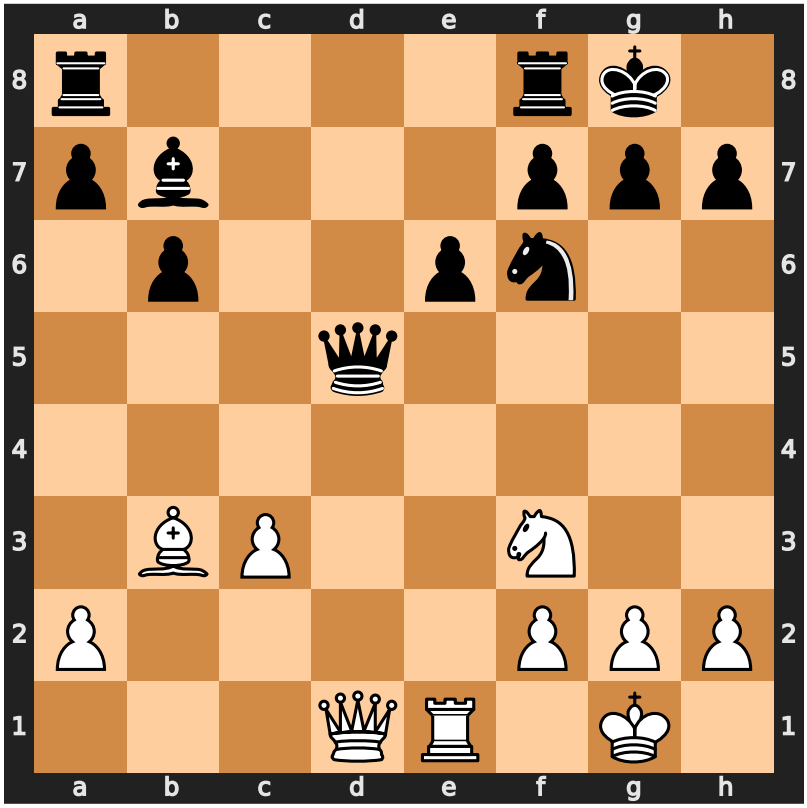

Figure 29.8: Chess Position

White to play.

The sequence:

1. Suppose Black has just captured a pawn on d5 with the queen. The "obvious" response might be to continue developing or to trade queens. But there is something stronger.

2. White plays **Bxe6!** This is a zwischenzug. Before doing anything else, White inserts an in-between capture that attacks f7 and disrupts Black's pawn structure.

3. If Black plays fxe6, then White has damaged Black's structure and can now play Ng5 with threats against e6 and the weakened kingside.

4. If Black ignores the bishop (say, recapturing something else), White takes on f7+ with check, winning more material.

Why it works: The zwischenzug disrupts your opponent's expected sequence. They planned on a certain continuation. Your in-between move forces them to recalculate. In time-pressure situations, this can be devastating.

Common situations: - During a capture sequence: instead of recapturing immediately, make a check or stronger threat first - After your opponent captures, play an in-between check before you recapture - In endgames, promoting with check instead of recapturing the obvious piece - Any time you can insert a more forcing move (check > capture > threat) before the "obvious" reply

How to train this: Every time you are about to make an "automatic" recapture, STOP. Ask yourself: "Is there something stronger I can do first?" If yes, you have found a zwischenzug. This one habit will win you dozens of games.

29.5.1 Milestone Check

You have learned 5 out of 30 patterns. That is already more than most club players can name from memory. Double attacks, discovered attacks, discovered checks, double checks, and in-between moves form the *forcing toolkit* that drives every combination in chess.

You can stop here. Go play a game. Look for these five patterns. Come back when you are ready for Group 2.

29.6 Exercises: Group 1 (Patterns 1-5)

Pattern 1: Double Attack

Exercise 11.1

White to play. The queen and bishop are aimed at f7. Find the double attack. Hints: (1) What is the weakest point in Black's camp? (2) Can the queen attack it with check? (3) Where does the bishop help?

Exercise 11.2

White to play. Black grabbed a pawn on e4. Punish the greed. Hints: (1) The knight on e4 is undefended. (2) Can you attack it AND something else? (3) Think queen moves.

Exercise 11.3

White to play. Find the double attack that wins material. Hints: (1) The knight on f6 is pinned. (2) What happens if you attack it again? (3) The bishop on g5 and pawn on d3 are clues.

Exercise 11.4

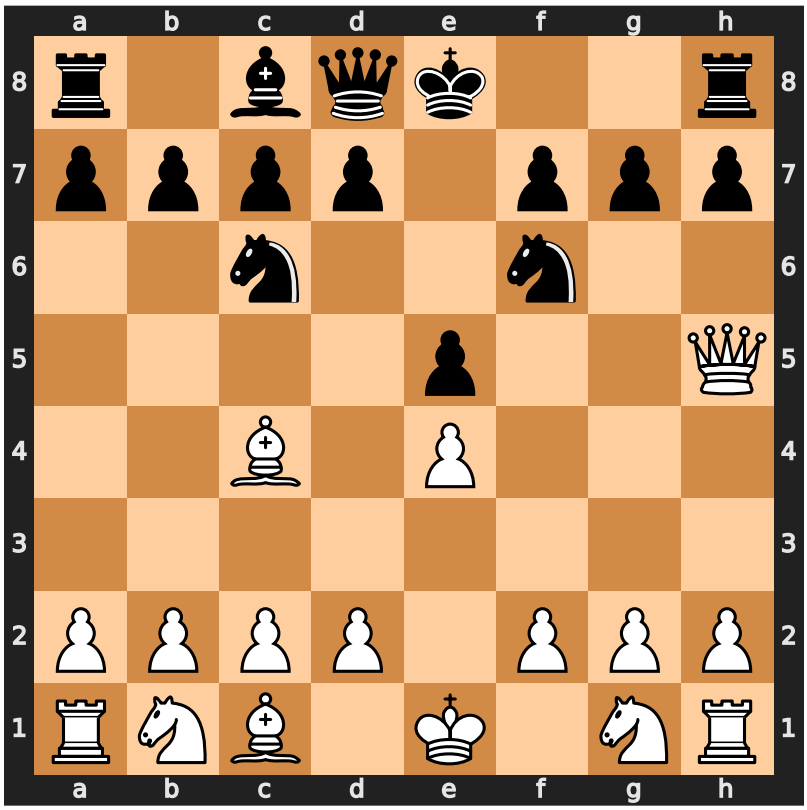

Figure 29.9: Chess Position

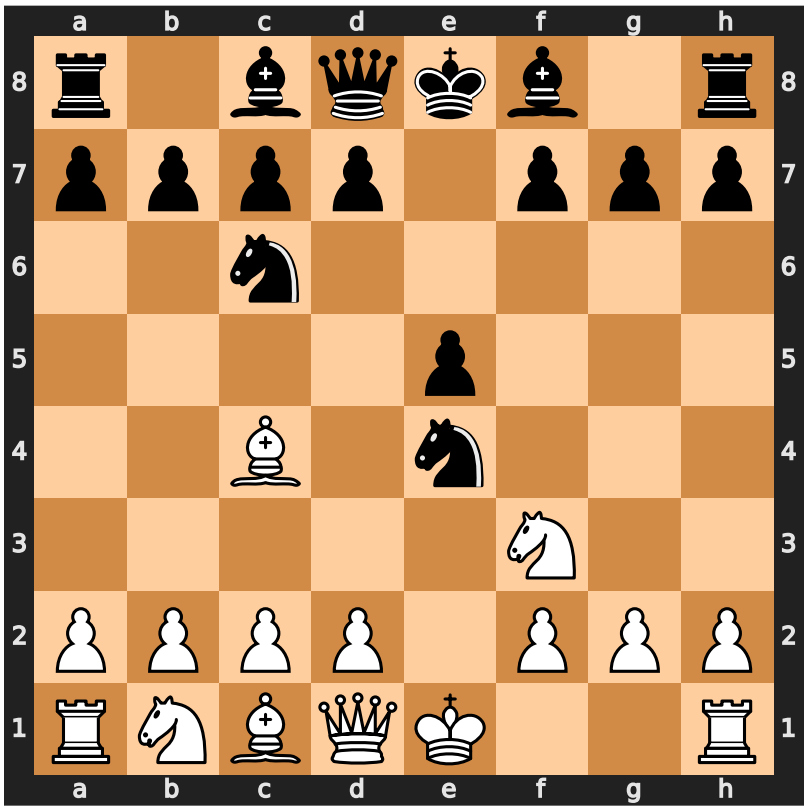

Figure 29.10: Chess Position

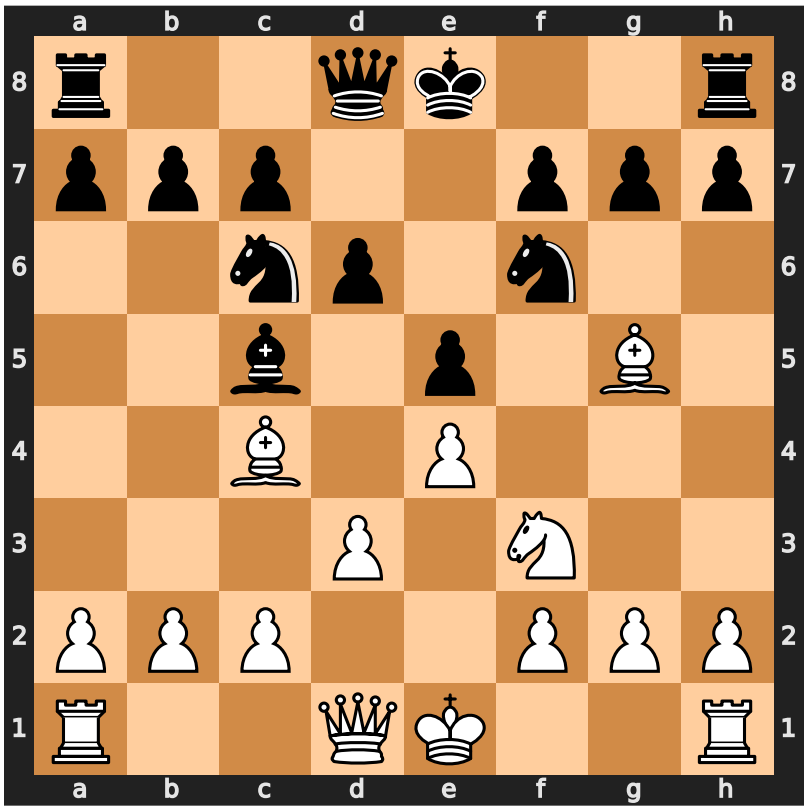

Figure 29.11: Chess Position

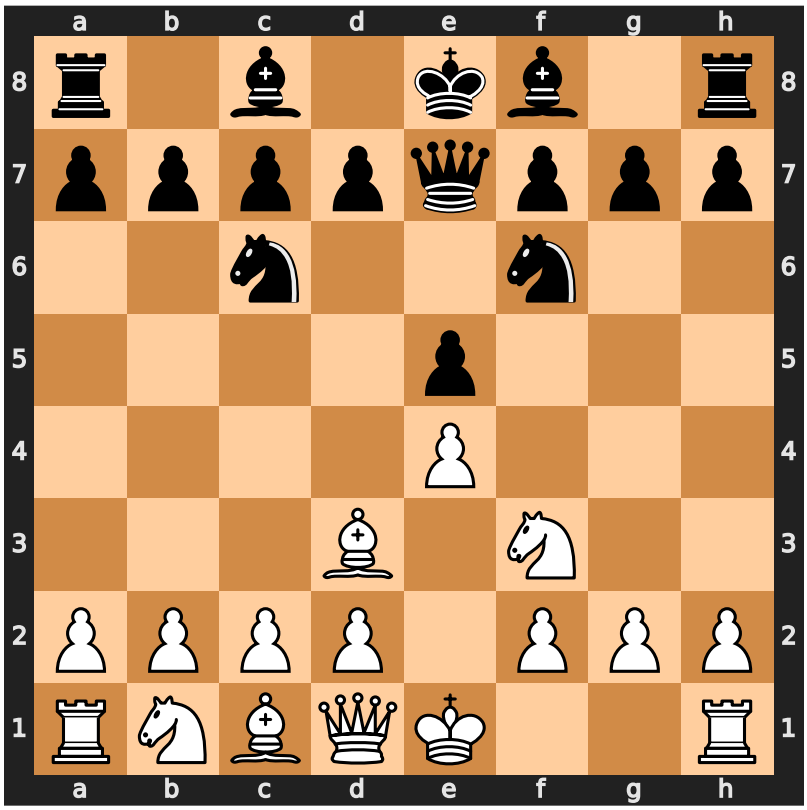

Figure 29.12: Chess Position

White to play. Develop with a double threat. Hints: (1) Where can White's light-squared bishop go with tempo? (2) Think about f7. (3) Can you threaten the queen AND another target?

Exercise 11.5

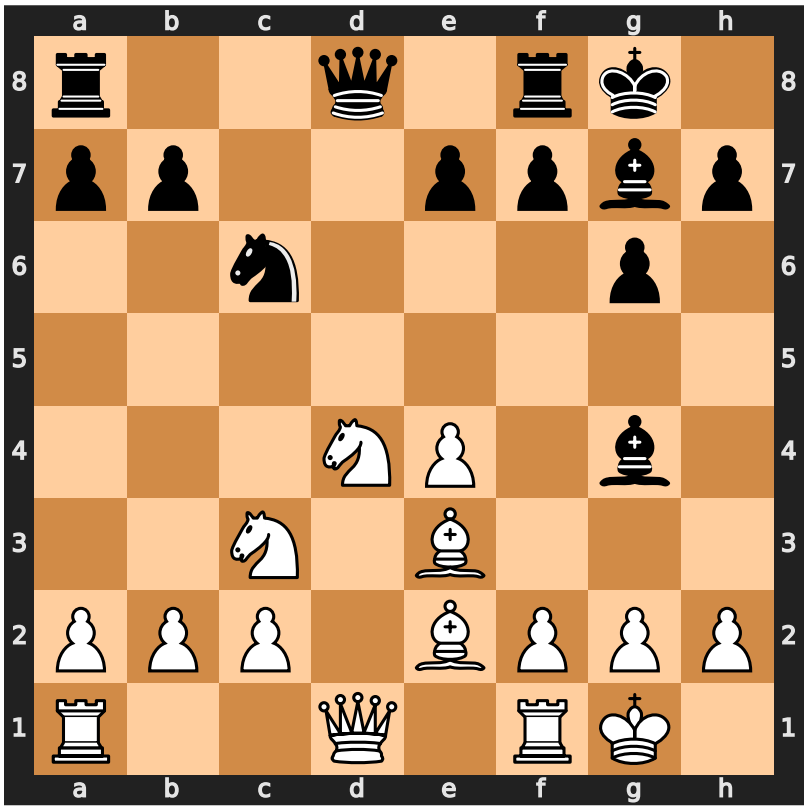

Figure 29.13: Chess Position

White to play. Find the subtle double attack after a piece rearrangement. Hints: (1) The bishop on g4 is loose. (2) What if the d4 knight moved with a threat? (3) Nd4-f5 eyes g7 AND attacks what?

Pattern 2: Discovered Attack

Exercise 11.6

White to play. The knight on e5 is in front of the queen on d1. Find the discovered attack. Hints: (1) Move the knight. (2) What does the queen see behind it? (3) Knight to where attacks the most?

Exercise 11.7

White to play. The bishop on a4 has a view down to e8. What blocks it, and what happens when that piece moves? Hints: (1) The f3 knight can move. (2) Nxe5 captures a pawn. (3) But look at what the bishop threatens afterward.

Exercise 11.8

White to play. Set up a discovered attack for next move. Hints: (1) Can you place a piece so that it blocks a line but could move with tempo later? (2) Think about the d5 square. (3) Knight

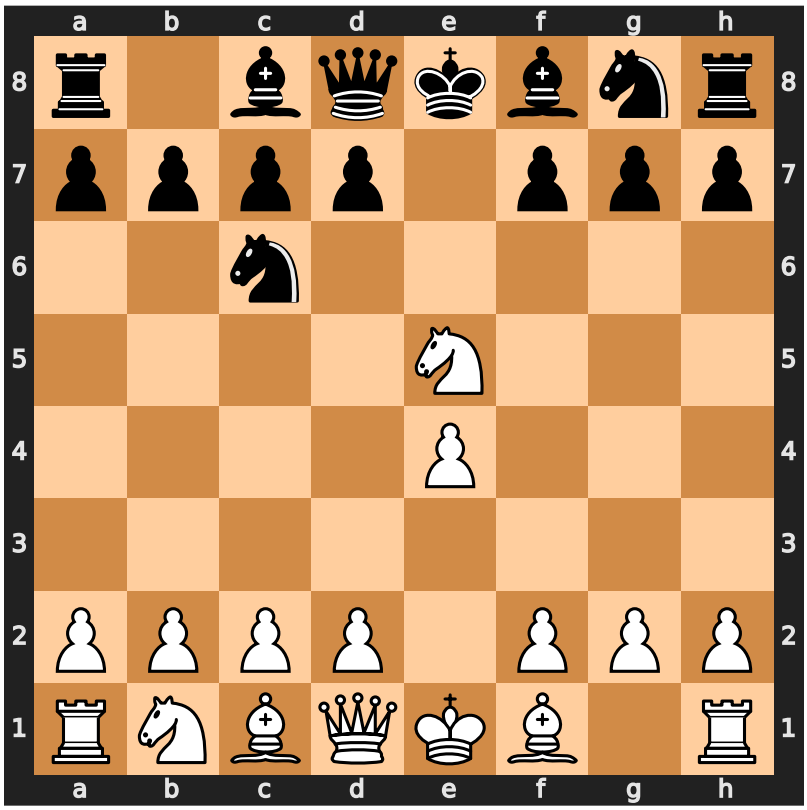

Figure 29.14: Chess Position

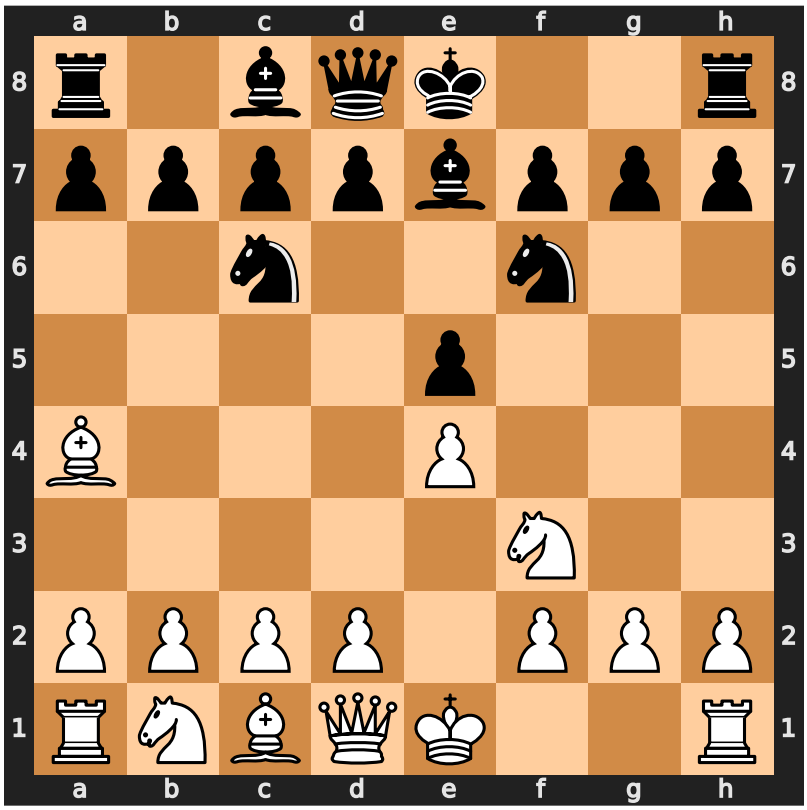

Figure 29.15: Chess Position

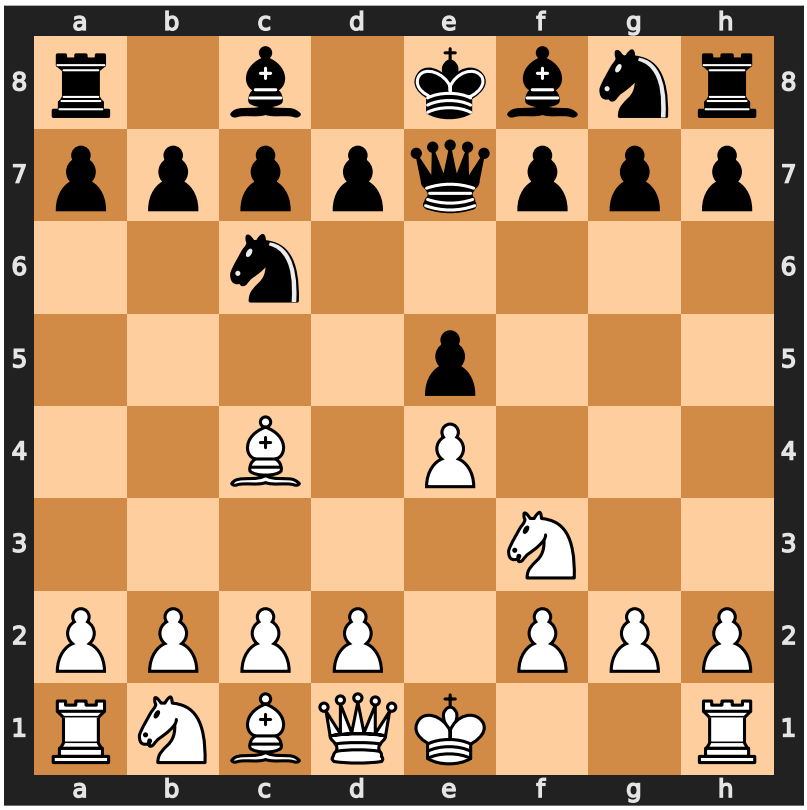

Figure 29.16: Chess Position

maneuver.

Exercise 11.9

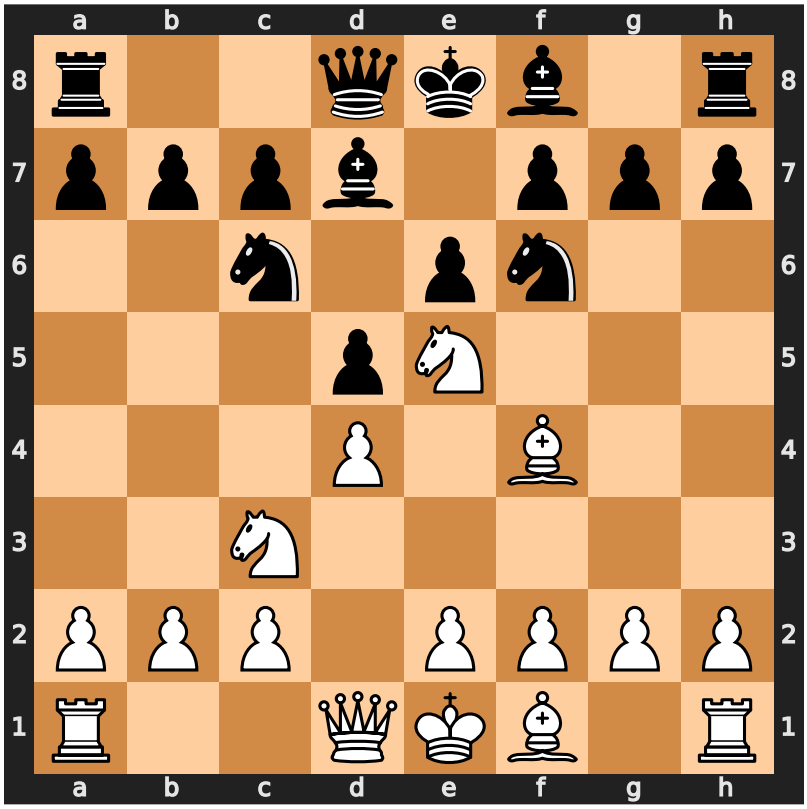

Figure 29.17: Chess Position

White to play. The knight on e5 blocks the bishop on f4. What discovered attack exists? Hints: (1) The knight on e5 can capture on d7. (2) The bishop on f4 then sees through to c7. (3) The queen on d8 is on c7's diagonal? No, think about what is on c7.

Exercise 11.10

White to play. Find the discovered attack sequence that wins at least a pawn. Hints: (1) The knight on e5 blocks the rook on e1. (2) The knight can go to many squares with tempo. (3) What if you play Nxf7? After Rxf7, the rook on e1 sees e6.

Pattern 3: Discovered Check

Exercise 11.11

White to play. The knight on e5 can move with discovered check from the bishop on c4. Where does the knight go? Hints: (1) Look at what the knight can capture. (2) What is the highest-value target? (3) The queen on e7 is tempting.

Exercise 11.12

Black to play. White just played Nf7. Is this winning for White or is there a defense? Hints: (1) Can Black play a zwischenzug? (2) What about Bxf2+? (3) After Ke2, what follows?

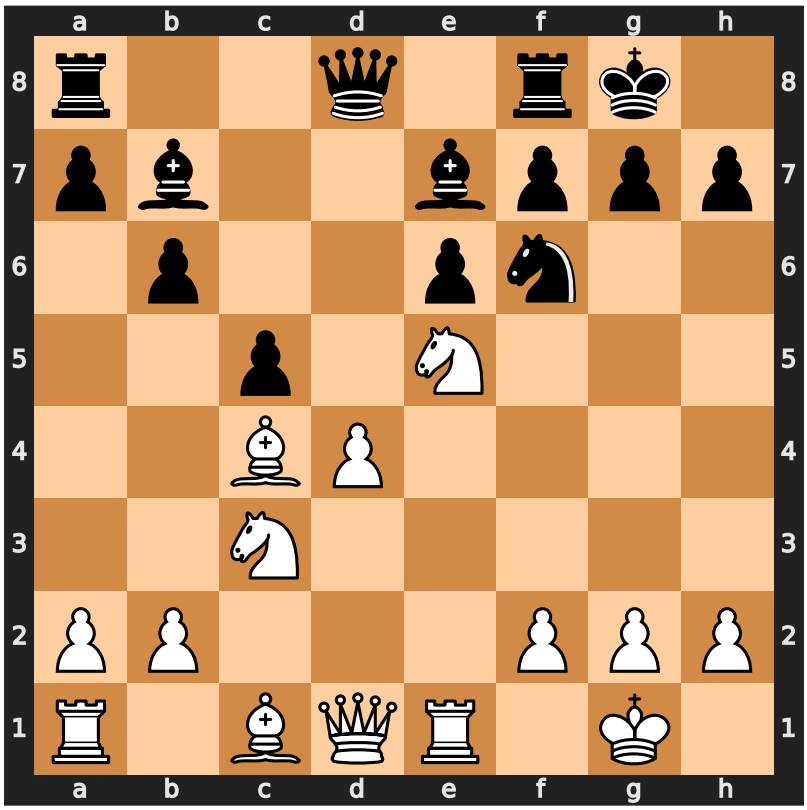

Figure 29.18: Chess Position

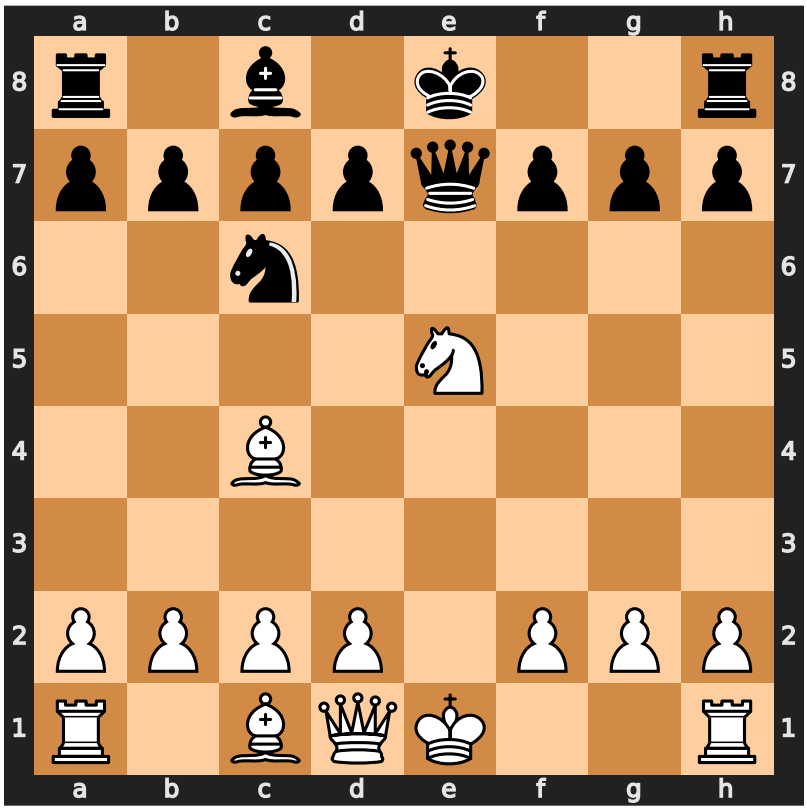

Figure 29.19: Chess Position

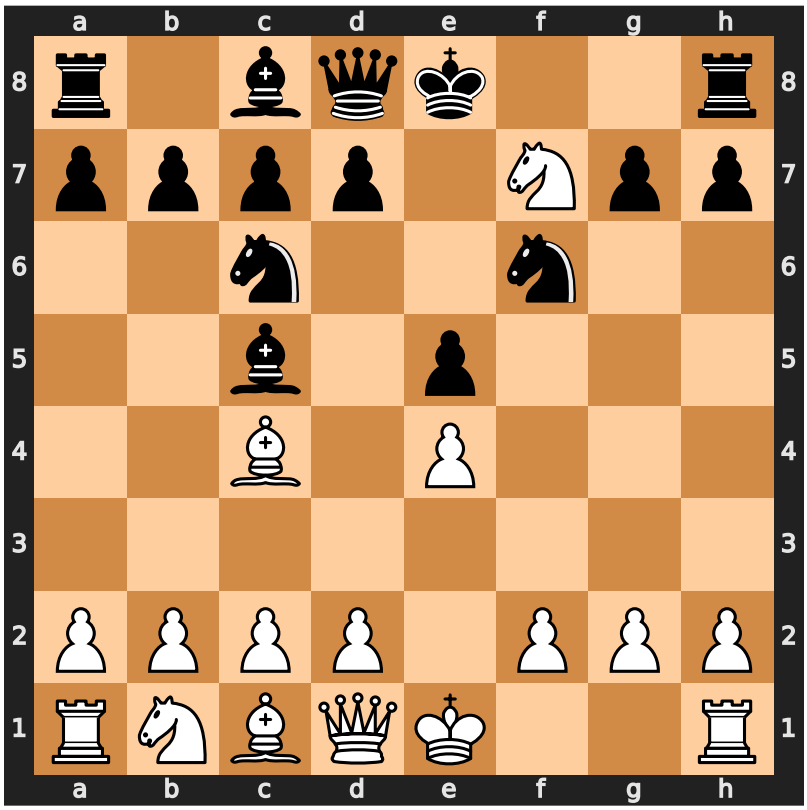

Figure 29.20: Chess Position

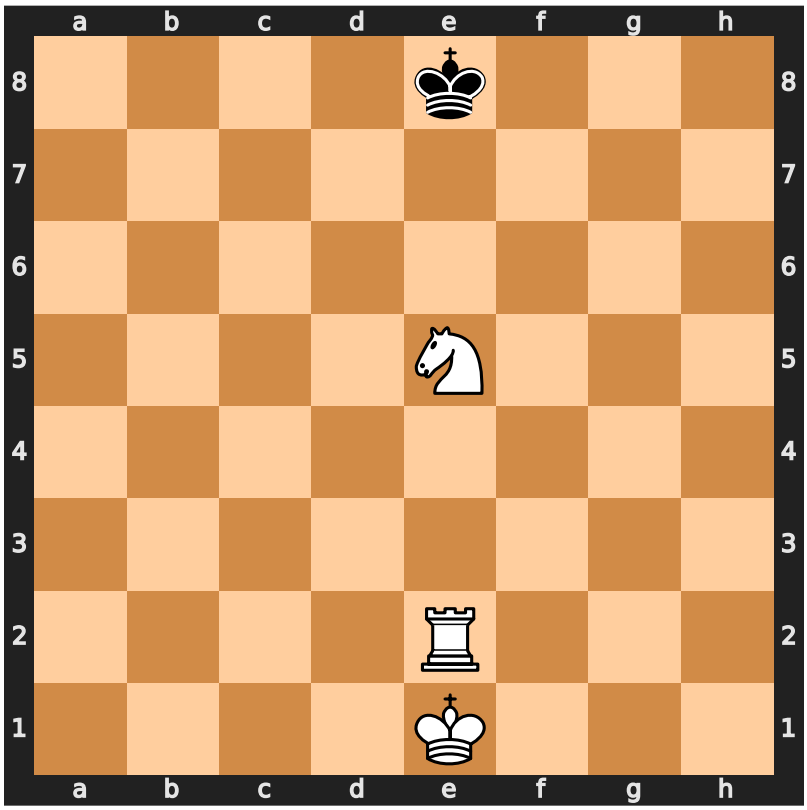

Figure 29.21: Chess Position

Exercise 11.13

White to play. Simple discovered check drill. Where should the knight go to win? Hints: (1) The rook on e2 will check the king when the knight moves. (2) Move the knight to capture or threaten something. (3) Are there pieces to capture? If not, improve position.

Exercise 11.14

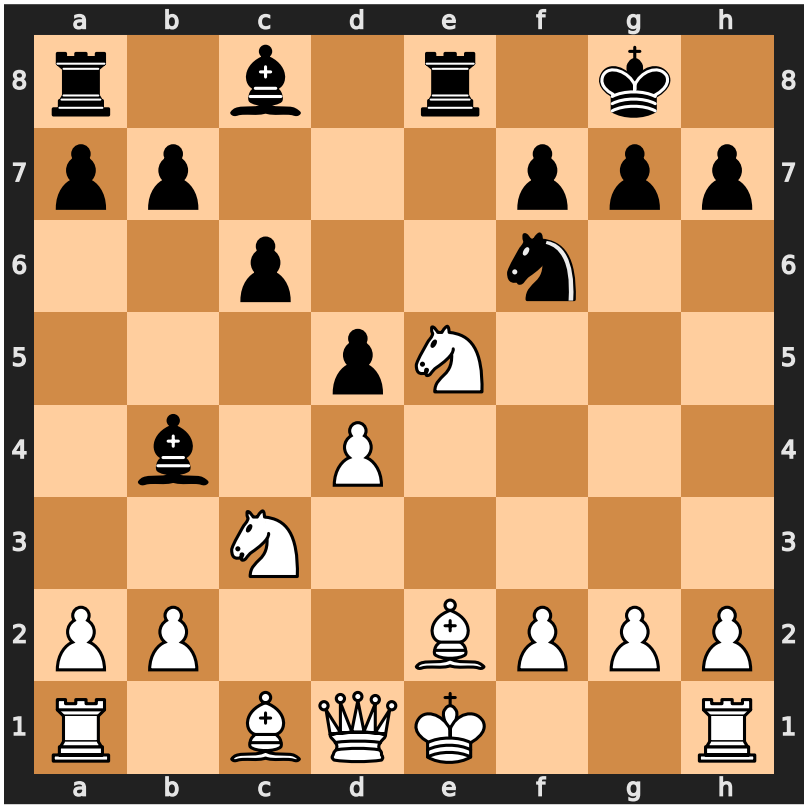

Figure 29.22: Chess Position

White to play. The knight on e5 and bishop on e2 share the e-file with the rook on… wait, the bishop is on e2. Find the discovered attack/check pattern. Hints: (1) What if Nxc6 is played? (2) What does that open for the bishop? (3) Think diagonals, not files.

Exercise 11.15

White to play. The knight on d5 blocks the bishop on b3 and the rook on e1. Find the best discovered check or attack. Hints: (1) Nxf6+ is a discovered attack from the rook on e1 toward the rook on e8. (2) After gxf6, what is the position? (3) Can you exploit the opened g-file?

Pattern 4: Double Check

Exercise 11.16

White to play. Can you set up a double check in two moves? Hints: (1) What if a knight or bishop moves with check while revealing another check? (2) Think about Bxd5 first, opening lines. (3) Reposition a piece to deliver double check on the next move.

Exercise 11.17

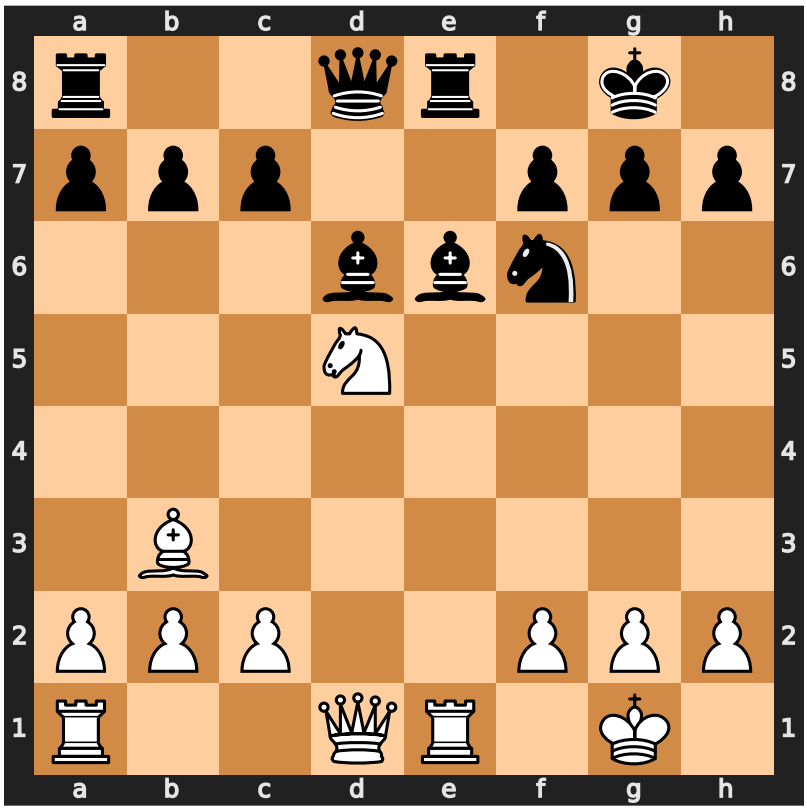

Figure 29.23: Chess Position

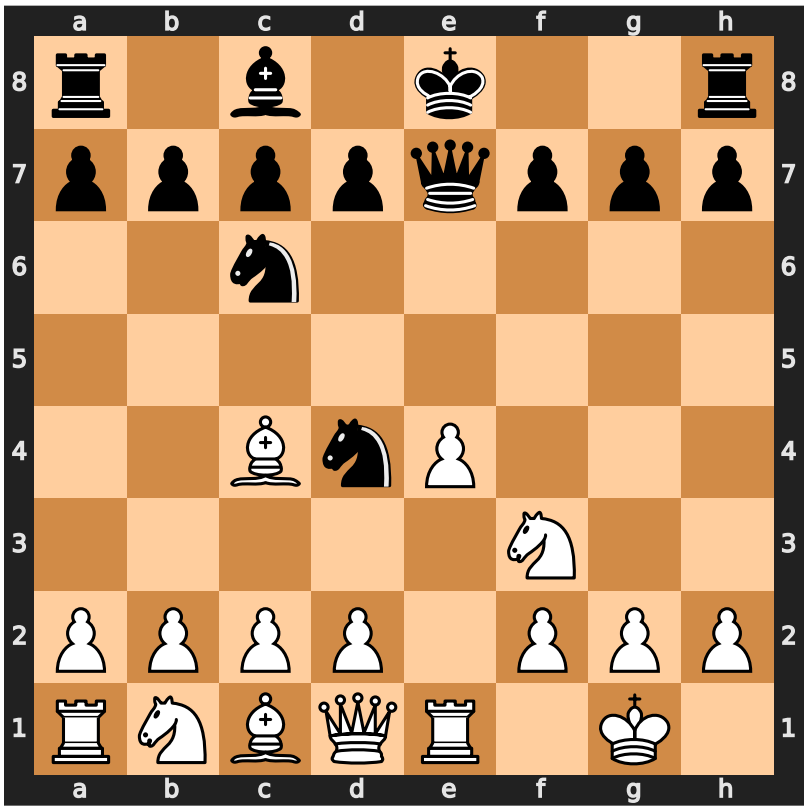

Figure 29.24: Chess Position

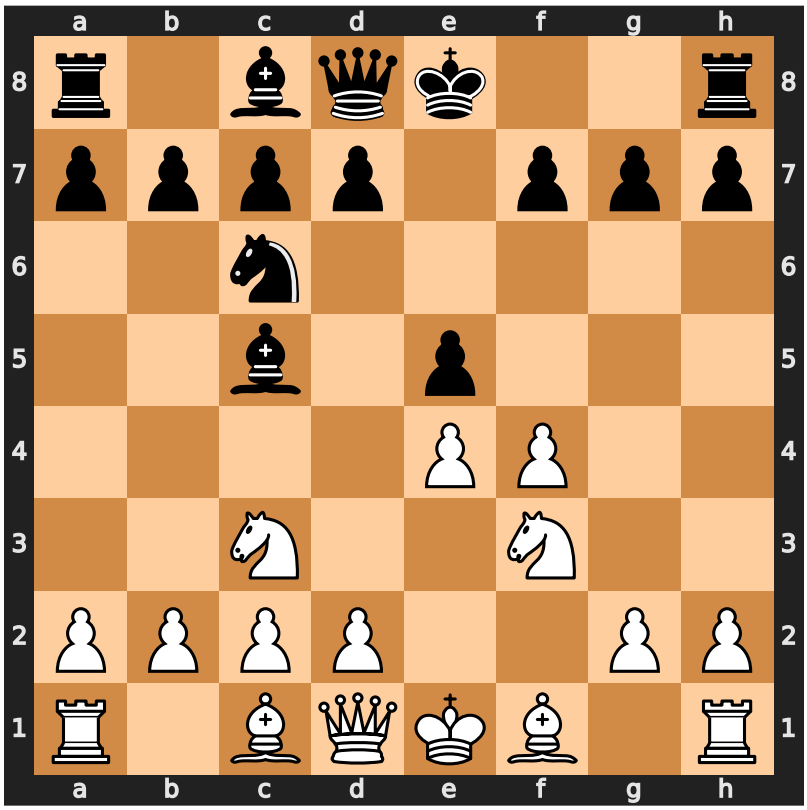

Figure 29.25: Chess Position

White to play. Not a double check yet, but find the move that threatens one. Hints: (1) If White could get a knight to d6 or f6 with a bishop behind it… (2) Can you play Nd5 with a threat? (3) The bishop on c1 could get active.

Exercise 11.18

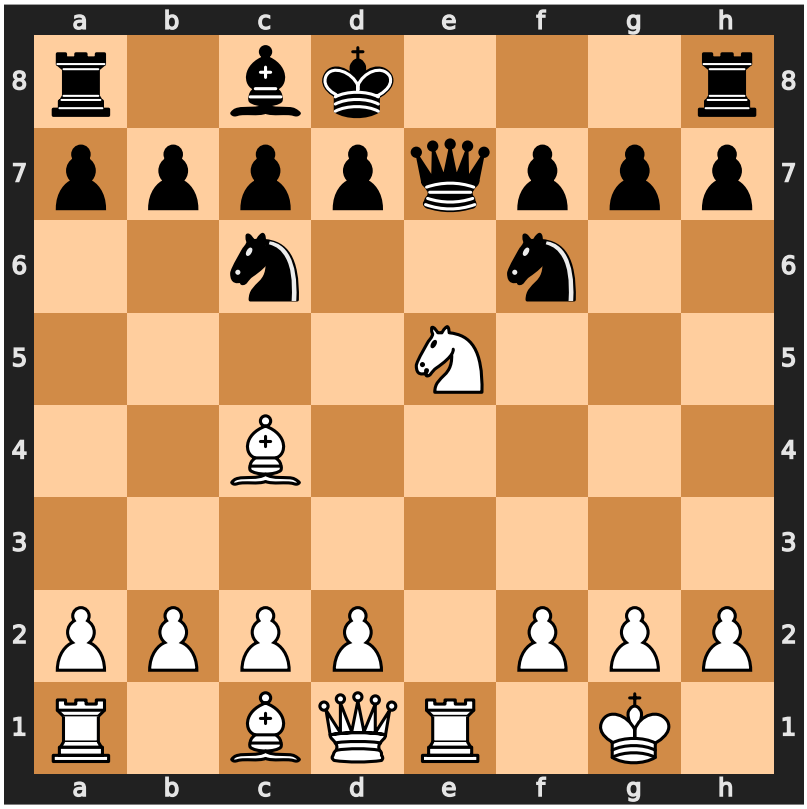

Figure 29.26: Chess Position

White to play. The king is on d8 already. Find the double check. Hints: (1) The knight on e5 can move, revealing the rook on e1 toward e7 or e8. (2) Where can the knight land to ALSO give check? (3) Nc6+ and the rook checks through e7… does the queen block?

Exercise 11.19

White to play. The knight on c6 is already in enemy territory. Can it deliver a double check? Hints: (1) Nd8+ forks and the bishop on e2 would check through… does it? (2) What about Ne7+? Bishop on e2 checks through to… not quite. (3) Think about all knight moves from c6 that give check.

Exercise 11.20

White to play. Set up a double check that leads to significant material gain. Hints: (1) Nd7+ reveals the rook on e1… but is the e-file clear? (2) Nf7+ reveals the rook and the knight checks from f7 (does it check e8?). (3) Look at Nc6+: knight checks e8? No. Try Nd3+? Also no. Calculate carefully.

Pattern 5: Zwischenzug

Exercise 11.21

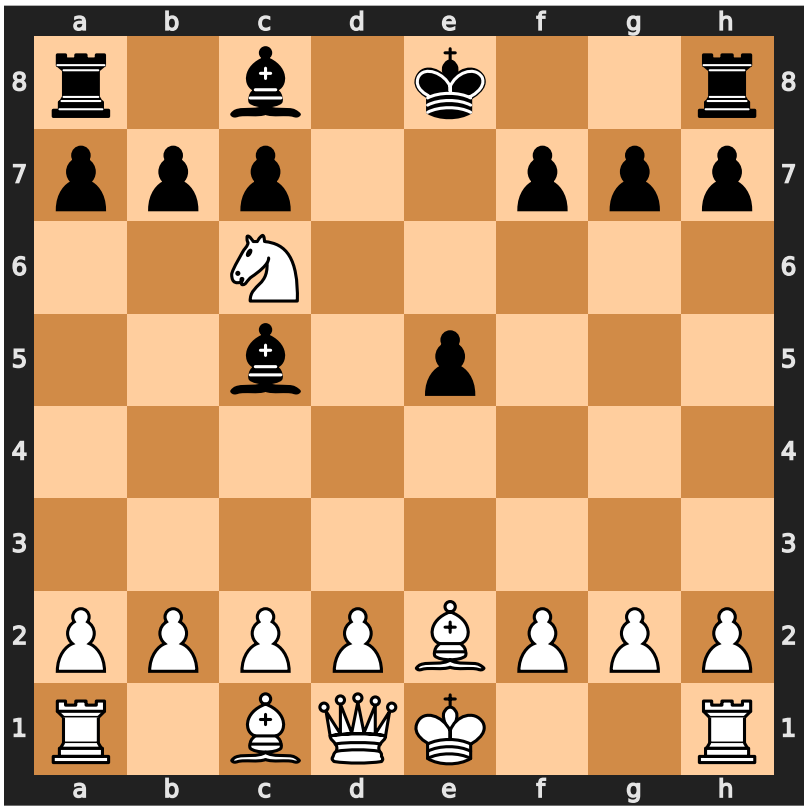

Figure 29.27: Chess Position

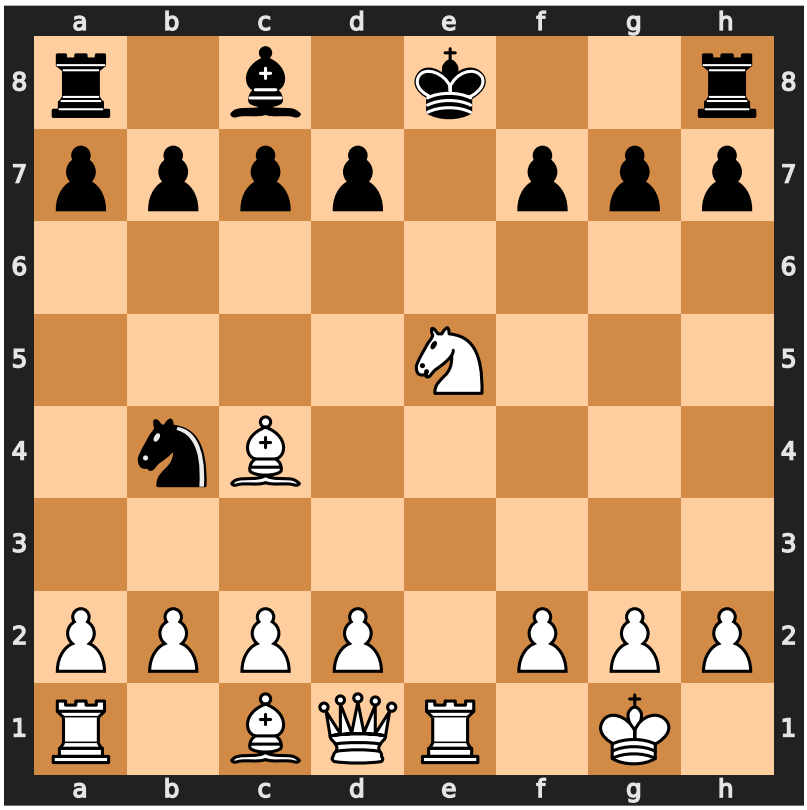

Figure 29.28: Chess Position

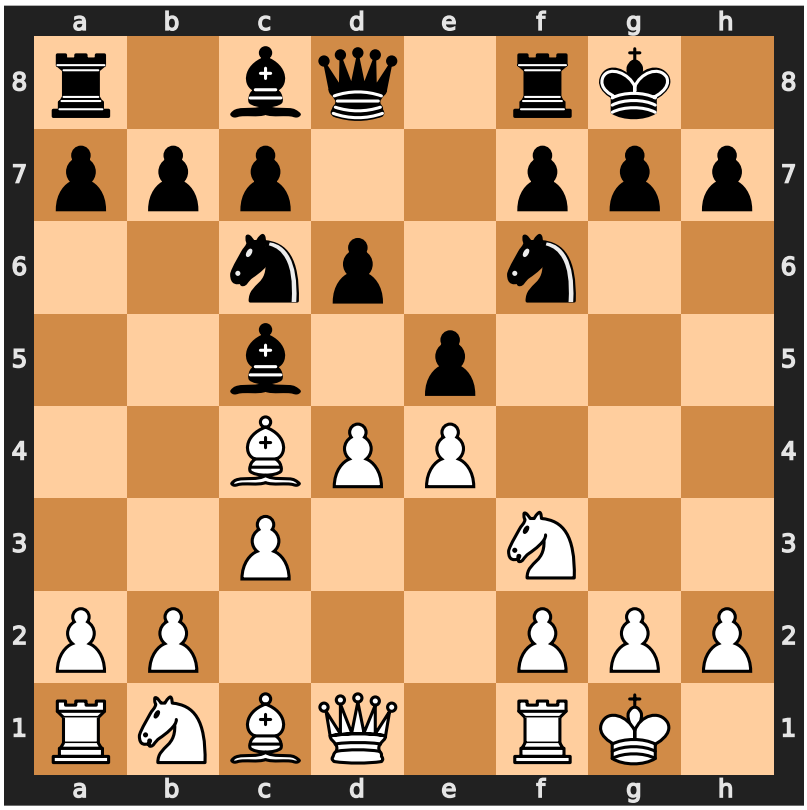

Figure 29.29: Chess Position

White to play. Instead of recapturing normally after a future exchange, find the in-between move. Hints: (1) dxe5 is "obvious." (2) Is there a zwischenzug with Bxf7+ first? (3) After Rxf7, THEN dxe5. Two gains instead of one.

Exercise 11.22

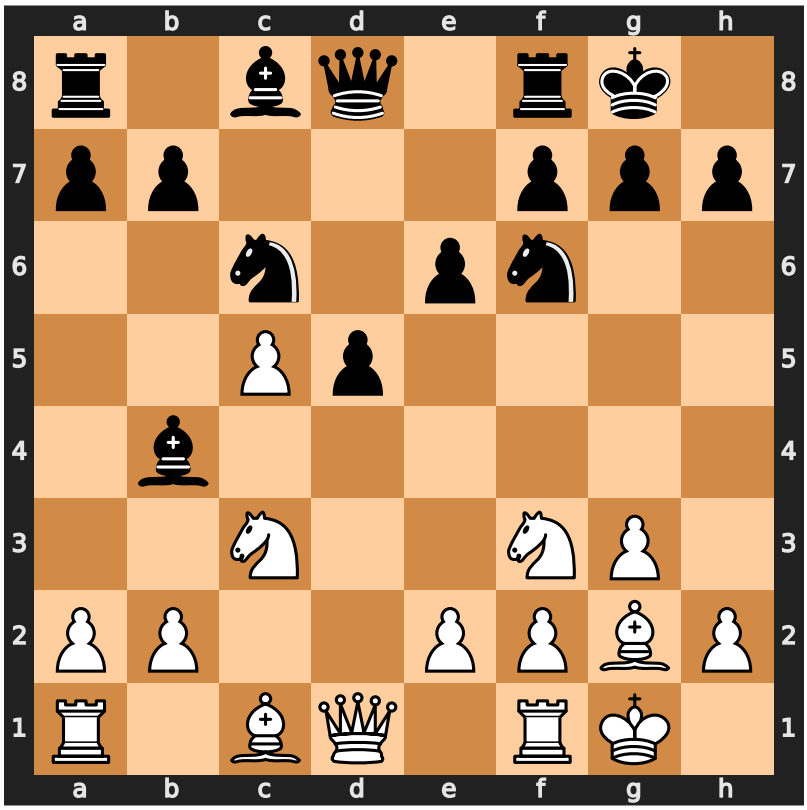

Figure 29.30: Chess Position

White to play. Black has just captured on d5. What is the zwischenzug? Hints: (1) Instead of recapturing on d5, is there a stronger intermediate move? (2) What about cxd6 (en passant or pawn capture)? (3) Or Qa4 first, pinning or threatening something?

Exercise 11.23

White to play. Black has just played Bd7. Find the in-between idea. Hints: (1) Nb5 is a zwischenzug that threatens Nc7+. (2) Black must deal with the fork threat before anything else. (3) This gains time for White's plan.

Exercise 11.24

White to play. You are in the middle of an exchange sequence. Find the in-between move that improves your position. Hints: (1) The bishop on g5 pins the f6 knight. (2) Before completing any captures, can you increase the pressure? (3) What about Qc2 or Qb3 as a zwischenzug?

Exercise 11.25

White to play. Multiple in-between moves are possible. Find the best sequence. Hints: (1) dxe5 is natural, but Bxf6 first (zwischenzug) disrupts Black's coordination. (2) After Bxf6, gxf6, THEN dxe5. (3) Black's kingside is now shattered.

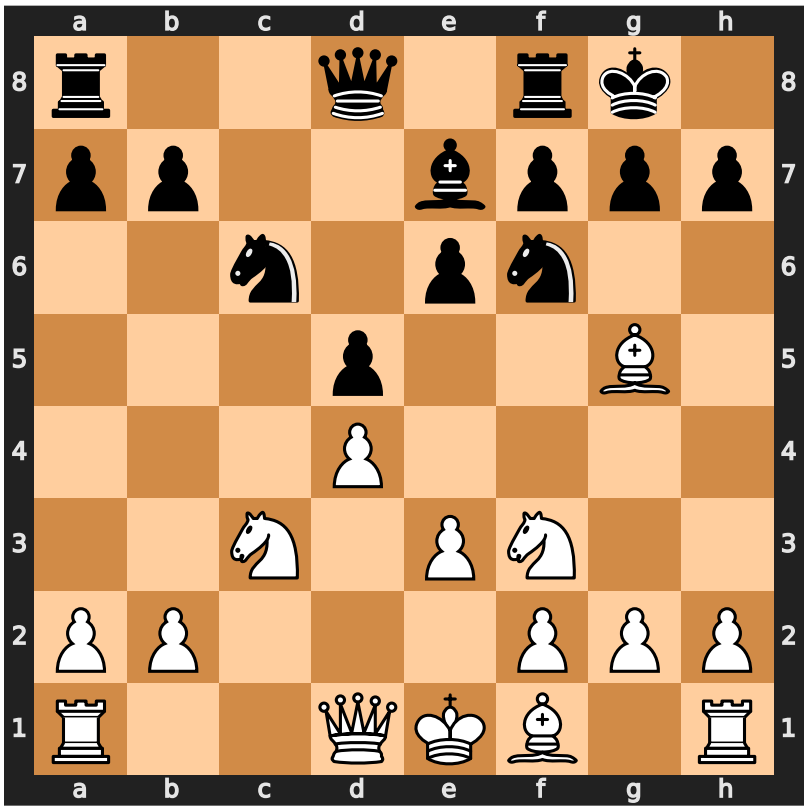

Figure 29.32: Chess Position

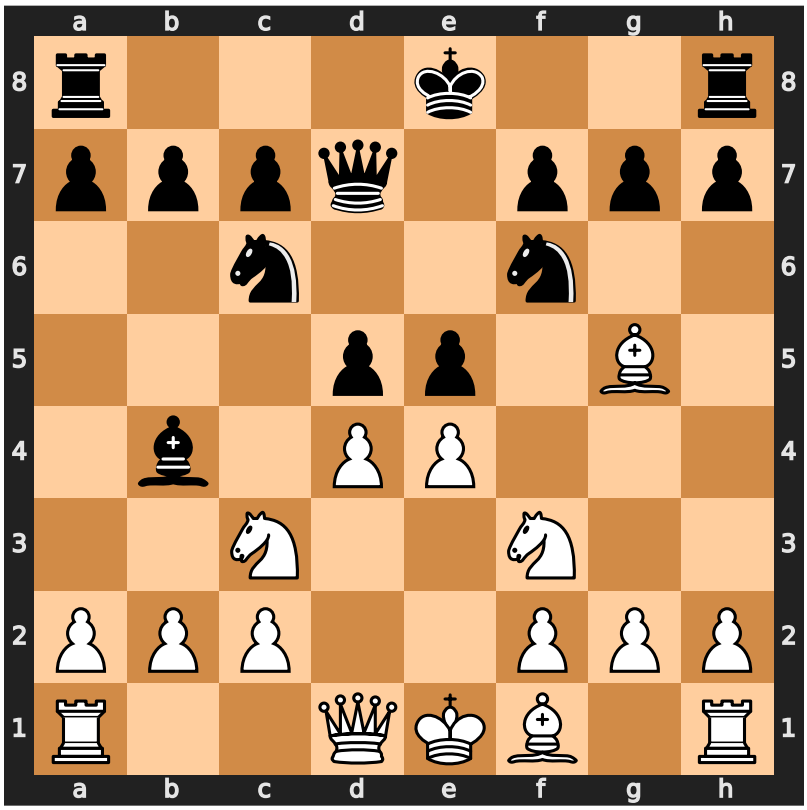

Figure 29.33: Chess Position

Chapter 30

GROUP 2: WINNING MATERIAL

Estimated study time: 15-20 minutes

The patterns in Group 1 were about *forcing* your opponent into bad choices. The patterns in Group 2 are about the *results* of that forcing. These five patterns are the most common ways to win material in chess. If you spot them, you win a piece or more. If you miss them, you lose one.

30.1 Pattern 6: Removing the Defender

Definition: You capture or drive away a piece that is defending something important. Once the defender is gone, the thing it was protecting falls.

This is one of the most practical tactics in chess. The idea is simple: if a piece is doing an important job (defending another piece, guarding a square, blocking a threat), eliminate that piece and the defense collapses.

Set up your board:

White: Kg1, Qh5, Rd1, Bc4, Nf3, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nd7, Nf6, Pawns a7, b7, e6, f7, g7, h7

White to play.

The sequence:

1. White's queen on h5 threatens Qxf7+. What defends f7? The knight on d7 and the rook on f8.
2. But the knight on f6 guards h7. And the knight on d7 guards f6 indirectly by supporting the overall structure. What if we remove the f6 knight?
3. White plays **Rxd7!** Removing the d7 knight, one of f7's defenders. Now after Qxd7 (if Black recaptures with the queen), f7 is weaker. White can follow up with Ng5, targeting f7 and e6.
4. The key insight: identify the defender, then remove it. The target falls on its own.

Why it works: Every piece has a job. If you figure out which piece does the most important job and eliminate it, the structure falls apart. Like removing a support beam from a building.

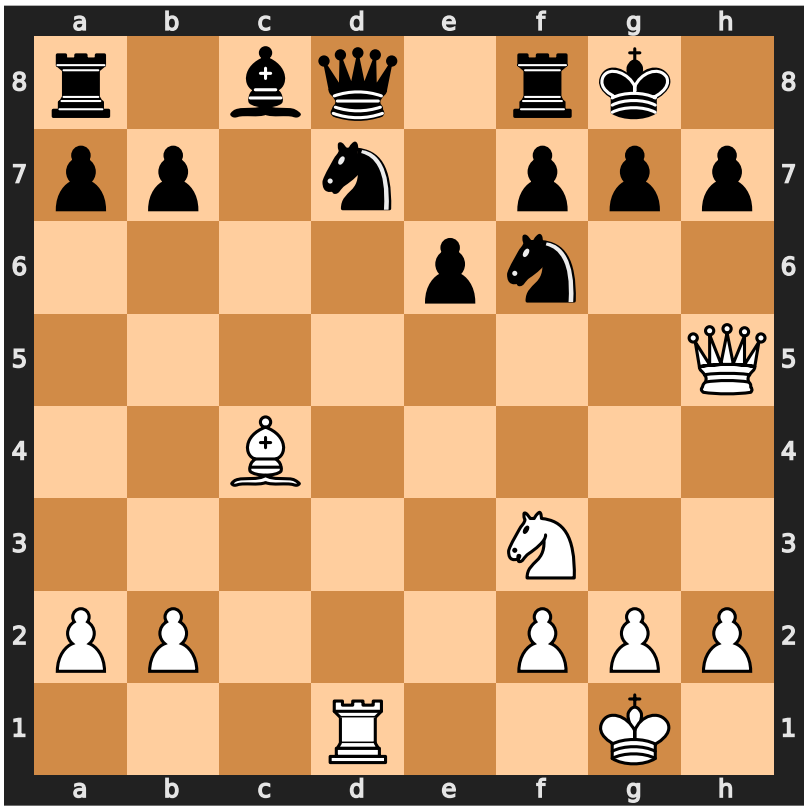

Figure 30.1: Chess Position

Common situations: - A knight that defends both a bishop and a mating square - A rook protecting the back rank and another piece - A pawn guarding a critical square or piece - Any piece that is the sole guardian of something important

Thinking process: When you see a target you want to attack, trace backward: "What defends it? Can I remove that defender?"

30.2 Pattern 7: Overloaded Piece

Definition: An overloaded piece has two or more defensive jobs but can only handle one at a time. When you force it to do one job, the other goes unfinished.

This is related to Removing the Defender, but subtler. You do not capture the defender. You force it to choose between its responsibilities.

Set up your board:

White: Kg1, Qe4, Rd1, Re1, Bb2, Pawns a2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d6, f7, g7, h7

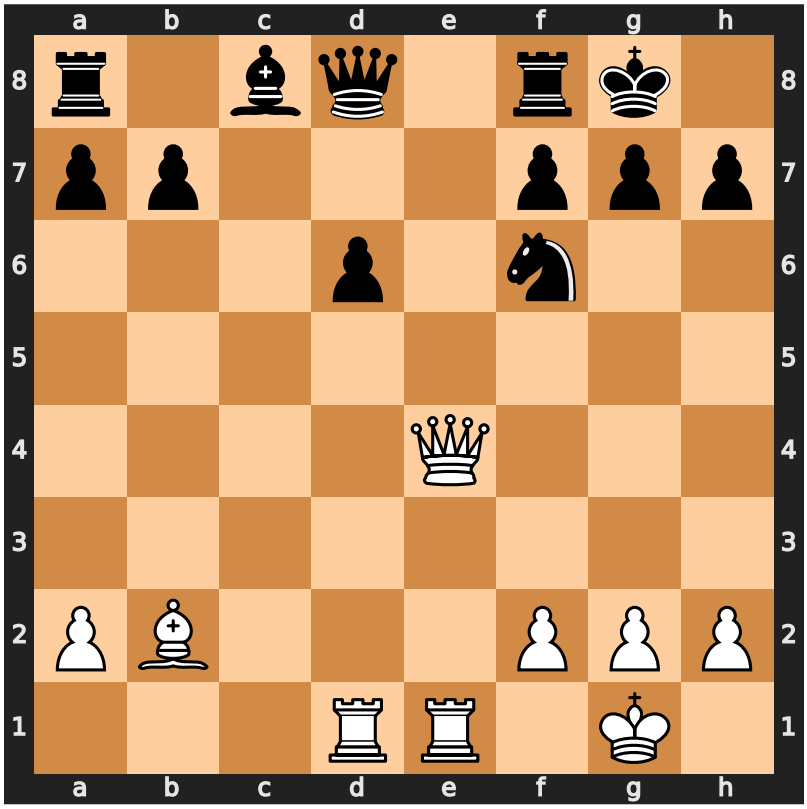

Figure 30.2: Chess Position

White to play.

The sequence:

1. Look at Black's knight on f6. It is doing two jobs: guarding the d5 square (preventing Qd5 ideas) and protecting h7.

2. White plays **Qb7!** Now the queen attacks a7 and threatens Qb8. But the deeper point: by moving the queen off the e-file, White also threatens Rd8. Black's queen on d8 is now overloaded: it must guard the back rank AND the d6 pawn AND stay connected to the defense.

3. Alternatively, White could play **Qh7+!** Nxh7. Now the knight has left f6 and d5 is available. The overloaded knight could not guard both h7 and the central squares.

Why it works: Every player has limited pieces. Those pieces often pull double duty. When you spot a piece doing two jobs, exploit it by making both jobs urgent at the same time.

How to spot it: Ask: "Does this piece have more than one job? Can I force it to choose?"

30.3 Pattern 8: Deflection

Definition: A deflection forces an enemy piece away from a square or line where it is doing something important. You lure it away from its post.

Deflection is the offensive cousin of Removing the Defender. Instead of capturing the defender, you force it to move somewhere it does not want to go.

Set up your board:

White: Kg1, Qh5, Rd1, Re1, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d5, f7, g7, h7

White to play.

The sequence:

1. Black's knight on f6 guards h7. White's queen on h5 would love to play Qxh7 checkmate, but the knight stops it.

2. White plays **Rd3!** preparing to swing the rook to g3 or h3. But an even stronger idea:

3. White plays **Re8!** The rook invades. If Black plays Qxe8 (deflecting the queen from d8), then White has Rxf8+ or simply Qxh7+ depending on the follow-up. If Nxe8? Then Qxh7 is checkmate.

4. The rook sacrifice on e8 *deflects* a defending piece (knight or queen) away from its job.

Why it works: Like a fake fire alarm that makes the guard leave the vault unattended. The defender must deal with the new threat and abandons its post.

Common situations: - A rook sacrifice on e8 or d8 to deflect the queen - A check that forces the king away from defending a piece - A capture that pulls a piece off a key square - In endgames, a pawn push that forces a piece away from the promotion path

---

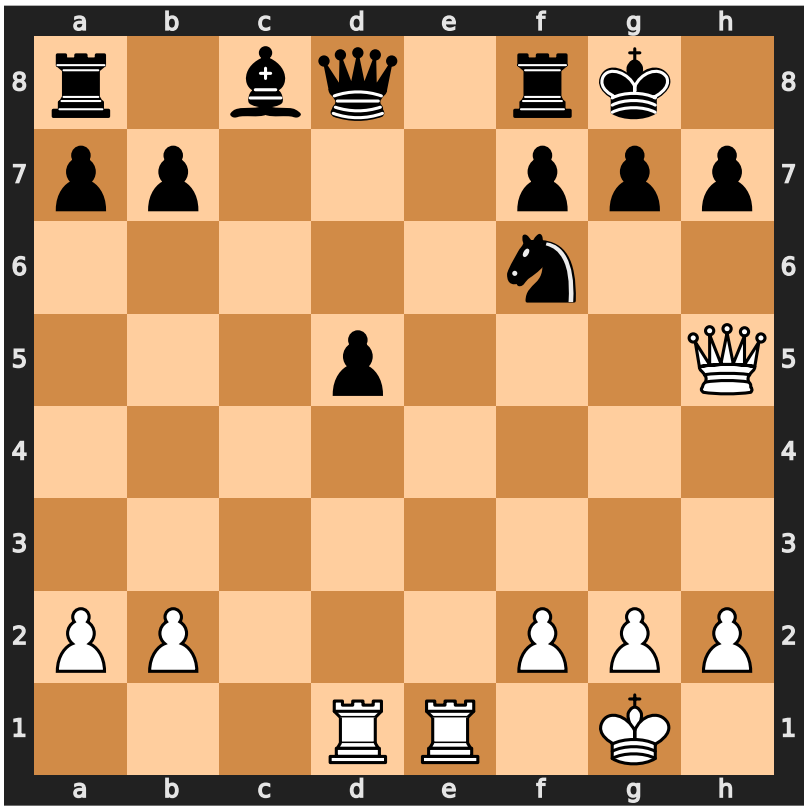

Figure 30.3: Chess Position

30.4 Pattern 9: Decoy

Definition: A decoy lures an enemy piece *to* a specific square where it becomes vulnerable. You sacrifice something to put the opponent's piece on exactly the wrong square.

Deflection pulls a piece *away* from where it wants to be. A decoy pulls a piece *toward* a trap.

Set up your board:

White: Kg1, Qf3, Rd1, Bc4, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qe7, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d6, e6, g7, h7

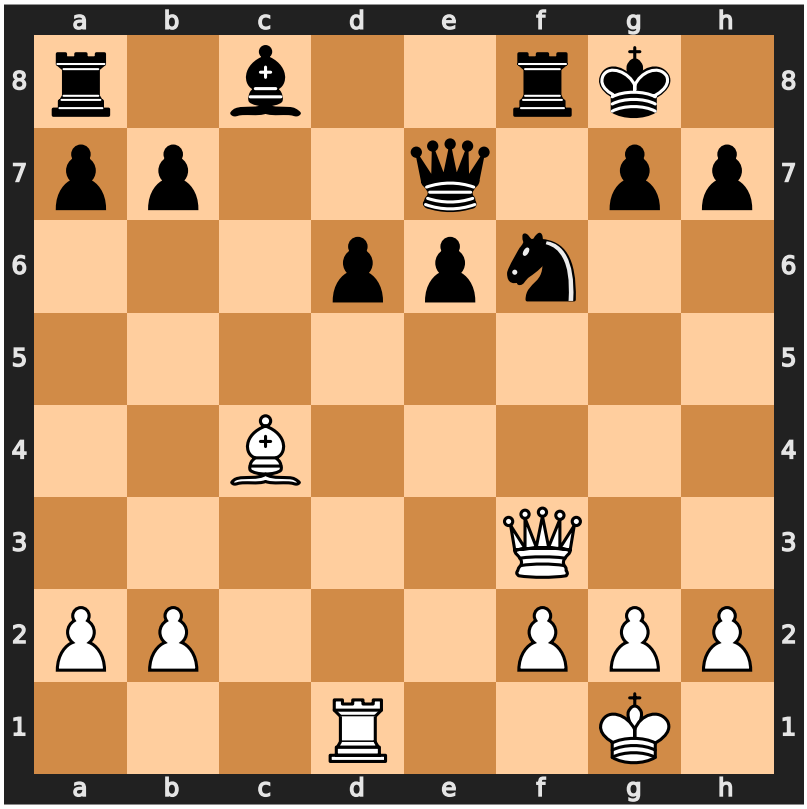

Figure 30.4: Chess Position

White to play.

The sequence:

1. White plays **Rd8!** offering the rook. If Rfxd8, the rook has been *decoyed* to d8. Now White plays Qxf6! winning the knight, because the f8 rook is no longer defending f6 (it moved to d8).

2. If Raxd8 instead, then Bxe6! fxe6, and White has Qxf6 anyway since the knight is now underdefended.

3. The initial sacrifice (Rd8) was the bait. Taking it puts the opponent's piece on the wrong square.

Why it works: A decoy exploits your opponent's reflexes. They see material offered and think "free stuff." But capturing it puts their piece exactly where you wanted.

Common situations: - A queen sacrifice that decoys the king into a mating net - A rook sacrifice that lures a piece to a back-rank vulnerability - A pawn sacrifice that pulls a piece to a square where it gets forked

---

30.5 Pattern 10: Trapped Piece

Definition: A trapped piece has no safe squares to move to. It might look fine right now, but if you attack it, it has nowhere to run.

Set up your board:

White: Kg1, Qd1, Ra1, Rf1, Bc1, Bc4, Nf3, Pawns a2, b2, c3, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bb4, Bg4, Nc6, Nf6, Pawns a7, b7, d5, e6, g7, h7

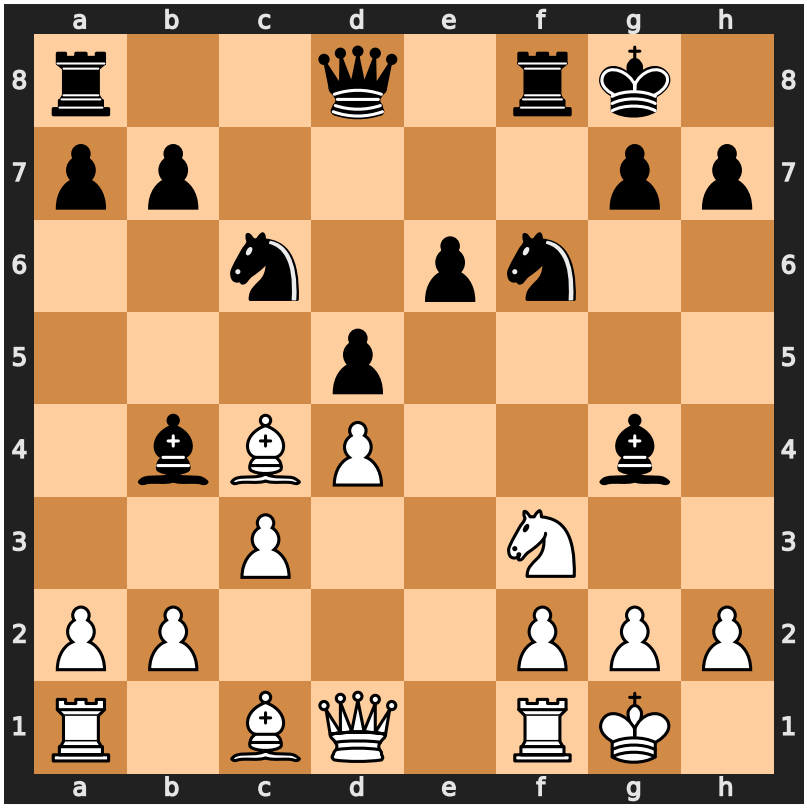

Figure 30.5: Chess Position

White to play.

The sequence:

1. Black's bishop on b4 has ventured into enemy territory. Look at its escape squares: a5, a3, c5, d6, e7.

2. White plays **a3!** Attacking the bishop. Now it must move. The only retreats are a5 or back to e7/d6/c5.

3. If the bishop goes to **a5**, White plays **b4!** Now the bishop is truly trapped. It has no squares: a6 is not a legal bishop square from a5 (wrong diagonal), a4 is not on the diagonal, and b4 blocks the retreat. The bishop is lost.

4. The bishop entered enemy territory and got surrounded.

Why it works: Every piece needs escape routes. When a piece moves to an aggressive square, it sometimes leaves itself without a way back. If you see a piece with limited squares, look for a way to cut off the last exits.

Common situations: - A bishop on b4/g4 in the opening getting trapped by a3+b4 or h3+g4 advances - A knight on a5 or h5 with no retreat squares - A rook on the seventh rank that cannot escape - Many opening traps (like the Englund Gambit) rely on piece trapping

The rule: Before moving a piece to an advanced square, always count its escape routes. If your opponent's piece has few routes, look for ways to shut them down.

30.5.1 Milestone Check

You have learned 10 out of 30 patterns. That is already more than most club players know. Removing the Defender, Overloaded Pieces, Deflection, Decoy, and Trapped Pieces are the five most common ways material changes hands in chess. If you learn to spot these in your games, you will win material regularly.

Good stopping point. Get up, stretch, grab some water. When you come back, we study the most dramatic patterns in chess: the mating attacks.

30.6 Exercises: Group 2 (Patterns 6-10)

Pattern 6: Removing the Defender

Exercise 11.26

White to play. The f7 pawn is defended by the king. Can you remove another defender of a key square? Hints: (1) The knight on f6 defends d5. (2) Can you trade it off? (3) After the knight is gone, what does d5 become?

Exercise 11.27

White to play. The d5 pawn is defended by e6 and the c6 knight. Remove a defender. Hints: (1) exd5 exd5 just trades. (2) What about Nxd5 Nxd5 Bxd5, winning a pawn? (3) Count the captures carefully.

Exercise 11.28

White to play. Black's d-pawn has been exchanged, but e6 is weak. What defends it? Hints: (1) The f6 knight and the bishop on b7 both eye e6's area. (2) What if you eliminated the f6 knight? (3) Nd2-f1-e3-d5 is too slow. Think forcing.

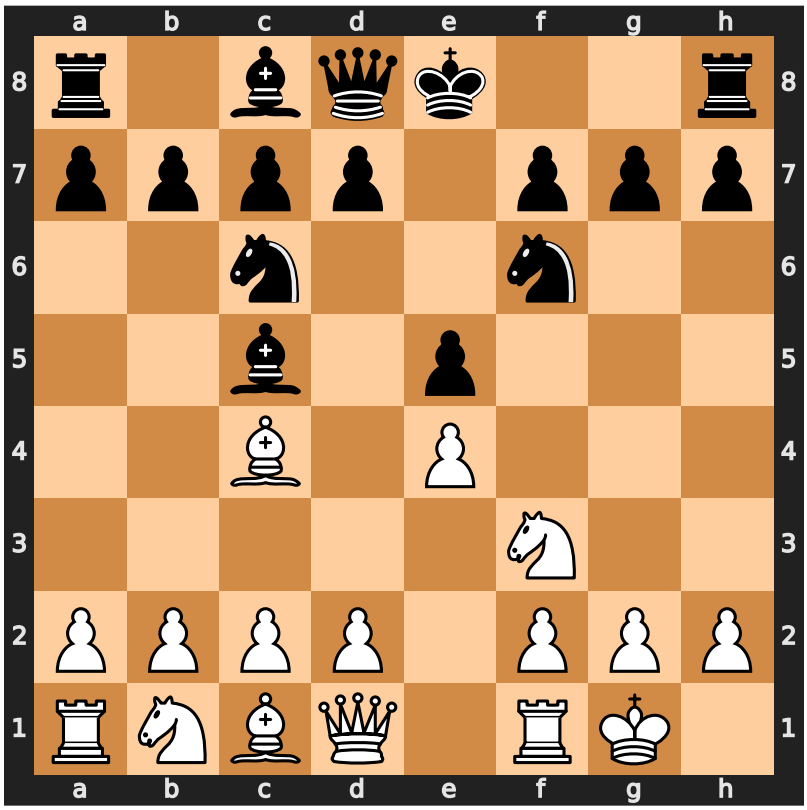

Figure 30.6: Chess Position

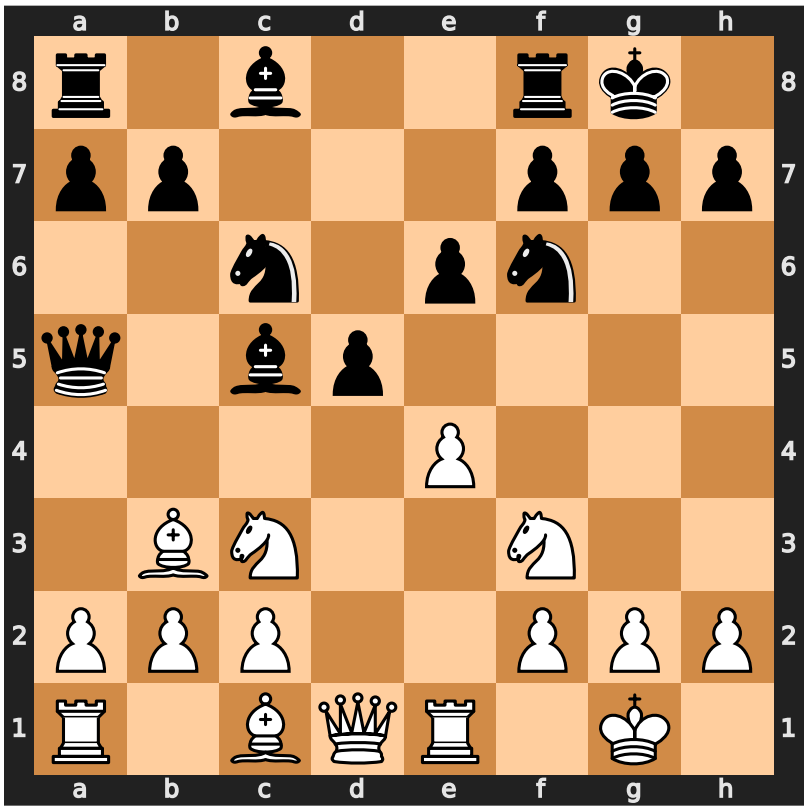

Figure 30.7: Chess Position

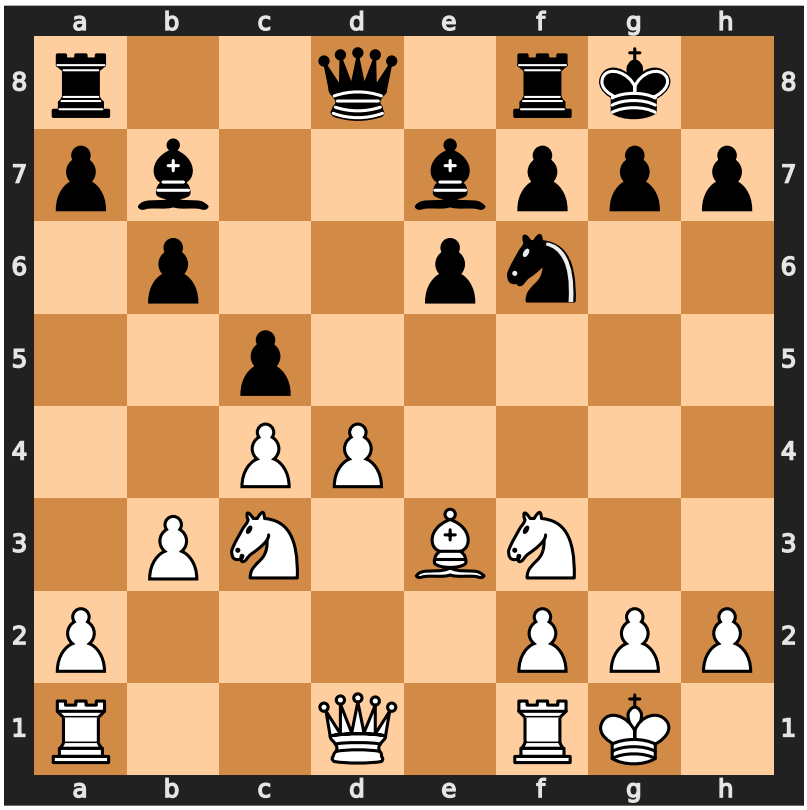

Figure 30.8: Chess Position

Exercise 11.29

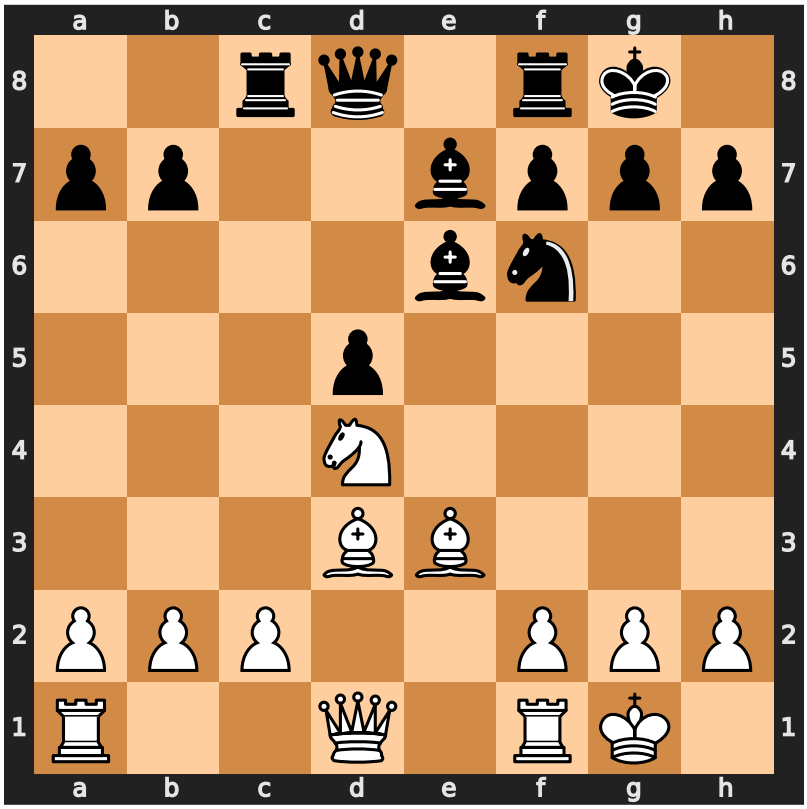

Figure 30.9: Chess Position

White to play. The e6 bishop defends d5. Remove it. Hints: (1) Bxe6 fxe6 weakens the structure. (2) After Bxe6, the d5 pawn is less protected. (3) Follow up with Nf5 or Nc6.

Exercise 11.30

White to play. Find the removing-the-defender sequence that wins material. Hints: (1) The knight on c6 defends e7 and d8. (2) What if you challenged c6 with Nb5? (3) After Nb5, the knight on c6 is overworked.

Pattern 7: Overloaded Piece

Exercise 11.31

White to play. Black's rook on d8 guards the back rank. Can you overload it? Hints: (1) The rook defends d8 (preventing Rd8 mate). (2) But does it also defend the 8th rank in general? (3) Re8+ forces the issue.

Exercise 11.32

White to play. The queen on e7 defends e5 and guards the kingside. Overload it. Hints: (1) What if you attack e5? (2) Rd6 threatens something on the 6th rank. (3) Can you force the queen to abandon e5 or the kingside?

Exercise 11.33

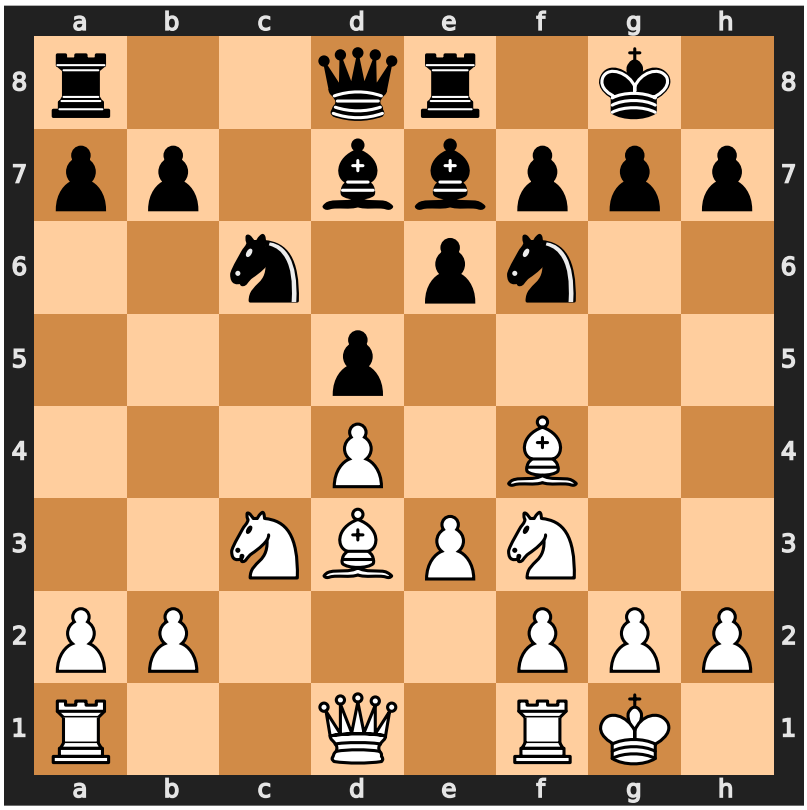

Figure 30.10: Chess Position

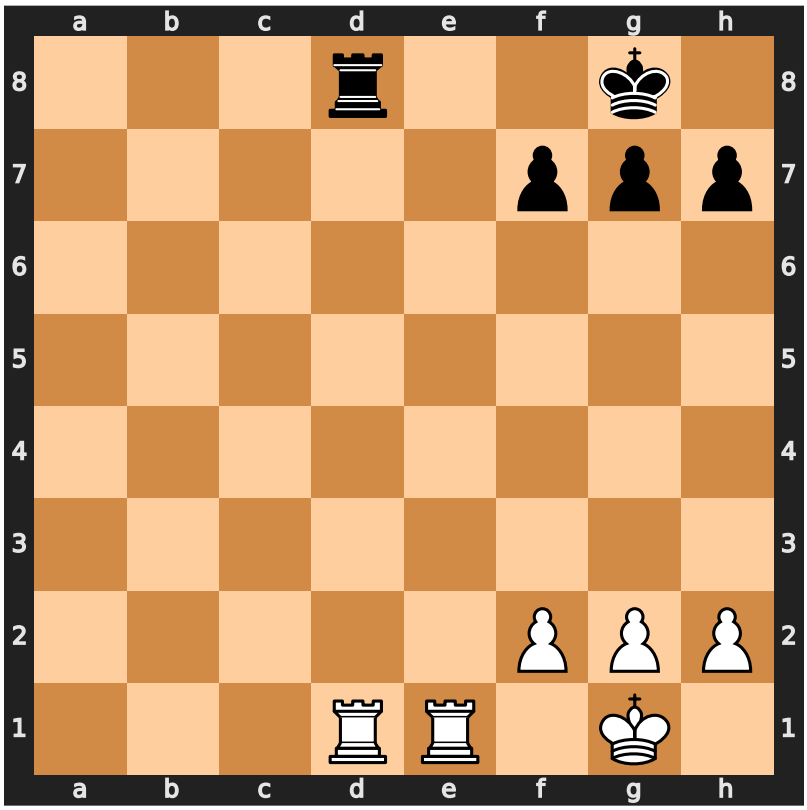

Figure 30.11: Chess Position

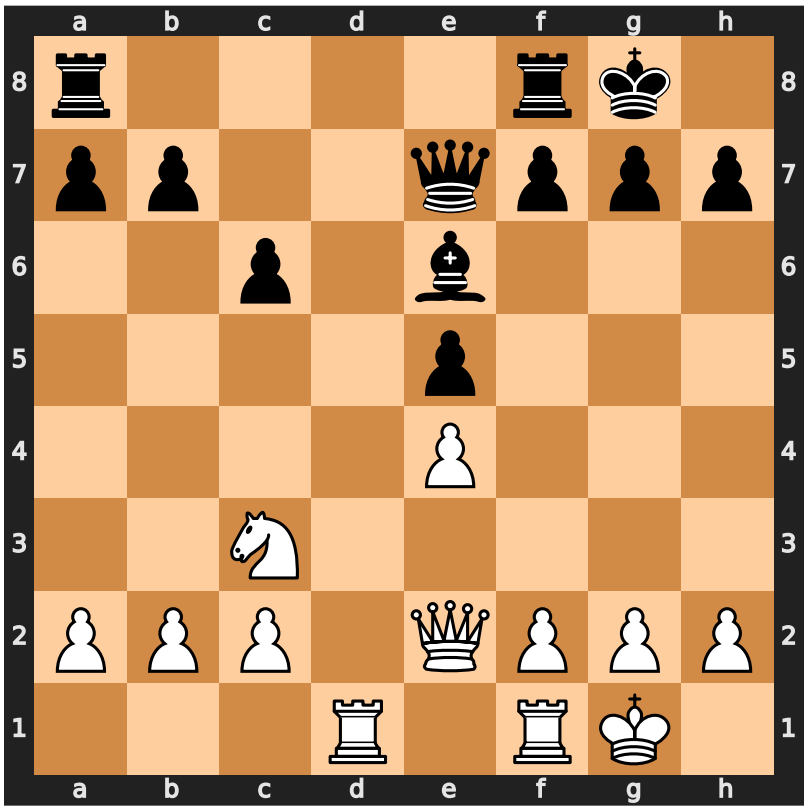

Figure 30.12: Chess Position

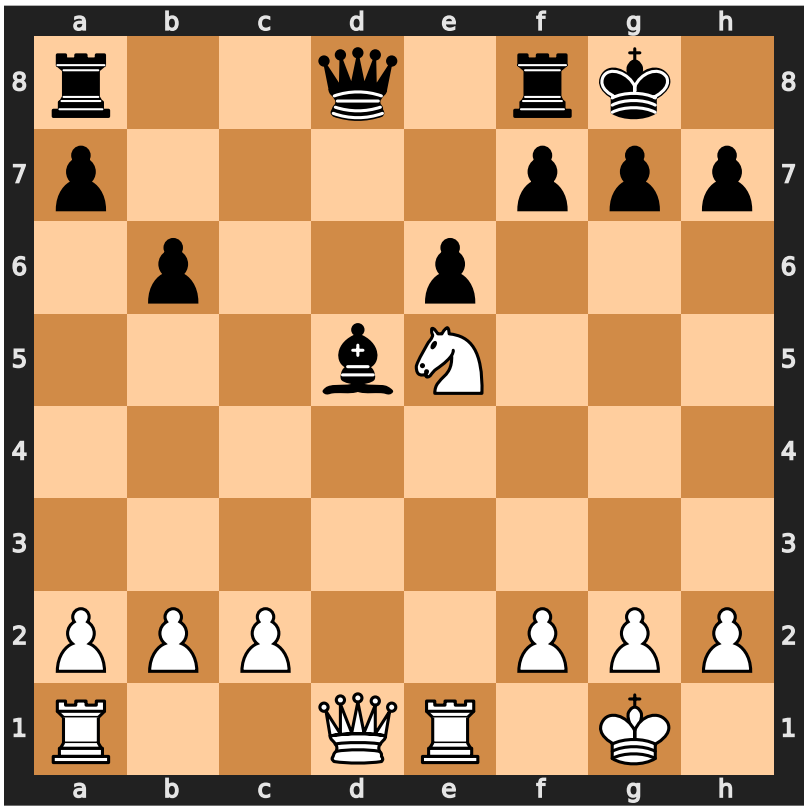

Figure 30.13: Chess Position

White to play. The f7 pawn defends both e6 and g6. Overload it. Hints: (1) Attack from two directions at once. (2) Qg4 threatens g7 and eyes e6. (3) After Qg4, if g6 then f7 has moved and e6 is weak.

Exercise 11.34

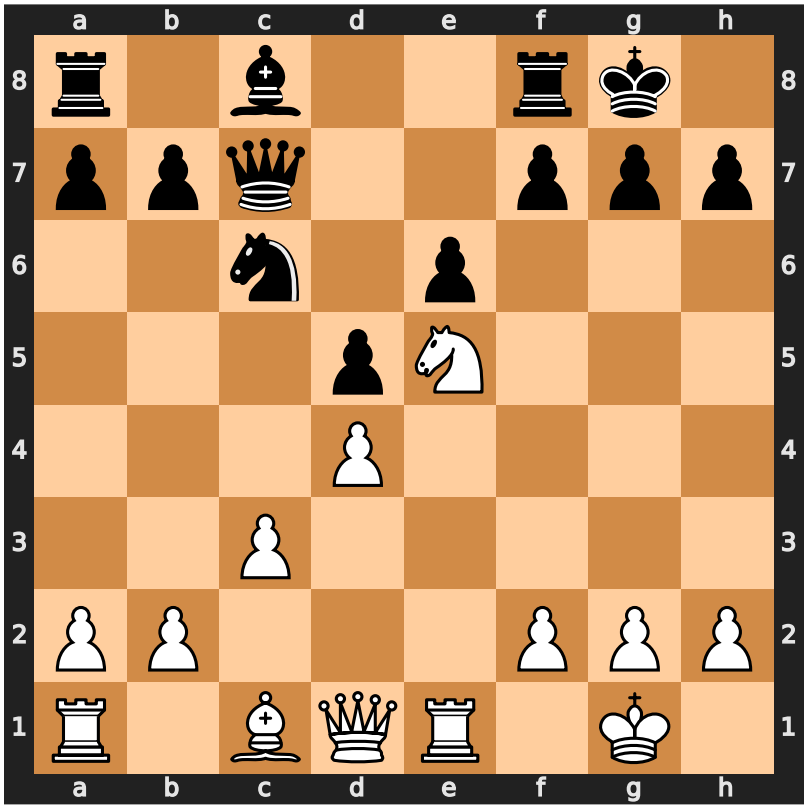

Figure 30.14: Chess Position

White to play. The c6 knight guards e7 and d8. Overload it. Hints: (1) Nxc6 trades the overloaded piece. (2) After bxc6, what was it defending? (3) If instead Qg4, the knight must handle multiple threats.

Exercise 11.35

White to play. Multiple Black pieces are overloaded. Find the combination. Hints: (1) The f7 pawn is doing three jobs. (2) Nf6 threatens mate and attacks the queen. (3) If gxf6, the king is exposed. The pawn on f7 cannot help everywhere.

Pattern 8: Deflection

Exercise 11.36

White to play. Black's rook defends the first rank. Deflect it. Hints: (1) Re8+ forces the king. (2) But what if Re1 instead, chasing the rook away? (3) Actually, Re8+ wins. After Kf7 (or similar), Black's rook is deflected from a1.

Exercise 11.37

White to play. Deflect the e6 bishop from defending d5. Hints: (1) Can you attack e6 while

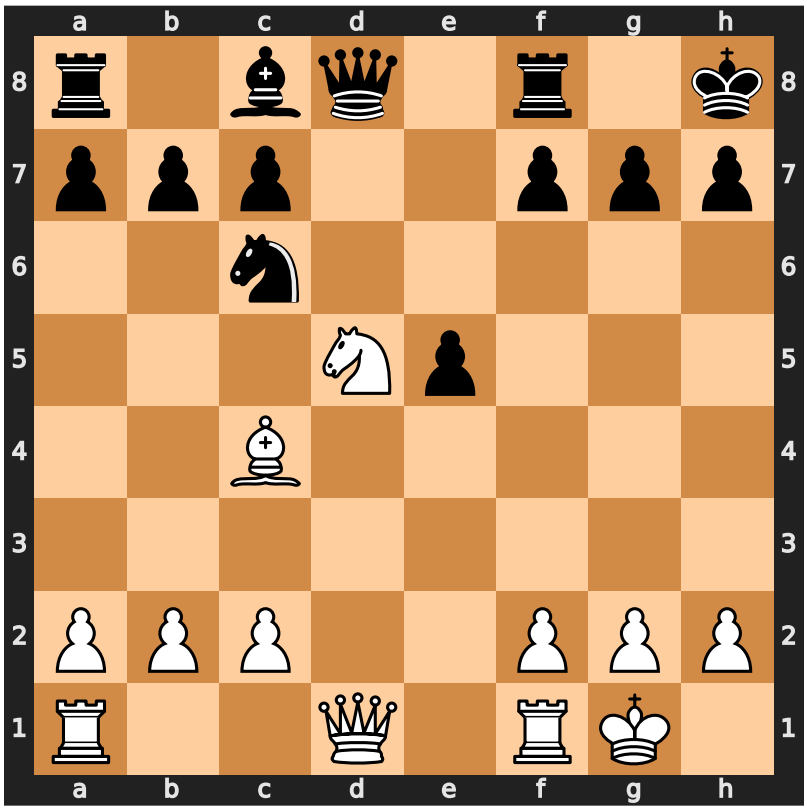

Figure 30.15: Chess Position

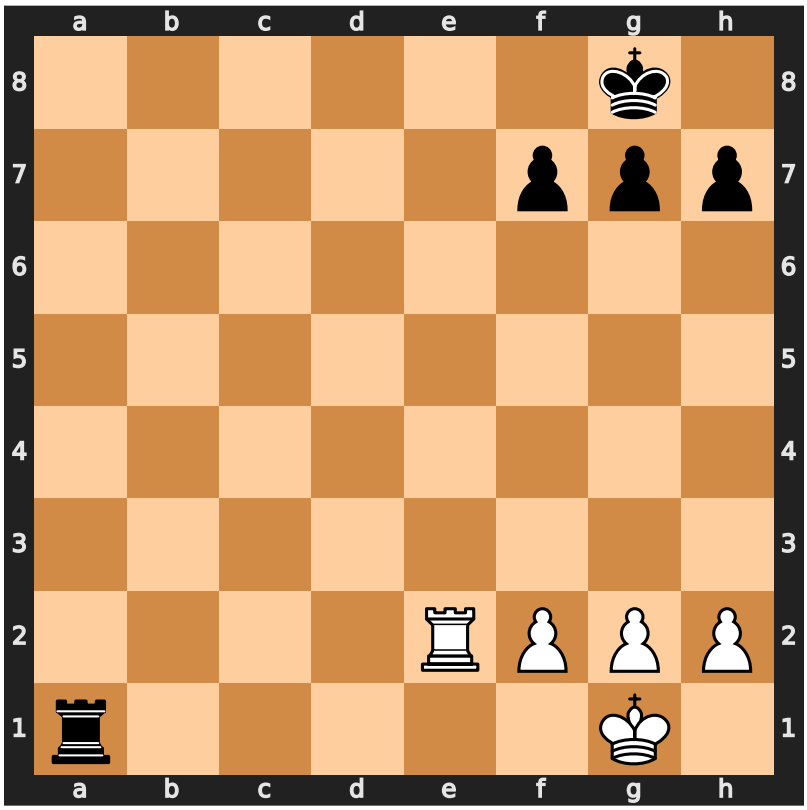

Figure 30.16: Chess Position

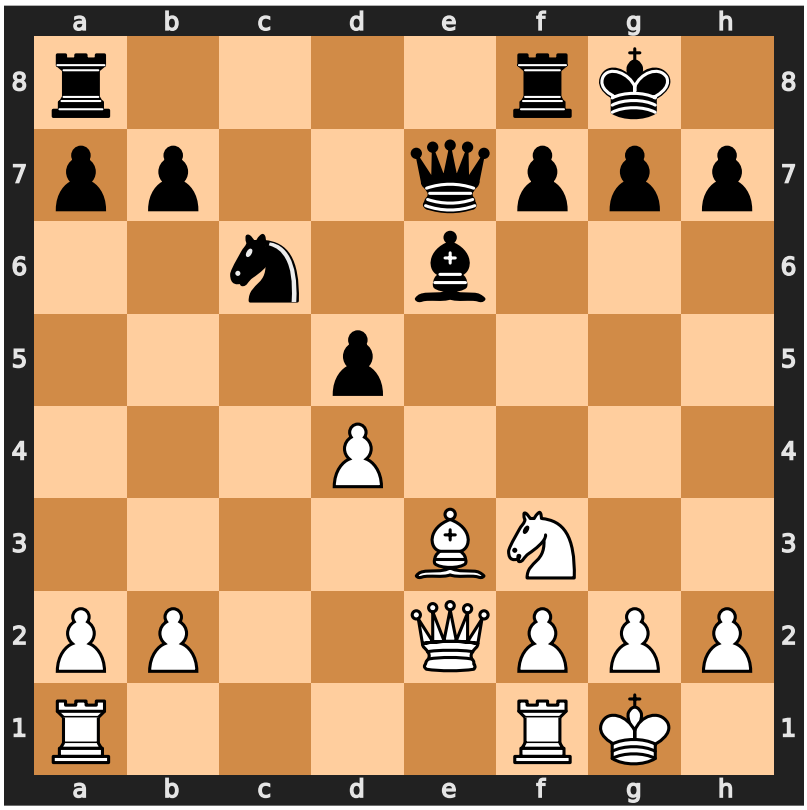

Figure 30.17: Chess Position

threatening something else? (2) Ng5 hits e6 and threatens f7. (3) If the bishop moves from e6, d5 falls.

Exercise 11.38

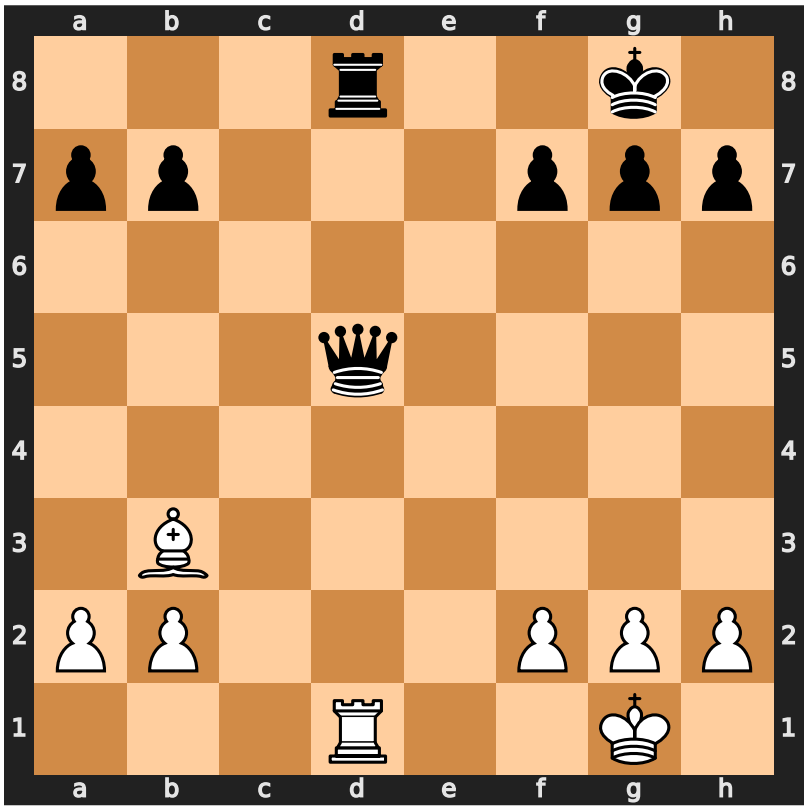

Figure 30.18: Chess Position

White to play. Can you deflect the queen from defending d8? Hints: (1) The queen defends d8. (2) If the queen leaves d5, Rd8 is crushing. (3) Bc4! attacks the queen and forces it to move. After Qxc4, Rd8+ leads to mate.

Exercise 11.39

White to play. The queen on f6 defends the knight on e4. Deflect it. Hints: (1) What if you threatened the queen with tempo? (2) Rf1 does not do enough. (3) Qg4 threatens both the queen's square and the knight.

Exercise 11.40

White to play. The queen on d8 is overworked: it guards both the rook on f8 and the back rank. Deflect it. Hints: (1) Rh3 threatens Rh8 mate. (2) The queen must stay connected to h8. (3) But the queen also must guard f8 and d8. Find the move that breaks the defense.

Pattern 9: Decoy

Exercise 11.41

White to play. Decoy the king. Hints: (1) Qf8+ is check. (2) Kxf8 removes the queen but the king is on f8 now. (3) Is there a back rank idea? (Not in this position, but Qf8+ Kxf8 shows the decoy

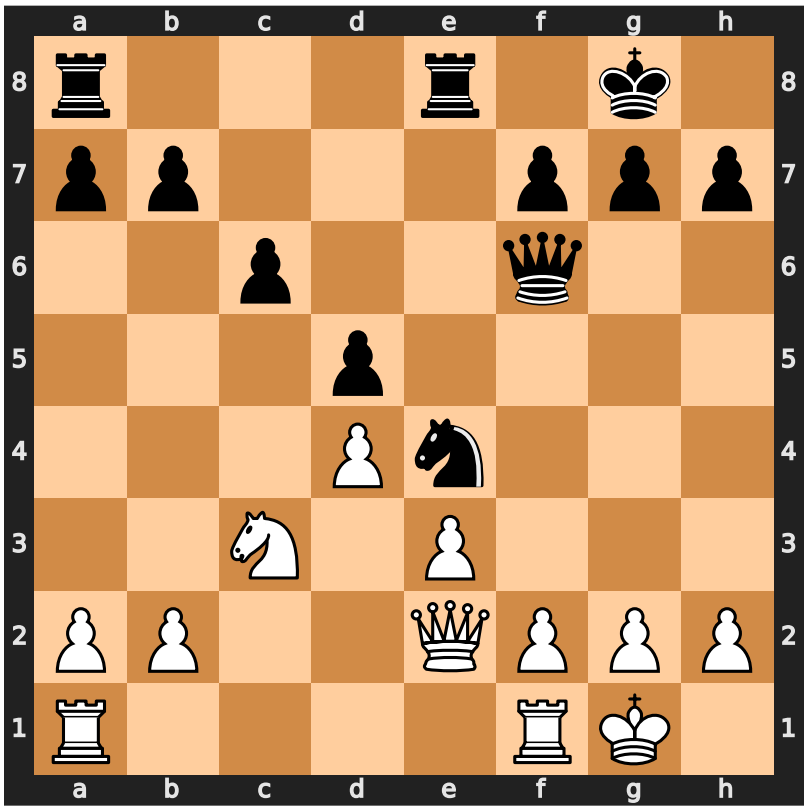

Figure 30.19: Chess Position

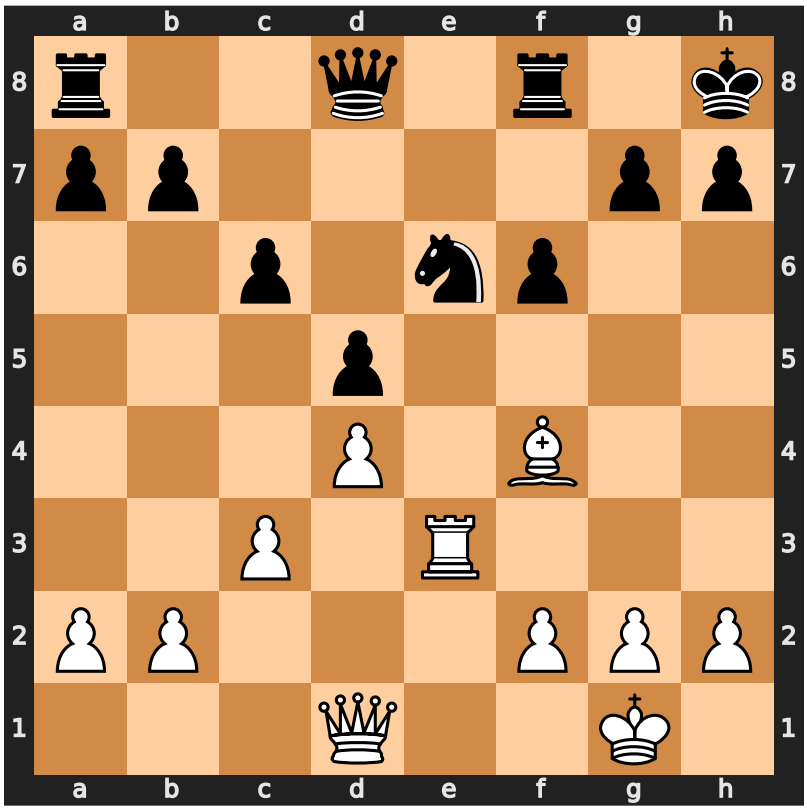

Figure 30.20: Chess Position

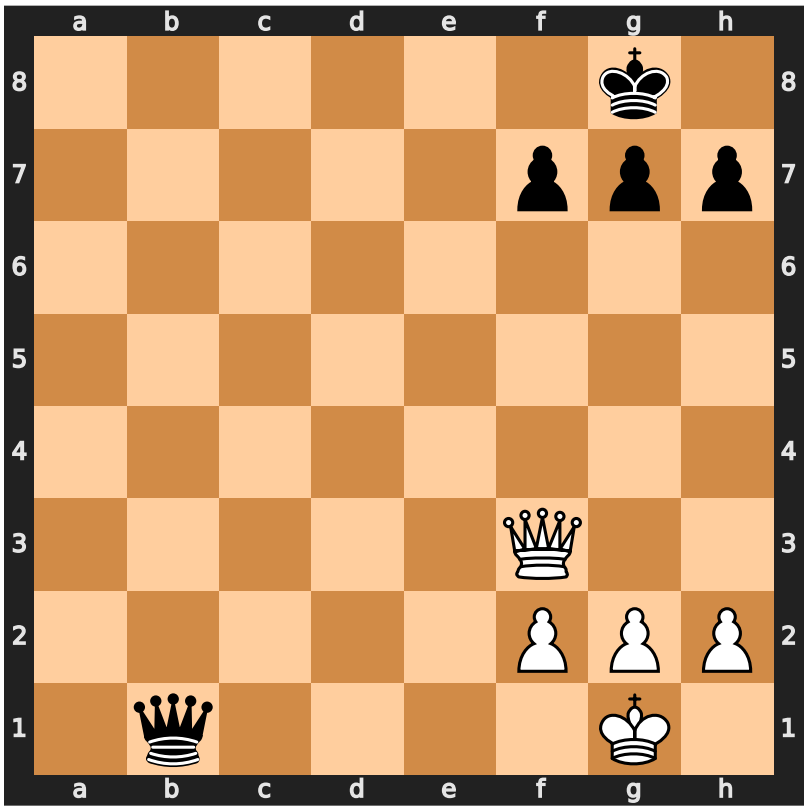

Figure 30.21: Chess Position

concept.)

Exercise 11.42

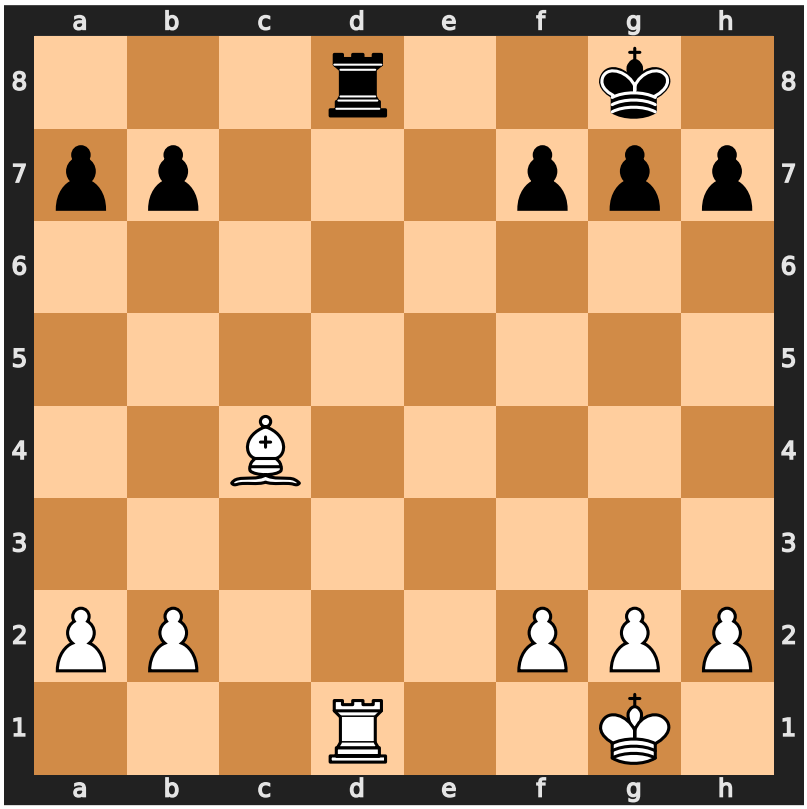

Figure 30.22: Chess Position

White to play. Decoy the rook to a bad square. Hints: (1) Rd8+ looks strong. But Rxd8 and the rook recaptured. (2) Wait: after Rd8+ Rxd8, the rook is now on d8. (3) And now Bxf7+ picks up material because the rook is on d8, not f8.

Exercise 11.43

White to play. The knight on d4 is powerful. Decoy it. Hints: (1) Can you lure the knight to a worse square? (2) Qe8 forces Rxe8 (deflection of the rook). (3) After Rxe8, the knight on d4 is still there. Think differently: Bxf7+ Rxf7, Qe8+. The rook was decoyed away from f8.

Exercise 11.44

White to play. Decoy the bishop from its defensive diagonal. Hints: (1) The bishop on e6 covers c4 and d5. (2) Nxe6 fxe6 and the bishop is gone (removal). (3) But what about Nc6? This decoys the bishop: if Bxc4 then Bxc4 and White dominates. The knight on c6 pulled the bishop off the e6 square.

Exercise 11.45

White to play. Find a decoy sacrifice that wins material. Hints: (1) The knight on d5 is strong, but what if it can be lured away? (2) Bxh7+ Kxh7 decoys the king. (3) After Kxh7, Ng5+ forks king and queen. Classic Greek Gift setup! If the king goes back, the queen invades.

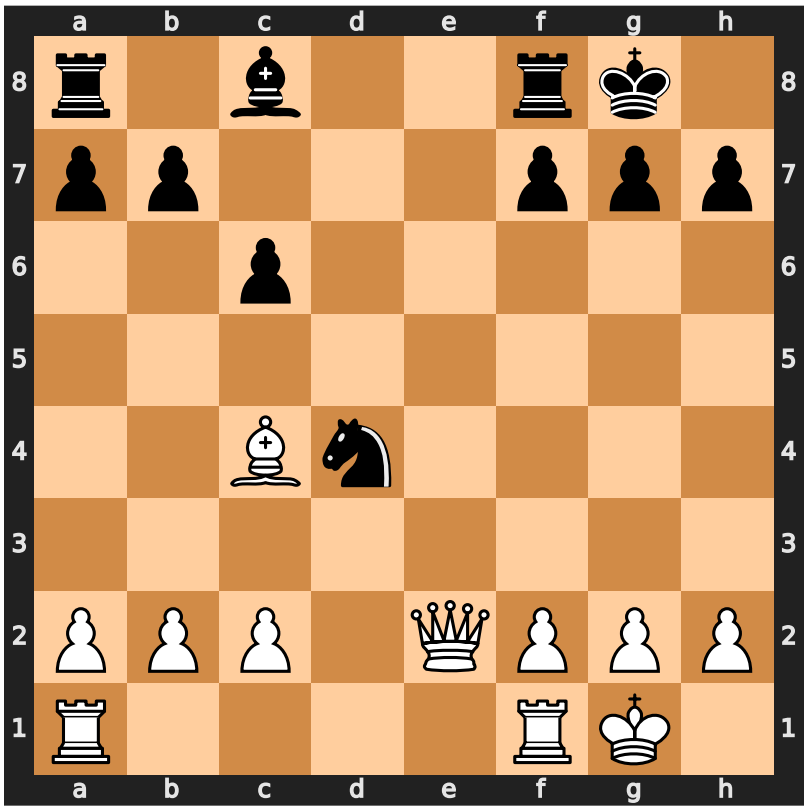

Figure 30.23: Chess Position

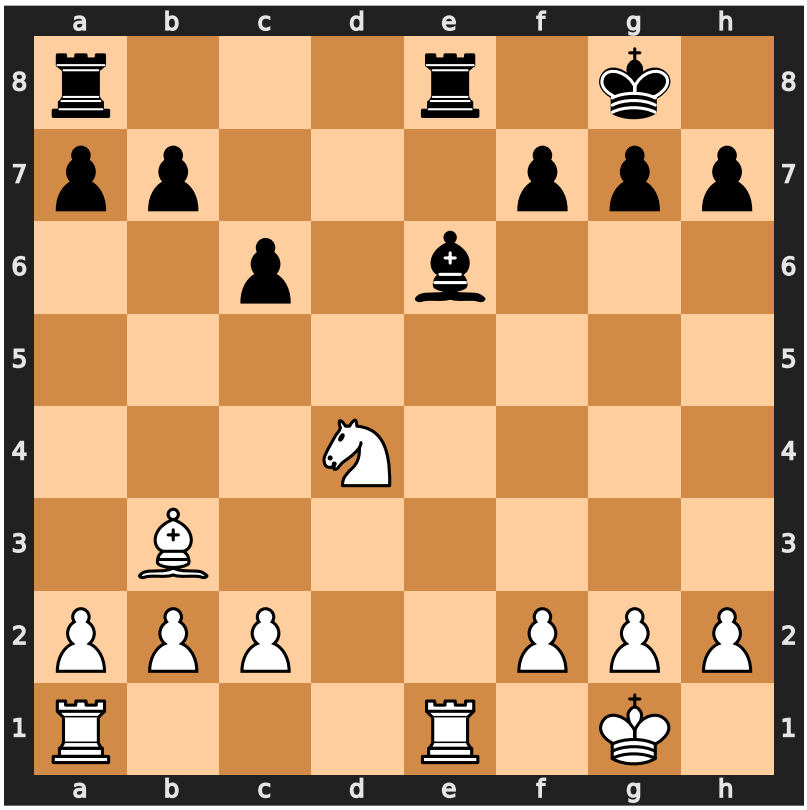

Figure 30.24: Chess Position

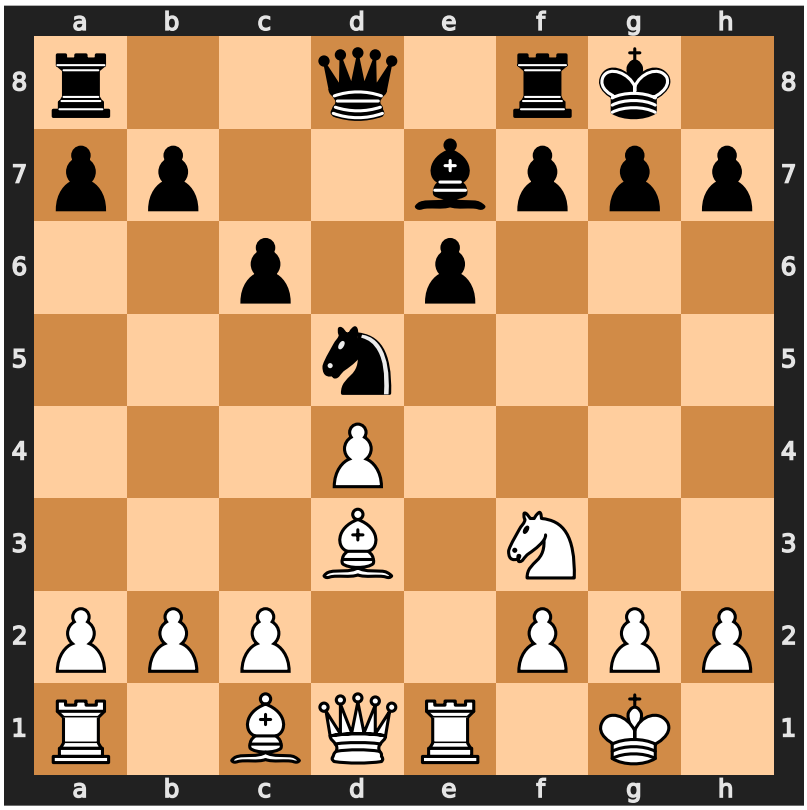

Figure 30.25: Chess Position

Pattern 10: Trapped Piece

Exercise 11.46

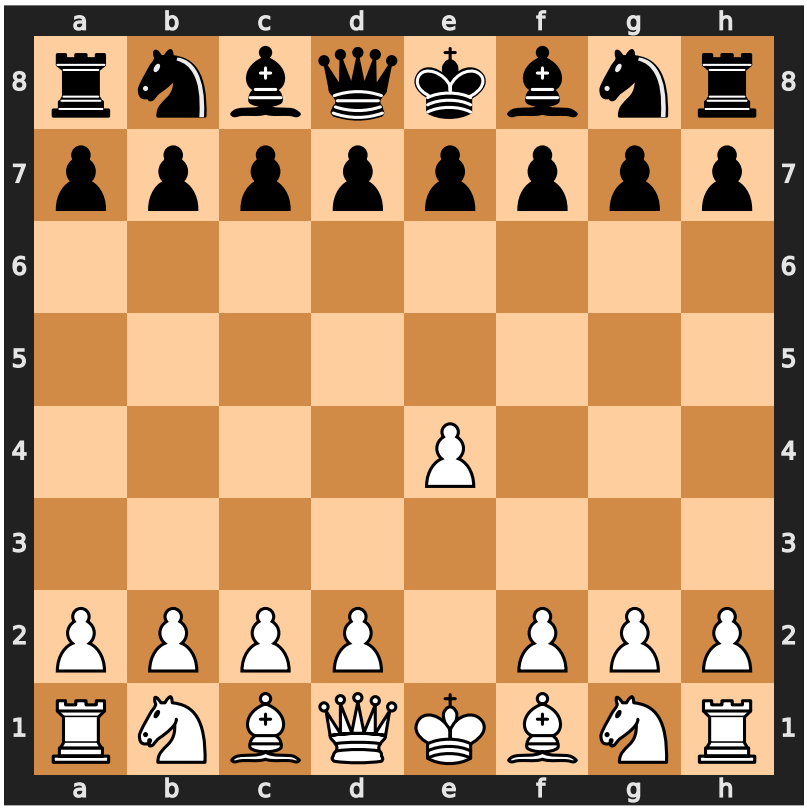

Figure 30.26: Chess Position

Black to play. If Black plays 1…d5 2.exd5 Qxd5 3.Nc3, where is the queen going? Count her escape squares. Is she in danger of being trapped? Hints: (1) The queen on d5 is exposed early. (2) Nc3 attacks it. (3) The queen must retreat, but to where? She is not trapped YET but she is uncomfortable.

Exercise 11.47

Black to play. Black's bishop on b7 is committed to the long diagonal. Can White ever trap it? Hints: (1) In some lines, d5 closes the diagonal. (2) If the diagonal closes, the bishop has nowhere useful to go. (3) This is why the Fianchetto bishop must be handled with care.

Exercise 11.48

White to play. Black has fianchettoed to g7. Can the bishop ever be trapped? Hints: (1) If White plays e4 and d5, the center closes. (2) The g7 bishop stares at a wall of pawns. (3) Not "trapped" in the literal sense, but functionally dead. This is a positional trap.

Exercise 11.49

White to play. The bishop on a4 looks active but could become trapped. Should White worry? Hints: (1) If Black plays b5, the bishop must retreat. (2) After Bb3, it is safe. (3) But if White delays, b5-b4 could chase the knight and the bishop simultaneously. Always watch your own pieces' retreat squares.

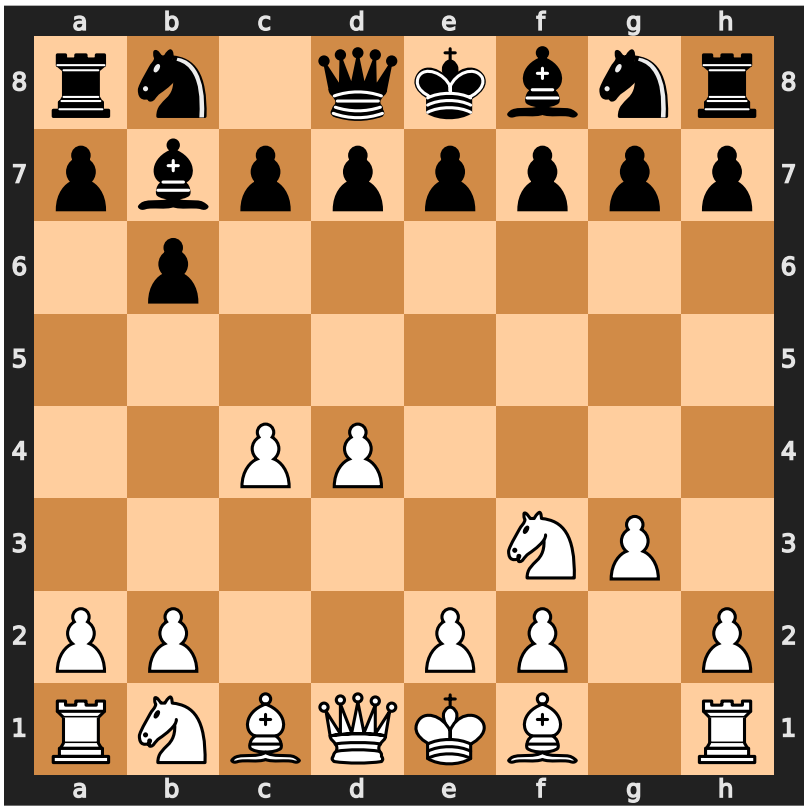

Figure 30.27: Chess Position

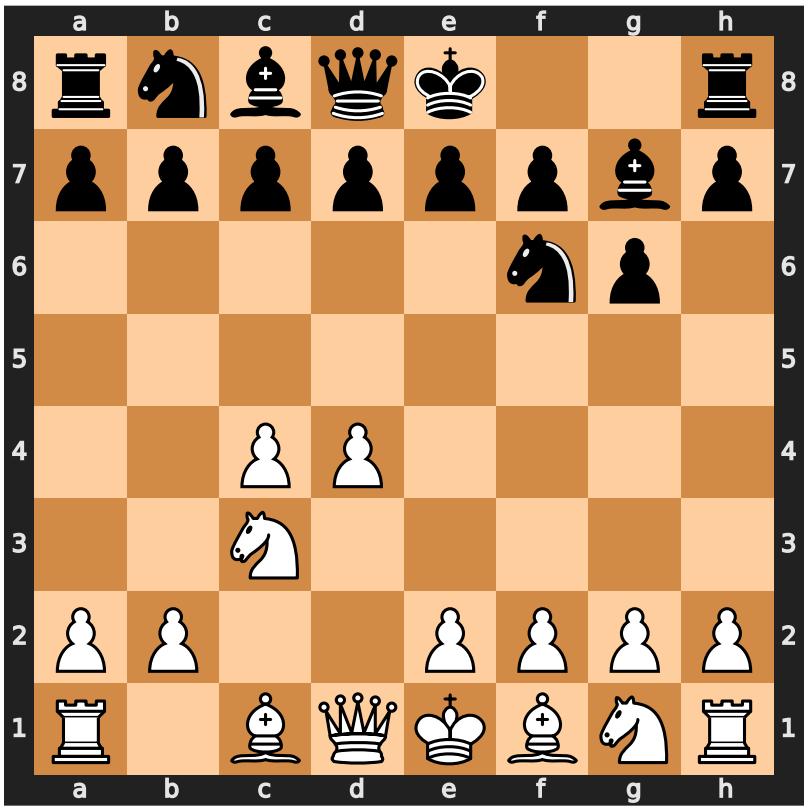

Figure 30.28: Chess Position

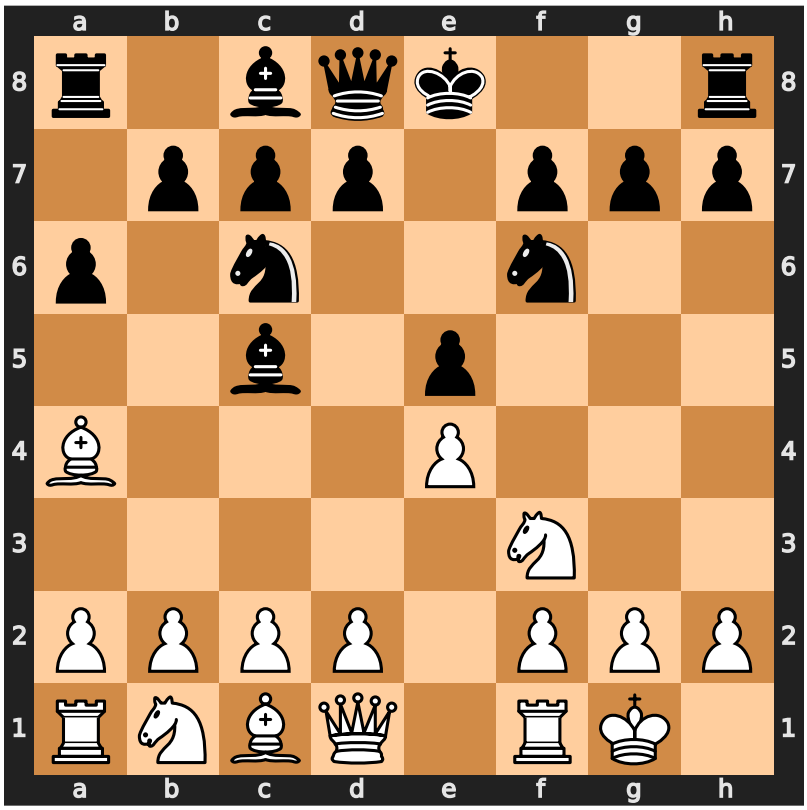

Figure 30.29: Chess Position

Exercise 11.50

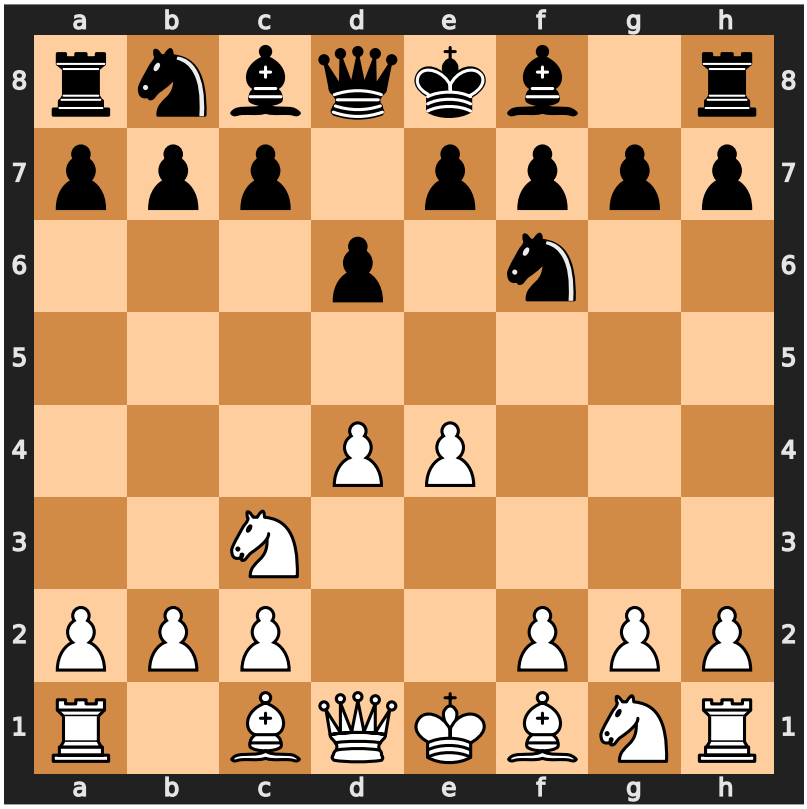

Figure 30.30: Chess Position

White to play. Black played the Pirc Defense. Can you set up a future piece trap? Hints: (1) After e5, the d6 pawn is pressured. (2) If Black plays dxe5, the position opens. (3) But if Black plays Nfd7, the knight retreats to a passive square. Trapping is not always about capturing; sometimes it is about making a piece useless.

_____

_____

Chapter 31

GROUP 3: MATING PATTERNS

Estimated study time: 20-25 minutes

Every chess game ends the same way: checkmate or resignation. The five patterns in this group are the most common mating attacks in middlegame chess. These are not basic checkmates like King and Queen vs. King (you learned those in Volume I). These are *mating attacks* that arise from specific piece configurations in real games.

Learn these patterns and you will see checkmate opportunities that your opponents miss entirely.

31.1 Pattern 11: Back Rank Mate

Definition: A back rank mate happens when a king is trapped on the first (or eighth) rank by its own pawns, and a rook or queen delivers checkmate along that rank.

This is the single most common mating pattern in club chess. It wins and loses more games between 1000 and 1600 than any other tactic. If you take nothing else from this chapter, take this: *always check your back rank.*

Set up your board:

White: Kg1, Qa4, Rc1, Rd1, Pawns f2, g2, h2 Black: Kg8, Qe7, Rd8, Ra8, Pawns f7, g7, h7

White to play.

The sequence:

1. Look at Black's king on g8. Pawns on f7, g7, h7 form a wall that *traps* the king on the back rank. No escape square.
2. White plays **Rxd8+!** Capturing the rook with check.
3. Black must respond. **Qxd8** is forced (the queen must take or the king is lost).
4. Now White plays **Rc8!** The rook invades to the back rank, pinning the queen on d8 to the king on g8. Black is lost.

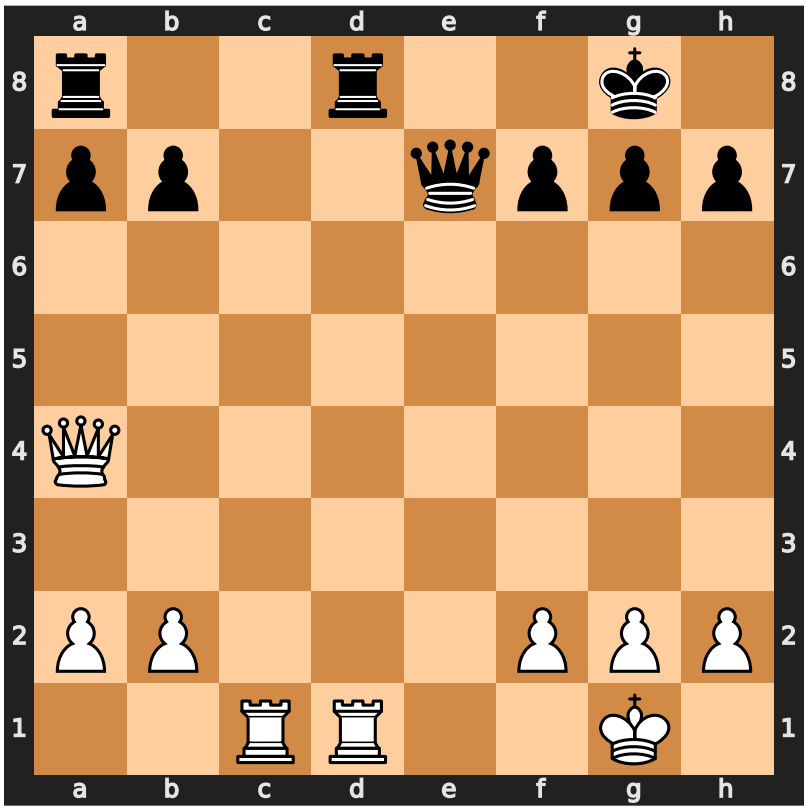

Figure 31.1: Chess Position

Cleaner Back Rank Example:

Set up your board:

White: Kg1, Qd3, Rc1, Pawns f2, g2, h2 Black: Kg8, Qe7, Rd8, Pawns f7, g7, h7

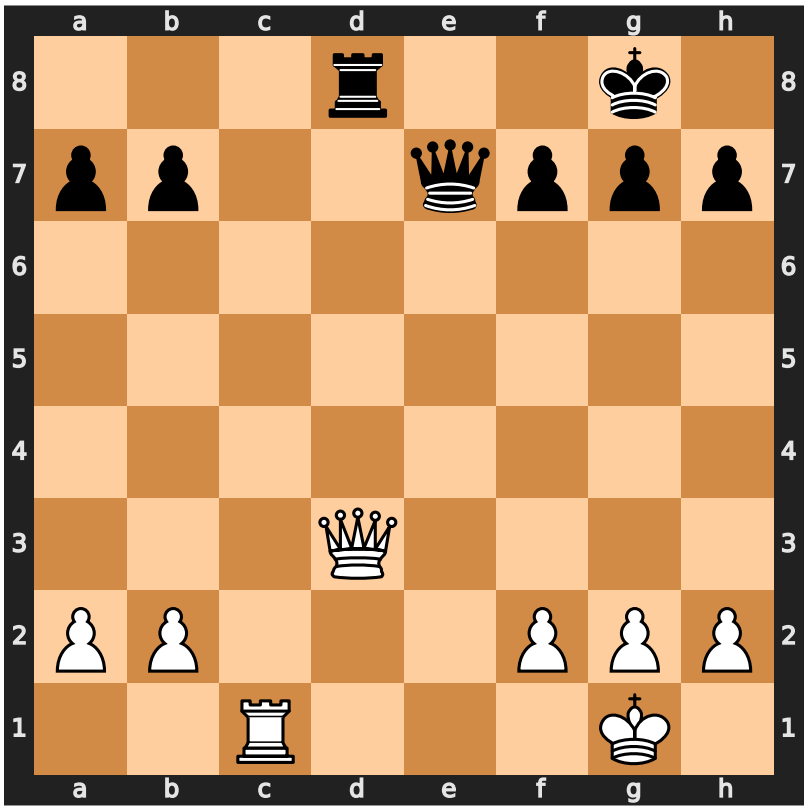

Figure 31.2: Chess Position

White to play.

1. White plays **Rc8!** The rook enters the eighth rank with deadly effect.
2. **Rxc8** is forced. If Black ignores it, White plays Rxd8+ and checkmate follows.
3. After Rxc8, White plays **Qd8+!** The queen enters the back rank. **Qe8** is forced (the only way to block the check).
4. **Qxe8#!** Checkmate. The king cannot escape through f7, g7, or h7 because its own pawns block every exit. The queen delivers the final blow on the back rank.

Pause and look: The key to back rank mate is the king's own pawns. Three unmoved pawns (f7, g7, h7 or f2, g2, h2) create a prison. The solution? Make a "luft" (German for "air"). Play h6 or h3 to give the king an escape square. This costs one tempo but saves the game.

Why it works: The king cannot escape through its own pawns. A rook or queen attacking along the back rank delivers mate that cannot be blocked.

Prevention: After castling, look for a moment to play h3 (as White) or h6 (as Black). One quiet pawn move prevents dozens of tactical tricks.

31.2 Pattern 12: Smothered Mate

Definition: A smothered mate is checkmate delivered by a knight against a king completely surrounded by its own pieces. The king has no squares because its own army blocks every exit.

This is the most beautiful checkmate in chess. It often involves a queen sacrifice to force the final position.

Set up your board:

White: Kg1, Qc4, Ng5, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Pawns f7, g7, h7

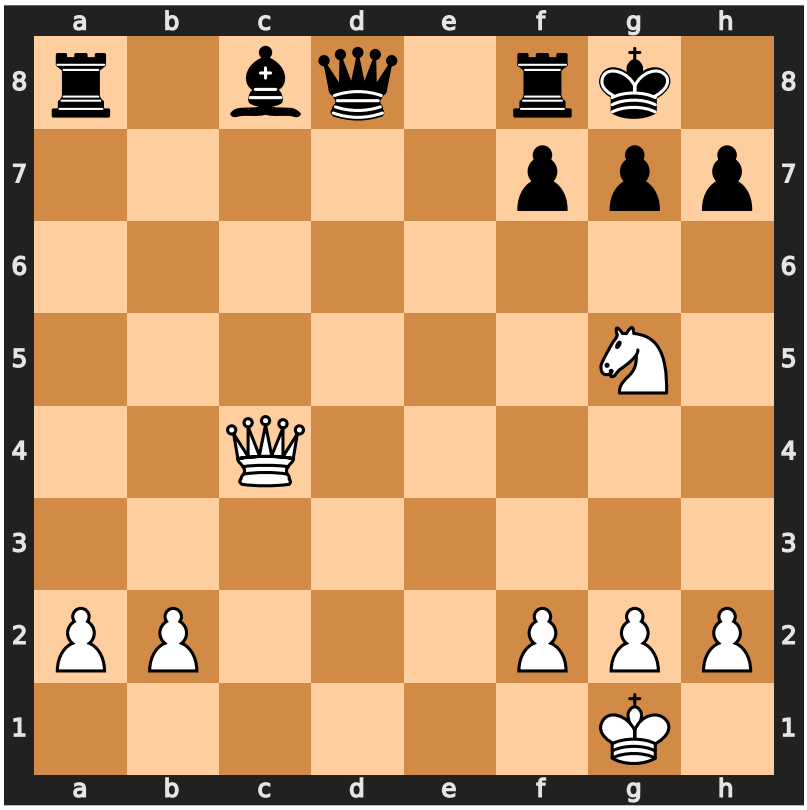

Figure 31.3: Chess Position

White to play.

The sequence (Philidor's Legacy):

1. White plays **Nh6+!** The knight gives check from h6. The king on g8 is in check (the knight on h6 attacks g8). The king must move: **Kh8** is forced. (Kf8 allows Qc5+ and White wins easily.)

2. White plays **Qg8+!!** The queen *sacrifices itself* on g8 with check. This is the most spectacular move in the whole chapter. **Rxg8** is the only legal response. The rook captures the queen.

3. White plays **Nf7#.** The knight returns to f7 and delivers checkmate. Look at the king on h8: it cannot go to g8 (blocked by its own rook that just captured the queen), h7 (blocked by its own pawn), or g7 (blocked by its own pawn). The knight on f7 gives check, and there is nowhere to go.

This is the smothered mate. The king is suffocated by its own pieces. The knight is the only piece that can deliver this checkmate because it jumps over the pieces that form the cage.

Why it works: The queen sacrifice on g8 forces Black's rook to g8, completing the prison. The knight then delivers the killing blow from f7, controlling h8 (yes, a knight on f7 attacks h8).

The lesson: Never dismiss a queen sacrifice without calculating. Some of the most brilliant moves in chess history involve giving up the queen to set up a smothered mate.

31.3 Pattern 13: Greek Gift Sacrifice (Bxh7+)

Definition: The Greek Gift is a bishop sacrifice on h7 (against a castled king) that opens the kingside for a devastating attack. White plays Bxh7+, and if the king takes, a knight and queen rush in to finish the job.

The sacrifice is named after the Trojan Horse. The bishop is the gift. Taking it leads to destruction.

Set up your board (Classic Greek Gift):

White: Kg1, Qd1, Re1, Bd3, Bc1, Nf3, Pawns a2, b2, c3, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Be7, Bc8, Nd7, Nf6, Pawns a7, b7, d5, e6, f7, g7, h7

White to play.

The sequence:

1. **The sacrifice:** White plays **Bxh7+!** The bishop captures the pawn on h7 with check. Black must decide: take the bishop or decline.
2. **If Black declines (Kh8):** White plays Bg6 (or retreats the bishop) with an extra pawn and a weakened kingside to target. White is better, but the attack is less violent.
3. **If Black accepts (Kxh7):** The king is exposed. White plays **Ng5+!** The knight jumps to g5 with check, attacking the king on h7.
4. **After Kg8** (going back): White plays **Qh5!** threatening Qh7 checkmate. The queen arrives with tremendous force. White will follow with Qxf7+ or Qh7+ depending on the position. The attack is usually winning.
5. **After Kg6** (going forward into the open): The king walks into danger. White plays **Qd3+!** The king is hunted across the board. This usually ends in checkmate within a few moves.

The three conditions for Bxh7+ to work:

You typically need ALL THREE of these: 1. A bishop that can reach h7 with check (usually from d3 or c2) 2. A knight ready to jump to g5 (usually already on f3) 3. A queen that can reach h5 quickly (usually from d1)

If any ingredient is missing, the sacrifice might not work. Always check all three before you sacrifice.

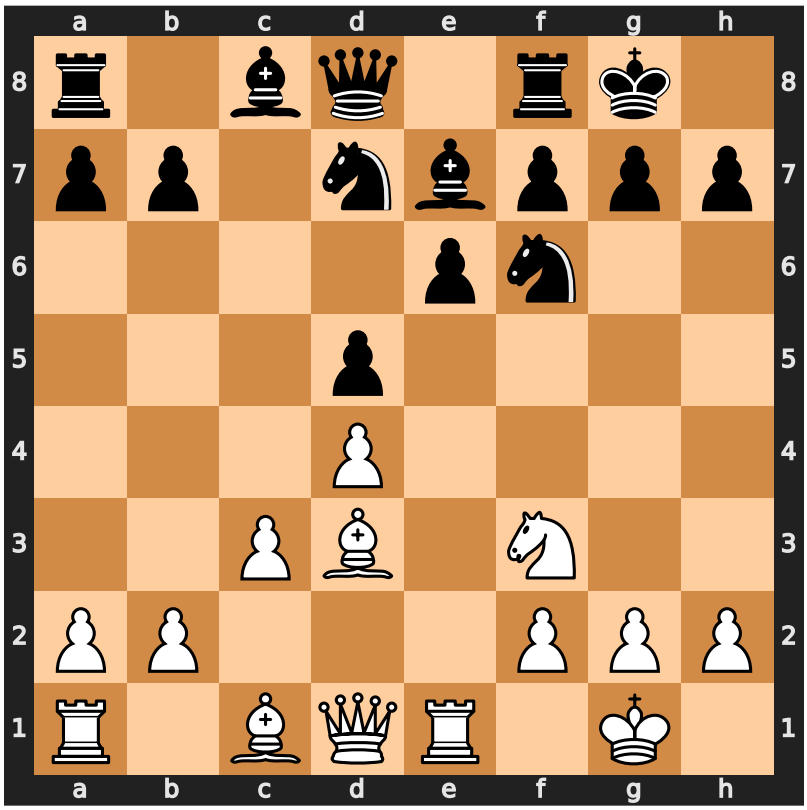

Figure 31.4: Chess Position

Why it works: The pawn on h7 is the last defender of the king's fortress on the kingside. Removing it opens a highway for the queen and knight. The king has nowhere safe because the queen and knight control all escape routes.

Warning: Not every Bxh7+ works. If Black has extra defensive pieces near the king, the sacrifice may fail. Always calculate.

31.4 Pattern 14: Arabian Mate

Definition: The Arabian Mate uses a rook and knight working together. The knight controls the escape squares while the rook delivers checkmate, typically near the corner.

Set up your board:

White: Kg1, Ra1, Nf6, Pawns a2, b2, f2, g2, h2 Black: Kh8, Pawns g7, h7

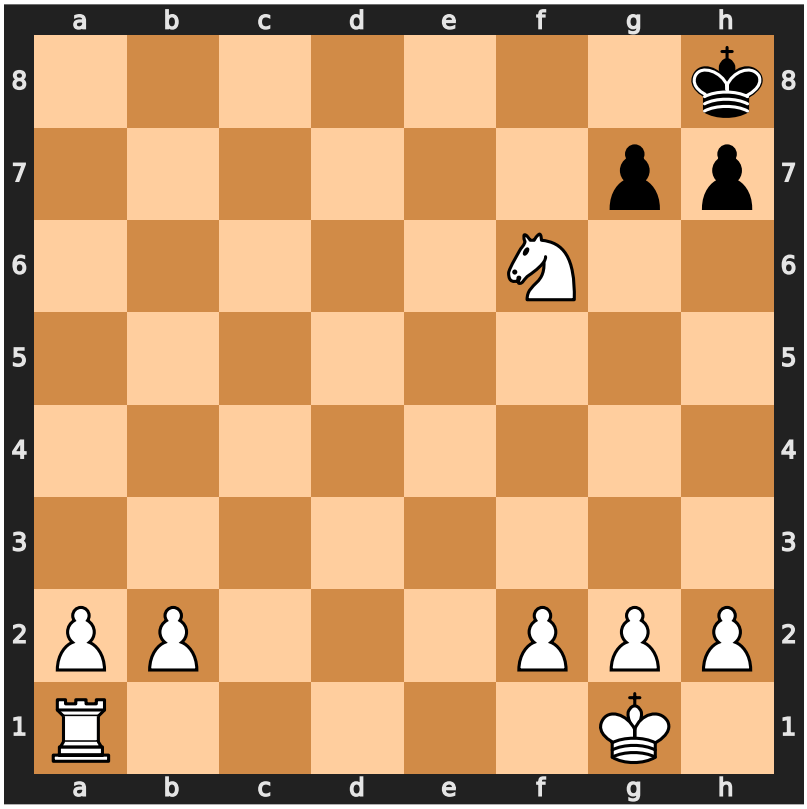

Figure 31.5: Chess Position

White to play.

The sequence:

1. White plays **Ra8#.** That is it. One move. Checkmate.
2. The rook gives check along the eighth rank. The king on h8 has no escape:
   - **Kg8:** Controlled by the knight on f6 (a knight on f6 attacks g8)

- **Kh7 (if it could go there):** Blocked by its own pawn. AND the knight on f6 attacks h7.
- **Kg7 (if it could go there):** Blocked by its own pawn.

3. The king is surrounded by its own pawns and the knight's control of the escape squares. The rook delivers the final blow from the eighth rank.

Why it works: The knight controls the flight squares (especially g8 and h7 from f6), and the rook attacks along the rank. The edge of the board and Black's own pawns complete the cage. Two pieces working in harmony deliver checkmate.

Common situations: - Endgames where a knight reaches f6 (or f3 against a white king) and a rook controls the back rank - Middlegame attacks where the knight has infiltrated and a rook invades - After an exchange sacrifice, the remaining rook plus knight can be enough for this pattern

The rook-knight partnership: The knight and rook complement each other perfectly. The rook controls long lines; the knight controls nearby squares in an L-shape. Together they form a lethal net.

31.5 Pattern 15: Anastasia's Mate

Definition: Anastasia's Mate uses a rook and knight to deliver checkmate on the edge of the board. The knight controls the king's escape squares while the rook checks along a file (usually the h-file or a-file). A pawn or the board edge traps the king.

This pattern is named after the novel *Anastasia and the Chess Game* by Wilhelm Heinse (1803).

Set up your board:

White: Kg1, Re1, Ne7, Pawns a2, b2, f2, g2, h2 Black: Kh7, Rf8, Pawns g7, h6

White to play.

The sequence:

1. White plays **Rh1!** The rook shifts to the h-file, aiming at the king on h7.

2. This is checkmate. The rook on h1 gives check along the h-file to the king on h7. The king's escape squares:

   - **Kg8:** Controlled by the knight on e7 (knight on e7 attacks g8 and g6)
   - **Kg6:** Also controlled by the knight on e7
   - **Kh8:** The rook on h1 still checks along the h-file
   - **g7:** Blocked by own pawn

3. The knight on e7 seals off all escape squares (g8 and g6), and the rook checks along the entire h-file. The Black pawn on g7 blocks the remaining square. Checkmate.

Why it works: The knight, positioned one file away from the king, controls the critical escape squares while the rook delivers check from a distance along the file. The king is sandwiched between the board edge, its own pawns, and the knight's control.

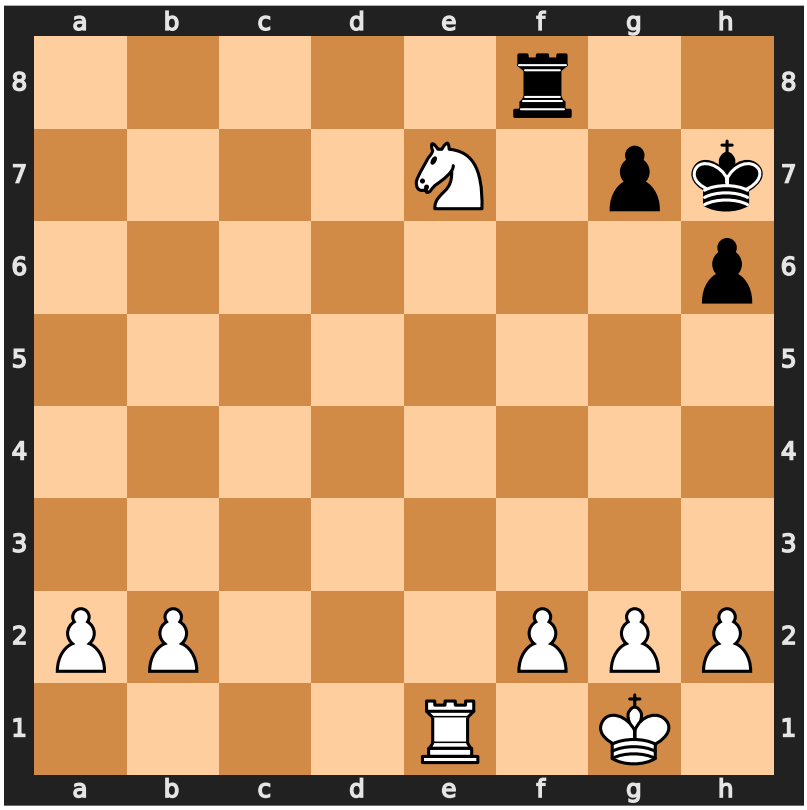

Figure 31.6: Chess Position

Common situations: - After a knight sacrifice on e7 (or e2 for Black), the king is pushed to the h-file - In attacking games where the h-file is opened by a pawn storm - When the opponent's king has fled to the corner and the knight can reach e7 or c7

31.5.1 Milestone Check

You have learned 15 out of 30 patterns. You are halfway. The mating patterns in this group win games outright. If you can spot a back rank mate, a smothered mate, a Greek Gift, an Arabian Mate, or Anastasia's Mate in a real game, you do not just win material. You win the game on the spot.

You have earned a break. Fifteen patterns in your toolkit is impressive. Come back fresh for Group 4. The geometric patterns will change how you see the board.

31.6 Exercises: Group 3 (Patterns 11-15)

Pattern 11: Back Rank Mate

Exercise 11.51

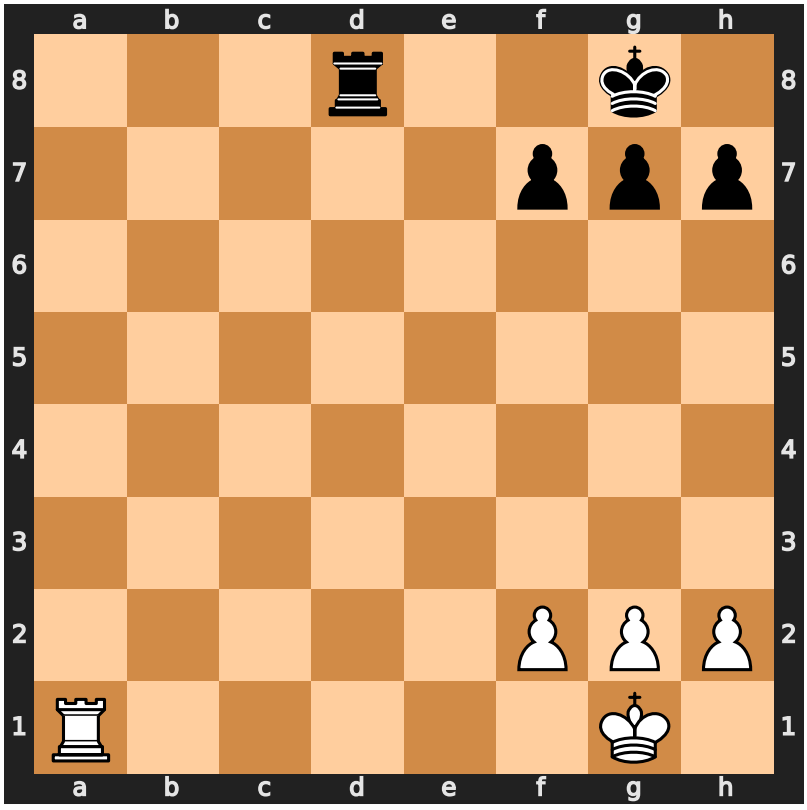

Figure 31.7: Chess Position

White to play. Can you win with a back rank mate? Hints: (1) The king on g8 has no escape. (2)

The rook on a1 can reach a8. (3) Is a8 the same rank as the king? Yes, Ra8+ and if Rd back-rank defense exists, follow up.

Exercise 11.52

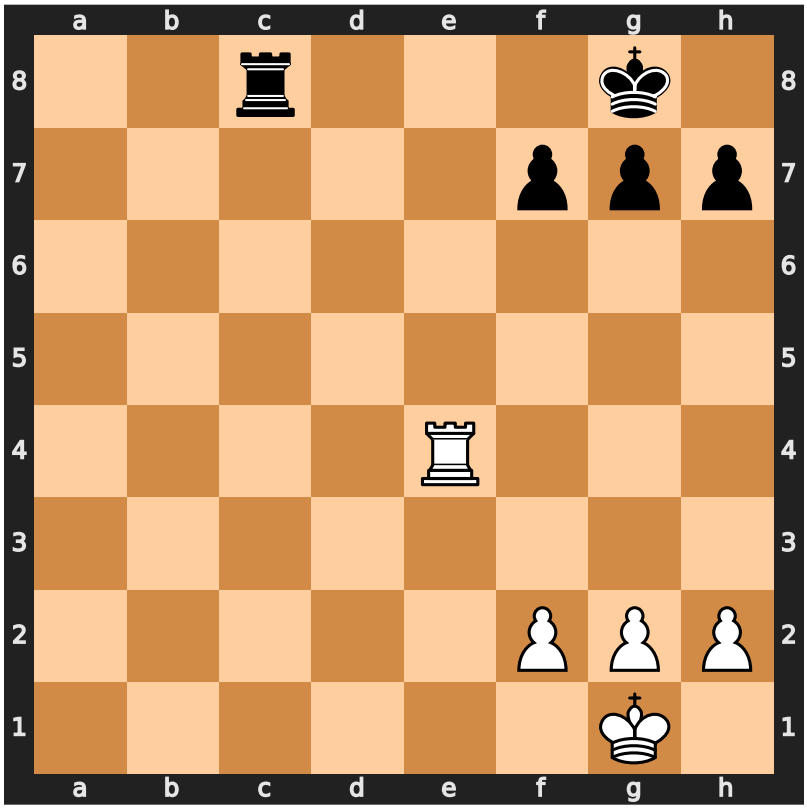

Figure 31.8: Chess Position

White to play. The rook on e4 can reach the back rank. Is it mate? Hints: (1) Re8+ is check. (2) Rxe8 captures. (3) But wait, does White have a second rook? No. This is NOT a back rank mate because after Rxe8, White has nothing left. You need TWO heavy pieces or a way to remove the defender. Recognize when the pattern does NOT work.

Exercise 11.53

White to play. You have two rooks. Find the back rank mate. Hints: (1) Rd8+ forces Rxd8. (2) Then Rxd8 is checkmate (the rook from b1 recaptures). (3) The classic one-two punch: sacrifice on the back rank, then invade.

Exercise 11.54

White to play. The queen on d8 defends the rook on c8. Can you break through? Hints: (1) Rd8 is not check but it attacks the queen. (2) If Qxd8, who defends the back rank? (3) Wait, after Qxd8, White has no more pieces to invade. But think about Bc5 first, cutting off the queen's defense, then Rd8. Wrong hint. Actually, just Rxd8+ Qxd8, then nothing. The pattern does not always work. Sometimes you need to CREATE the back rank weakness first.

Exercise 11.55

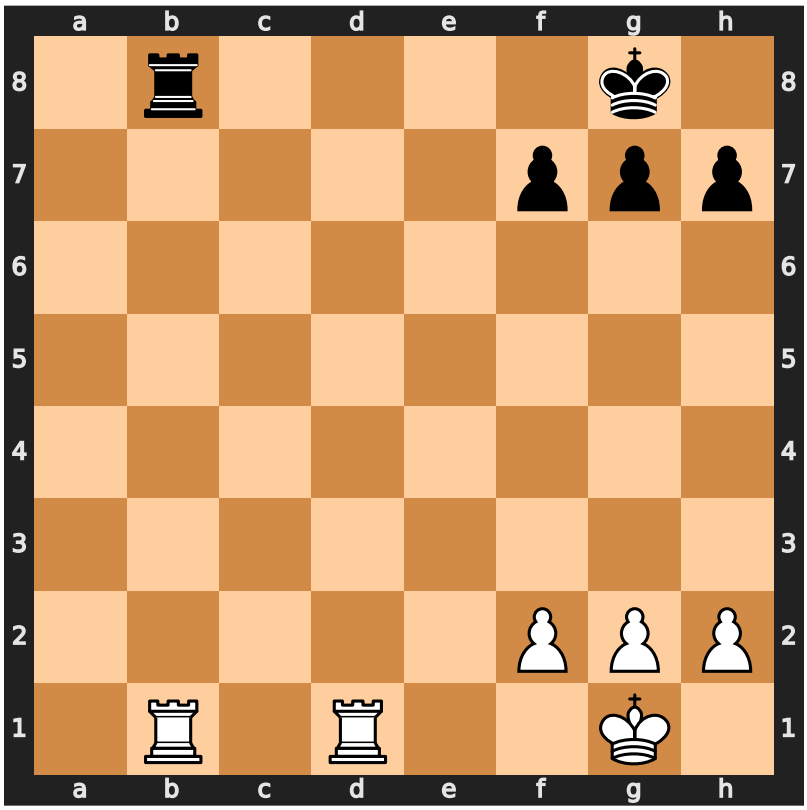

Figure 31.9: Chess Position

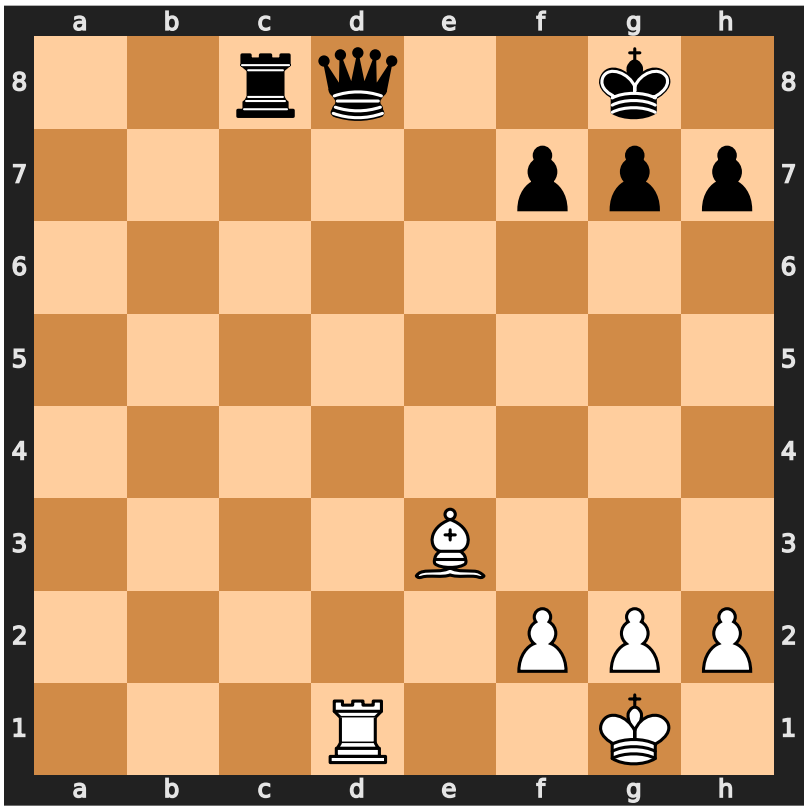

Figure 31.10: Chess Position

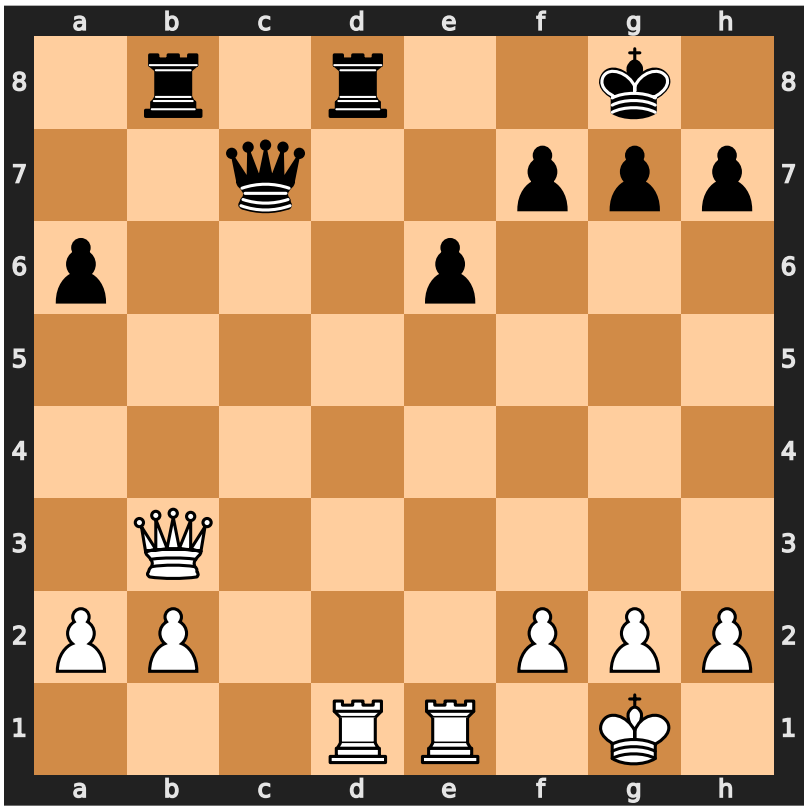

Figure 31.11: Chess Position

White to play. Two rooks on the first rank. The Black king has no luft. Find the back rank combination. Hints: (1) Qe3 or Qa3 might work, but look for something direct. (2) Rd8+! Rxd8. (3) Re8+! And now Rd back rank is forced, and Rxd8 is checkmate. The classic double rook sacrifice.

Pattern 12: Smothered Mate

Exercise 11.56

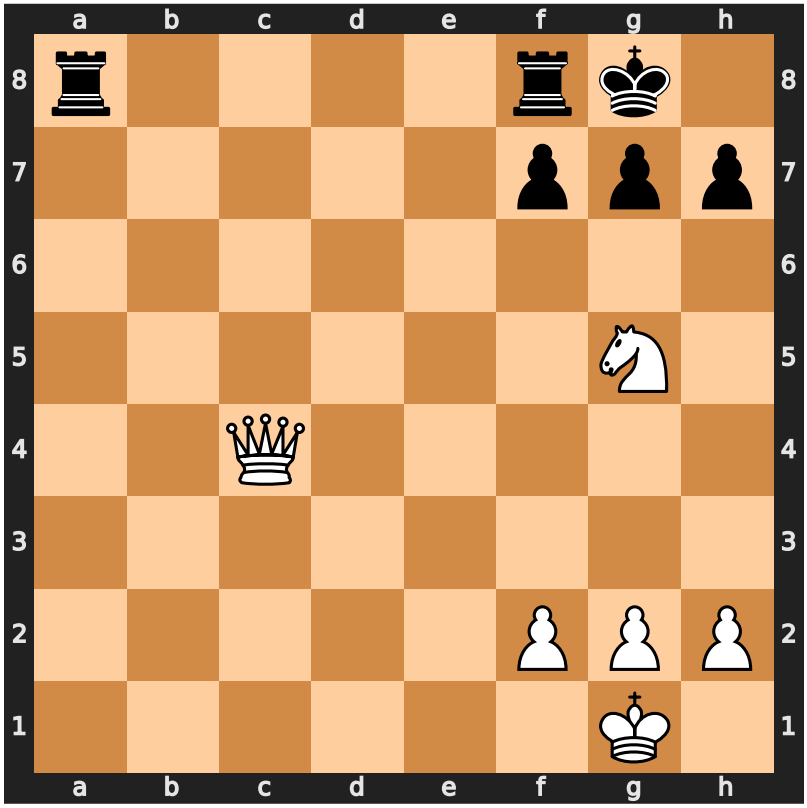

Figure 31.12: Chess Position

White to play. Set up the smothered mate. Hints: (1) Nh6+ first. (2) Kh8 is forced. (3) Qg8+ Rxg8 Nf7 is checkmate.

Exercise 11.57

White to play. Can you deliver a smothered mate from this position? Hints: (1) The knight is on f3, not g5. It needs two moves to reach the right square. (2) Nh4 first, then Ng6 or Nf5-h6. (3) Actually, from f3 the knight can go to g5 in one move: Ng5. Then Nh7 or continue from there. This exercise is about planning the knight route, not executing immediately.

Exercise 11.58

White to play. The knight is on e4. Find the path to smothered mate. Hints: (1) Nf6+ is check (knight on f6 attacks g8). (2) After gxf6 the king is exposed but it is not smothered mate. (3) After Kh8 (declining the capture), Qh5 threatens Qxh7 mate.

Exercise 11.59

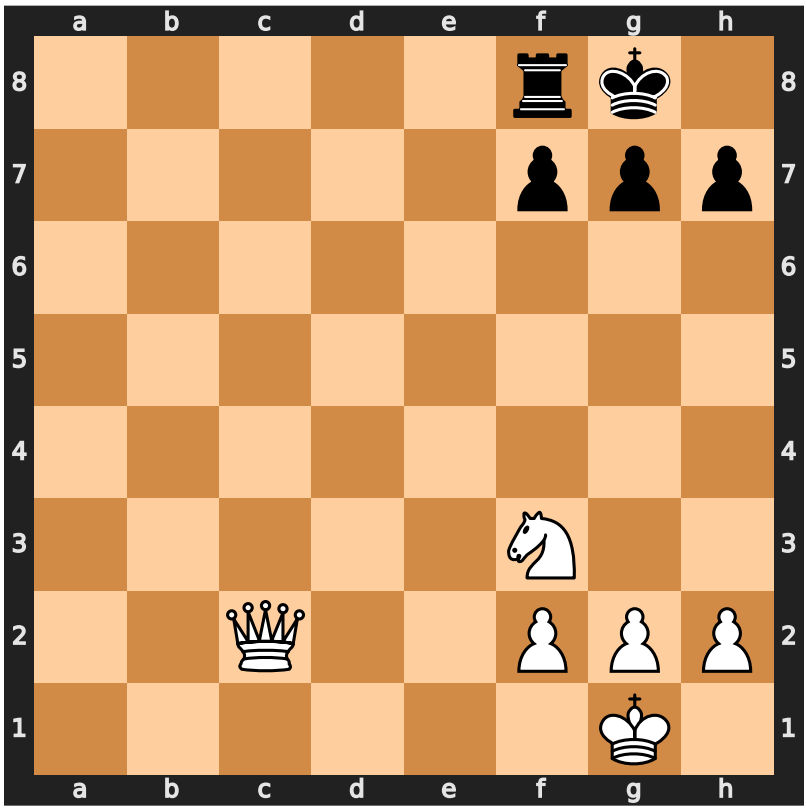

Figure 31.13: Chess Position

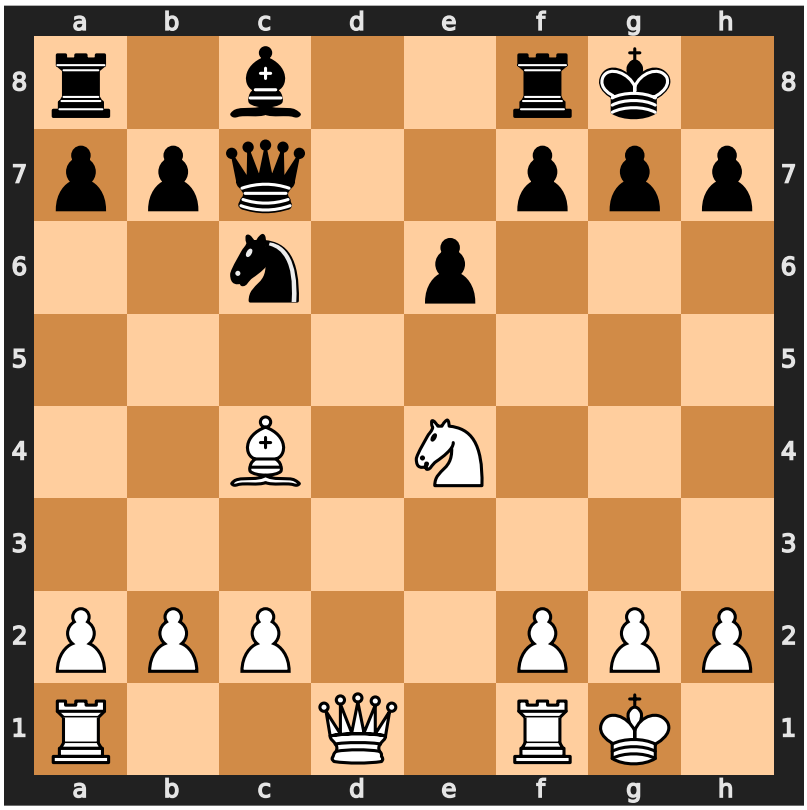

Figure 31.14: Chess Position

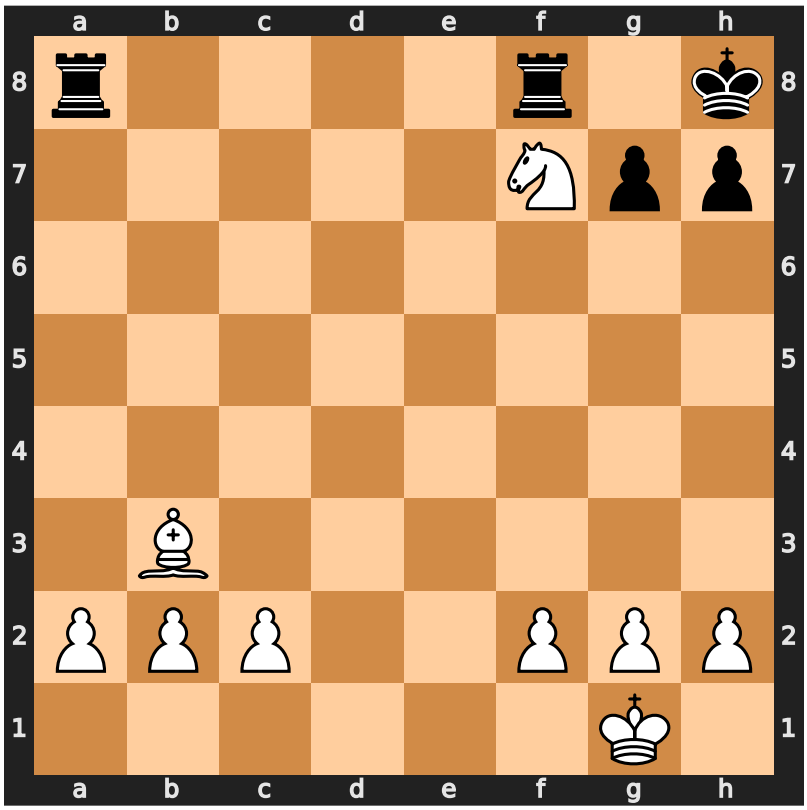

Figure 31.15: Chess Position

White to play. The knight is already on f7. Is a smothered mate possible? Hints: (1) The king is on h8, knight on f7. (2) Nh6 threatens Qg8 ideas, but White has no queen here. (3) Without a queen, smothered mate is impossible. You need all the pieces for the pattern to work. Know when the pattern CANNOT apply.

Exercise 11.60

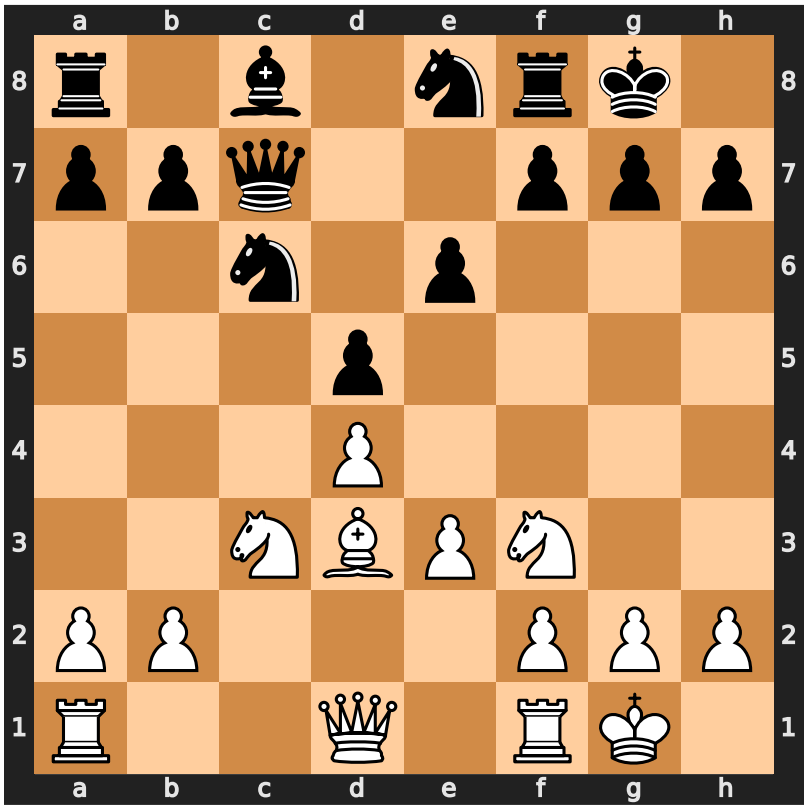

Figure 31.16: Chess Position

White to play. Find a multi-move sequence that leads to a smothered mate threat. (It does not have to be forced mate; the threat alone may win material.) Hints: (1) Bxh7+ starts the Greek Gift. (2) After Kxh7 Ng5+ Kg8, can you set up a smothered mate? (3) Qh5 threatens Qh7 mate, and if Black defends with Re8 or similar, Nh7 followed by Nf6+ ideas could arise.

Pattern 13: Greek Gift

Exercise 11.61

White to play. All three Greek Gift conditions are met. Execute the sacrifice. Hints: (1) Bishop on d3 can reach h7. (2) Knight on f3 can reach g5. (3) Queen on d1 can reach h5. Go: Bxh7+ Kxh7 Ng5+ and then Qh5.

Exercise 11.62

White to play. Does the Greek Gift work here? Hints: (1) Check the three conditions: Bishop to h7? Bd3 can reach h7. (2) Knight to g5? Nf3 is ready. (3) Queen to h5? Qd1 can get there. (4) But wait: Black has a knight on d7 that can come to f6 or f8 to defend. Calculate whether the extra defender stops the attack.

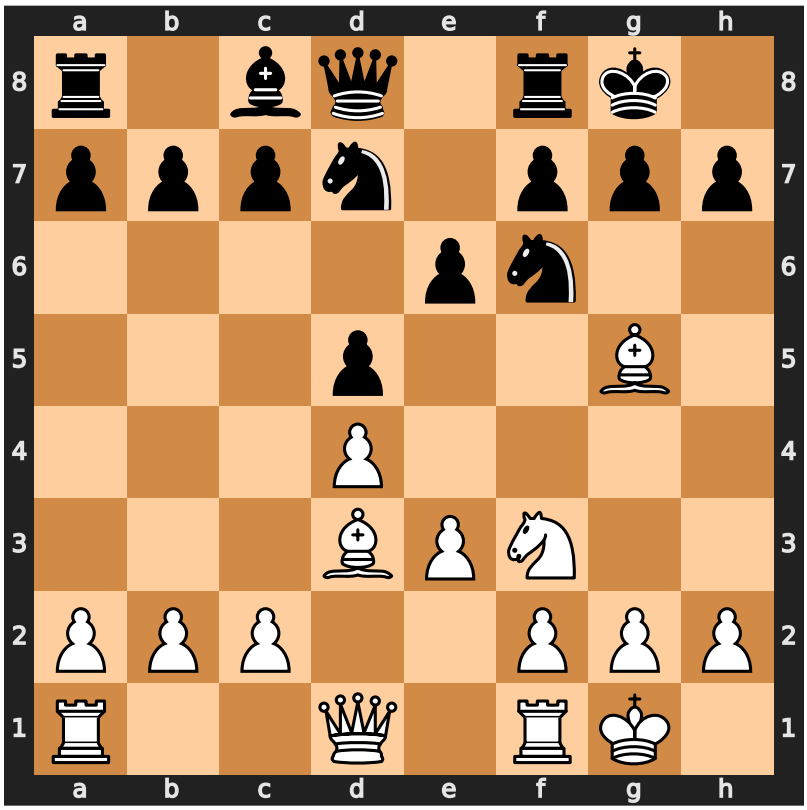

Figure 31.17: Chess Position

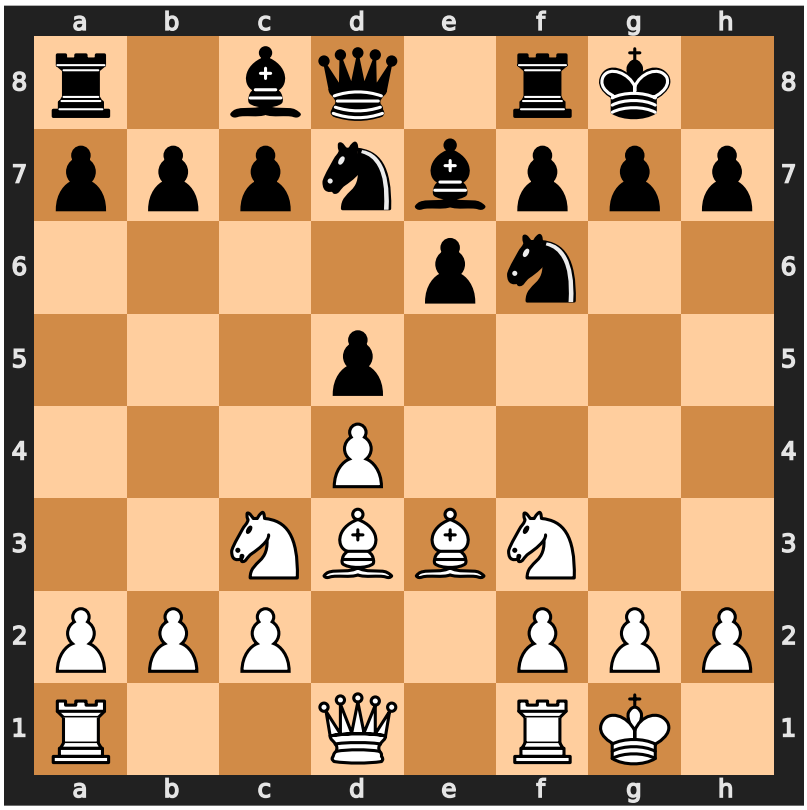

Figure 31.18: Chess Position

Exercise 11.63

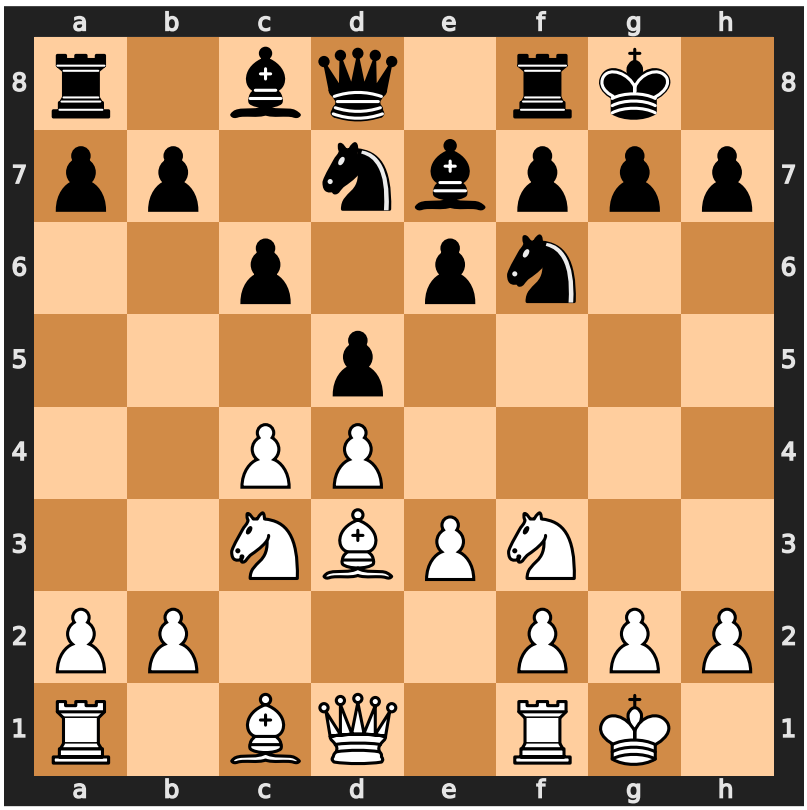

Figure 31.19: Chess Position

White to play. The Greek Gift looks tempting but is it sound? Hints: (1) Bxh7+ Kxh7 Ng5+ Kg6. (2) Now the king is in the open. Qg4 threatens Qh5 mate. (3) But Black has f5! blocking. Calculate whether White's attack is fast enough. This is an exercise in JUDGMENT, not just pattern recognition.

Exercise 11.64

White to play. The knight is on d2, not f3. Does the Greek Gift still work? Hints: (1) After Bxh7+ Kxh7, the knight on d2 cannot reach g5 in one move. (2) Can you play Ng5 from somewhere else? No second knight. (3) The Greek Gift FAILS here because the knight cannot support the attack. Know when the pattern does NOT work.

Exercise 11.65

White to play. Black has played Bd6, blocking the diagonal. Does Bxh7+ still work? Hints: (1) Bxh7+ Kxh7 Ng5+ Kg8. (2) Qh5 threatens Qh7 mate. (3) But Black can play Bxf4! winning a piece and defending. The bishop on d6 provides extra defense. The Greek Gift is unsound here.

Pattern 14: Arabian Mate

Exercise 11.66

White to play. Find Ra8 checkmate (Arabian Mate). Hints: (1) The knight on f6 controls g8 and h7. (2) The rook can reach a8. (3) Ra8 is checkmate. Verify by checking all of the king's escape squares.

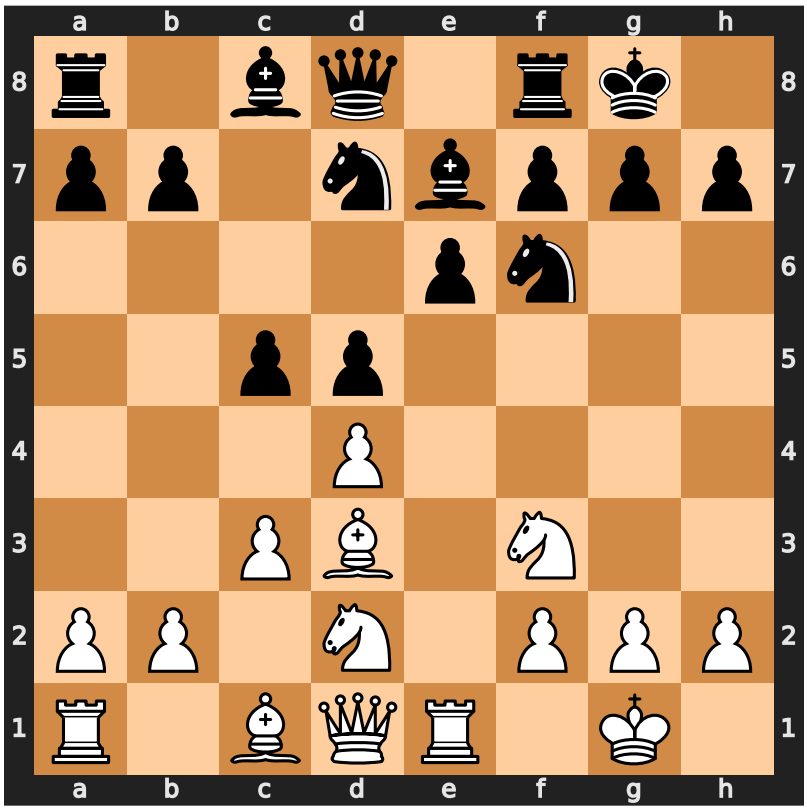

Figure 31.20: Chess Position

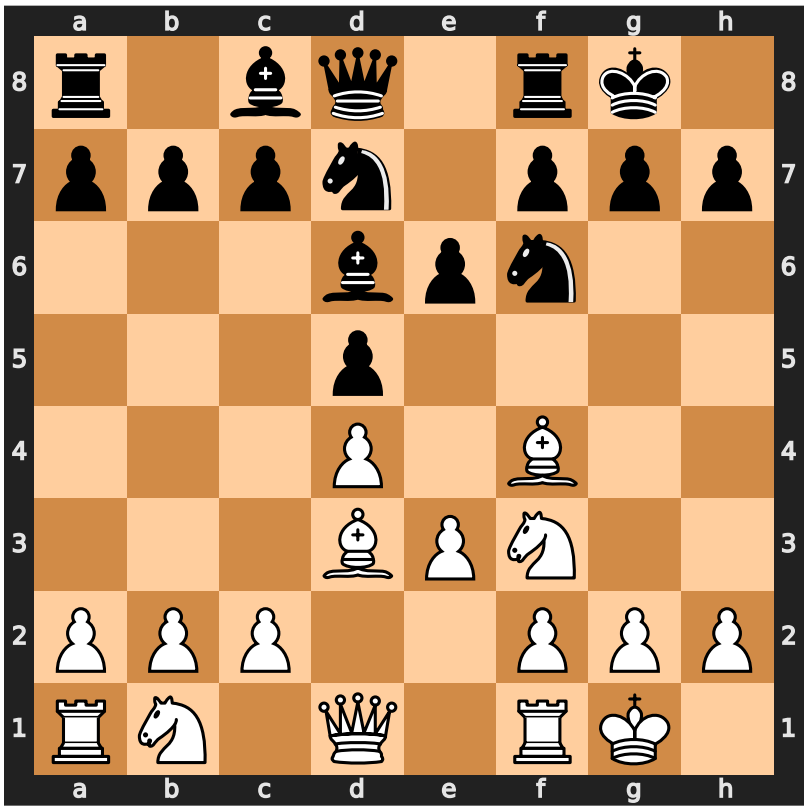

Figure 31.21: Chess Position

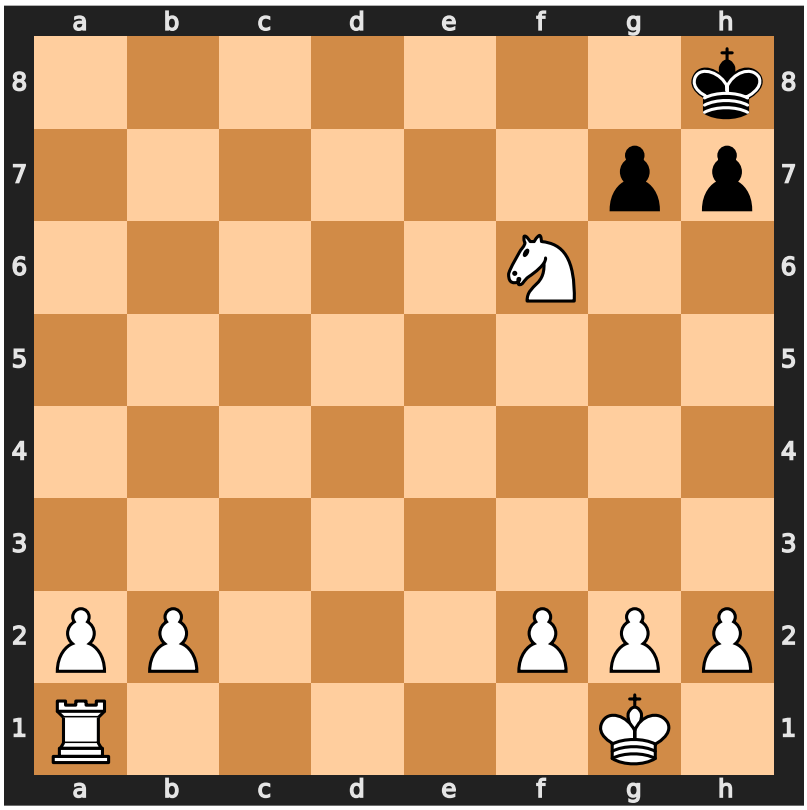

Figure 31.22: Chess Position

Exercise 11.67

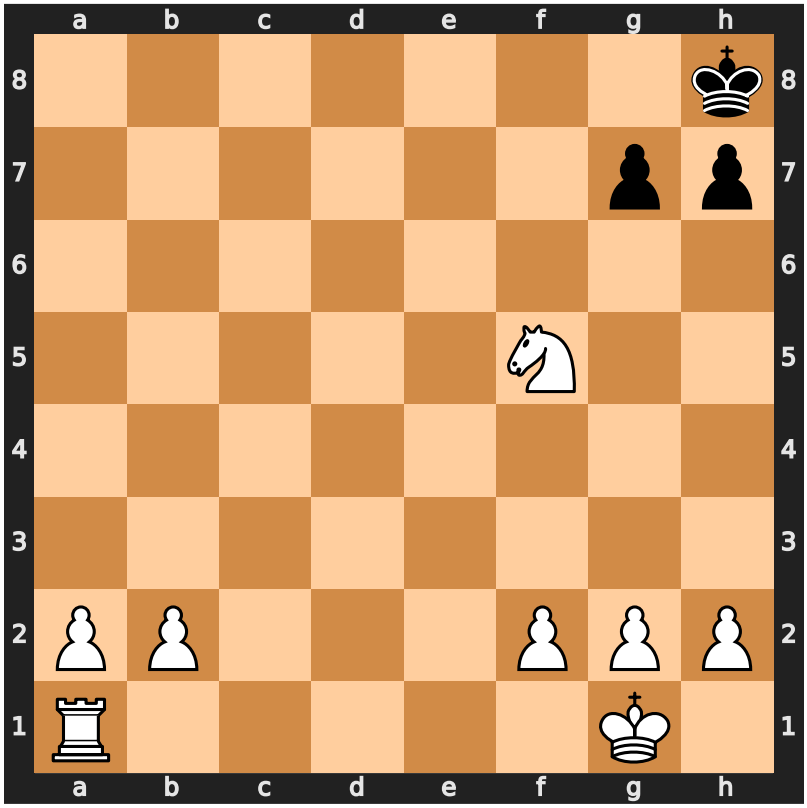

Figure 31.23: Chess Position

White to play. The knight is on f5, not f6. Can you still deliver Arabian Mate? Hints: (1) From f5, the knight can reach h6 in one move. (2) After Nh6, does the knight control g8? Knight on h6 controls f7, g8, g4, f5. YES, it controls g8. (3) But Nh6 is not check. You need two moves: Nh6 then Ra8 mate. Does Black have a defense in between?

Exercise 11.68

White to play. The king is on g8, not h8. Does Arabian Mate work? Hints: (1) Ra8+ is check. (2) After Kf7 (escaping), the knight on f6 does not control f7 escape… wait, does it? Knight on f6 attacks e8, g8, d7, h7, d5, h5, e4, g4. NOT f7. So the king escapes to f7. (3) Arabian Mate requires the king on h8 (corner). This does NOT work with king on g8.

Exercise 11.69

White to play. The rook is already on g7. Is this checkmate? Hints: (1) Rook on g7 attacks along the 7th rank, not the 8th. (2) It does not check the king on h8. (3) But it does control g8, combining with the knight. Can you find a mate? Rg8 is checkmate! The rook checks from g8, and the knight on f6 controls h7.

Exercise 11.70

White to play. There is a rook on a8 (Black's). Does Arabian Mate work here? Hints: (1) Ra8 would capture Black's rook but is it mate? (2) Rxa8+ is check, but after Kf7 the king escapes. (3)

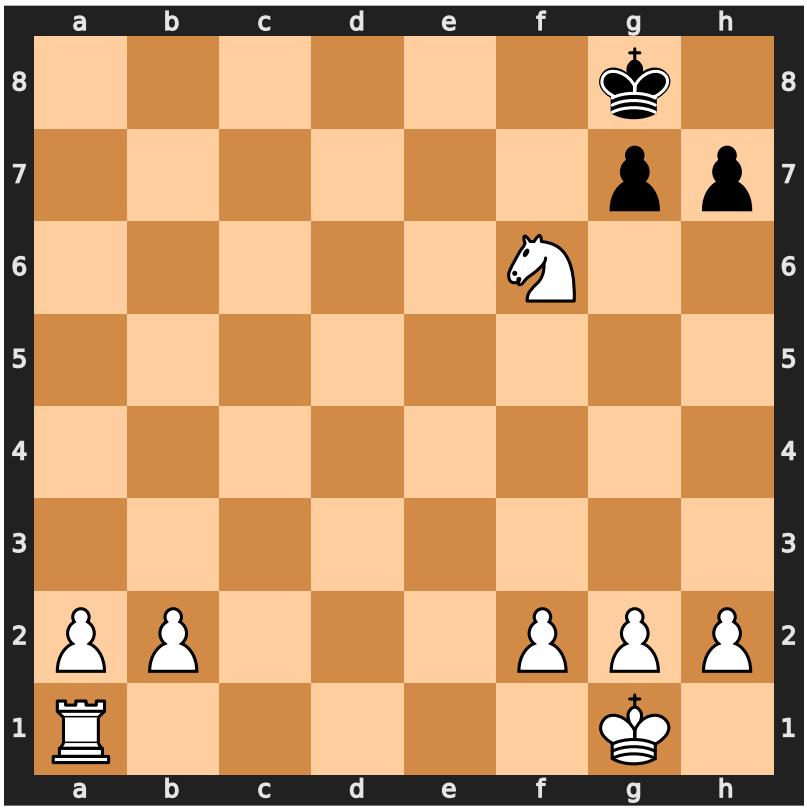

Figure 31.24: Chess Position

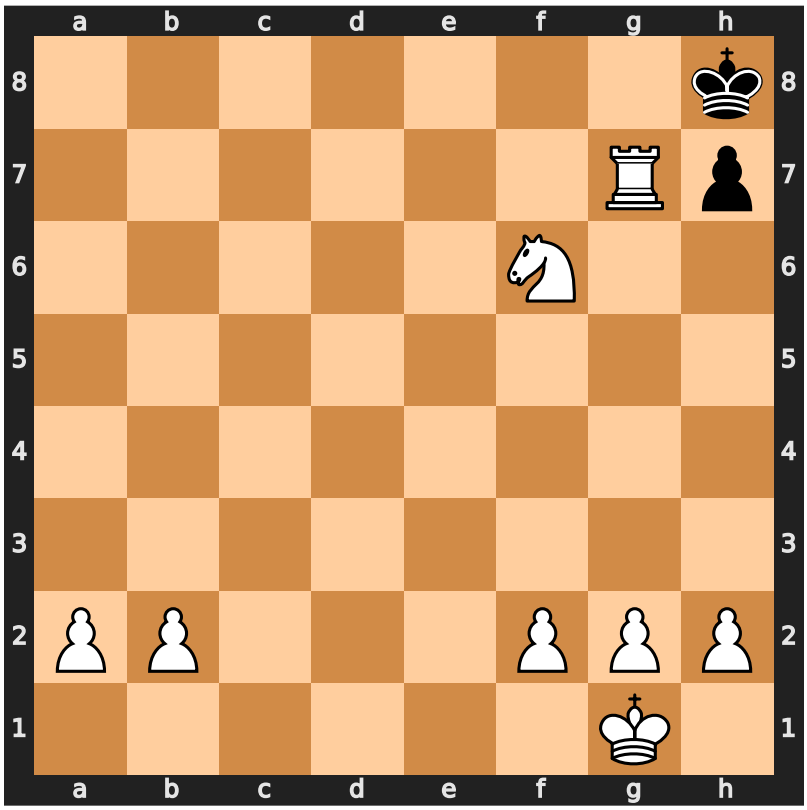

Figure 31.25: Chess Position

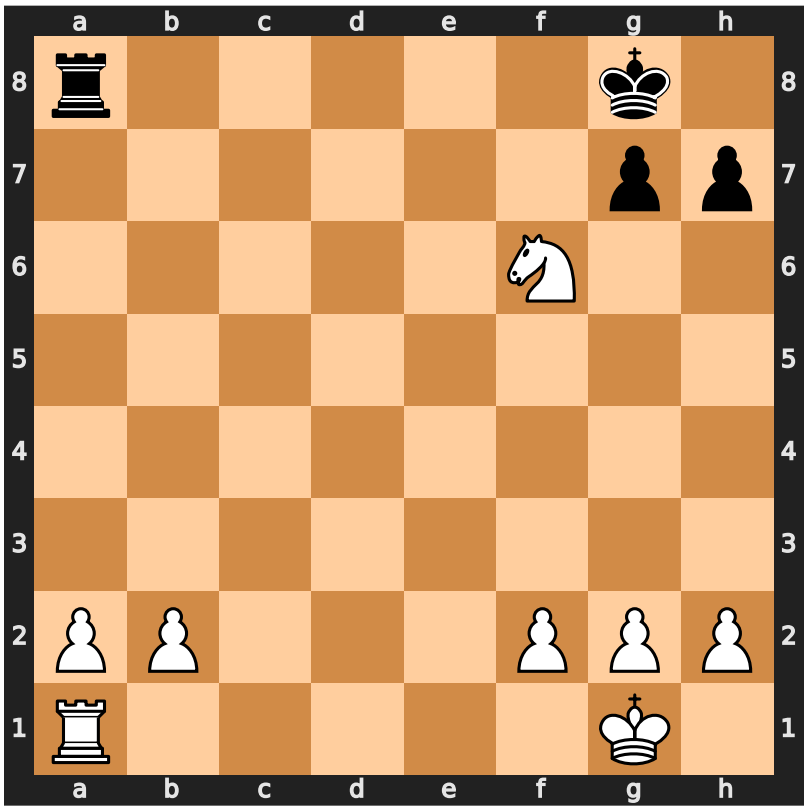

Figure 31.26: Chess Position

The Black rook blocks your rook from reaching the 8th rank cleanly. You need to remove the rook first. This is a more complex version of the pattern.

Pattern 15: Anastasia's Mate

Exercise 11.71

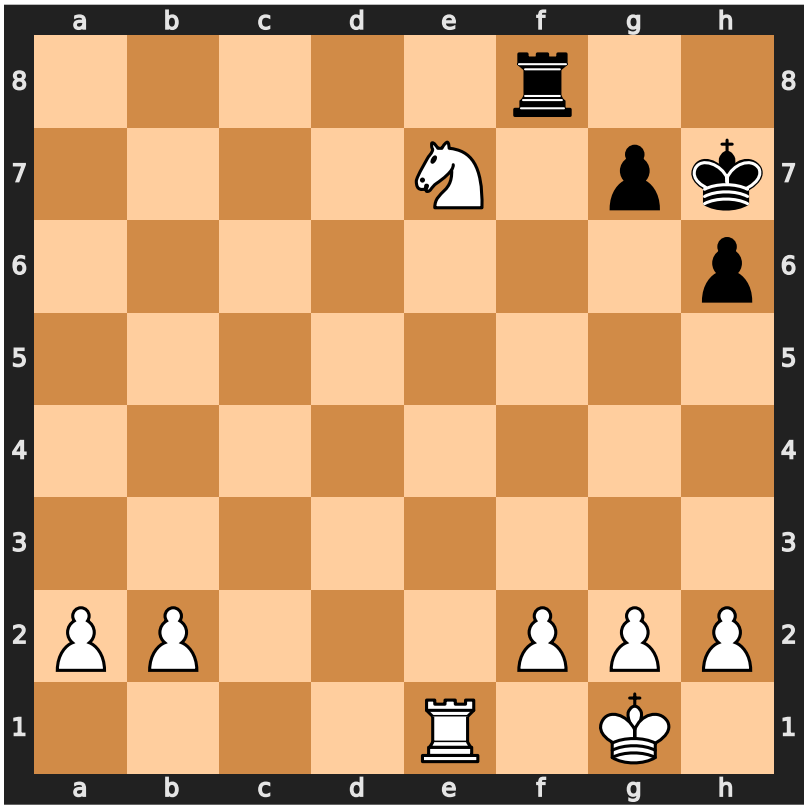

Figure 31.27: Chess Position

White to play. Find the Anastasia's Mate (or the setup for it). Hints: (1) The knight on e7 controls g8 and g6. (2) The rook on e1 can go to the h-file. (3) Rh1 is checkmate because the king on h7 cannot escape.

Exercise 11.72

White to play. The king is on g8, knight on e7. Can you set up Anastasia's Mate? Hints: (1) The knight on e7 controls g8, g6, c8, c6. But does it control g8? Yes. (2) The king is ON g8. It is in check from the knight? No. But Kh8 or Kf8 are the only moves if you check. (3) Re8+ first. After Rxe8, the rook is gone. Not enough pieces. Think about whether you need Rh1 after getting the king to h7 first.

Exercise 11.73

White to play. The knight is on e7 and White has two rooks. Find the winning combination. Hints: (1) Check ideas: can you force the king toward the h-file? (2) Rd8 looks strong, threatening the queen and the back rank. (3) If Qxd8 (or Rxd8), then Re8+ forcing more trades, and eventually the knight + rook mate pattern emerges.

Exercise 11.74

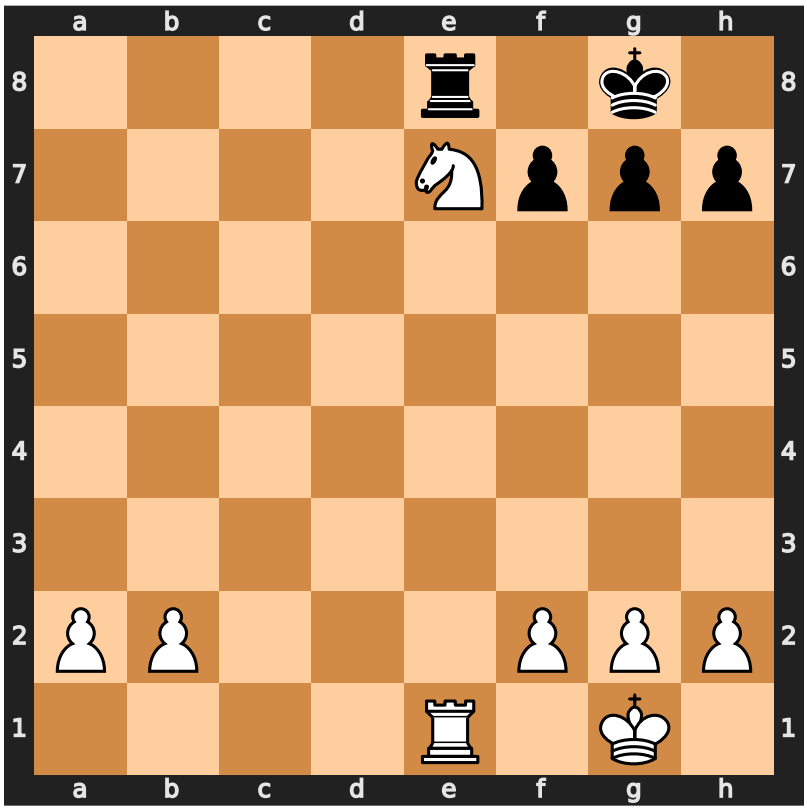

Figure 31.28: Chess Position

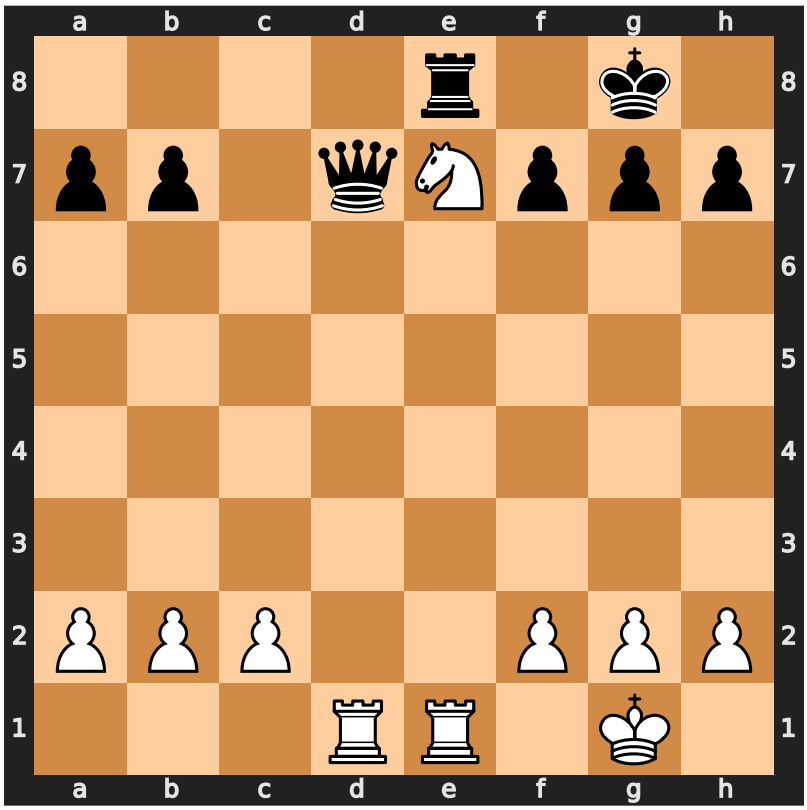

Figure 31.29: Chess Position

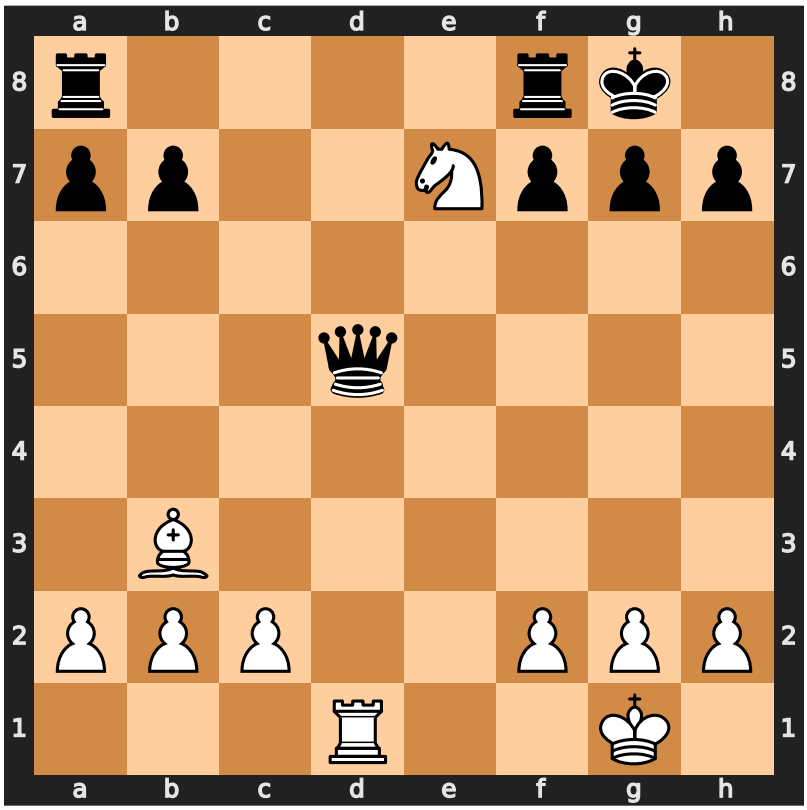

Figure 31.30: Chess Position

White to play. The knight is on e7 (check!). After the king moves, can you set up Anastasia's Mate? Hints: (1) Ne7+ is already check. Kh8 is the likely response. (2) Now the king is on h8. The knight on e7 controls g8 and g6. (3) Can the rook reach the h-file for Rh1? Rd1 to Rh1? The rook would need to go d1-h1. Is h1 clear? Yes. But is it checkmate? King on h8, Rh1+, Kg8 is controlled by Ne7. Not quite, because h7 pawn blocks… Actually if King is on h8 with g7, h7 pawns, then Rh1 does NOT check (rook on h1, king on h8, the h-file is clear between h1 and h8). Rh1+ would be check! And then Kg8 is blocked by Ne7. And Kxh7… wait, there is nothing on h7 to take. Kh7 is blocked by the pawn. So Rh1# might be mate!

Exercise 11.75

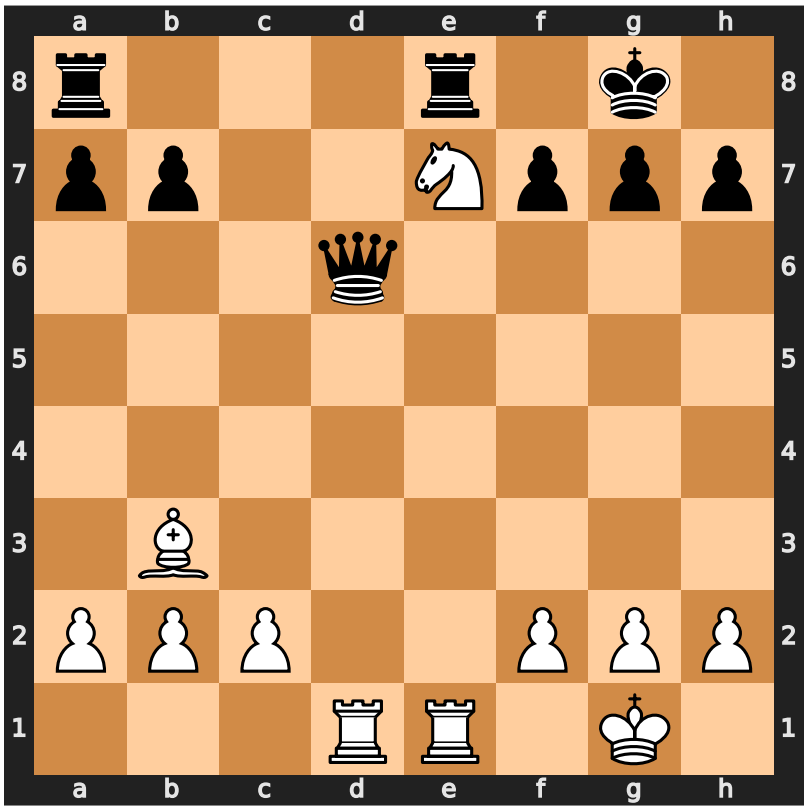

Figure 31.31: Chess Position

White to play. Find the winning combination that ends in Anastasia's Mate. Hints: (1) Start with a forcing move on the d-file or e-file. (2) Rd8 attacks the queen and threatens the back rank. (3) After the exchanges, try to reach the Rh1 + Ne7 pattern against a king stuck on h7 or h8.

Chapter 32

GROUP 4: GEOMETRIC PATTERNS

Estimated study time: 15-20 minutes

The patterns in this group are about the *geometry* of the chessboard. Lines, diagonals, files, and the relationships between pieces across the board. These patterns are harder to see because they involve pieces that are far apart, working together across distance. Once you learn to see these geometric relationships, you will find combinations that look like magic.

32.1 Pattern 16: X-Ray Attack

Definition: An X-ray attack (also called a "skewer through a piece") is when a piece attacks through another piece to a target behind it. The front piece blocks the attack for now, but if it moves, the piece behind it is captured.

You learned skewers in Volume I. The X-ray takes this further. It is not just about attacking two pieces on the same line. It is about using the *threat* of attacking through a piece to control the game.

Set up your board:

White: Kg1, Qa4, Rd1, Pawns a2, f2, g2, h2 Black: Kg8, Qd8, Rd7, Bc8, Pawns a7, b7, f7, g7, h7

White to play.

The sequence:

1. White plays **Rxd7!** Capturing the rook. Black recaptures **Qxd7**.
2. Now White plays **Qa8!** The queen attacks the bishop on c8 AND X-rays through the queen on d7 to the back rank ideas. If the queen moves off the d-file, White might threaten Qxc8.
3. The X-ray concept: the queen on a8 "looks through" the bishop on c8 and controls the entire 8th rank behind it. Pieces on the same line as your heavy pieces are always under invisible pressure.

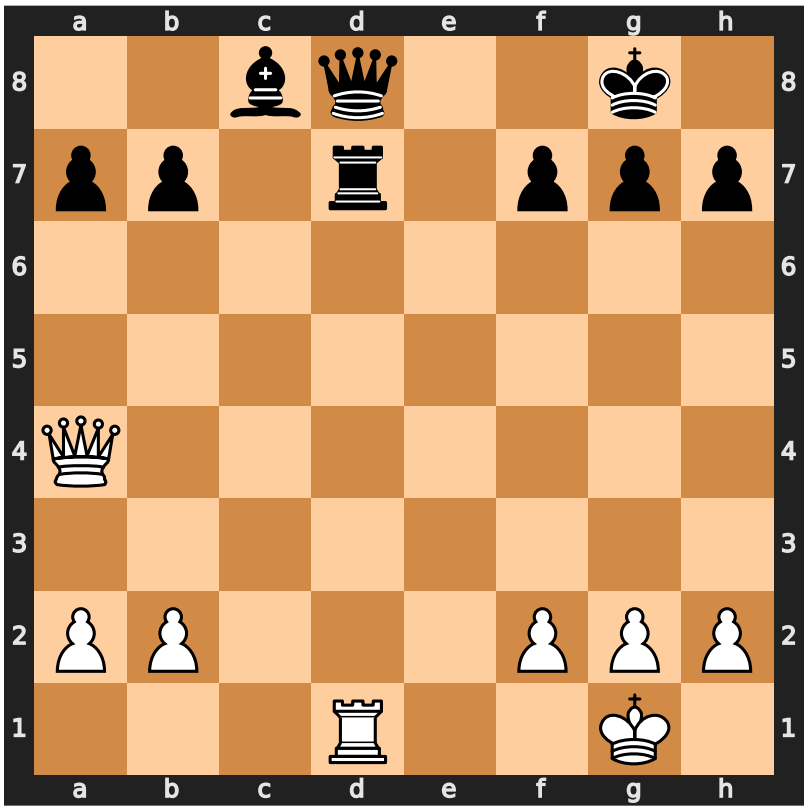

Figure 32.1: Chess Position

Why it works: Heavy pieces (queens and rooks) project power along entire lines. Even when a piece blocks the line, the threat of what happens if that piece moves creates constant pressure. Think of the X-ray as an invisible beam that passes through obstacles.

Common situations: - A queen behind a rook on the same file (X-ray battery: if the rook is captured, the queen controls the file) - A rook "looking through" a pinned piece to the king behind it - Two rooks on the same file where the front rook sacrifices and the back rook continues the attack

---

32.2 Pattern 17: Windmill

Definition: A windmill is a repeated discovered check that wins material on every turn. One piece gives check, then returns to its original square while the other piece captures something. Then the first piece moves again with another discovered check. This cycle repeats, harvesting material like a windmill grinding grain.

The windmill is the most spectacular tactical pattern in chess. When it works, it is almost impossible to stop.

Set up your board (inspired by Torre vs. Lasker, 1925):

White: Kg1, Qd4, Re7, Bg5, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qf6, Ra8, Rf8, Pawns a7, b7, f7, g6, h7

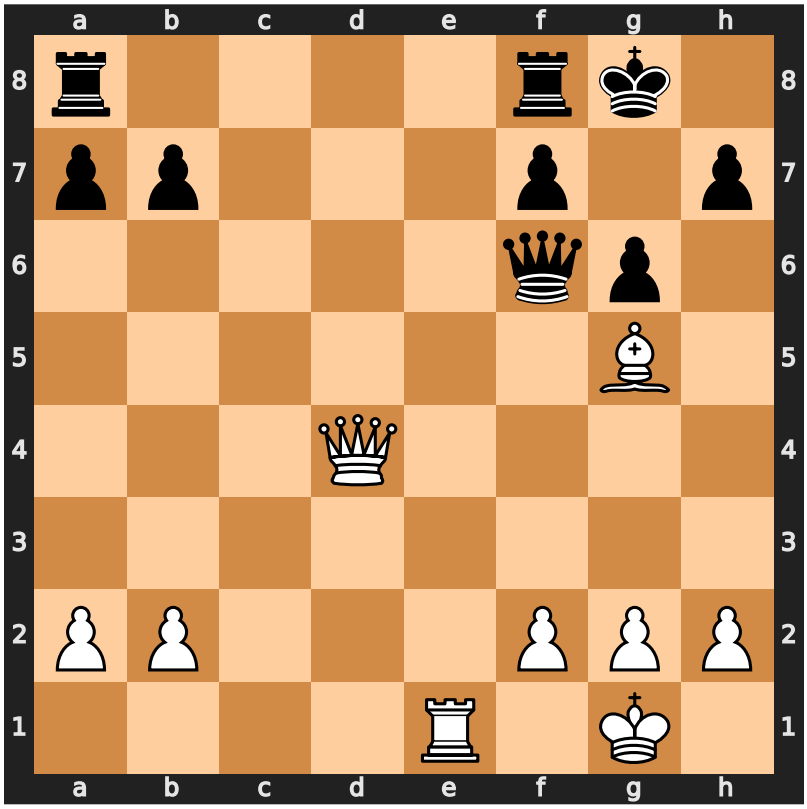

Figure 32.2: Chess Position

White to play.

The concept:

1. In the famous Torre-Lasker game, White executed a windmill with a bishop and rook. The bishop gave discovered checks repeatedly while the rook captured pieces.

2. The key setup: one piece (the "blade") moves back and forth between two squares, giving discovered check each time it moves. The other piece (the "grinder") captures a new piece each turn.

3. Each cycle of the windmill wins more material. The opponent can only move the king back and forth because every other move is met with another discovered check.

Why it works: The discovered check forces the king to move. The opponent gets no chance to do anything else. Meanwhile, the "grinder" piece takes everything in sight.

Common situations: - A bishop on g5/f6/e7 giving discovered checks while a rook captures pieces along the seventh rank - Any position where a piece can repeatedly return to a checking square while clearing the way for another piece

Rarity note: Full windmills are rare in practice. But even a *partial* windmill (two or three cycles) can be devastating. When you see a discovered check possibility, always check whether the checking piece can come back for a second round.

32.3 Pattern 18: Interference

Definition: Interference is when you place a piece on a square that blocks an important defensive line. By putting a piece "in the way," you cut off communication between your opponent's pieces.

Think of it as jamming the signal between two pieces that are trying to coordinate.

Set up your board:

White: Kg1, Qg4, Rd1, Rd7, Pawns a2, f2, g2, h2 Black: Kg8, Qc3, Rb8, Re8, Pawns a7, f7, g7, h7

White to play.

The sequence:

1. Black's queen on c3 and rook on e8 are defending the back rank together. The queen can get to e1 to block if needed, and the rook guards e8.

2. White plays **Re7!** This interference move blocks the connection between the rook on e8 and the rest of the board. The rook on e7 stands between Black's defensive pieces.

3. Now Qg8+ is threatened (or Rd8+). The rook on e8 cannot help because Re7 blocks its communication with the queen and other pieces.

Why it works: Chess pieces defend each other along lines (files, ranks, diagonals). If you place a piece on a square that cuts a defensive line, the pieces on either side become disconnected. They can no longer help each other.

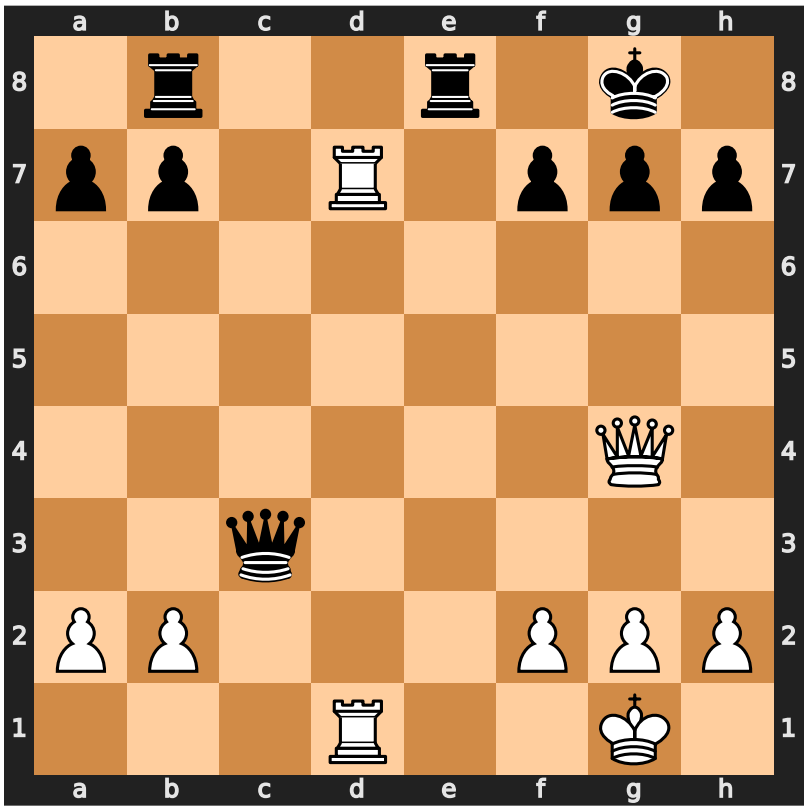

Figure 32.3: Chess Position

Common situations: - A pawn or piece placed on a square that blocks a bishop's diagonal - A rook on the seventh rank that cuts the connection between the opponent's pieces - A knight sacrifice on a square that blocks a rook from defending the back rank - In endgames, a pawn that blocks a bishop from reaching a critical diagonal

---

32.4 Pattern 19: Clearance Sacrifice

Definition: A clearance sacrifice removes one of your OWN pieces from a square so that another piece can use that square or line. You sacrifice your own piece to clear the way.

This is the opposite of most tactics, where you attack your opponent's pieces. Here, the "obstacle" is your own piece, and you sacrifice it to get it out of the way.

Set up your board:

White: Kg1, Qd1, Rd4, Be5, Nf3, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d6, f7, g7, h7

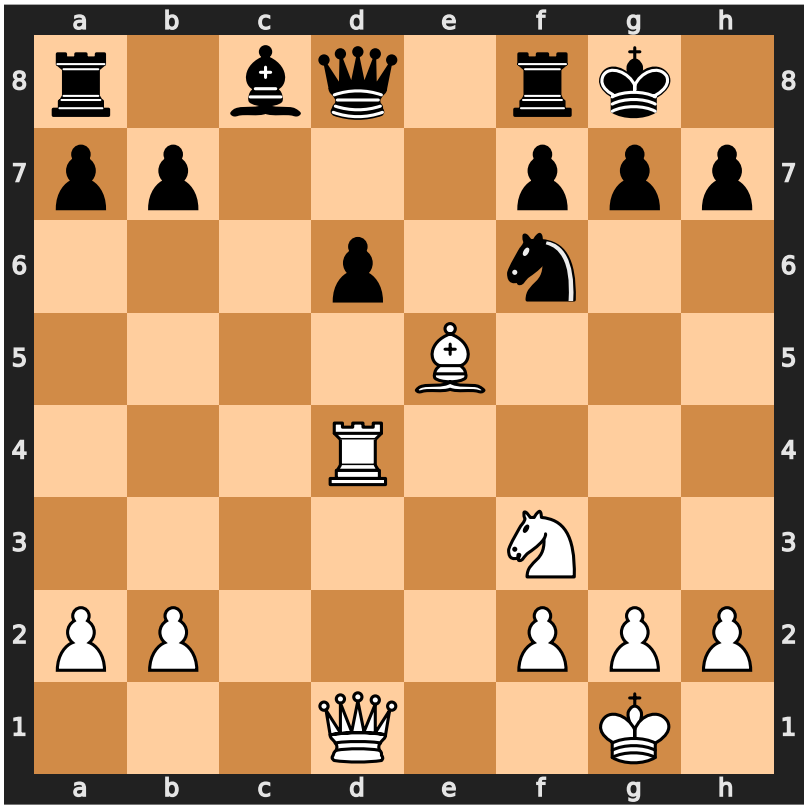

Figure 32.4: Chess Position

White to play.

The sequence:

1. White's rook on d4 is on the same file as the queen on d1. If the rook were not on d4, the queen would have a clear shot down the d-file to d8.

2. White plays **Rd5!** This is a clearance move (not a sacrifice in this case, but the concept). The rook moves off d4, clearing the d-file for the queen while also placing the rook on an active square.

3. A true clearance sacrifice would be: **Rxf6!** Sacrificing the rook to clear the e5 bishop's diagonal or to open lines for the queen. After gxf6, White plays Qd4 with devastating threats against f6 and the weakened kingside.

Why it works: Sometimes your own pieces block your best ideas. A clearance sacrifice removes the blockage at the cost of material, opening lines for a stronger attack.

Common situations: - A pawn sacrifice to open a file for a rook - A rook sacrifice to clear a square for the queen - A knight sacrifice to open a diagonal for a bishop - Moving a piece with tempo so it both clears a line and creates a threat

---

32.5 Pattern 20: Battery

Definition: A battery is two (or more) pieces lined up on the same file, rank, or diagonal, reinforcing each other's power. The most common batteries are Rook + Queen on a file, and Bishop + Queen on a diagonal.

A battery multiplies the power of each piece. Two rooks on the same file are stronger than two rooks on separate files. A queen behind a bishop on the same diagonal creates threats that neither piece could create alone.

Set up your board:

White: Kg1, Qc2, Rd1, Bd3, Nf3, Pawns a2, b2, e4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Be7, Bc8, Nf6, Nd7, Pawns a7, b7, d5, e6, g7, h7

White to play.

The sequence:

1. White has a bishop on d3 and a queen on c2, both aimed at the h7 pawn along the b1-h7 diagonal. This is a **Bishop-Queen battery**.

2. The battery aims at h7. If the h7 pawn is defended only by the king, this battery threatens Bxh7+ (the Greek Gift from Pattern 13).

3. White can build pressure by adding another piece to the attack: Ng5 would add the knight's threat to e6 and f7, making the battery even more dangerous.

4. **Rook battery:** If White had two rooks on the d-file (Rd1 and another rook on d2), they would form a rook battery. The front rook can sacrifice on d8, and the back rook follows up.

Why it works: Batteries concentrate force on a single line. The front piece can sacrifice because the piece behind it continues the attack. It is the chess equivalent of a one-two punch.

Common batteries: - **Queen + Bishop** on a diagonal (aims at the opponent's king, often h7 or h2) - **Queen + Rook** on a file (dominates open files, threatens back-rank invasions) - **Rook + Rook** on a file (the classic "doubled rooks," one of the most powerful configurations in chess) - **Queen + Rook + Rook** on the same file (a triple battery, often game-ending)

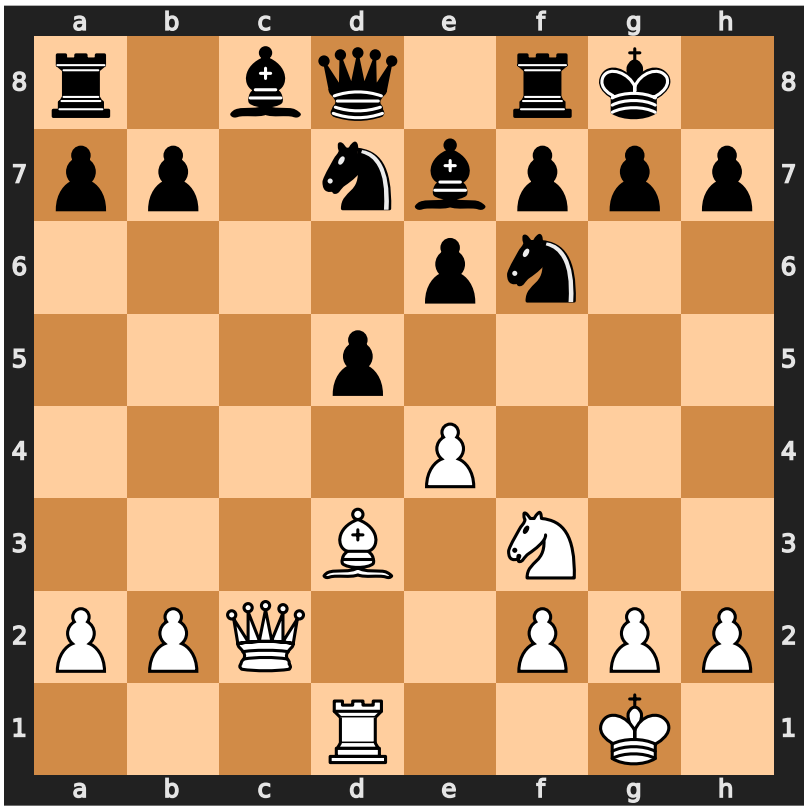

Figure 32.5: Chess Position

How to build batteries: Look for open files and diagonals. Place your heavy pieces on them. The first piece to arrive "opens the door," and the second piece reinforces the attack.

32.5.1 Milestone Check

You have learned 20 out of 30 patterns. You are two-thirds of the way through. The geometric patterns (X-Ray, Windmill, Interference, Clearance, and Battery) change how you think about the board. You now see invisible lines of force, communication between pieces, and the power of coordinated attacks.

Rest here if you need to. Twenty patterns is a serious arsenal. The next group covers advanced combinations that tie everything together.

32.6 Exercises: Group 4 (Patterns 16-20)

Pattern 16: X-Ray Attack

Exercise 11.76

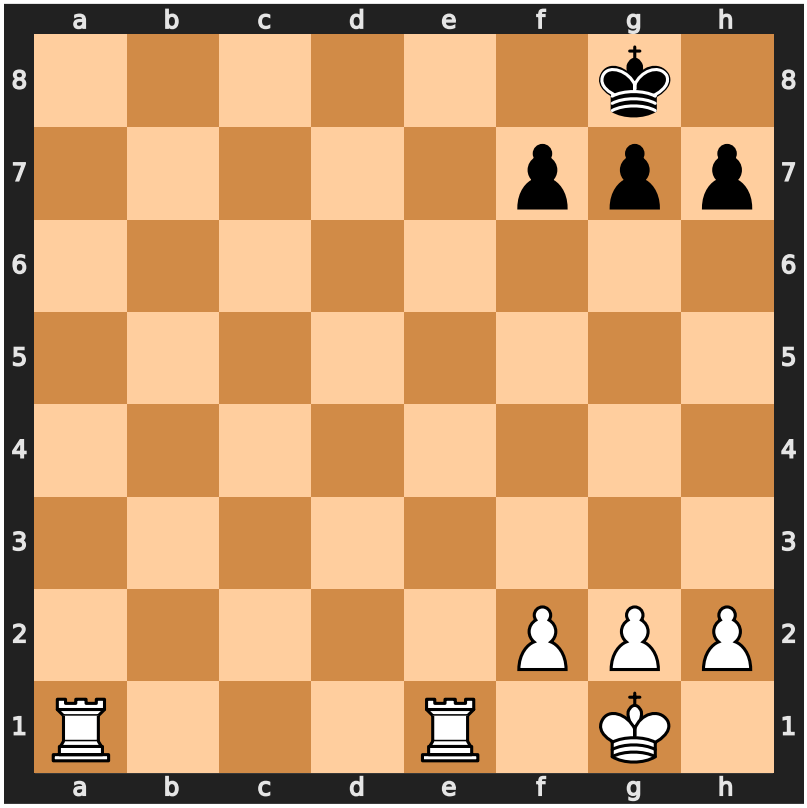

Figure 32.6: Chess Position

White to play. Line up the rooks on the e-file. The back rook "X-rays" through the front rook. Hints: (1) Put both rooks on the same file. (2) Re8+ is the start. (3) After the king moves, Ra8

or Re7 continues the pressure.

Exercise 11.77

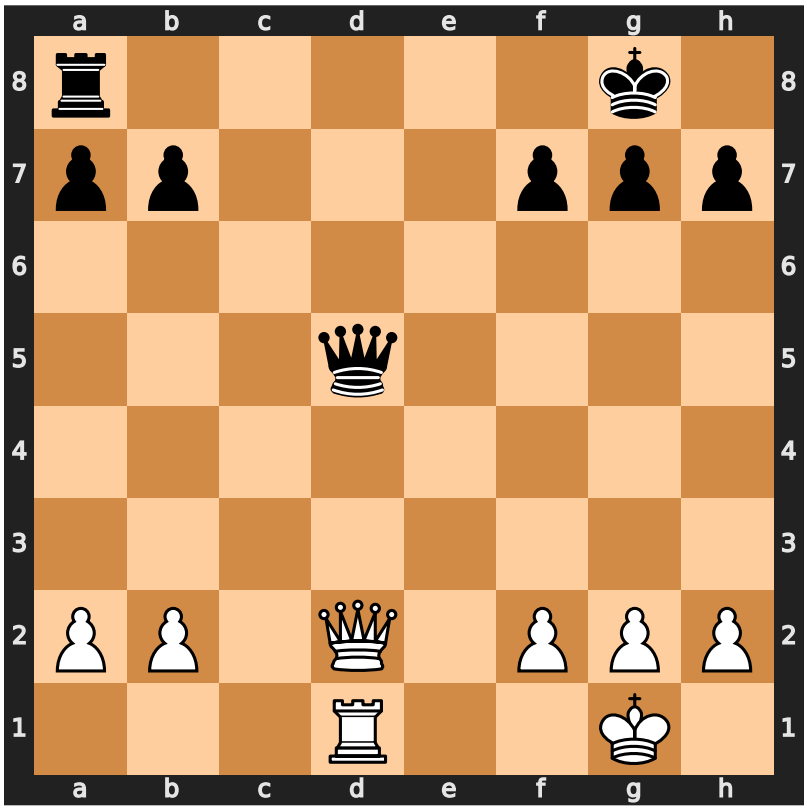

Figure 32.7: Chess Position

White to play. The queen on d2 X-rays through any piece on d5. Can you exploit this? Hints: (1) Rd5 is not possible (there is nothing to capture). (2) What about Rd8+? (3) After Rxd8+ Qxd8, your queen on d2 X-rays through to d8.

Exercise 11.78

White to play. Set up an X-ray on the e-file. The queen on e2 and a rook can form a battery. Hints: (1) Rae1 doubles on the e-file. (2) The queen X-rays through the rook to e7. (3) If Black's queen moves off e7, the rook invades.

Exercise 11.79

White to play. The queen X-rays through the rook on e4. Can you use this? Hints: (1) Re8+ Rxe8 and then Qxe8 is checkmate? (2) Check: after Rxe8, the queen on e2 captures on e8 with check (Qe8+). (3) Is it checkmate? The king on g8 has f7 and h8. Not quite. But it is a winning combination.

Exercise 11.80

White to play. Use an X-ray battery (doubled rooks or queen-rook) to break through. Hints: (1) Rae1 puts three pieces on the e-file. (2) The queen X-rays through the rook. (3) Pressure on e6 could crack the position open. Build the battery, then strike.

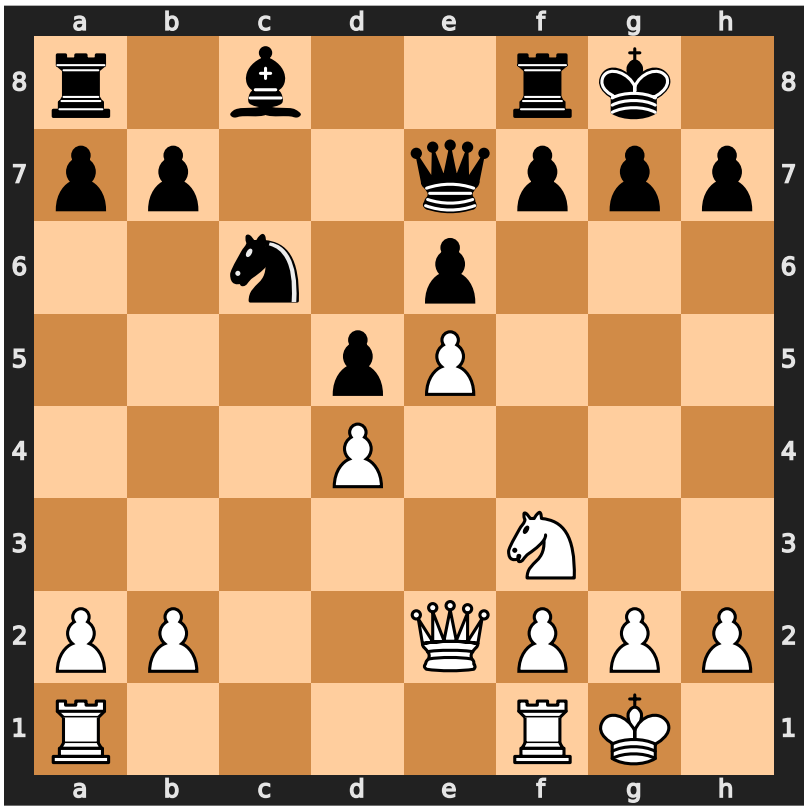

Figure 32.8: Chess Position

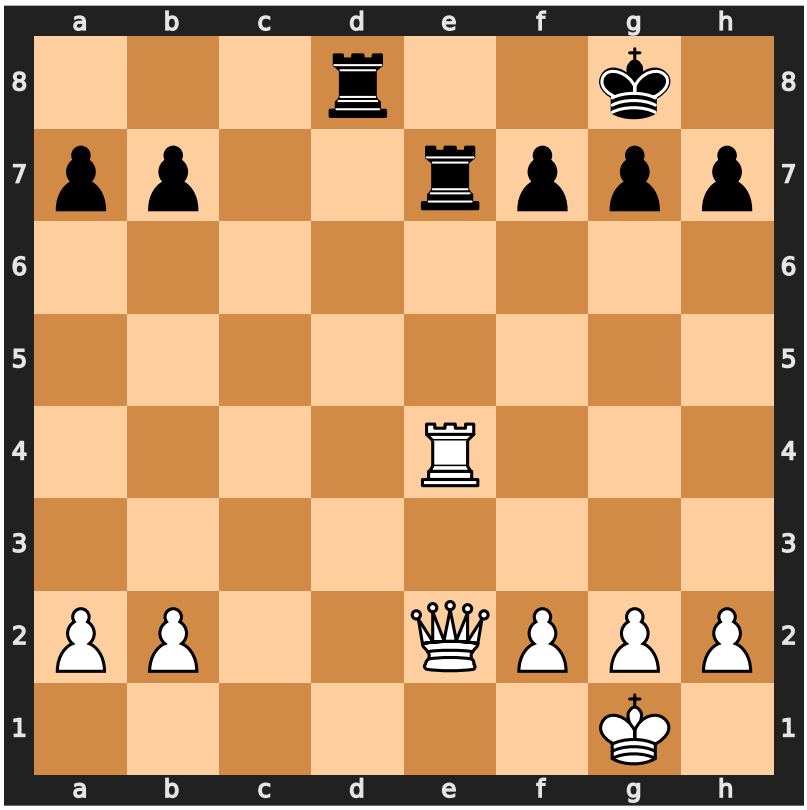

Figure 32.9: Chess Position

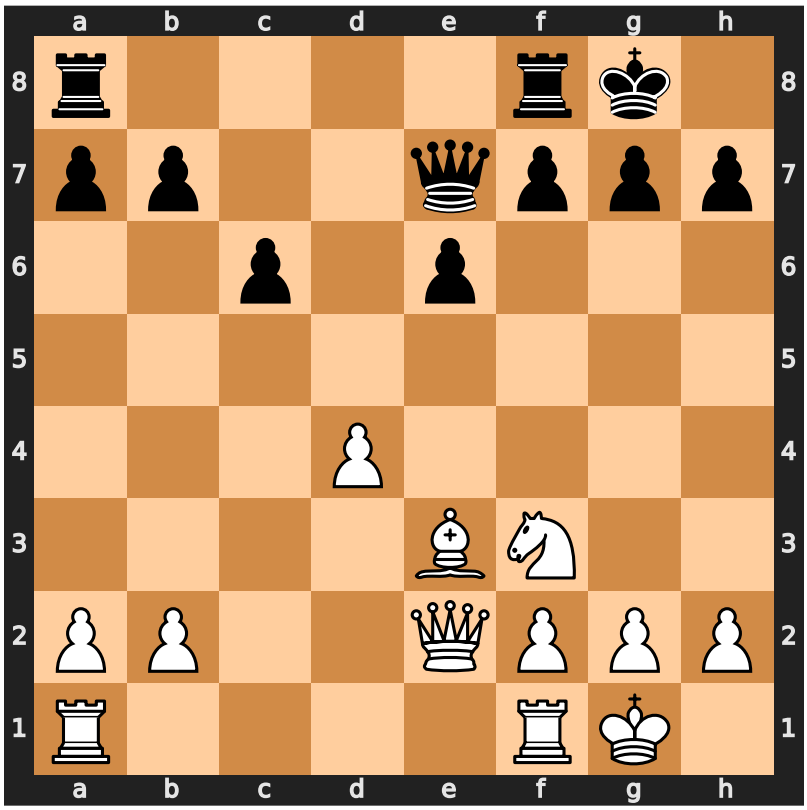

Figure 32.10: Chess Position

Pattern 17: Windmill

Exercise 11.81

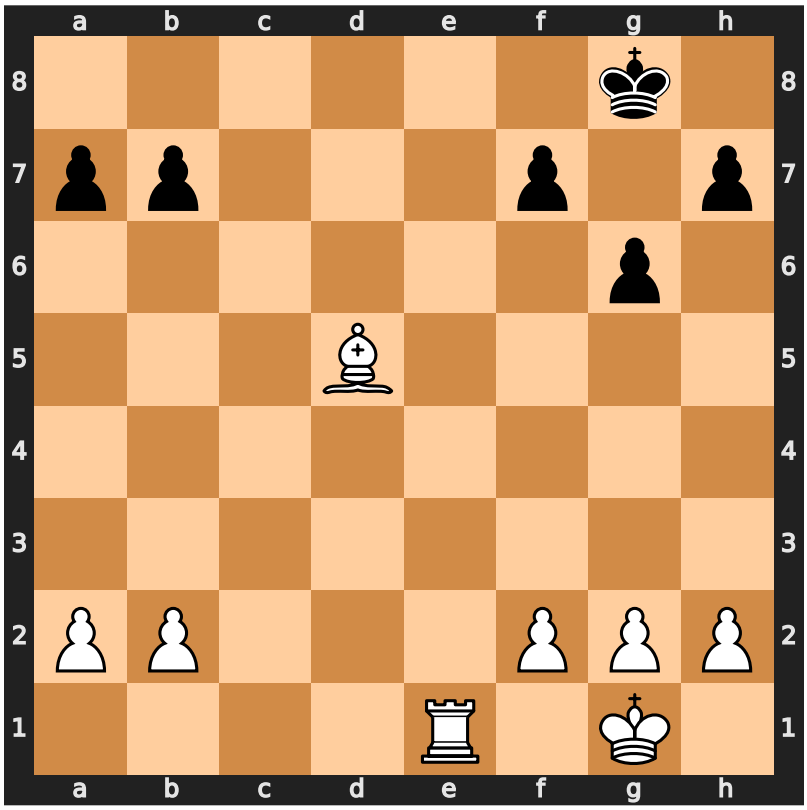

Figure 32.11: Chess Position

White to play. The bishop on d5 and rook on e1 can coordinate. Find a combination. Hints: (1) Re8+ is check. Kf7… wait, no. Kf8? (2) After Re8+ the king moves and the bishop supports. (3) This is not a full windmill but the rook-bishop coordination is the same idea.

Exercise 11.82

White to play. The bishop is on f6, aimed at the king. The rook on e1 can give discovered check. Hints: (1) Re8 is strong but not check. (2) Re7 threatens Rxf7 mate (rook on f7 + bishop on f6 covering g7). (3) If Black defends, the pattern of Re7-Rxf7 with the bishop covering g7 is the windmill's spirit: repeated threats the opponent cannot escape.

Exercise 11.83

White to play. The rook is on d7 (the seventh rank). The bishop on c4 supports the attack. Find a winning continuation. Hints: (1) Rxf7 captures a pawn with a threat. (2) After Rxf7, Rf1 defending, but Rxf8+ Kxf8 and the bishop is still powerful. (3) The rook on the seventh rank combined with an active bishop is a classic winning pattern, even without a true windmill.

Exercise 11.84

White to play. Can you create a windmill or windmill-like sequence? The rook on d5 and bishop on g5 work together. Hints: (1) Rd8+ Kf7… wait, does the bishop give discovered check? No. (2)

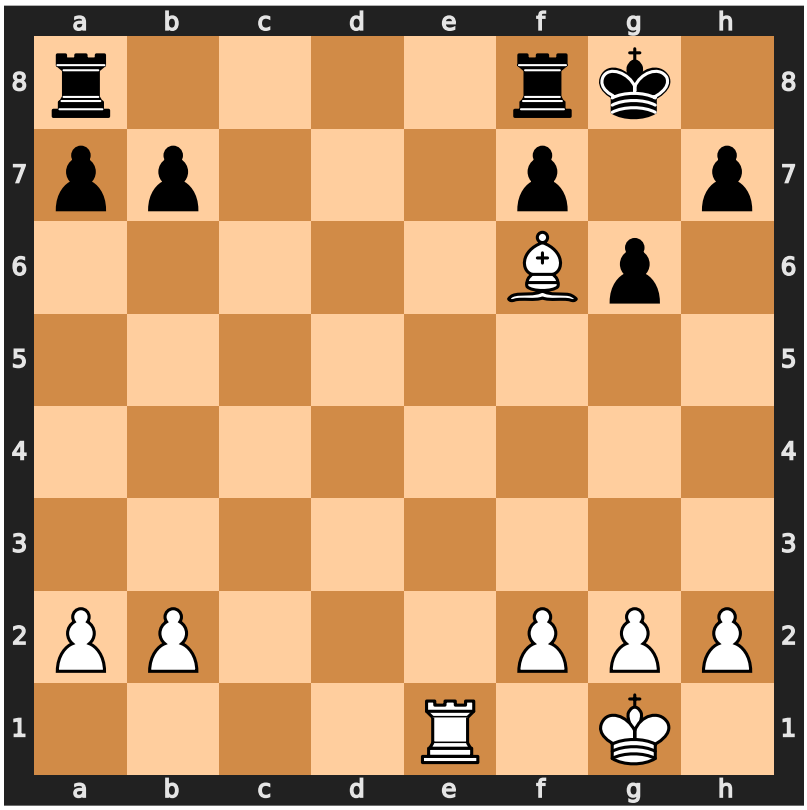

Figure 32.12: Chess Position

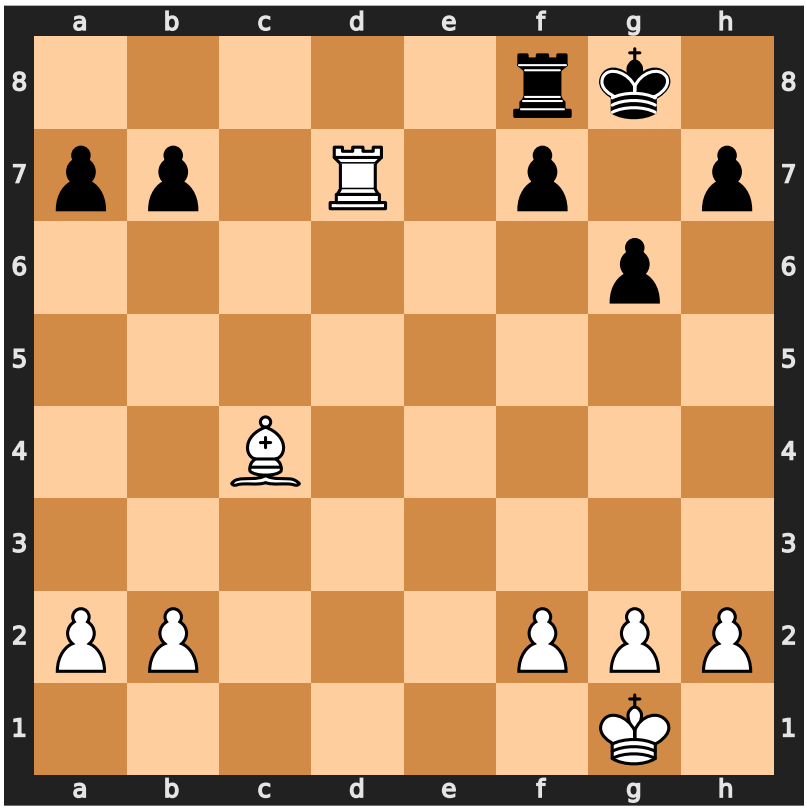

Figure 32.13: Chess Position

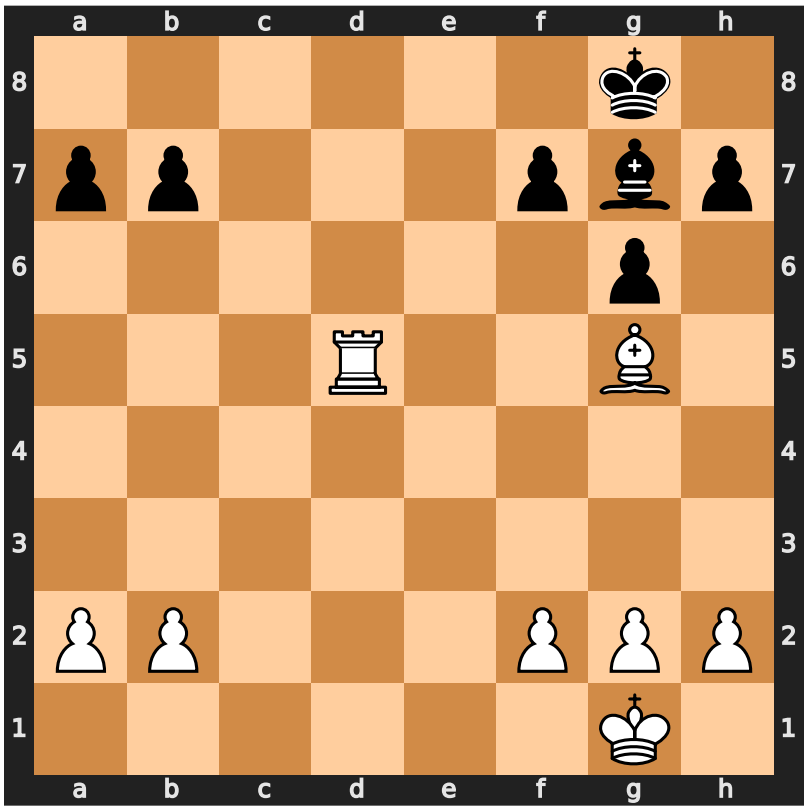

Figure 32.14: Chess Position

But Rd7 threatens the f7 pawn. (3) Bf6! attacks g7 and threatens Rd8 mate. After Bxf6, Rxf7. The combination uses alternating threats to win material.

Exercise 11.85

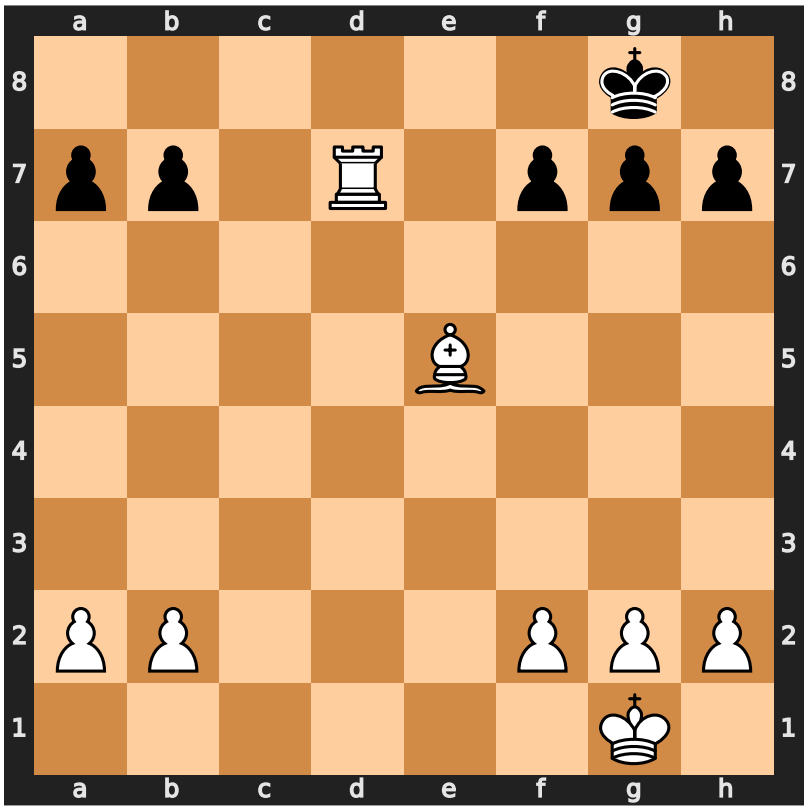

Figure 32.15: Chess Position

White to play. Classic rook-on-the-seventh plus bishop. Find the winning sequence. Hints: (1) Rxf7 captures a pawn. (2) After Kh8 (forced), the rook and bishop dominate. (3) Re7 next, threatening Re8 mate. The bishop controls key squares. This systematic squeezing is the positional cousin of the windmill.

Pattern 18: Interference

Exercise 11.86

White to play. Black's queen on e5 and rook on e8 are on the same file. Can you interfere? Hints: (1) What happens if White plays Re5? (2) This is not an interference per se, but if Rd8, the rook interferes with the e8 rook's view of the e-file. (3) After Rd8 Rxd8 Re8+ Rxe8 is a simplification that wins the exchange.

Exercise 11.87

White to play. The queen on b6 and rook on b8 are connected. Can you interfere? Hints: (1) Rb5 interferes between the queen on b6 and rook on b8. (2) Now the queen and rook cannot support each other. (3) After Rb5, the queen must move and the rook on b8 is loose.

Exercise 11.88

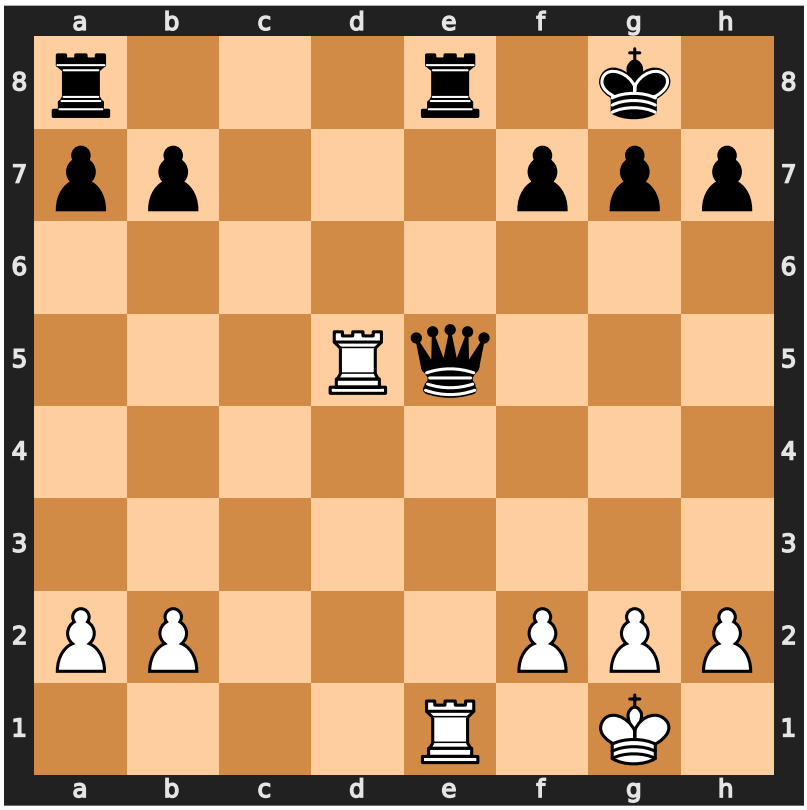

Figure 32.16: Chess Position

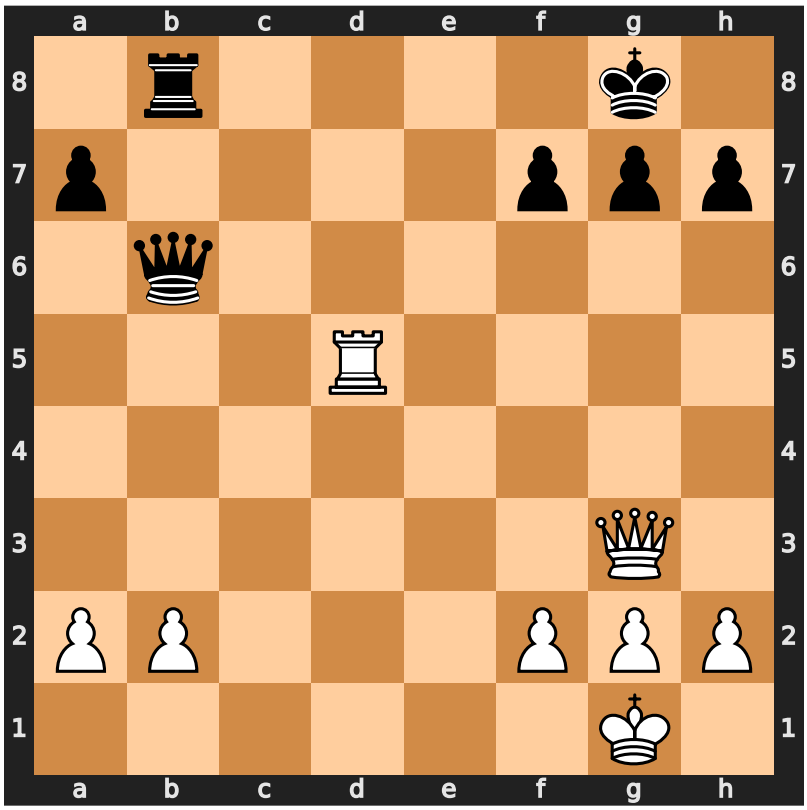

Figure 32.17: Chess Position

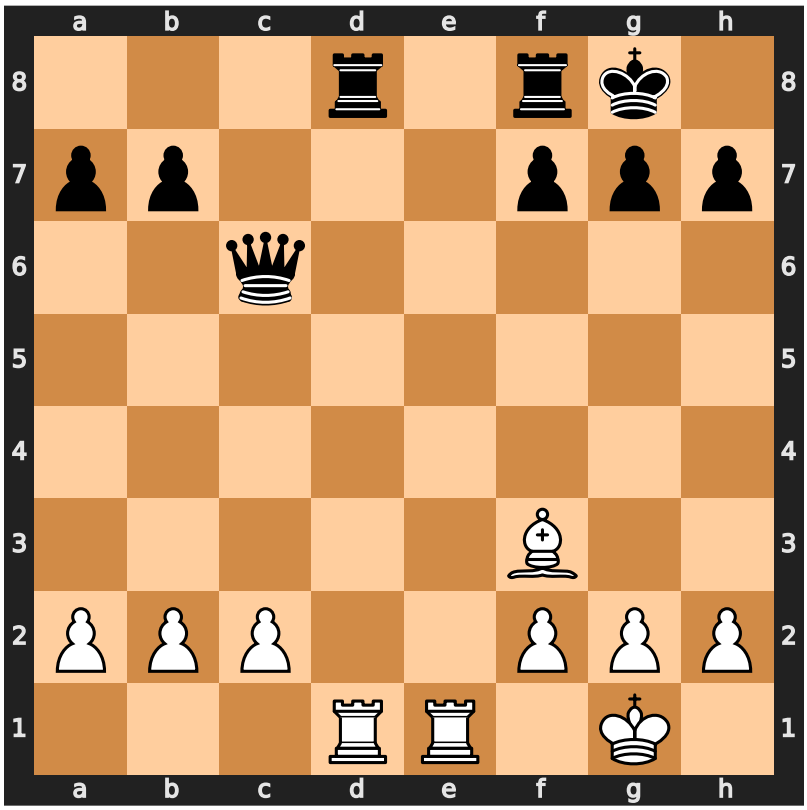

Figure 32.18: Chess Position

White to play. Black's queen on c6 and rook on d8 are both on important lines. Find an interference move. Hints: (1) Rd6! interferes between the queen and the f8 rook. (2) The queen on c6 is attacked. (3) If Qxd6, then Re8+ leads to back rank mate (the rook on f8 is cut off by the queen's new position on d6).

Exercise 11.89

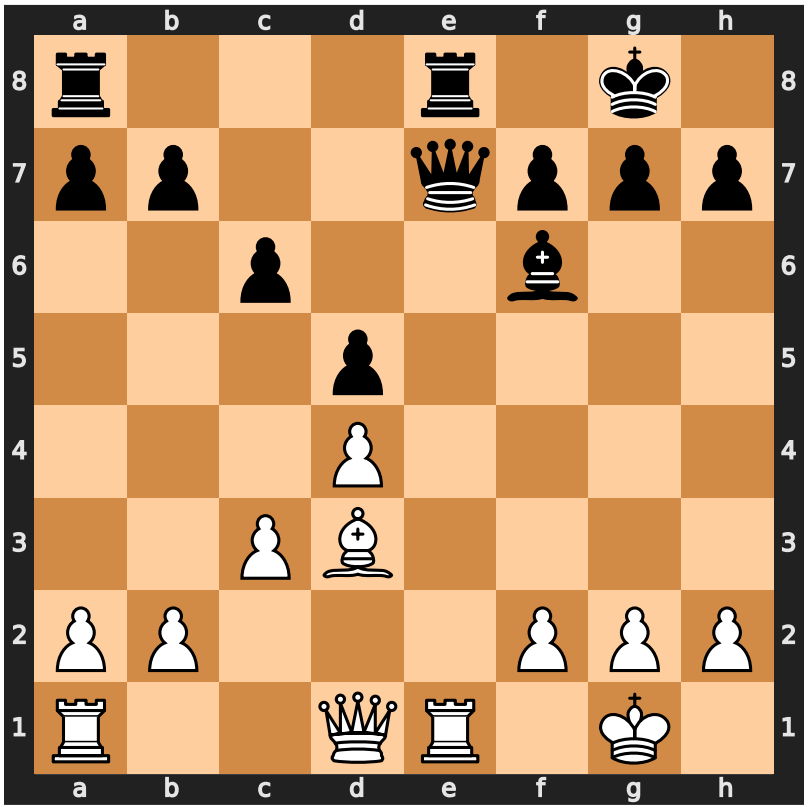

Figure 32.19: Chess Position

White to play. Black's bishop on f6 and queen on e7 coordinate to defend. Find the interference. Hints: (1) Be4! or d5? Something that blocks a line. (2) If d5, the c6 pawn is under pressure and the bishop on d3 opens the diagonal. (3) Dxc5 with an interference on a critical line. This exercise requires calculation.

Exercise 11.90

White to play. The knight on d5 and bishop on e5 can interfere with Black's coordination. Find the combination. Hints: (1) Nf6+ is check and the knight interferes with the queen's defense of d8. (2) After gxf6 Bxf6, the bishop attacks the queen AND the rook on d8. (3) The queen on e7 cannot defend d8 because the bishop on f6 now blocks that path.

Pattern 19: Clearance Sacrifice

Exercise 11.91

White to play. The pawn on e5 blocks the bishop on d3 from reaching h7. Clear the way. Hints: (1) Can the e5 pawn advance or be sacrificed? (2) e6! opens the d3-h7 diagonal. (3) After fxe6, Bxh7+ is the Greek Gift.

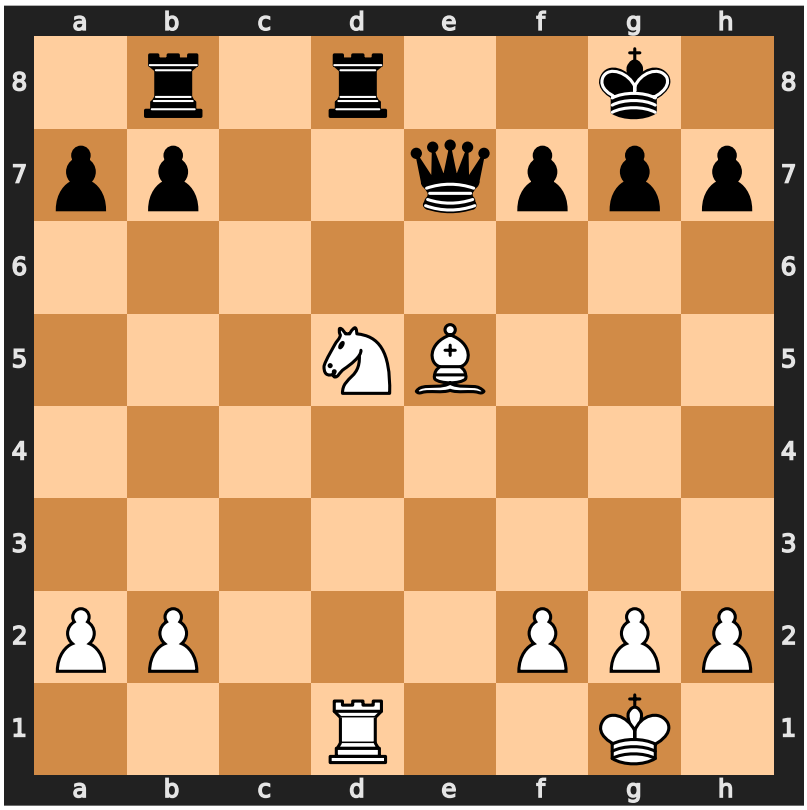

Figure 32.20: Chess Position

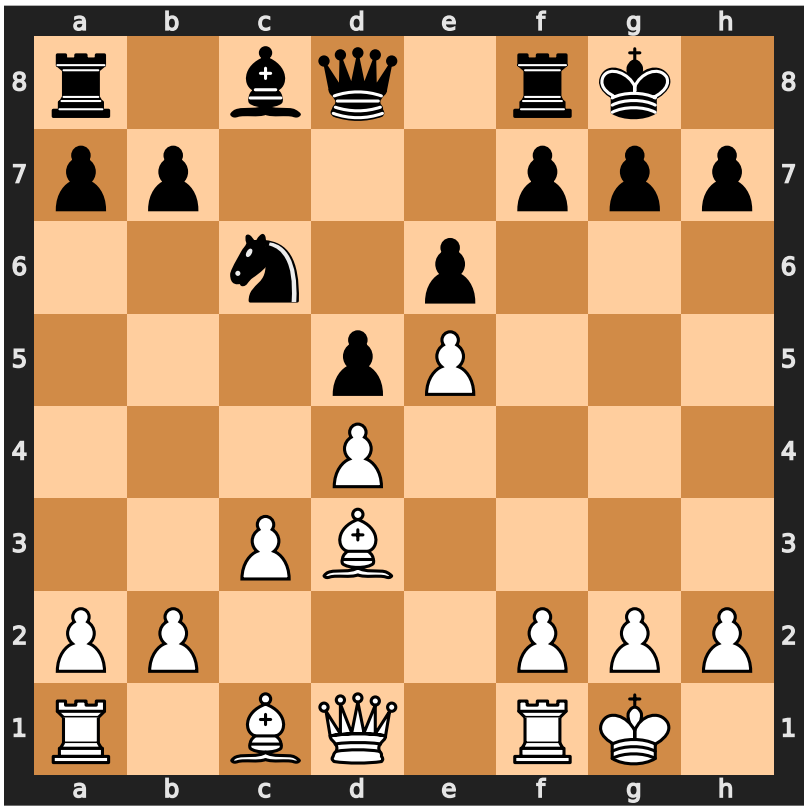

Figure 32.21: Chess Position

Exercise 11.92

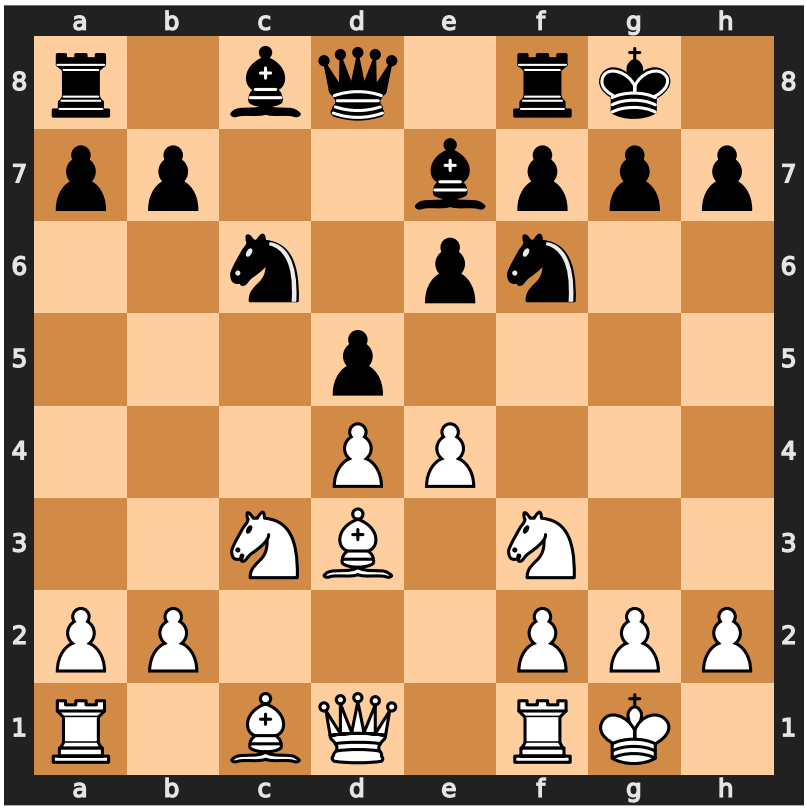

Figure 32.22: Chess Position

White to play. The d4 pawn blocks the bishop on c1 from reaching g5 or h6. Clear the way. Hints: (1) d5 advances with tempo (attacks the knight on c6). (2) After exd5 or Nb8, the diagonal a1-h8 or c1-h6 opens. (3) The pawn sacrifice cleared the diagonal for the bishop.

Exercise 11.93

White to play. The knight on e5 blocks the f-file for the rook on f1. Should you sacrifice the knight? Hints: (1) Nxc6 trades the knight and opens the e5 square for the bishop. (2) But Nxf7! is a clearance sacrifice: it removes the knight from e5, opens the f-file, and captures a pawn. (3) After Rxf7, the rook recaptures and the f-file is open.

Exercise 11.94

White to play. You need the d3 bishop to reach h7. The e5 knight blocks the path on one plan, and the d4 pawn blocks another. Find the clearance sequence. Hints: (1) Nxf7! Rxf7, then Bxh7+ is the Greek Gift. The knight sacrifice cleared the path. (2) After Kxh7 Ng5+, the attack rolls. (3) Wait, if the knight is on e5 and captures f7, does that open the path for the bishop? The bishop is on d3, aimed at h7 via e4, f5, g6. Not through e5. So Nxf7 just removes a defender, not a clearance. The TRUE clearance would be e4! clearing the d3 bishop's diagonal. Think carefully.

Exercise 11.95

White to play. The e4 pawn blocks the bishop on f1 from developing to d3 or c4. Should you sacrifice the pawn to clear the way? Hints: (1) e5 advances with tempo (attacks the f6 knight). (2)

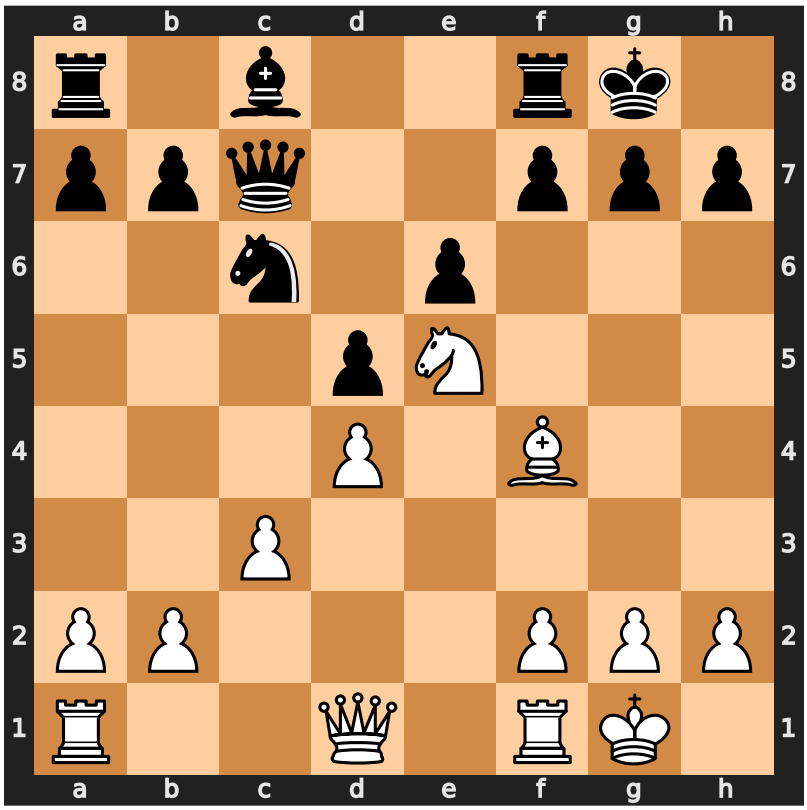

Figure 32.23: Chess Position

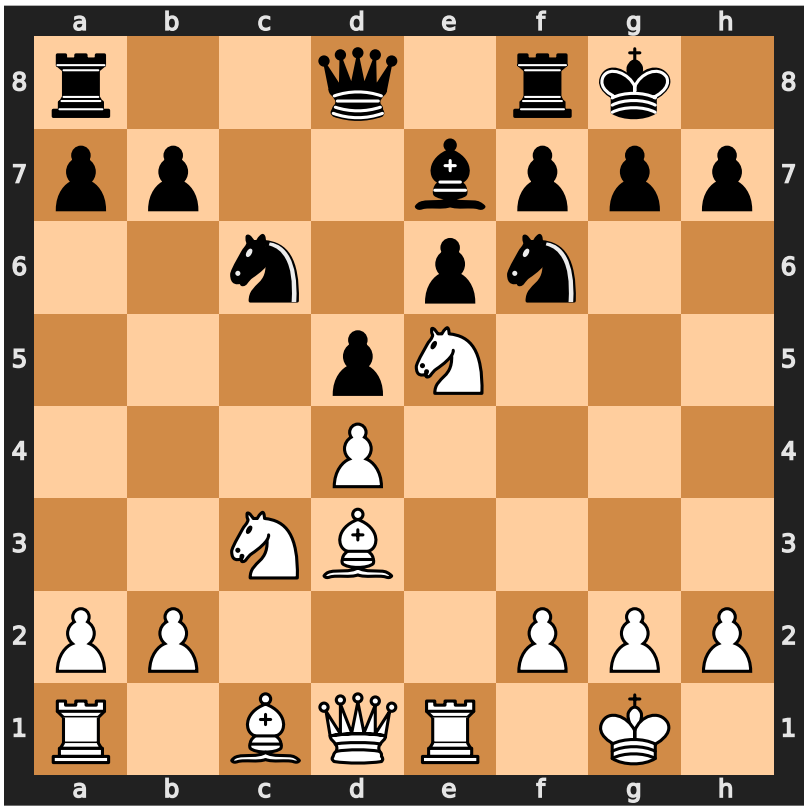

Figure 32.24: Chess Position

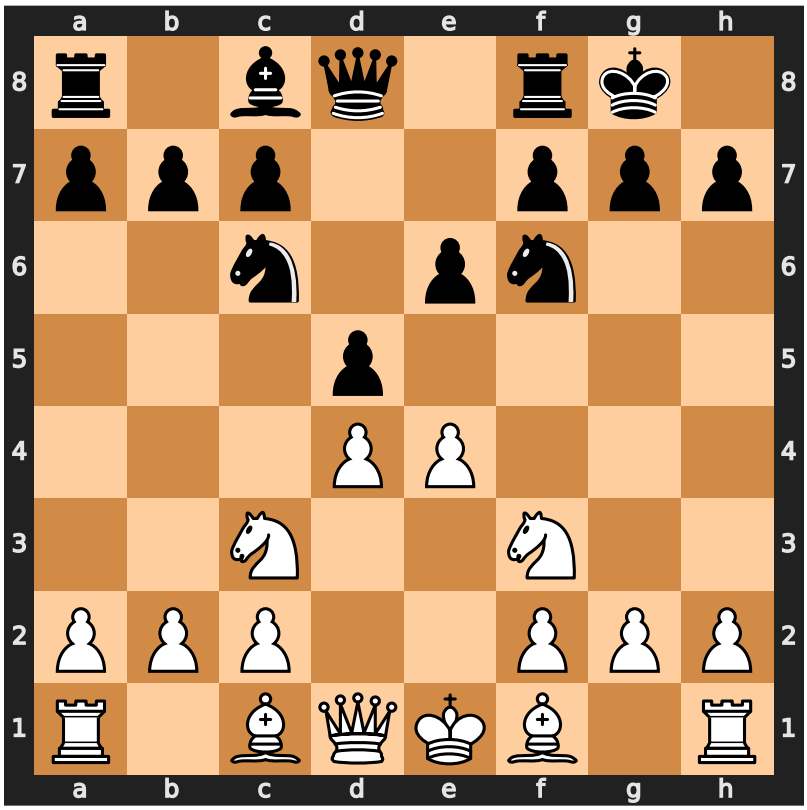

Figure 32.25: Chess Position

After Nd7, the diagonal f1-a6 opens and the bishop can develop actively. (3) The pawn advance is a clearance move, not a sacrifice. Sometimes clearance costs nothing.

Pattern 20: Battery

Exercise 11.96

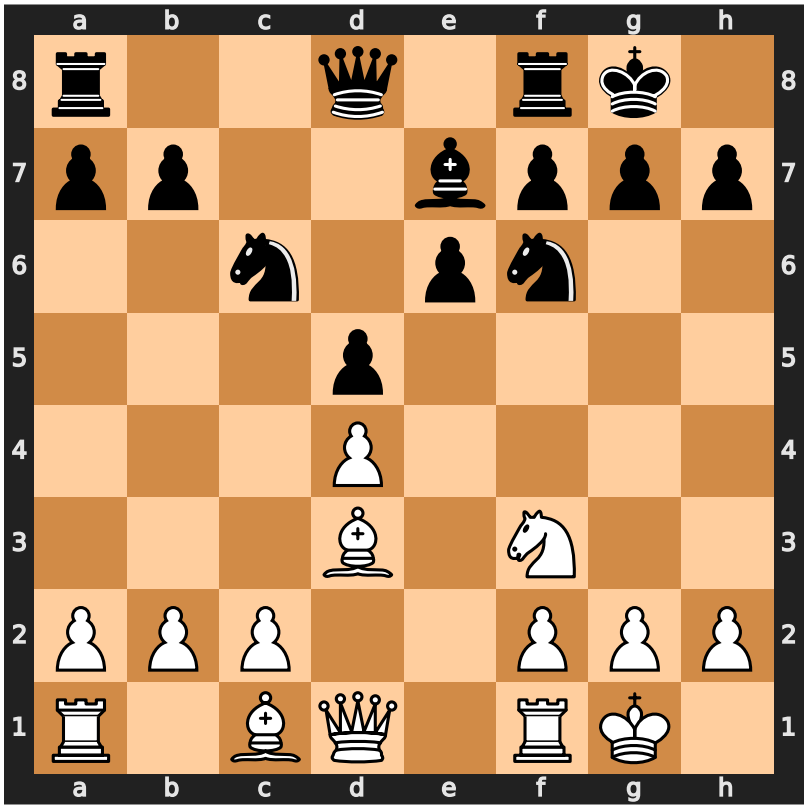

Figure 32.26: Chess Position

White to play. Build a Queen-Bishop battery aimed at h7. Hints: (1) The bishop is on d3. Where should the queen go to form a battery? (2) Qc2 puts the queen behind the bishop on the b1-h7 diagonal. (3) After Qc2, the battery Bd3+Qc2 aims at h7. This is a classic setup for the Greek Gift.

Exercise 11.97

White to play. Build a Rook-Queen battery on the e-file. Hints: (1) The queen on f1 can go to e2. (2) After Qe2, the rook on e1 and queen on e2 form a battery on the e-file. (3) Wait, the queen should go BEHIND the rook. Qe2 puts the queen in front. Better: move the rook forward first, then the queen supports from behind.

Exercise 11.98

White to play. Double your rooks on an open file. Hints: (1) The b-file has two rooks but is it open? (2) Is there an open file? The d-file is semi-open. (3) Rd1 or Rd2 are not available (wrong square names). Rbb1? Actually, maneuver one rook to the d-file to create a rook battery.

Exercise 11.99

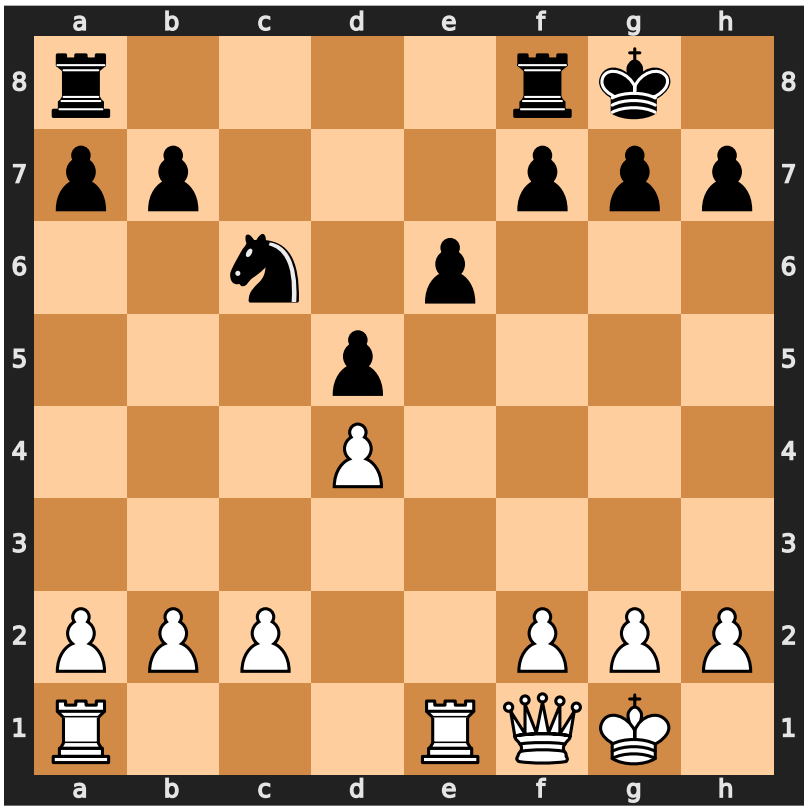

Figure 32.27: Chess Position

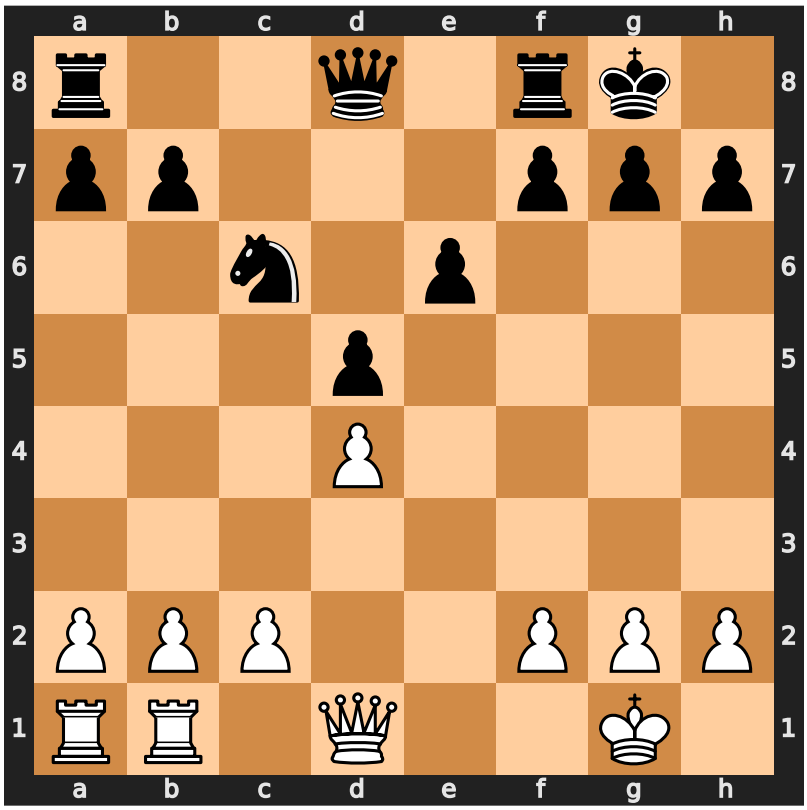

Figure 32.28: Chess Position

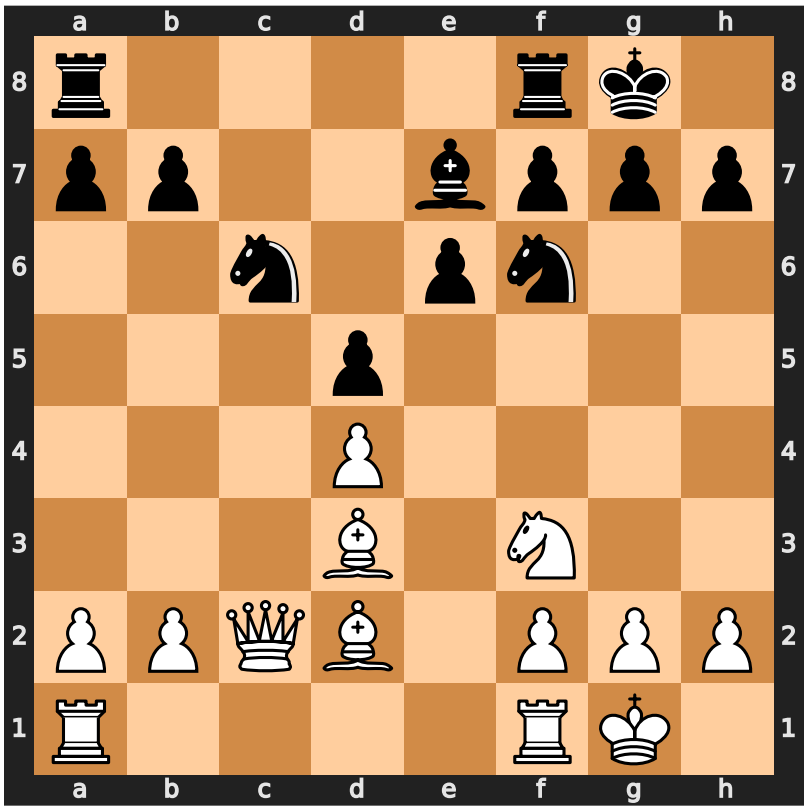

Figure 32.29: Chess Position

White to play. You have a Queen-Bishop battery on the b1-h7 diagonal. Add a third piece to the kingside attack. Hints: (1) Ng5 adds a knight to the attack on h7. (2) Now three pieces aim at h7: Bd3, Qc2, Ng5. (3) After Ng5, the threat of Bxh7+ becomes irresistible. The battery plus the knight creates the complete Greek Gift package.

Exercise 11.100

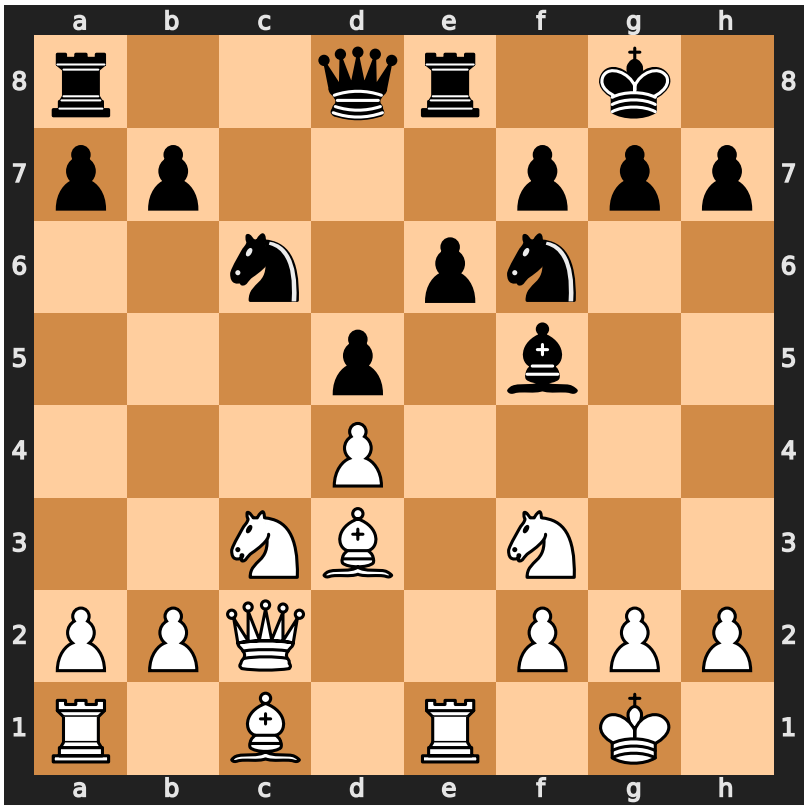

Figure 32.30: Chess Position

White to play. Build a battery AND a second battery to create overwhelming pressure. Hints: (1) Qc2+Bd3 is the diagonal battery. Can you also create a rook battery on the e-file? (2) Re1 and another rook on e2 or the a1 rook to e1. (3) With two batteries (diagonal and file), Black cannot defend everything. Multiple batteries = multiple threats.

Chapter 33

GROUP 5: ADVANCED COMBINATIONS

Estimated study time: 15-20 minutes

The patterns in this group combine multiple simpler ideas into more complex sequences. If Groups 1 through 4 were your vocabulary, Group 5 is where you start forming sentences. These patterns require you to think two or three ideas deep.

33.1 Pattern 21: Desperado

Definition: A desperado is a piece that is about to be captured and decides to do maximum damage on its way out. "If I am going to die, I am taking something with me."

When a piece is lost no matter what (it is trapped, or an exchange is happening), the best move is to use that piece's last breath to capture something, give check, or create a threat. The piece is doomed, so it has nothing to lose.

Set up your board:

White: Kg1, Qa4, Re1, Bb5, Nf3, Pawns a2, f2, g2, h2 Black: Kg8, Qd6, Ra8, Rf8, Bb4, Nc6, Nf6, Pawns a7, d5, e6, f7, g7, h7

White to play.

The sequence:

1. White's bishop on b5 is attacked by the knight on c6 and Black's bishop on b4 attacks a4. Pieces are hanging on both sides.
2. White plays **Bxc6!** The bishop is a "desperado." It was under attack and about to be exchanged anyway. By capturing on c6 first, White wins a knight before the bishop is lost.
3. If Black plays Qxc6, then Qxb4, and White has won a piece in the exchanges.
4. The bishop on b5 was going to be traded or lost. Instead of waiting passively, it struck first.

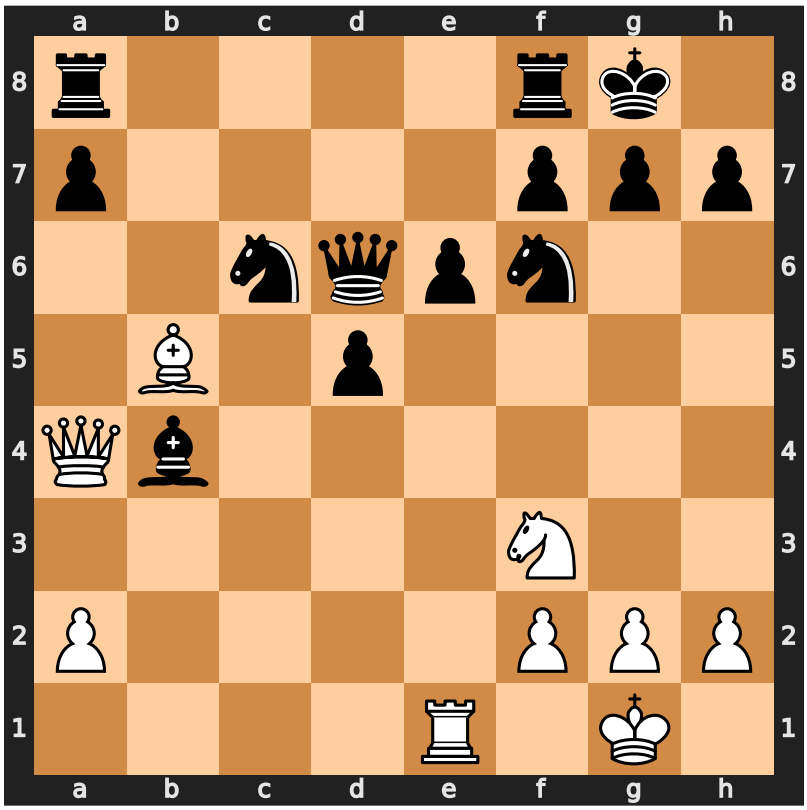

Figure 33.1: Chess Position

Why it works: When a piece is doomed, its material value becomes zero. A piece worth zero has nothing to lose by capturing something on its way out. Always check: "Is my piece about to be lost? Can it do damage first?"

Common situations: - During a complex exchange sequence where pieces are hanging on both sides - When a piece is trapped but can capture something before it falls - In time pressure, when both players have hanging pieces and the order of captures matters

---

33.2 Pattern 22: Undermining

Definition: Undermining is attacking or removing the pawn support of a piece or pawn chain. Instead of attacking the piece directly, you attack the pawn that holds it up.

Think of it as pulling the rug out from under something. The piece or structure looks stable until you remove its foundation.

Set up your board:

White: Kg1, Qd1, Re1, Bc1, Nf3, Pawns a2, b2, c4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nd5, Nf6, Pawns a7, b7, d6, e5, f7, g7, h7

White to play.

The sequence:

1. Black's knight on d5 looks powerful and centralized. What supports it? The pawn on e5 (if d6 were not there, c6 might). And c6 is empty, so c4 attacks d5 directly.
2. White plays **c4!** This is not a sacrifice. It is undermining. The pawn on c4 attacks the knight on d5, forcing it to move. But more importantly, if the knight moves, the pawn on e5 may become weak (no knight to protect it).
3. After the knight moves (say, Nf4), White can follow up with capturing e5 or repositioning.
4. The c4 push undermined the knight's position. The knight looked strong, but its foundation was fragile.

Why it works: Pieces need support. Pawns are the most common support structure. If you attack the supporting pawns, the pieces on top become unstable.

Common situations: - A centralized knight supported by a pawn: attack the pawn - A pawn chain: attack the base (the pawn at the bottom of the chain) - A piece protected by a pawn: advance your own pawn to attack the defending pawn

---

33.3 Pattern 23: Pawn Fork (Advanced)

Definition: A pawn fork is when a pawn advances to attack two pieces at once. Because pawns are the least valuable piece, the pieces being attacked usually cannot afford to capture the pawn and must retreat.

You saw basic pawn forks in Volume I. Advanced pawn forks involve setting up the fork through preparatory moves, sometimes sacrificing material to place the opponent's pieces on the right squares.

Set up your board:

White: Kg1, Qd1, Rd1, Bc1, Nf3, Pawns a2, b2, d4, e4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc5, Nc6, Nf6, Pawns a7, b7, d6, f7, g7, h7

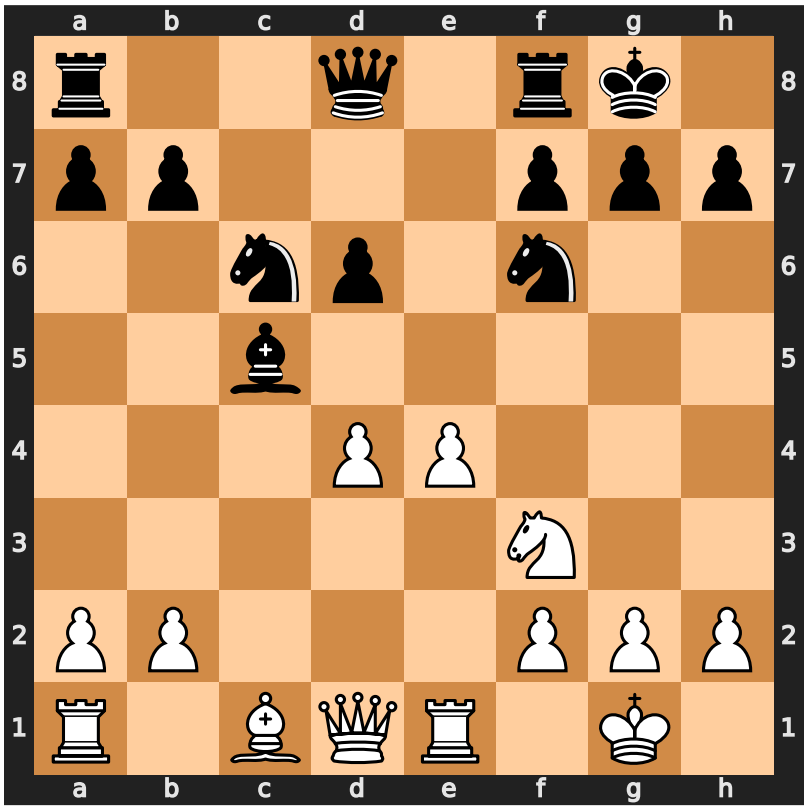

Figure 33.2: Chess Position

White to play.

The sequence:

1. Black's bishop is on c5 and knight on c6. Both are within range of a pawn fork.
2. White plays **d5!** The pawn advances, attacking both the knight on c6 and threatening to win the bishop on c5 (after dxc6 or d5-d6 pushing the bishop away). The knight is forked alongside the pressure on the bishop.
3. The knight must move. After Nb8 or Ne5, White has gained space and disrupted Black's coordination.

Why it works: Pawn forks are uniquely powerful because the pawn is worth only one point. Even if the opponent captures the pawn, they lose something worth more. Advancing a pawn with a fork is nearly always profitable.

Common situations: - After exchanging pieces, a pawn advance forks the remaining pieces - In

the center, d4-d5 or e4-e5 advances that attack two pieces - In endgames, passed pawn advances that force the opponent's pieces apart

---

33.4 Pattern 24: Knight Fork (Advanced Positions)

Definition: The knight fork is the most common tactic in chess. At the advanced level, you do not just spot forks that exist on the board. You *create* them through preparatory moves.

The advanced knight fork involves setting up the position so that a knight CAN deliver a fork, even if the fork is two or three moves away.

Set up your board:

White: Kg1, Qd1, Rd1, Bc4, Nf3, Pawns a2, b2, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Be7, Nf6, Pawns a7, b7, c6, d5, f7, g7, h7

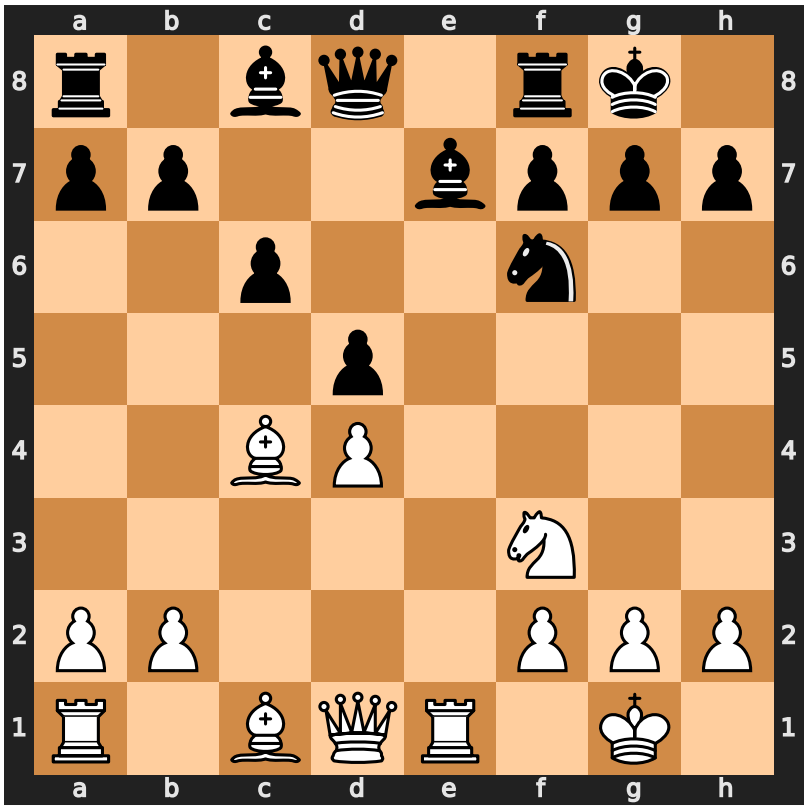

Figure 33.3: Chess Position

White to play.

The sequence:

1. White sees a potential fork on e7: if the knight could reach e7, it would attack g8 (the king) and c8 (the bishop). But the knight is on f3 and cannot reach e7 directly in one move.

2. White plays **Ng5!** The knight repositions to g5, threatening Nxf7 (a fork of queen and rook) and also threatening Nxe6.

3. If Black plays h6 to chase the knight, White plays **Nxf7!** The knight captures the pawn on f7, forking the queen on d8 and the rook on f8.

4. The knight fork was *created* through the Ng5 maneuver. It did not exist on move one, but White built it.

Why it works: Knights are the most dangerous forking pieces because they attack in L-shapes that are hard to block. Advanced players set up forks by driving the knight toward a square where it will attack two targets, even if it takes multiple moves to get there.

Common fork squares to watch: - **f7/f2** (attacks the king's neighborhood and the queen) - **e7/e2** (attacks king, queen, and rooks) - **c7/c2** (forks queen and rook in many positions) - **d6/d3** (central forks that often catch a bishop and rook)

33.5 Pattern 25: Pin Exploitation

Definition: Pin exploitation involves using, breaking, or intensifying a pin to win material or deliver checkmate. A pin restricts a piece's movement. If you can pile pressure on the pinned piece, it eventually collapses.

There are three levels of pin mastery: 1. **Creating a pin** (lining up your piece with two enemy pieces) 2. **Exploiting a pin** (attacking the pinned piece with additional pressure) 3. **Breaking a pin** (freeing your own pinned piece through a counter-tactic)

Set up your board:

White: Kg1, Qd1, Re1, Bg5, Nf3, Bc4, Pawns a2, b2, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Be7, Nc6, Nf6, Pawns a7, b7, d5, e6, g7, h7

White to play.

The sequence (Exploiting a Pin):

1. The bishop on g5 pins the knight on f6 to the queen on d8. The knight cannot move without losing the queen.

2. White piles on the pin: **Nd2!** (rerouting to f1-e3-f5 to attack the pinned knight again) or more directly **Qc2** (or Qb3) to add pressure on the d5 pawn and coordinate.

3. The most direct exploitation: **Bxf6!** Bxf6. Now White plays **Bxd5!** exd5, and White has won a pawn. The pin on f6 allowed White to favorably exchange and then capture the now-undefended d5 pawn.

4. Alternatively, if White does not capture immediately but adds pressure (say, Re3 and then Rg3 or Qf3), the pinned knight becomes an unbearable liability.

Breaking a Pin (the defensive side):

What if YOUR knight is pinned? Common ways to break a pin: - **Interpose a piece** between the pinner and the valuable piece behind the pinned piece - **Attack the pinning piece** with a pawn

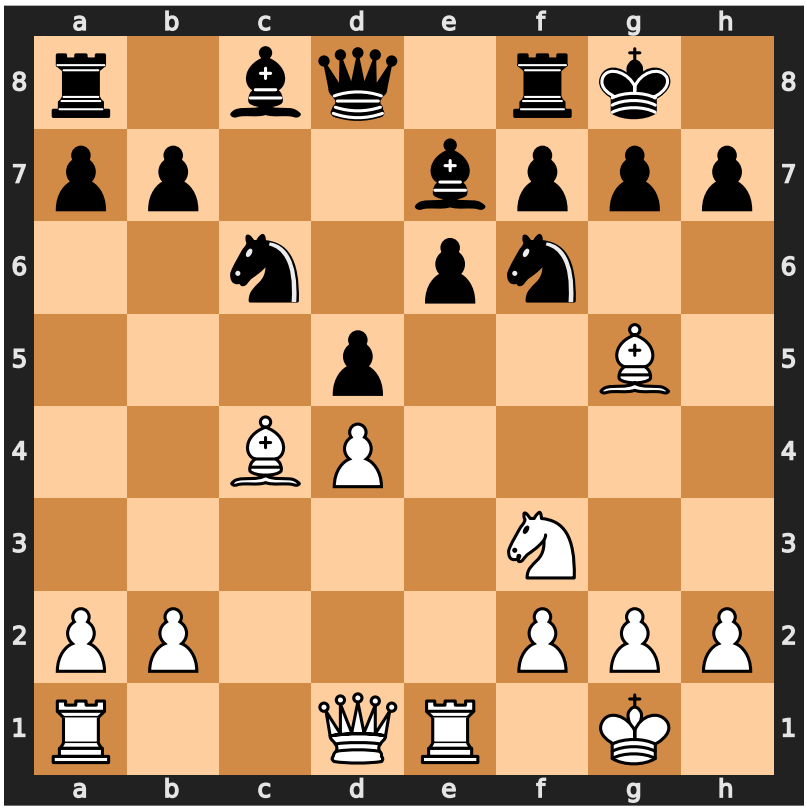

Figure 33.4: Chess Position

advance (h6 against Bg5) - **Move the piece behind the pin** so the pin no longer matters (king safety move) - **Counter-pin or counter-attack** to force the opponent to deal with your threat instead

Why it works: A pinned piece is partially paralyzed. It cannot move (absolute pin to the king) or should not move (relative pin to the queen). Every additional attacker on the pinned piece makes the situation worse. Eventually, the pin wins material.

Common situations: - Bg5 pinning Nf6 to Qd8 (the most common pin in chess) - Bb5 pinning Nc6 to the king in the Ruy Lopez - A rook pinning a piece to the king along a file - A queen pinning a piece to a rook along a rank

---

33.5.1 Milestone Check

You have learned 25 out of 30 patterns. Five more to go. You now have a tactical vocabulary that covers forcing moves, material-winning patterns, mating attacks, geometric relationships, and advanced combinations. The final group covers the practical patterns that tie everything together in real games.

Almost there. Take a break if you need one. The last five patterns are about practical thinking, and they might be the most useful of all.

33.6 Exercises: Group 5 (Patterns 21-25)

Pattern 21: Desperado

Exercise 11.101

White to play. Black has captured on g4 and the queen is hanging. But is White's bishop on c4 also in danger? Find the desperado. Hints: (1) The bishop on c4 is en prise if the position simplifies. (2) Bxf7+ is a desperado: the bishop is already in danger, so it strikes first. (3) After Kxf7 (or Ke7), White then deals with the queen on g4.

Exercise 11.102

Black to play. White has just played Bxf7+. Is this a good desperado for White? Hints: (1) If Ke7, White has won a pawn but the king is displaced. (2) If Kxf7, White's bishop is gone but the king is exposed. (3) Evaluate: is this a GOOD desperado or a PREMATURE sacrifice? Sometimes the desperado is not the best move.

Exercise 11.103

White to play. Both sides have pieces hanging. Find the correct desperado sequence. Hints: (1) The knight on e4 attacks White's position. The bishop on b4 attacks d2. (2) Bxf7+ is the desperado: the bishop is hanging anyway. (3) After Ke7, Nxc6+ forks king and queen. Two desperado captures in a row.

Exercise 11.104

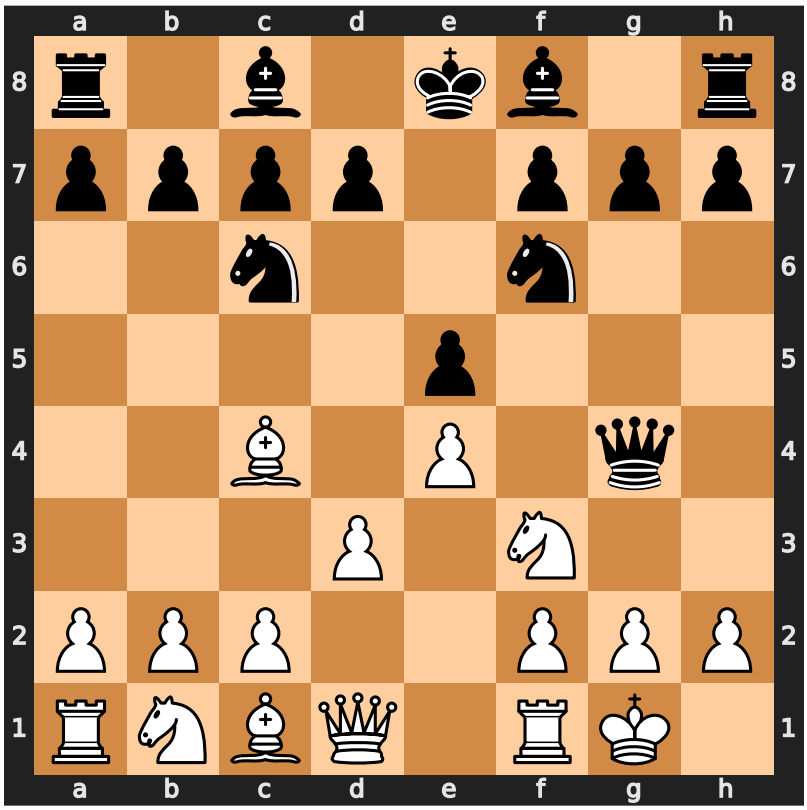

Figure 33.5: Chess Position

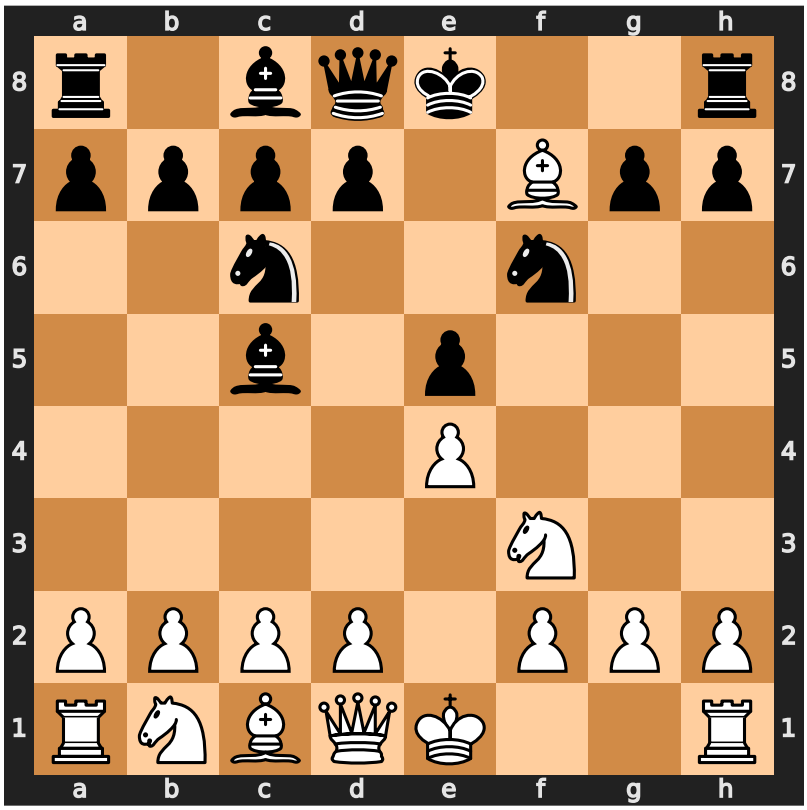

Figure 33.6: Chess Position

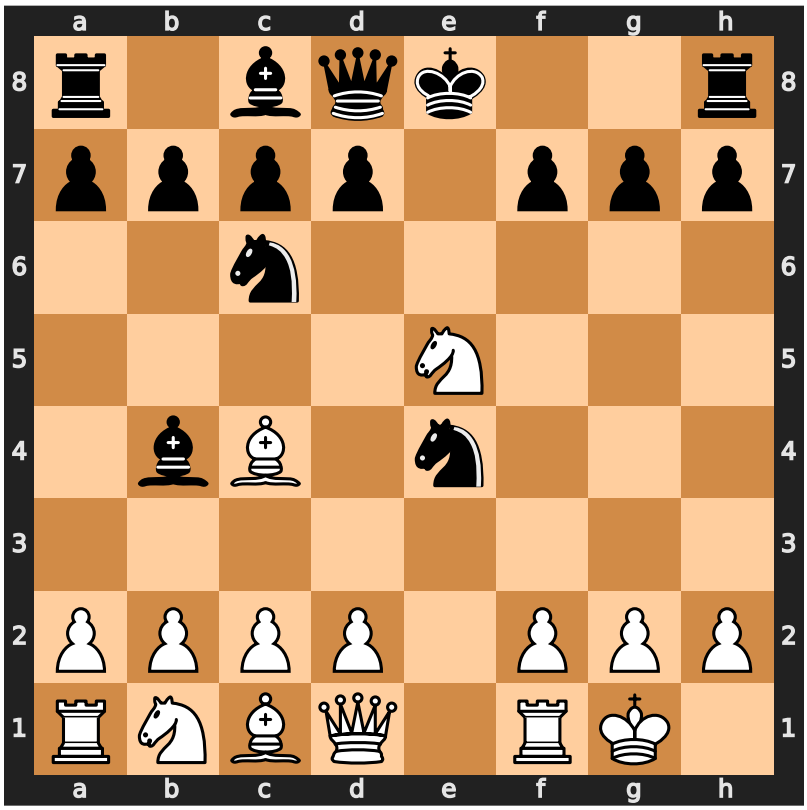

Figure 33.7: Chess Position

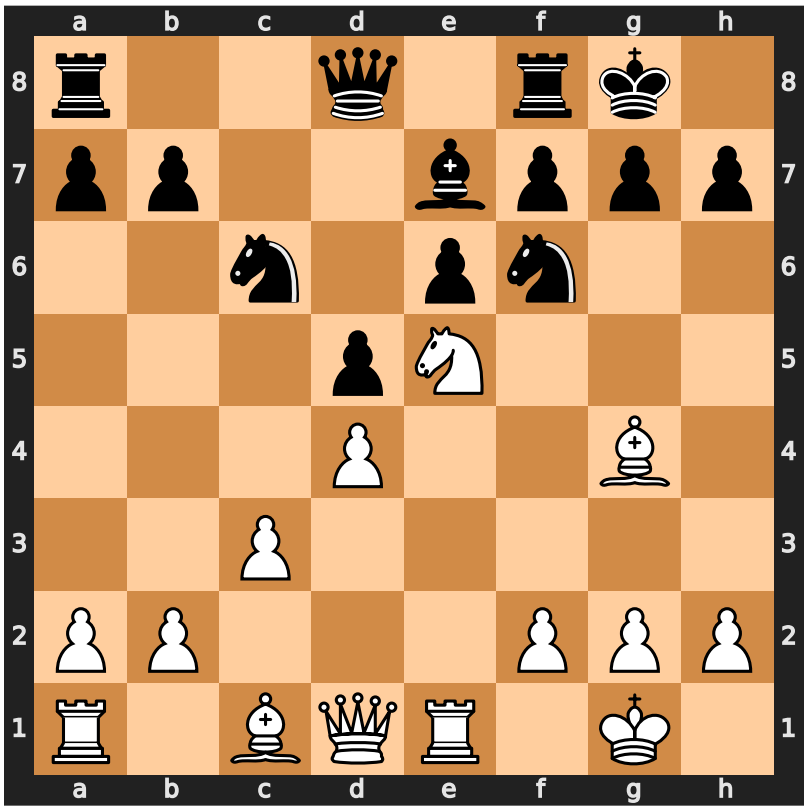

Figure 33.8: Chess Position

White to play. The bishop on g4 is attacked by the knight on f6. But the knight on e5 is also under fire from c6. Find the double desperado. Hints: (1) Nxc6 is a desperado (the knight was attacked anyway). (2) After bxc6, now Bxf6 is also a desperado (removing a defender). (3) After Bxf6, gxf6 or Bxf6, evaluate the resulting position.

Exercise 11.105

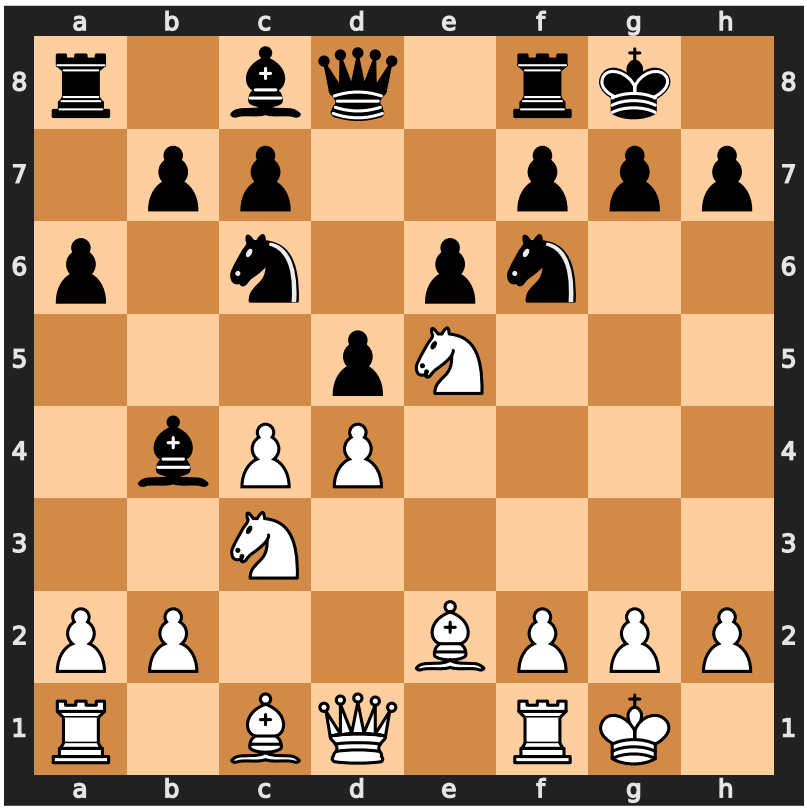

Figure 33.9: Chess Position

White to play. Pieces are under fire on both sides. Find the best sequence. Hints: (1) cxd5 is natural, but Nxc6 first is a desperado since the e5 knight is attacked. (2) After bxc6 (or Qxd1 Rxd1 bxc6), White plays dxc5. (3) The knight did maximum damage before being exchanged.

Pattern 22: Undermining

Exercise 11.106

White to play. Black's d5 pawn is the foundation. Undermine it. Hints: (1) c4! attacks d5 from the side. (2) After dxc4 Bxc4, the center opens and White's bishop is active. (3) If d5 stands, it blocks everything. Undermining it changes the game.

Exercise 11.107 White to play. Black's pawn chain is d5-e6. Attack the base. Hints: (1) The base of Black's chain is d5 (or e6, depending on perspective). (2) c4 (if the c-pawn were not on c5) would undermine d5. (3) f4! could undermine e6 by preparing f5.

Exercise 11.108

White to play. The knight on f6 is protected by the pawn on e7… wait, e7 has the bishop. The knight on f6 is just placed there. Can you undermine its support? Hints: (1) What supports the f6

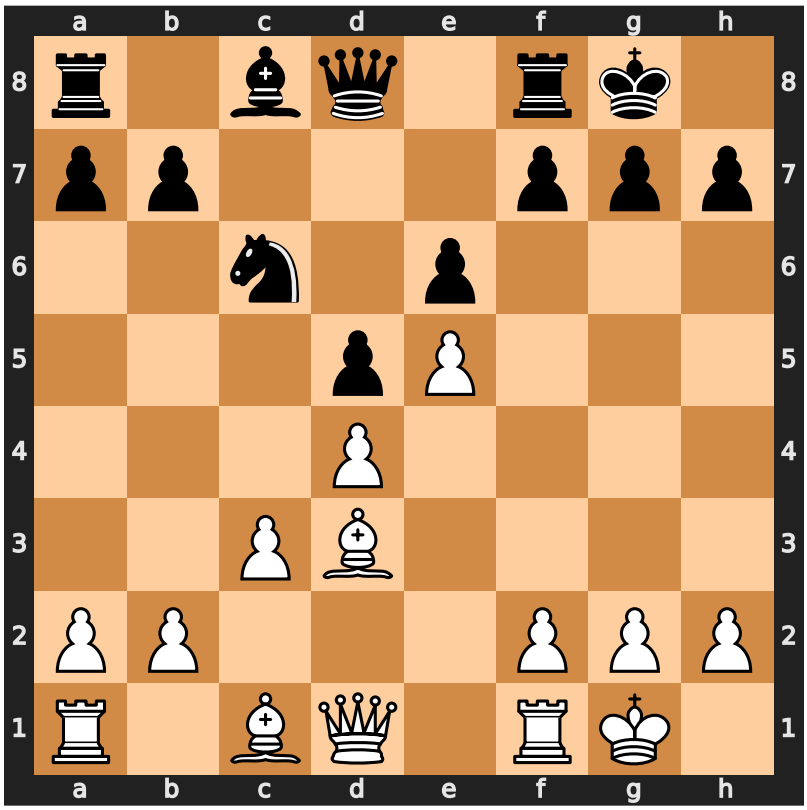

Figure 33.10: Chess Position

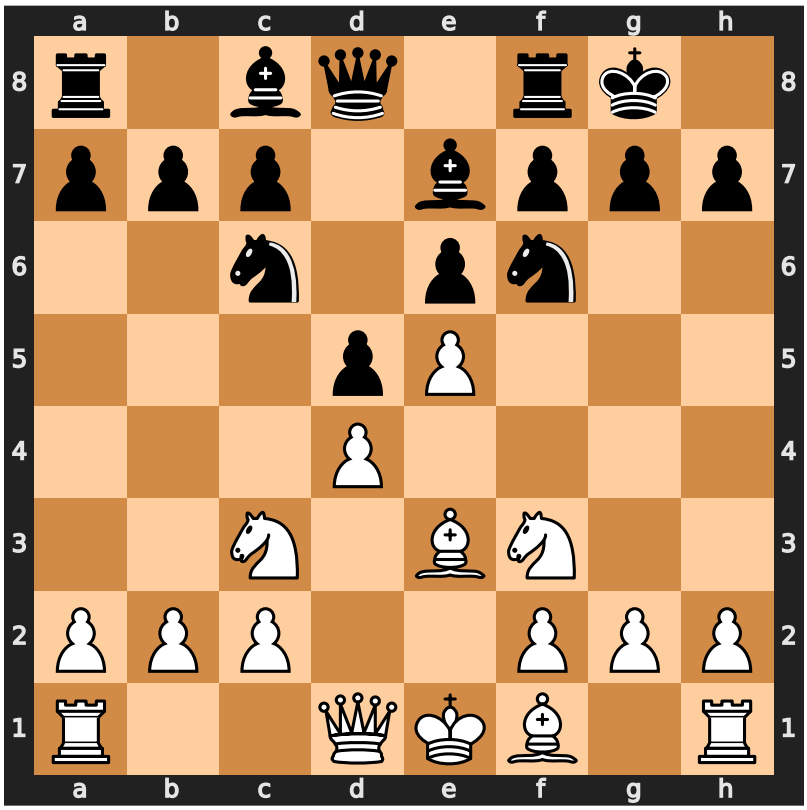

Figure 33.11: Chess Position

knight? Nothing except its own position. (2) But if you play e6! (pawn sacrifice), you undermine the f7 pawn and create chaos. (3) After fxe6, the position opens and Black's king is exposed.

Exercise 11.109

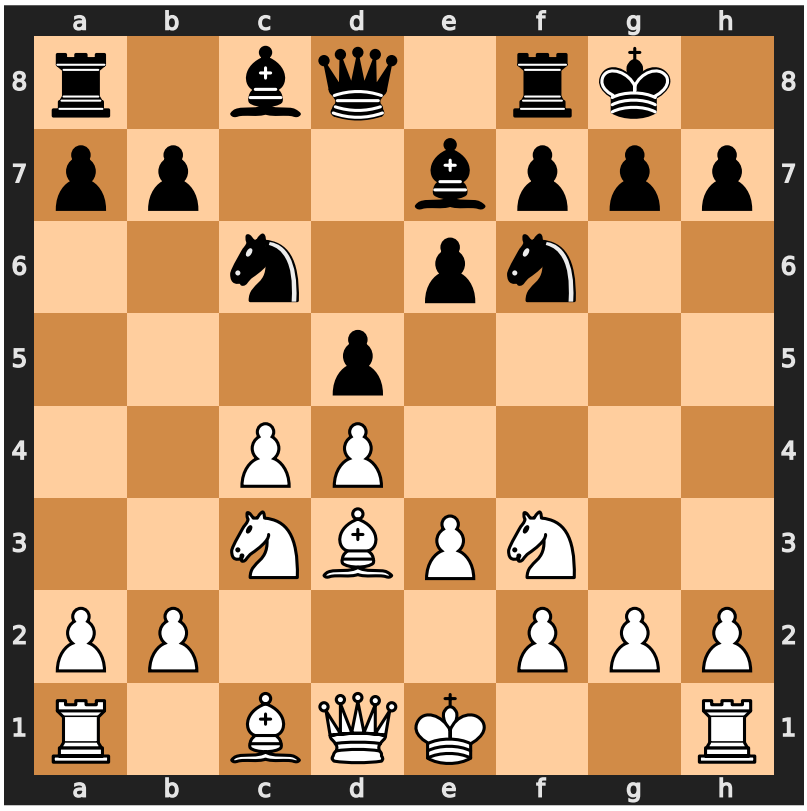

Figure 33.12: Chess Position

White to play. The d5 pawn is supported by e6 and the c6 knight. Undermine both supports. Hints: (1) cxd5 exd5 just trades. (2) But c5! followed by Nb5 puts pressure on d5 from a different angle. (3) Or e4! undermining d5 from the other direction. Choose the right plan based on the full position.

Exercise 11.110

White to play. Black has a knight on f5 attacking d4 and e3. Undermine the knight. Hints: (1) g4! attacks the knight directly and undermines its position. (2) After Nh4 (retreat), the knight is passive. (3) Or Ne7, and White continues with Qc2 and a kingside attack.

Pattern 23: Pawn Fork

Exercise 11.111

White to play. Classic center pawn fork. Find it. Hints: (1) d5 attacks the knight on c6. (2) e5 attacks the knight on f6. (3) But you can only play one move. Which pawn fork is better? d5! because it gains space and attacks the knight with tempo.

Exercise 11.112

White to play. Set up a pawn fork with cxd5 followed by d5 or d4-d5. Hints: (1) cxd5 exd5 and

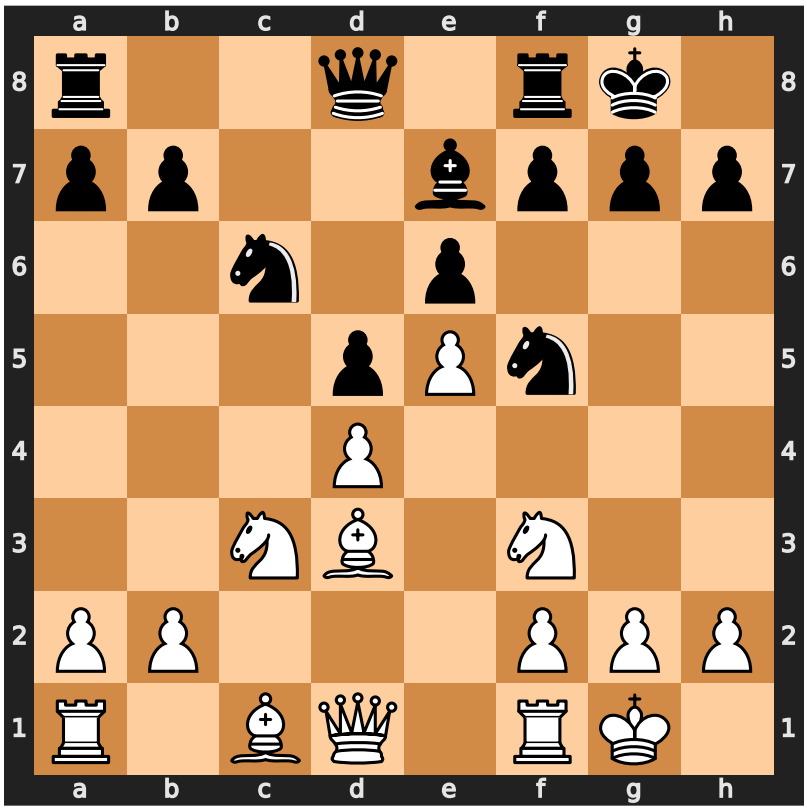

Figure 33.13: Chess Position

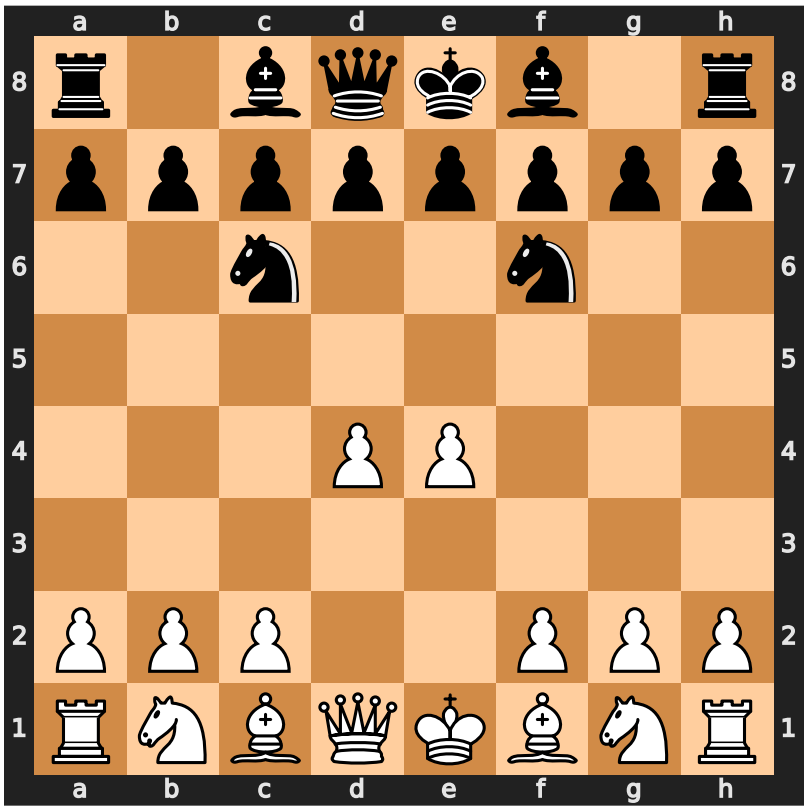

Figure 33.14: Chess Position

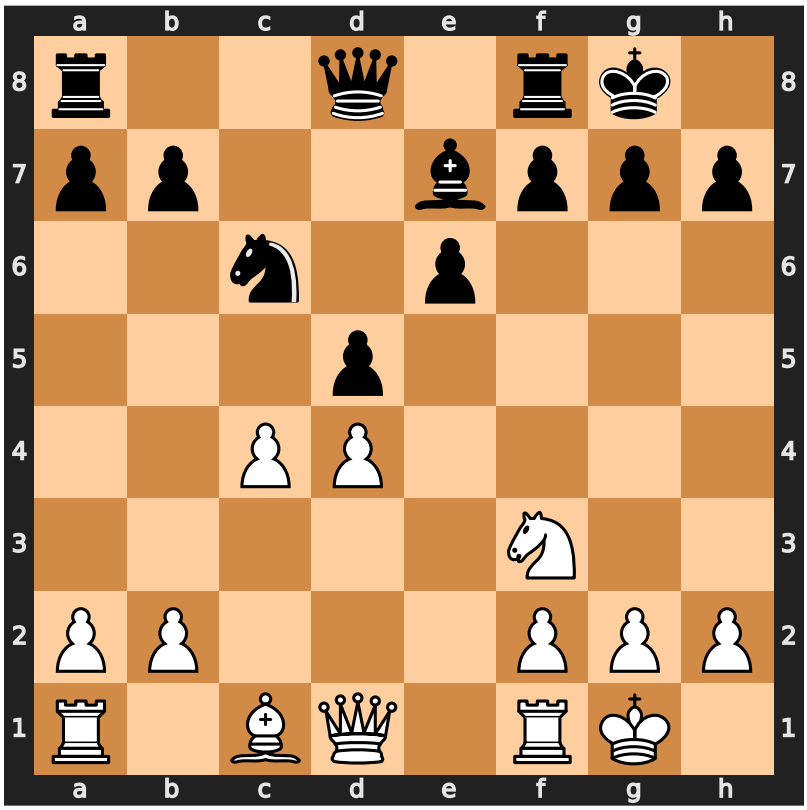

Figure 33.15: Chess Position

then the d4 pawn is no more. (2) But what about d5 directly? (3) d5! forks the knight on c6 and attacks e6. The pawn fork wins space and displaces the knight.

Exercise 11.113

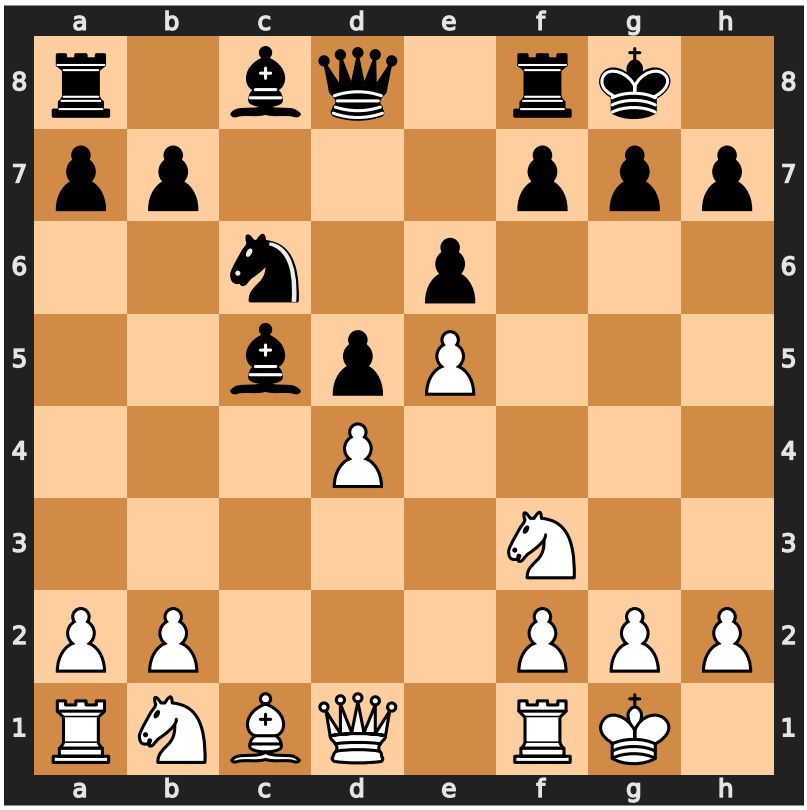

Figure 33.16: Chess Position

White to play. The e5 pawn is advanced. Can you create a pawn fork on d6? Hints: (1) d5 is not possible (pawn is on d4, d5 is occupied). (2) But exd6? Wait, what is on d6? Nothing. (3) Actually, think about advancing: can d4-d5 create a fork? After d5, it attacks c6 and e6. If exd5, the pawn on e5 is now passed.

Exercise 11.114

White to play. Set up a pawn fork that wins material. Hints: (1) The knight on c6 and bishop on e7 are both within range of a d5 advance. (2) d5! attacks c6 (knight) and opens the position. (3) If exd5, Nxd5 attacks the queen on c7 and the bishop on e7. A knight recapture creates a SECOND fork.

Exercise 11.115

White to play. The French Defense Advance Variation. Find the pawn break that creates a fork. Hints: (1) c3 is solid but slow. (2) dxc5 opens the d-file but gives up the center. (3) f4! prepares f5 which would fork e6 and g6 (if it gets there). Or exf6 could open things up. The advanced pawn fork requires preparation.

Pattern 24: Knight Fork

Exercise 11.116

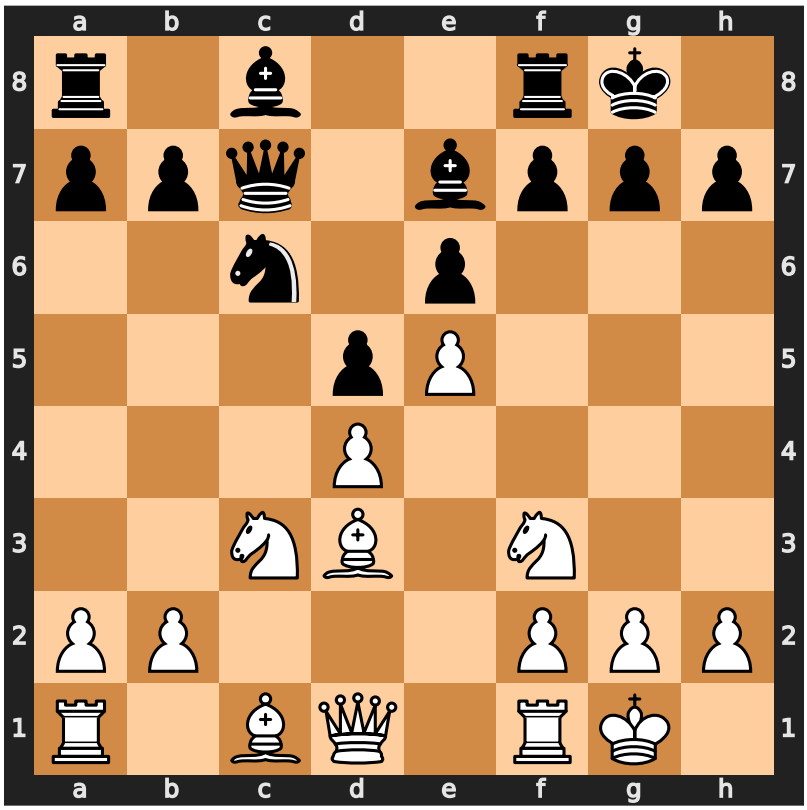

Figure 33.17: Chess Position

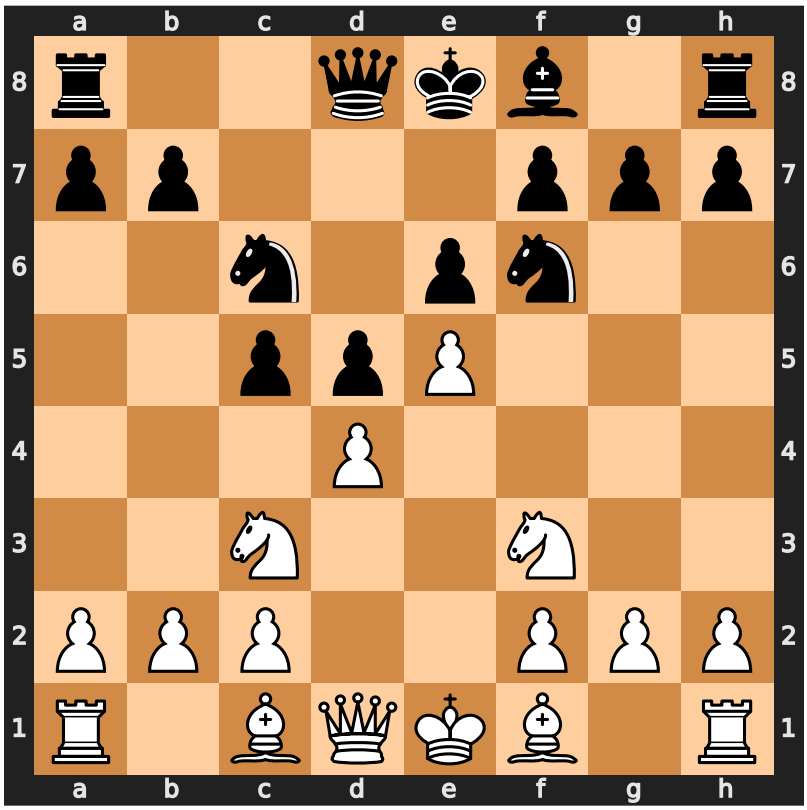

Figure 33.18: Chess Position

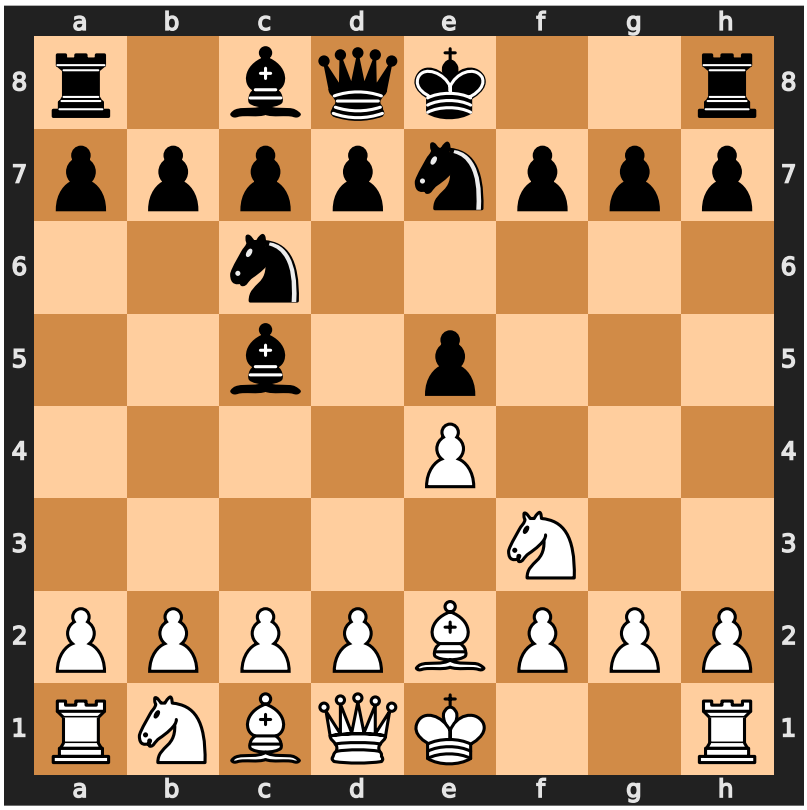

Figure 33.19: Chess Position

White to play. Can you set up a knight fork on d5? Hints: (1) Nd5 would attack c7 (a pawn), e7 (the knight), and other squares. (2) But is Nd5 possible right now? The f3 knight needs to get there. (3) O-O first, then c3, then d4, then Nd5. Building toward the fork takes patience.

Exercise 11.117

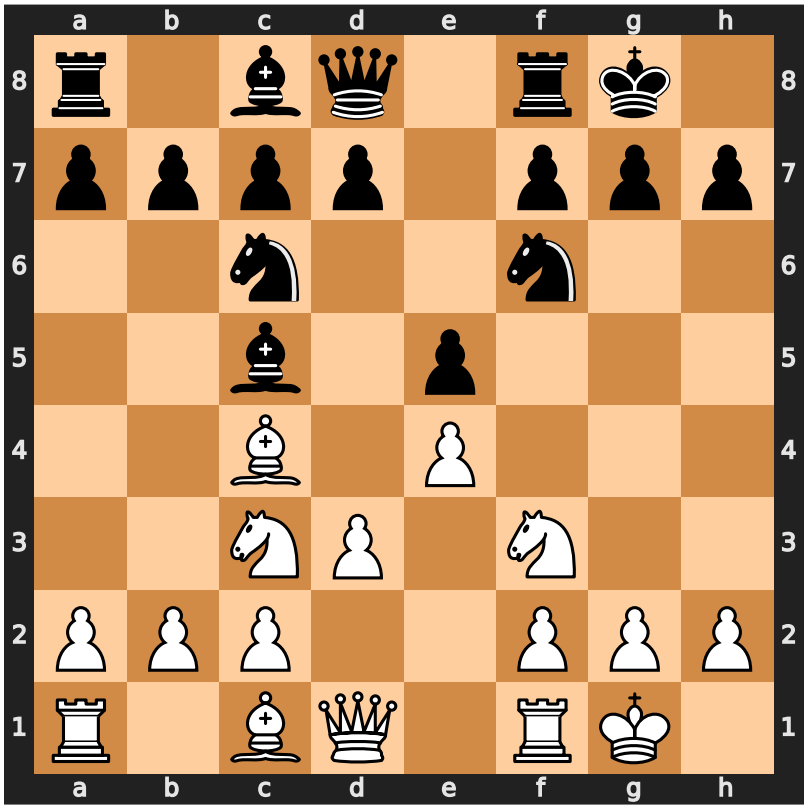

Figure 33.20: Chess Position

White to play. The knight can reach d5 or f5. Which creates a better fork? Hints: (1) Nd5 attacks c7 and e7 (if the knight on f6 moves, Nc7 forks the rooks). (2) Nf5 attacks g7 and e7, threatening the bishop on c5 indirectly (through d6 ideas). (3) Both are strong but Nd5 creates more immediate threats.

Exercise 11.118

White to play. Sacrifice to set up a knight fork. Hints: (1) Bxf7+ Rxf7 (or Kxf7). (2) After Kxf7, Ng5+ forks the king and the queen (if the queen is on d8). (3) The bishop sacrifice creates the conditions for the knight fork. Classic combination.

Exercise 11.119

White to play. Can you maneuver a knight to c7 to fork the rooks? Hints: (1) Nc3-b5 eyes c7 and d6. (2) Nb5 threatens Nc7 forking queen on d8 and rook on a8. (3) Black must respond to the Nc7 threat immediately. This is a common motif in many openings.

Exercise 11.120

White to play. A complex position where a knight fork is hidden three moves deep. Hints: (1) Nb5

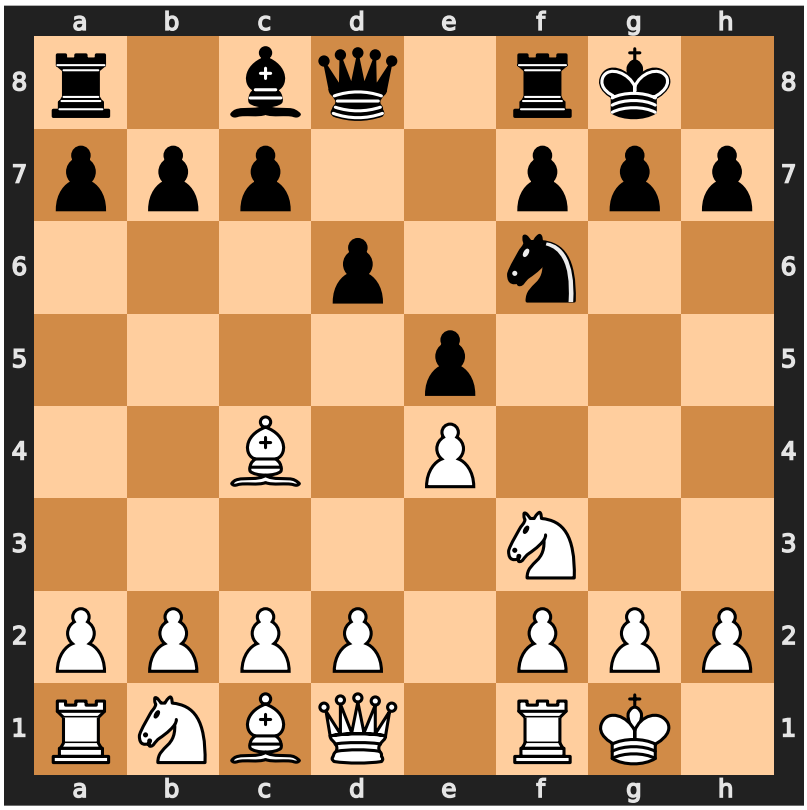

Figure 33.21: Chess Position

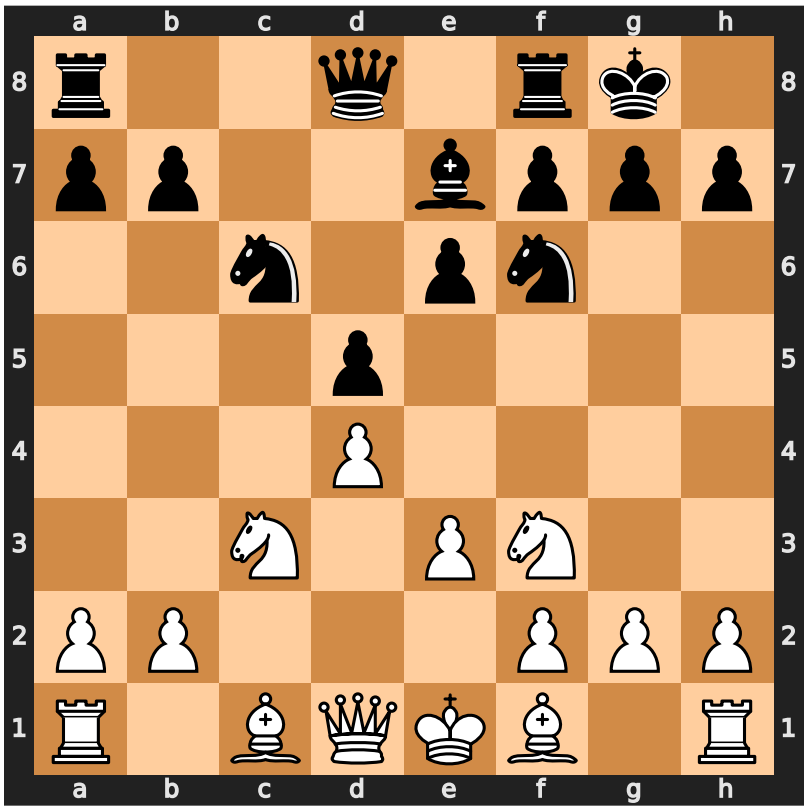

Figure 33.22: Chess Position

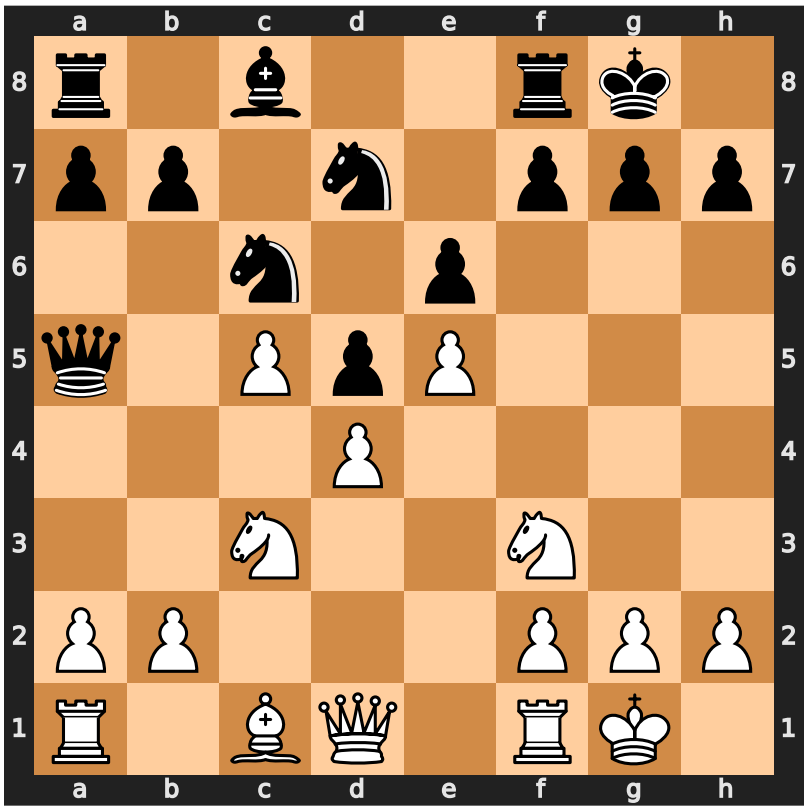

Figure 33.23: Chess Position

threatens Nc7. (2) After Nb5, the queen on a5 must move. (3) If Qa4, then Nc7 forks a8 and e6. But if Qd8, Nc7 still forks rook on a8 and knight on c6 is displaced. Calculate all the variations.

Pattern 25: Pin Exploitation

Exercise 11.121

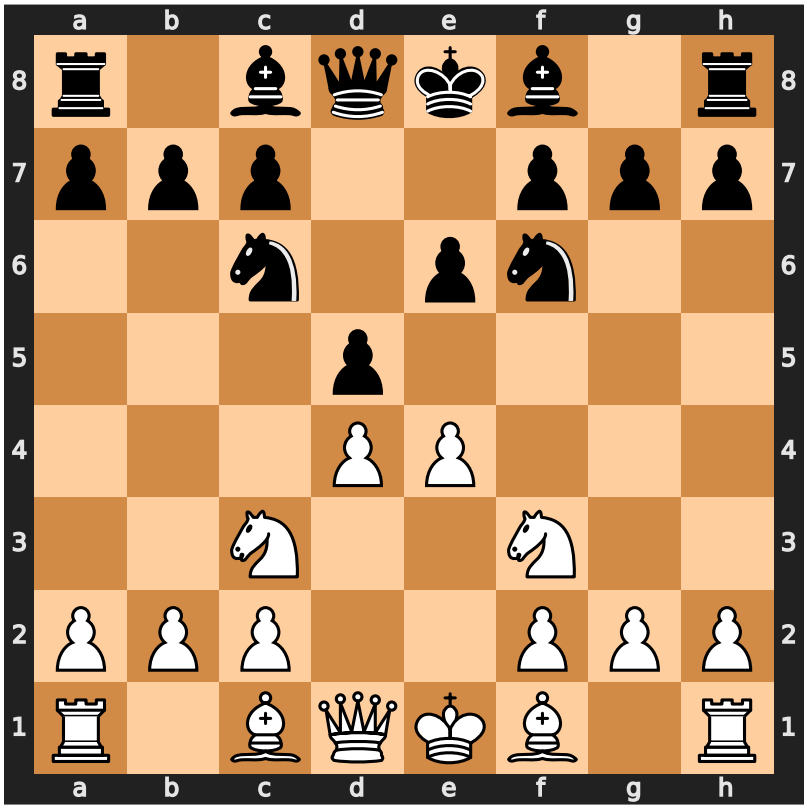

Figure 33.24: Chess Position

White to play. Pin the knight on f6. How? Hints: (1) Bg5 pins the f6 knight to the queen on d8. (2) After Bg5, the knight cannot move. (3) Now pile on with e5 or Qd3 to increase the pressure on the pinned piece.

Exercise 11.122

White to play. The knight on f6 is pinned by Bg5. How do you exploit the pin? Hints: (1) e5 is tempting but the knight is pinned, so it cannot move to d7 or e4 anyway. (2) Qd3 or Qc2 adds pressure to the d5 pawn (the knight on f6 cannot help defend d5 since it is pinned). (3) After e5, the pin becomes meaningless because the knight is now FORCED to stay. Think about what the pin prevents and exploit THAT.

Exercise 11.123

White to play. You have two bishops aimed at the kingside. Can you create a SECOND pin? Hints: (1) Bd3 aims at h7 (the Greek Gift setup). (2) But a second pin: what about Qd2, lining up on the d-file with the king? (3) The double pin (Bg5 on the f6 knight + Bd3 aimed at h7) creates the conditions for Bxf6 followed by Bxh7+.

Exercise 11.124

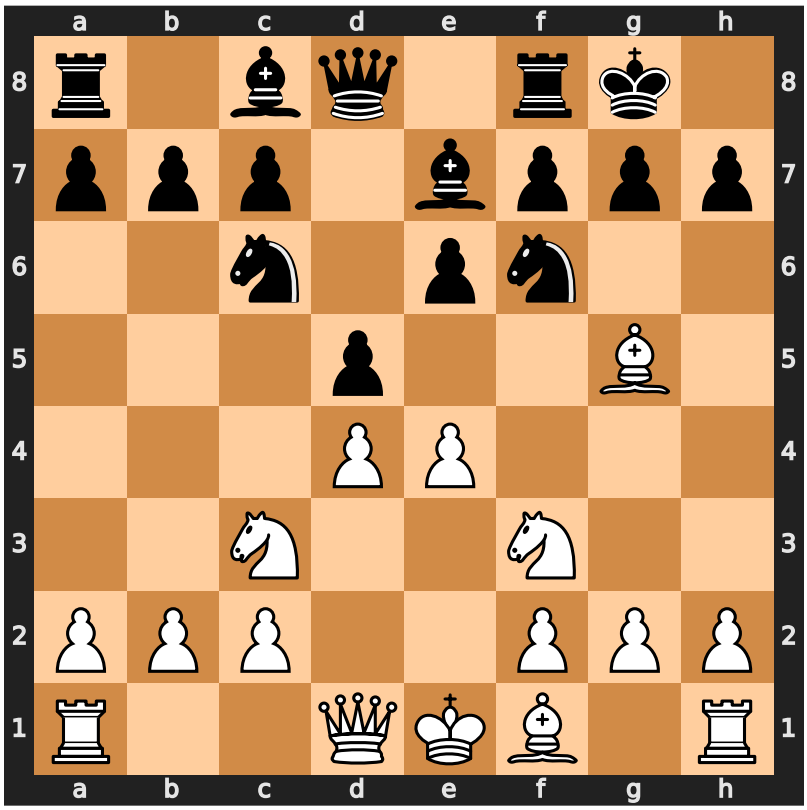

Figure 33.25: Chess Position

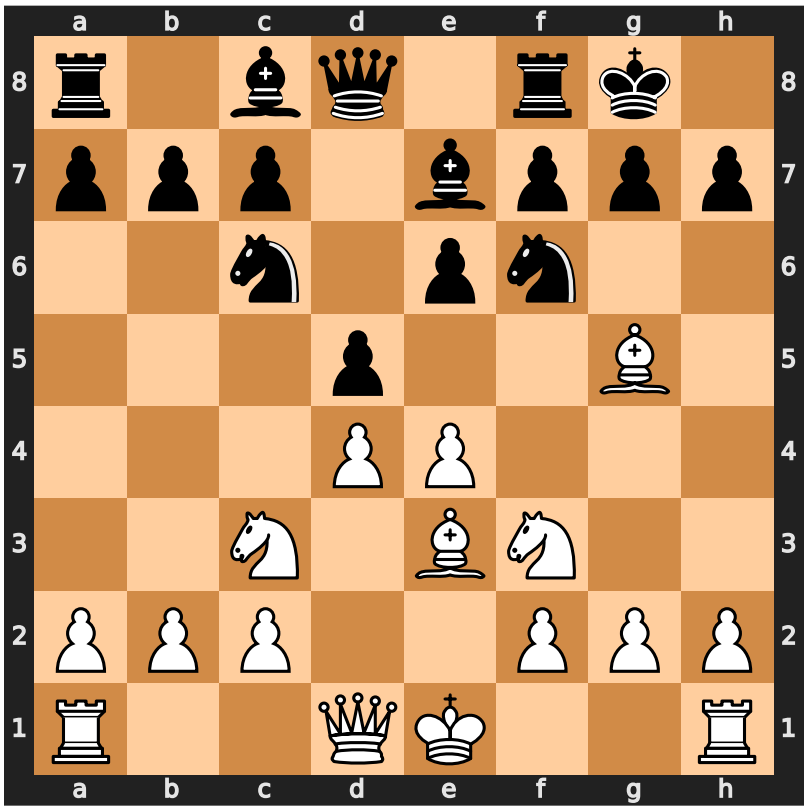

Figure 33.26: Chess Position

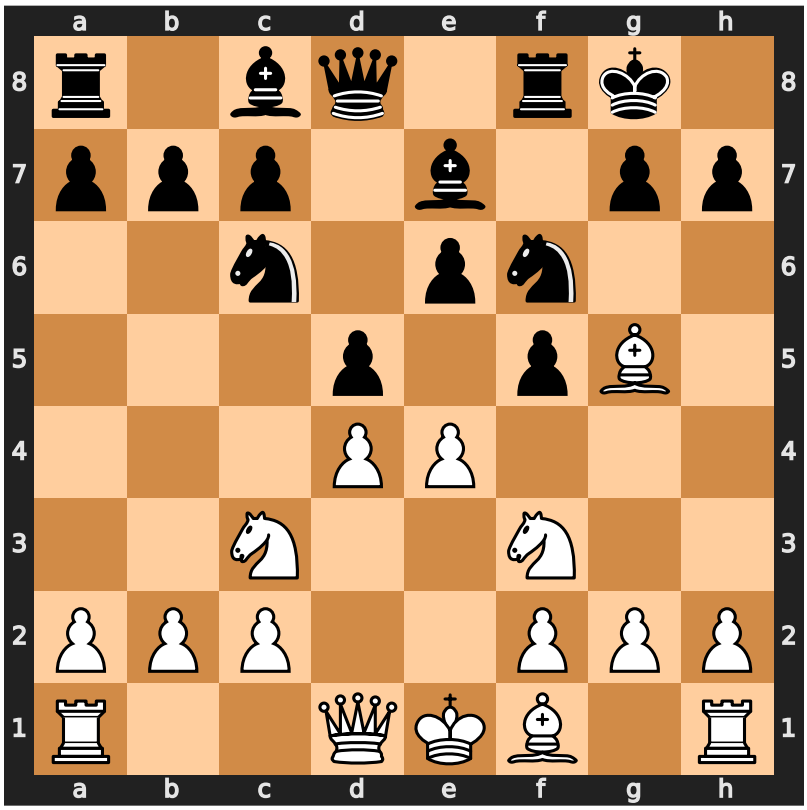

Figure 33.27: Chess Position

White to play. The knight on f6 is pinned but Black has played f5 to break free. How do you respond? Hints: (1) f5 weakens e5 and g5. (2) Bxf6 Bxf6 (now the pin is broken but White has the bishop pair). (3) Or dxe5? Or exf5? Multiple ways to exploit the weaknesses created by Black's attempt to break the pin.

Exercise 11.125

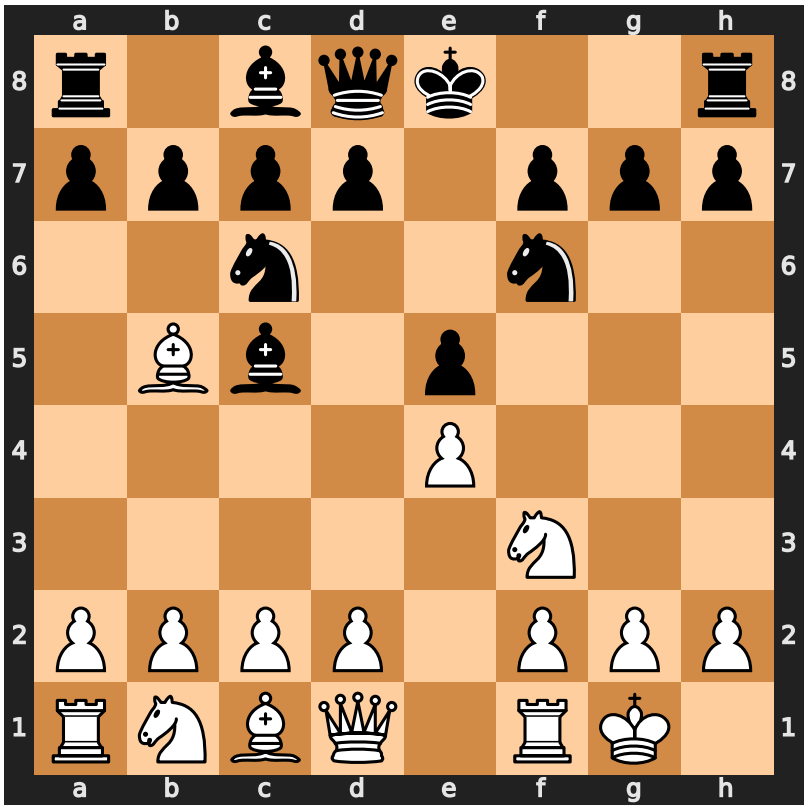

Figure 33.28: Chess Position

White to play. The bishop on b5 pins the knight on c6 to the king. Exploit it. Hints: (1) The knight on c6 cannot move without exposing the king. (2) Can you pile up on c6? Nc3 adds another attacker. (3) After Nc3, d5 is under additional pressure because the c6 knight is paralyzed. The Ruy Lopez pin is one of the oldest and most effective in chess.

_____

Chapter 34

GROUP 6: PRACTICAL PATTERNS

Estimated study time: 15-20 minutes

The first five groups taught you specific tactical motifs. This final group teaches you how to *think* about tactics in real games. These are not flashy sacrifices or spectacular checkmates. They are the quiet, practical habits that win material and games through careful observation.

Master these five patterns and you will stop losing pieces to simple oversights.

34.1 Pattern 26: Counting (Attackers vs. Defenders)

Definition: Counting is the most fundamental tactical habit in chess. Before you capture a piece or move to a contested square, count how many pieces attack that square and how many defend it. If you have more attackers than defenders, the capture works. If not, it does not.

This sounds obvious. It is not. Most blunders between 1000 and 1600 happen because a player forgot to count.

Set up your board:

White: Kg1, Qd1, Re1, Bc4, Nf3, Nd2, Pawns a2, b2, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Be7, Nc6, Nf6, Pawns a7, b7, d5, e6, f7, g7, h7

White to play.

The exercise:

Look at the d5 pawn. Count the attackers and defenders:

White attacking d5: Bishop on c4 (1), Pawn on d4 does NOT attack d5 (it is on d4, pawns attack diagonally, so it attacks c5 and e5). Knight on f3 attacks d4 and e5, NOT d5. So: just the bishop on c4 attacks d5. Wait, actually the queen on d1 could attack d5 too if the d4 pawn were not in the way… but d4 blocks the queen from d5. So: 1 attacker (Bc4).

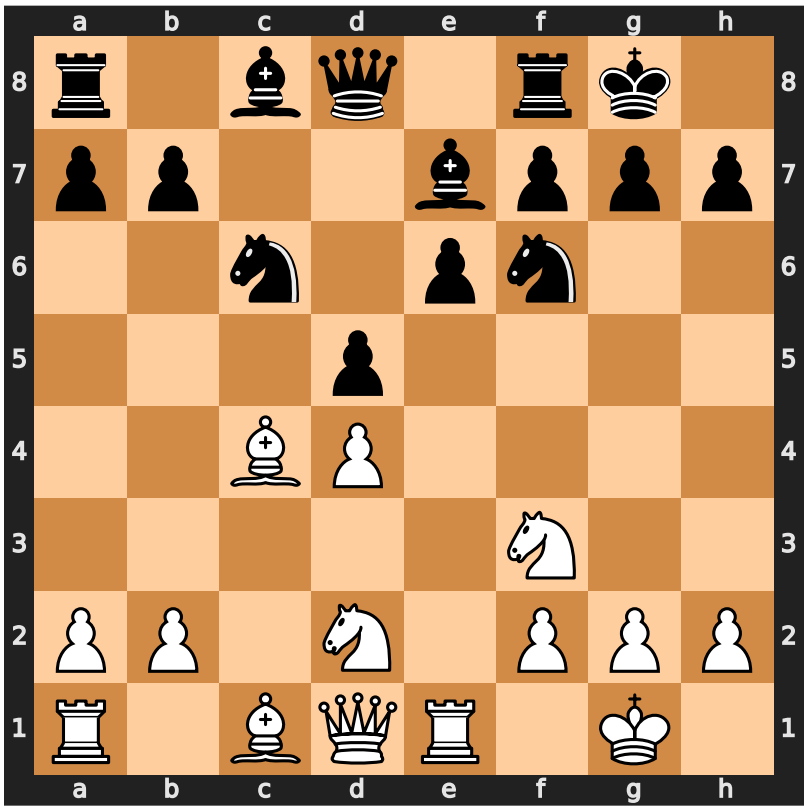

Figure 34.1: Chess Position

Black defending d5: Knight on c6? No, Nc6 does not control d5 (knight on c6 controls b4, b8, d4, d8, a5, a7, e5, e7). Wait: c6 knight controls d4, not d5. Actually from c6: a5, a7, b4, b8, d4, d8, e5, e7. No d5. Knight on f6 controls d5? From f6: d5, d7, e4, e8, g4, g8, h5, h7. YES, Nf6 controls d5. Pawn on e6 controls d5? Pawns capture diagonally. e6 pawn controls d5 (one square diagonally forward for Black would be d5 and f5). YES. Queen on d8 controls d5? Through d7, d6, d5, yes (if nothing blocks). Is anything blocking? d7 and d6 are empty, so the queen reaches d5. That is 3 defenders: Nf6, pawn on e6, and Qd8.

Result: 1 attacker vs. 3 defenders. Do NOT capture on d5. You would lose material.

This is counting. Do it before every capture. It takes five seconds and prevents 90% of blunders.

How to count efficiently: 1. Look at the target square 2. Count all your pieces that attack it (including pawns, knights, bishops, rooks, queens) 3. Count all opponent's pieces that defend it 4. If you have MORE attackers, the capture works 5. Also consider the ORDER of captures: always capture with the LEAST valuable piece first

---

34.2 Pattern 27: Hanging Pieces

Definition: A hanging piece is a piece that is not defended by anything. It is just sitting there, waiting to be captured for free.

This sounds too simple to be a "pattern." But hanging pieces are the number one source of free material in club chess. Your opponents leave pieces undefended all the time. And so do you.

Set up your board:

White: Kg1, Qd1, Ra1, Rf1, Bc1, Bc4, Nc3, Nf3, Pawns a2, b2, d4, e4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Bg4, Nc6, Nf6, Pawns a7, b7, d6, e5, f7, g7, h7

White to play.

The exercise:

Scan the board for hanging (undefended) pieces on BOTH sides:

- Black's bishop on g4: Is it defended? It is on g4. What defends it? Nothing. The bishop on g4 is hanging.
- White's d4 pawn: Attacked by e5. Defended by? The knight on f3 (no, f3 does not defend d4), the queen on d1 (through d2, d3, d4 if clear), the c3 knight (attacks d5, not d4… wait, Nc3 attacks d5 and b5. Does it attack d4? No. But the pawn on e4? No, that does not defend d4.). Actually, the d4 pawn is attacked by Black's e5 pawn (dxe5 or exd4). White's d4 pawn is defended by the c3 knight? No, c3 knight does not control d4. By Nf3? Nf3 attacks d4? No, f3 knight controls d2, d4, e1, e5, g1, g5, h2, h4. YES, Nf3 controls d4. So the pawn is defended.

The key habit: **After every opponent move, scan for hanging pieces.** It takes three seconds. Do it every single move. You will find free pieces more often than you would believe.

The "blunder check" routine: 1. Your opponent just moved. What did they leave undefended? 2. Before you play YOUR move, check: does my move leave anything undefended? 3. This two-step scan prevents most blunders at the club level.

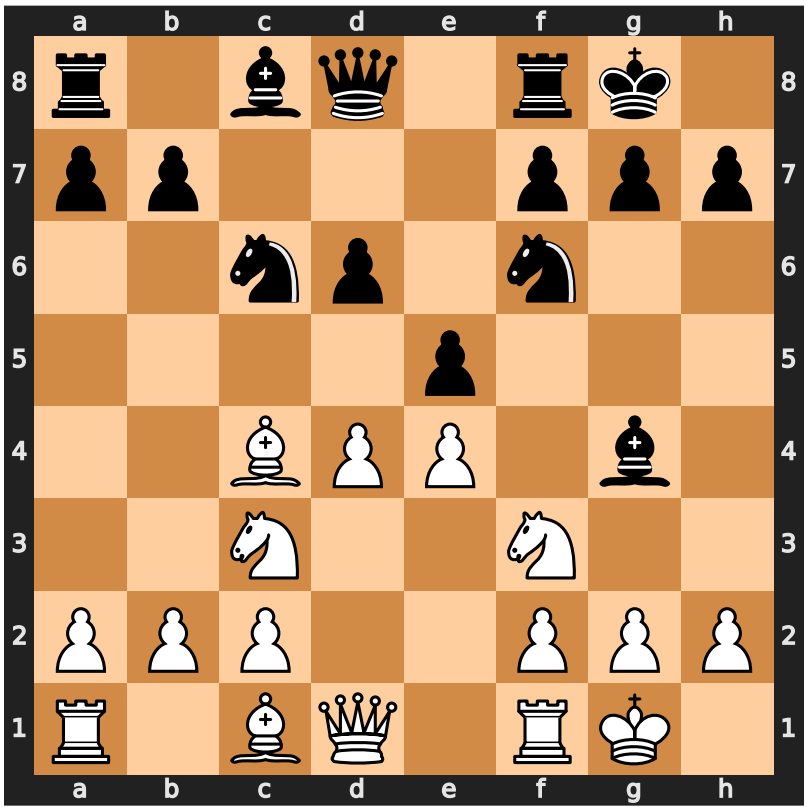

Figure 34.2: Chess Position

34.3 Pattern 28: Loose Pieces Drop Off (LPDO)

Definition: "Loose pieces drop off" (LPDO) is a shorthand rule: pieces that are not defended tend to get lost to tactics. The more undefended pieces in a position, the more likely a tactic exists.

This is the big-picture version of Pattern 27. Instead of looking for one hanging piece, you scan for multiple undefended pieces and look for a move that attacks two (or more) of them at once.

Set up your board:

White: Kg1, Qe2, Ra1, Rf1, Bb5, Nf3, Pawns a2, b2, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc5, Bg4, Nc6, Nf6, Pawns a7, b7, d6, f7, g7, h7

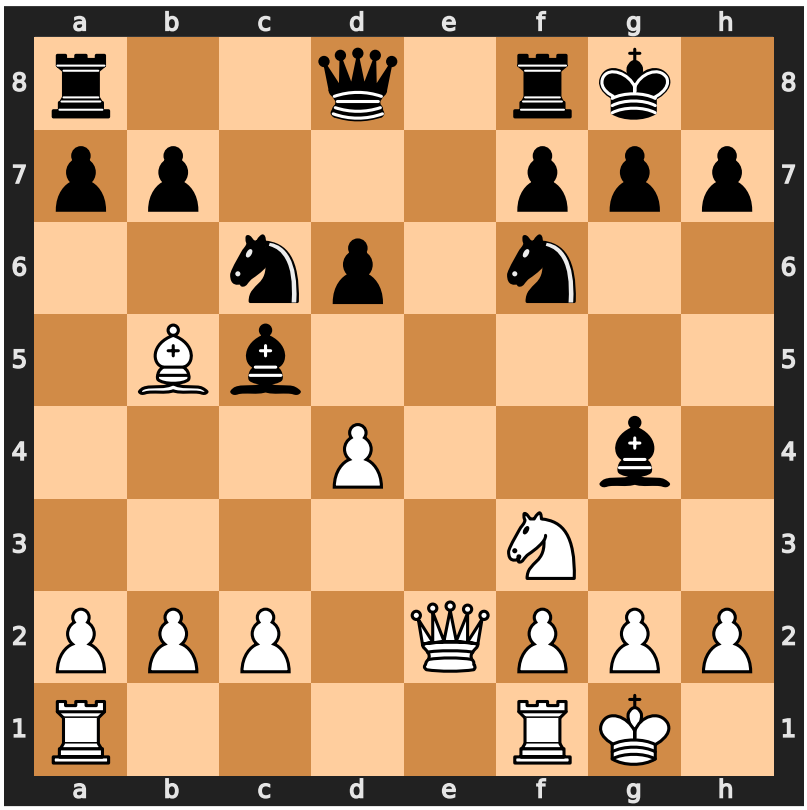

Figure 34.3: Chess Position

White to play.

The exercise:

Scan for loose (undefended) Black pieces: - Bishop on c5: defended by anything? The d6 pawn? d6 does not defend c5 (pawns attack diagonally, d6 pawn would defend c5 if it were on d6 for Black, wait, Black pawns move down. d6 pawn as Black would defend e5 and c5. YES, d6 pawn defends c5). So Bc5 is defended. - Bishop on g4: defended? Nothing on f5, h5, f3 is White's knight. Undefended. - Knight on c6: defended? The a7 pawn? No, a7 defends b6. The queen on d8? Maybe through d7-c6. Is d7 clear? Yes. So Qd8 defends c6. Defended. - Knight on f6: defended?

No pawns on e7 or g7 (g7 is a pawn but it defends f6? g7 pawn as Black defends f6? Black pawn on g7 captures toward f6? Pawns capture diagonally forward. For Black, forward is toward rank 1. So g7 pawn attacks f6 and h6. YES, g7 defends f6). Defended.

Loose piece: Bishop on g4. Now look for a double attack that targets it AND something else.

Bxc6 bxc6 and Qxg4 picks up the hanging bishop? Or simpler: Qe3 threatens the bishop AND the pawn on d4 is more solidly held. Or: after Nbd2 (if there were a knight to reroute), attack g4.

The LPDO principle: The more undefended pieces your opponent has, the more likely a combination exists. When you see two or more loose pieces, search for the move that threatens all of them at once.

34.4 Pattern 29: In-Between Check (Zwischenschach)

Definition: An in-between check is a zwischenzug (Pattern 5) that happens to be a check. It is even more powerful because a check is the most forcing move possible. Your opponent MUST deal with the check before doing anything else.

Set up your board:

White: Kg1, Qd4, Rd1, Bc4, Pawns a2, b2, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bc8, Nf6, Pawns a7, b7, d5, e6, f7, g7, h7

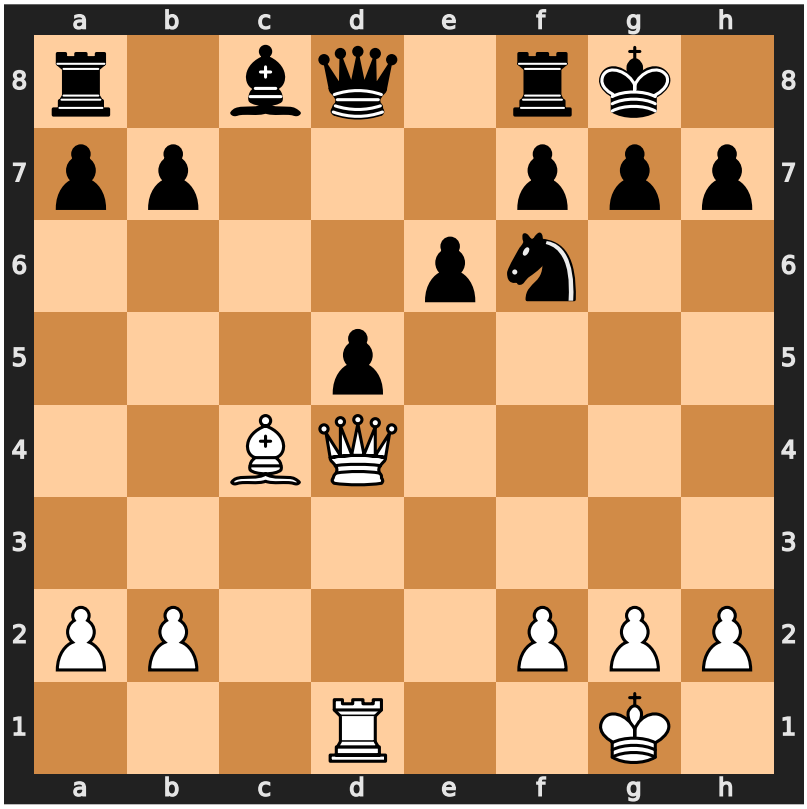

Figure 34.4: Chess Position

White to play.

The sequence:

1. Suppose pieces are being exchanged and Black expects White to recapture on a certain square. Instead:
2. White plays **Bxd5!** capturing the pawn. Black recaptures **exd5**. Now instead of the "expected" continuation:
3. White plays **Qxd5!** and this IS a capture, but in many positions, the key idea would be an in-between CHECK. Imagine the bishop were on a different square:

Better example of Zwischenschach:

White has just captured something, and Black recaptures. But before the dust settles:

Set up your board:

White: Ke1, Qd1, Ra1, Rh1, Bf1, Bc1, Nb1, Nf3, Pawns a2, b2, c2, d4, f2, g2, h2 Black: Kg8, Qd8, Ra8, Rf8, Bb4, Bc8, Nc6, Nf6, Pawns a7, b7, d5, e6, f7, g7, h7

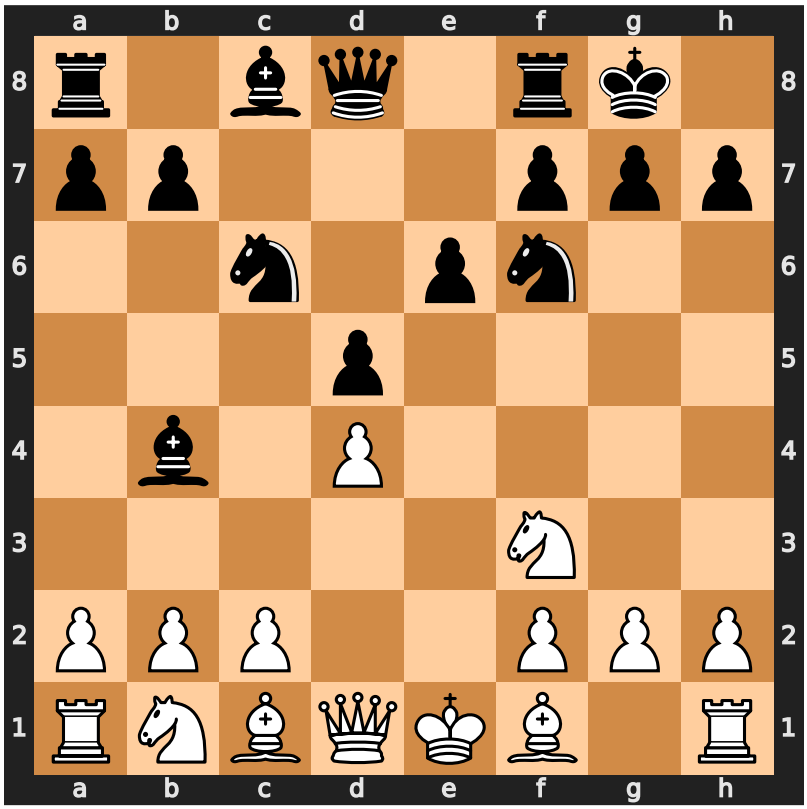

Figure 34.5: Chess Position

1. Black has just played Bb4+, checking the king on e1. Instead of blocking with Bd2 or Nc3 (the "expected" response), White plays:
2. **c3!** This is both a block of the check AND an attack on the bishop. It is an in-between defensive move that gains time.

3. Or in a more dramatic scenario: during an exchange, instead of recapturing, you give a *check* that changes the entire position. The opponent must deal with the check, and by the time they do, you have recaptured with advantage.

Why it works: Checks are absolute. They must be addressed. An in-between check disrupts your opponent's plan at the most critical moment. It is the strongest form of zwischenzug.

Common situations: - During a piece exchange, you give check before recapturing - After a sacrifice, the opponent takes but you check before the position stabilizes - In endgames, promoting a pawn with check before the opponent promotes theirs

---

34.5 Pattern 30: Quiet Move in Combinations

Definition: A quiet move is a non-forcing move (not a check, capture, or direct threat) that nonetheless creates an unstoppable threat. In the middle of a tactical sequence full of checks and captures, a single quiet move can be the strongest move of all.

This is the hardest pattern in the chapter. Everything else we have studied involves forcing moves: checks, captures, threats. A quiet move is the opposite. It looks like nothing. But it sets up something unstoppable.

Set up your board:

White: Kg1, Qd1, Rd1, Bc1, Nf3, Pawns a2, b2, d4, e5, f2, g2, h2 Black: Kg8, Qd8, Rd8, Bc8, Nf6, Nc6, Pawns a7, b7, e6, f7, g7, h7

White to play.

The concept:

1. Imagine you are in the middle of a combination. You have been checking and capturing for three moves. Now it is your turn, and there is no check, no capture, and no obvious threat. What do you do?

2. You play a **quiet move** that creates an unavoidable problem. For example: **Bg5!** This is not a check. It is not a capture. But it pins the knight on f6 (Pattern 25), and threatens Bxf6 followed by Qxd8. Black cannot deal with all the threats at once.

3. The quiet move is like the pause before the punchline. It is the setup move that makes everything else work.

Why it works: Your opponent is prepared for checks and captures. They are calculating forced lines. A quiet move disrupts their calculation because it is unexpected. It creates a threat they have to find and address in a position they thought was under control.

Common quiet move types: - A piece reposition that creates a dual threat (no check, but mate is threatened) - A pawn advance that restricts the opponent's pieces (like h3 or a3, cutting off escape squares) - A piece placement that improves your coordination (putting a piece on the perfect square without attacking anything immediately) - A backward move (retreating a piece to a better square) that sets up an unstoppable combination

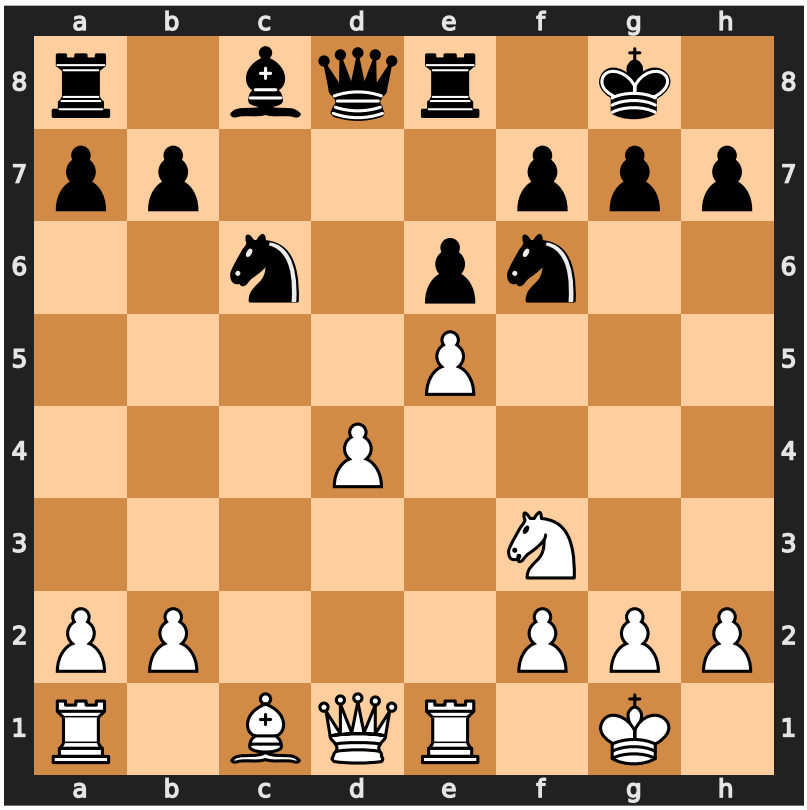

Figure 34.6: Chess Position

How to find quiet moves: After calculating all checks and captures, ask: "What if I played a move that is NOT a check and NOT a capture? Is there a move that creates a problem my opponent simply cannot solve?"

This is the question that separates good players from great ones.

34.5.1 Milestone Check

You have learned all 30 patterns. Read that again. You now have a tactical vocabulary larger than most club players ever develop. Forcing patterns, material-winning patterns, mating attacks, geometric relationships, advanced combinations, and practical thinking habits: you have them all.

This is not the end. This is the beginning. Now you need to PRACTICE. The 150 exercises in this chapter are your training ground. The games section shows you these patterns in action at the highest level. And every game you play from now on is a chance to spot these patterns in the wild.

You deserve a long break after this. Get up. Walk around. Eat something. Be proud of what you have just learned.

34.6 Exercises: Group 6 (Patterns 26-30)

Pattern 26: Counting

Exercise 11.126

Black to play. Count the attackers and defenders of the d5 square. Can Black safely play d5? Hints: (1) What attacks d5 for White? The e4 pawn. (2) What defends d5 for Black? The queen on d8, the pawn on e6 (if it were there). (3) If Black plays d5, exd5 Qxd5 is fine. Count before you capture.

Exercise 11.127

Black to play. Count attackers and defenders of e5. Can Black capture on e5? Hints: (1) e5 is defended by Nf3. (2) e5 is attacked by Nc6 and potentially d6. (3) Nxe5 loses the knight to Nxe5? Wait, no. After Nxe5, White plays d4, but the knight can retreat. Count carefully.

Exercise 11.128

White to play. Count attackers and defenders of d5. Should White play exd5? Hints: (1) Attackers of d5: e4 pawn. (2) Defenders of d5: knight on f6, knight on c6, pawn on e6, queen on d8. (3) 1 attacker vs 4 defenders. exd5 is a trade, not a winning capture. The COUNT tells you this is equal, not advantageous.

Exercise 11.129

White to play. Count attackers and defenders of d5 after cxd5 exd5. Hints: (1) After cxd5 exd5, the d5 pawn is now defended only by… count again. (2) With the e6 pawn gone (it captured on d5), d5 has fewer defenders. (3) This is why exchanging on d5 first can change the count for a follow-up Nxd5.

Exercise 11.130

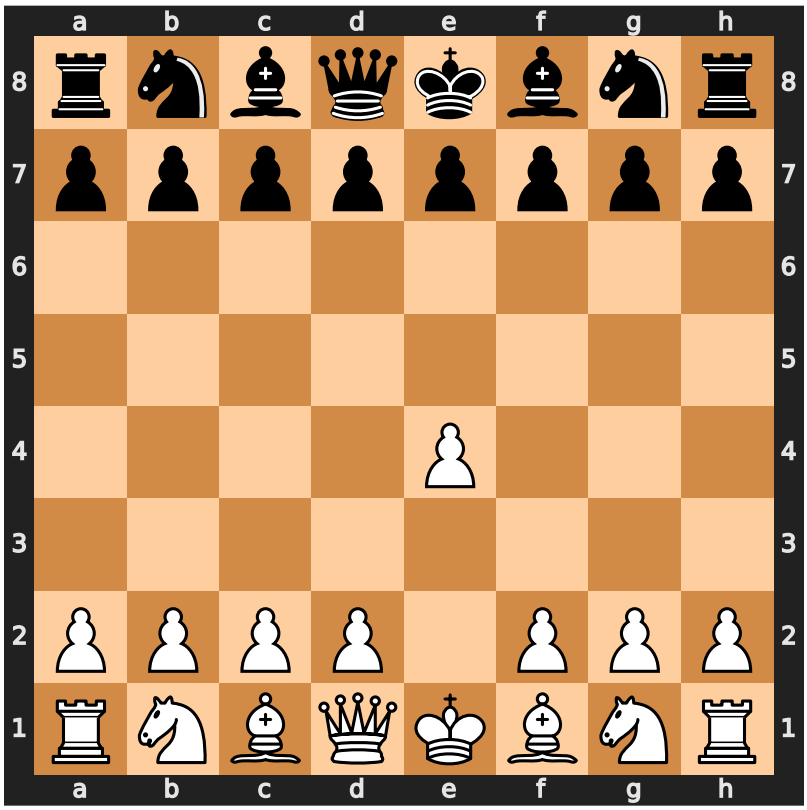

Figure 34.7: Chess Position

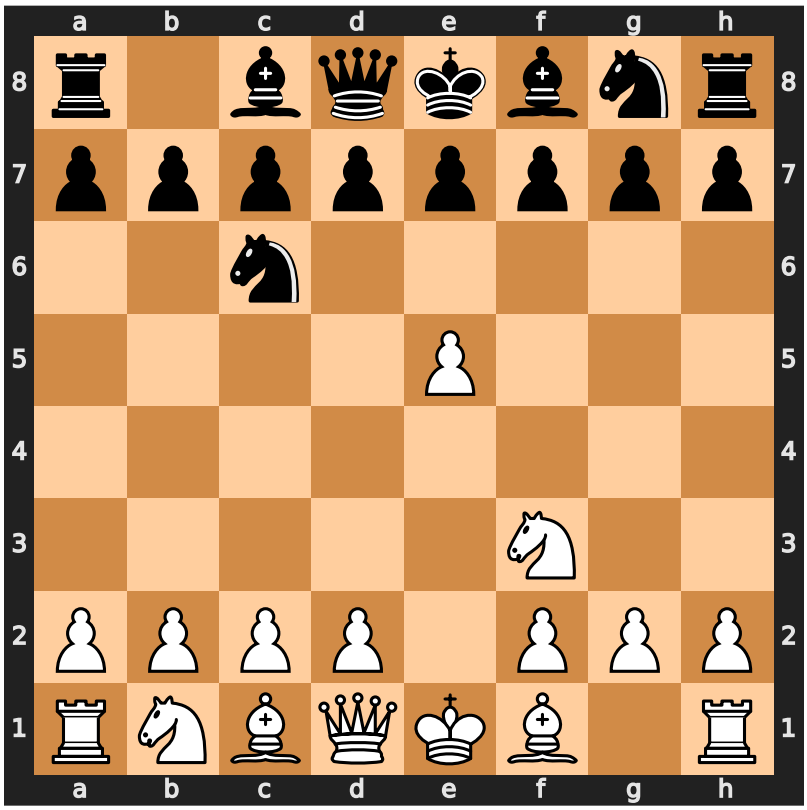

Figure 34.8: Chess Position

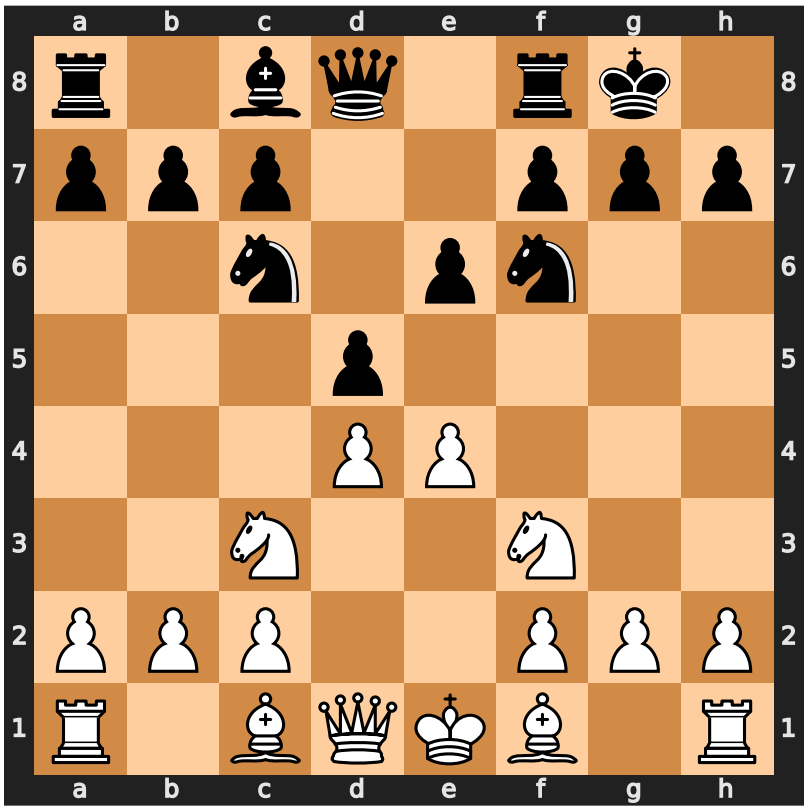

Figure 34.9: Chess Position

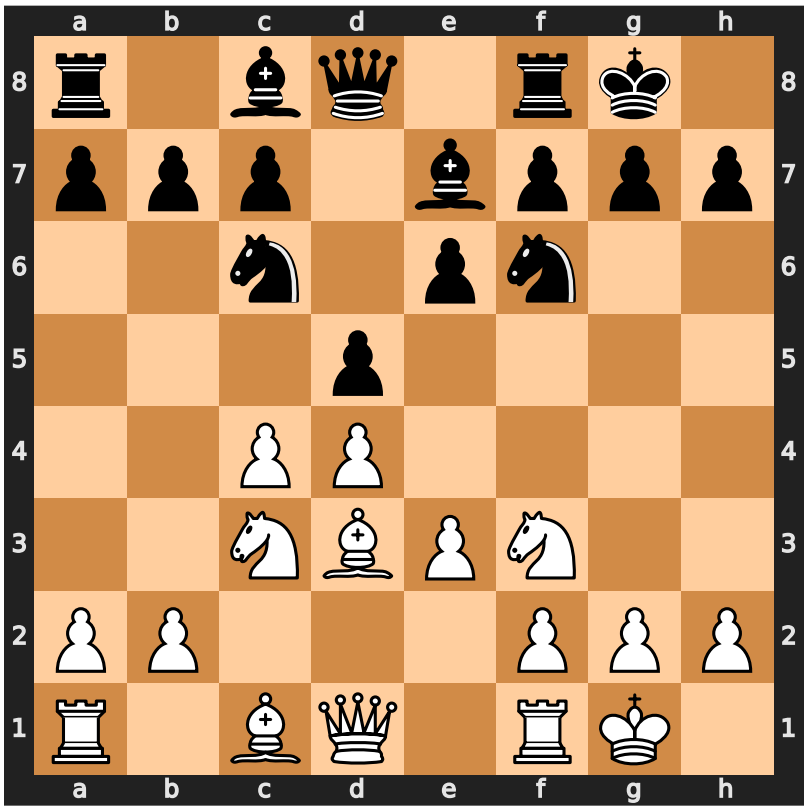

Figure 34.10: Chess Position

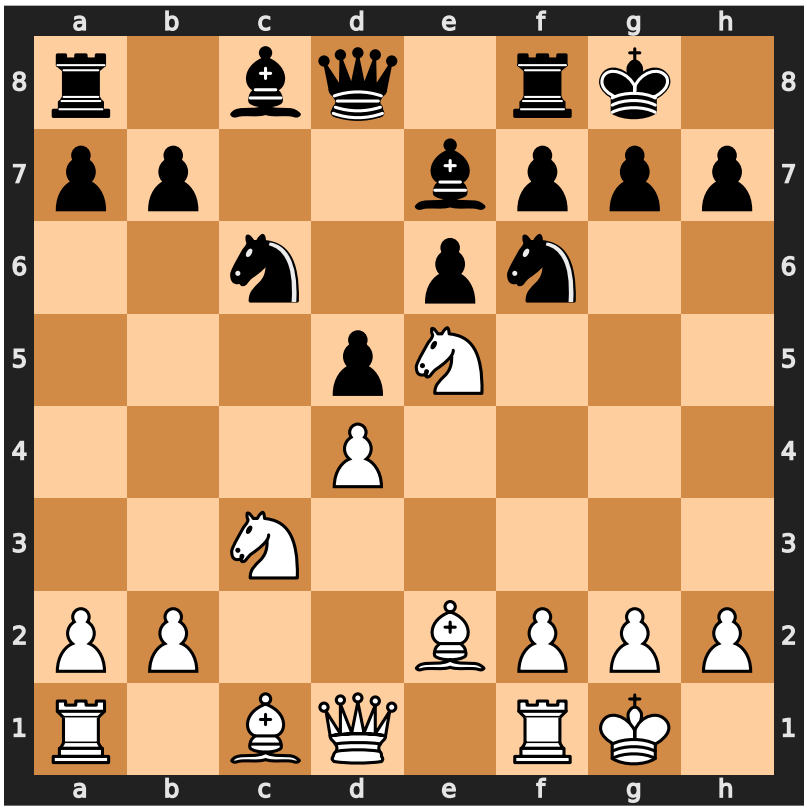

Figure 34.11: Chess Position

White to play. Count attackers and defenders of f7. Is Nxf7 a sound sacrifice? Hints: (1) Attackers of f7: Ne5? No, e5 attacks d7, f7 is attacked by… does Ne5 attack f7? From e5: c4, c6, d3, d7, f3, f7, g4, g6. YES, Ne5 attacks f7. (2) Defenders of f7: Kg8 (king defends f7), Rf8 (rook on f8 defends f7 along the f-file), Qd8 (does the queen defend f7? Through e7-f7? The bishop on e7 blocks). (3) 1 attacker vs 2+ defenders. Nxf7 loses material UNLESS it leads to a combination. Counting tells you when to calculate deeper.

Pattern 27: Hanging Pieces

Exercise 11.131

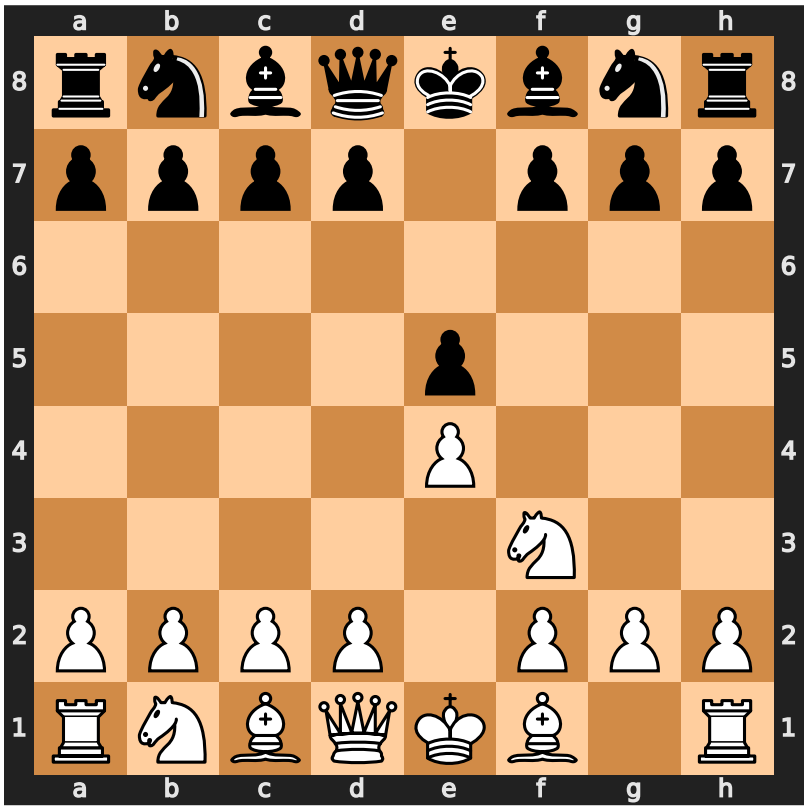

Figure 34.12: Chess Position

Black to play. Scan the board. Are any White pieces hanging? Hints: (1) Nf3 is defended? Yes, by the d2 pawn and the queen. (2) The e4 pawn? Defended by nothing? Wait, the f3 knight defends e5, not e4. (3) d2 pawn defends… the pieces, not e4. The e4 pawn IS defended by the d-pawn through d3? No. Actually Nf3 defends e5, not e4. And the queen on d1 defends d2 and other squares. The e4 pawn is hanging! But can Black take it? Nf6 attacks e4 indirectly (develops and hits e4). d5 attacks e4 directly.

Exercise 11.132

White to play. Scan for hanging pieces. Is the e5 pawn hanging? Hints: (1) e5 is defended by Nc6 and Nf6 does NOT defend e5 (f6 knight controls e4, d5, etc.). Does Nc6 defend e5? From c6: b4, b8, a5, a7, d4, d8, e5, e7. YES, Nc6 defends e5. (2) So e5 is defended. (3) What about the f7 pawn? Is it hanging? Yes, in many openings f7 is the weakest point.

Exercise 11.133

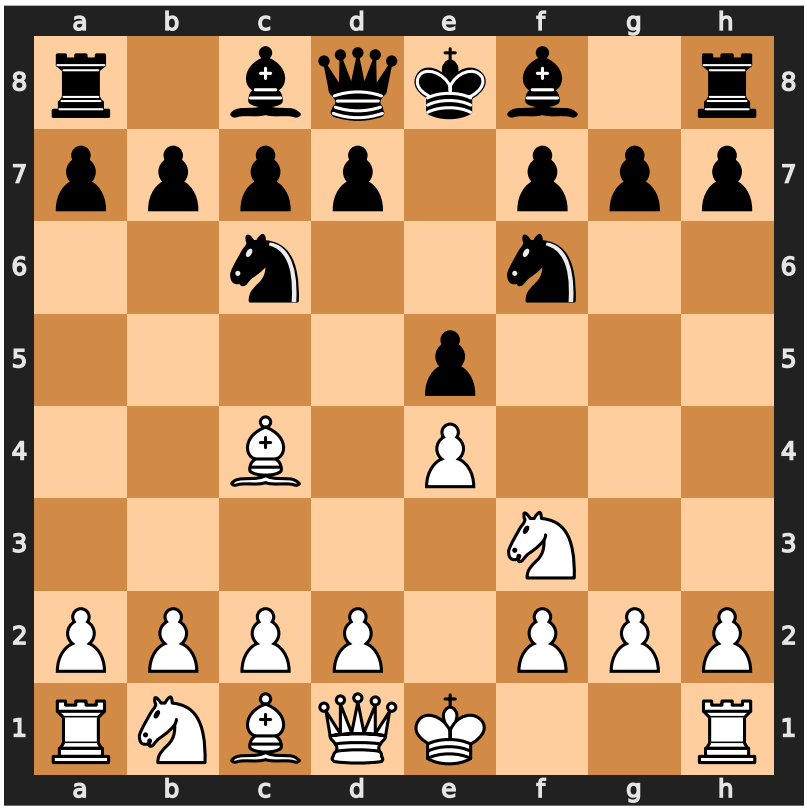

Figure 34.13: Chess Position

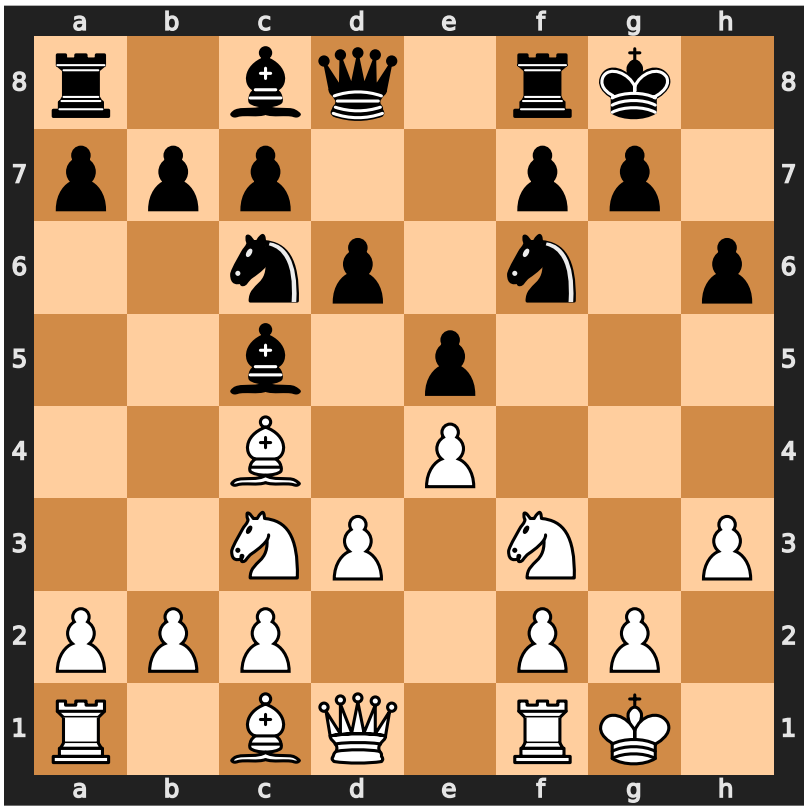

Figure 34.14: Chess Position

White to play. Multiple pieces and pawns are potentially undefended. Find all the hanging pieces on both sides. Hints: (1) Scan systematically: start with Black's a7, b7, c5, c6, d6, e5 pawns and pieces. (2) Is the bishop on c5 defended? The d6 pawn defends it (Black pawn on d6 defends c5). (3) The h6 pawn? The g7 pawn defends it. Check everything systematically.

Exercise 11.134

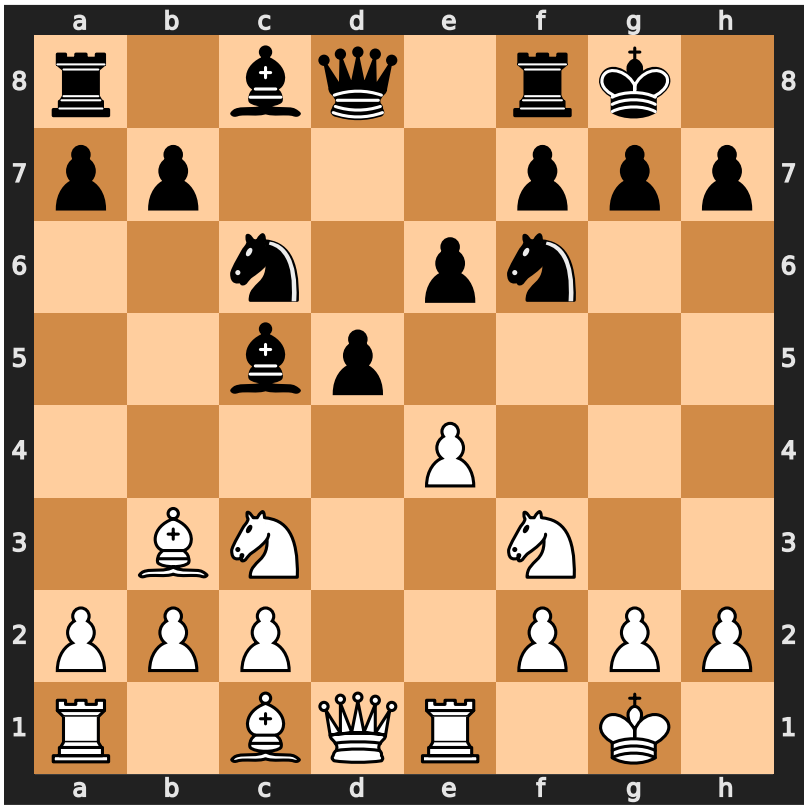

Figure 34.15: Chess Position

Black to play. White has just played Bb3. Is the bishop on b3 defended? Hints: (1) The a2 pawn defends b3. (2) But the bishop on c5 is hanging? No, the d4 square… (3) Think about dxe4. If Black plays dxe4, what becomes hanging? The f3 knight is now attacked by e4. Is it defended? Count.

Exercise 11.135

White to play. Find ALL hanging pieces on the board and determine if a tactic exists. Hints: (1) Scan White: any hanging pieces? (2) Scan Black: Bd7 is it defended? Bc5 defended? Nc6? d5 pawn? (3) If d5 is hanging (count attackers vs defenders), exd5 might work. But is the c5 bishop ALSO loose? A move that attacks TWO loose pieces (LPDO) wins material.

Pattern 28: LPDO (Loose Pieces Drop Off)

Exercise 11.136

White to play. Count loose pieces. Are there enough for a combination? Hints: (1) Black's pieces are mostly defended. (2) But after cxd5 exd5, the d5 pawn becomes potentially loose. (3) Two loose pieces = time to look for a double attack.

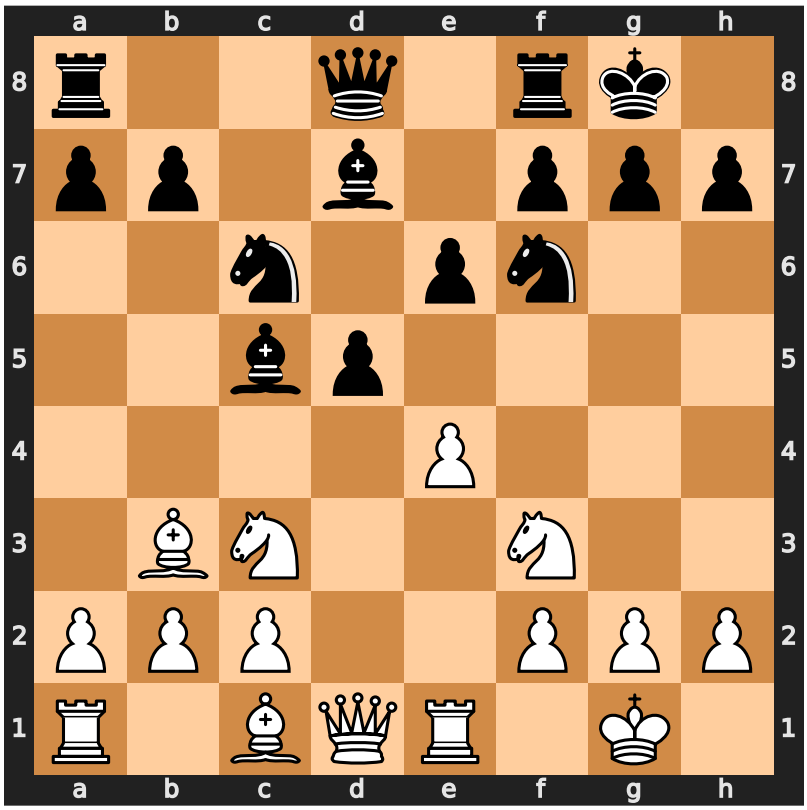

Figure 34.16: Chess Position

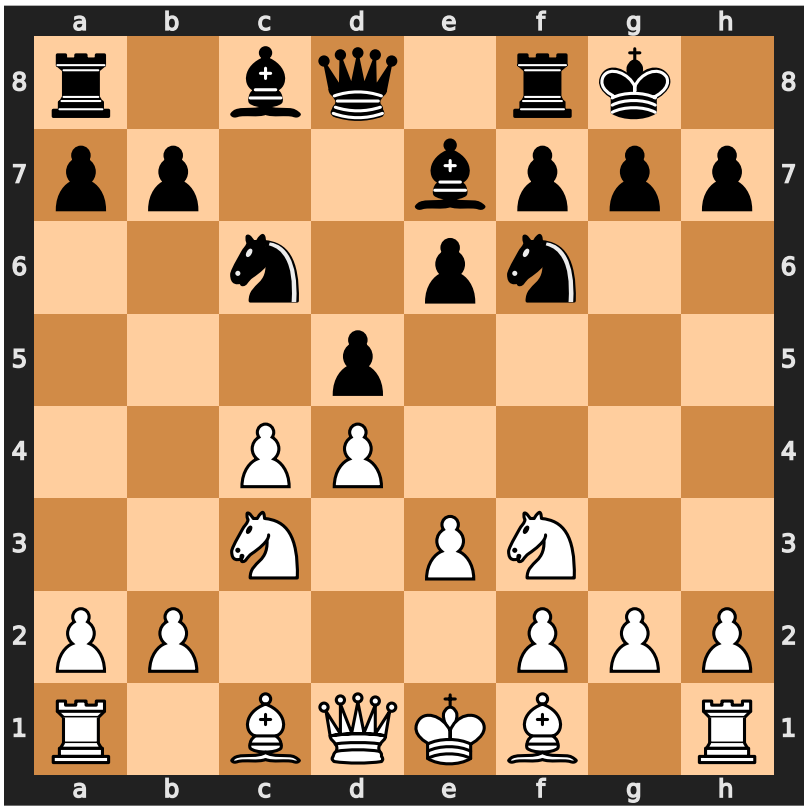

Figure 34.17: Chess Position

Exercise 11.137

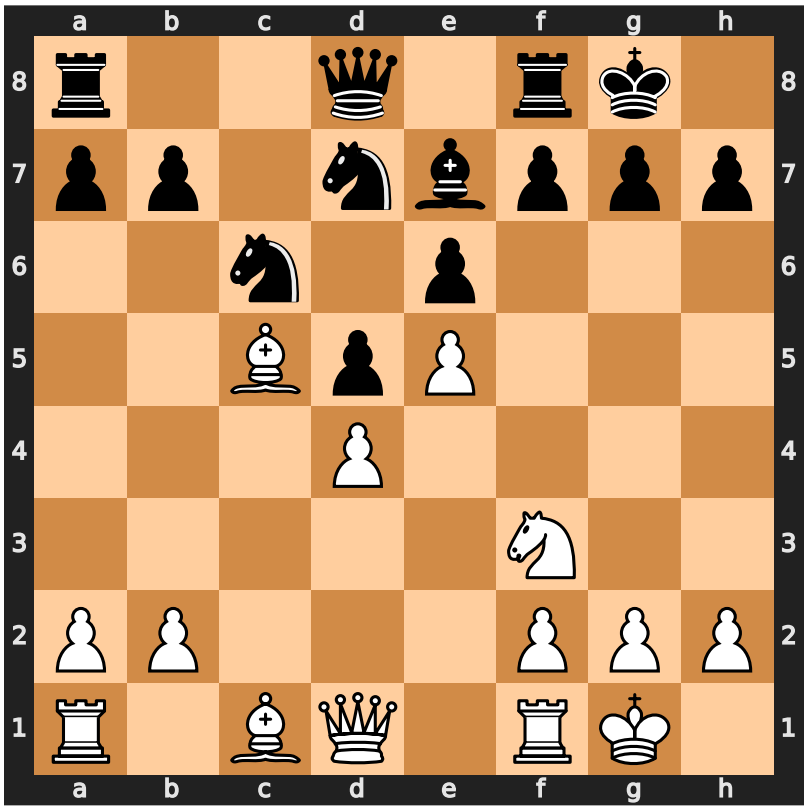

Figure 34.18: Chess Position

White to play. Two Black pieces are on exposed squares. Find the LPDO combination. Hints: (1) The knight on d7 and knight on c6 are both in the bishop's range. (2) If the c5 bishop takes c6, what does it open up? (3) Bxc6 bxc6 leaves d7 hanging and the pawn structure weakened.

Exercise 11.138

White to play. The bishop on c5 and the pawn on d5 are both potentially loose. Find a move that exploits both. Hints: (1) exd5 exd5 and now Nxd5 attacks the bishop on c5 (if the knight lands on d5, it might attack c7 or b4 and the bishop). (2) Or exd5 Nxd5 Nxd5 exd5 and now the bishop is loose. (3) LPDO: when two pieces are undefended, a simple sequence often wins one.

Exercise 11.139

White to play. The bishop on c5, the d5 pawn, and the knight on c6 form a cluster. Count defenders for each and find the LPDO tactic. Hints: (1) The d5 pawn: attacked by Bc4 and e4. Defended by Nc6, Nf6, queen. (2) The bishop on c5: defended by d6? No d6 pawn. Defended by nothing? If so, Bxd5 wins a pawn and ATTACKS the loose bishop. (3) After Bxd5 exd5 (or Nxd5), the bishop on c5 might be en prise to Na4 or similar.

Exercise 11.140

White to play. The bishop on b4 is loose (what defends it?). The d5 pawn is under pressure. Find the LPDO combination. Hints: (1) Bb4 is defended by… the queen on e7. But the queen is far away. (2) cxd5 exd5 and now the queen must stay on the a3-f8 diagonal to defend b4. But Qa4!

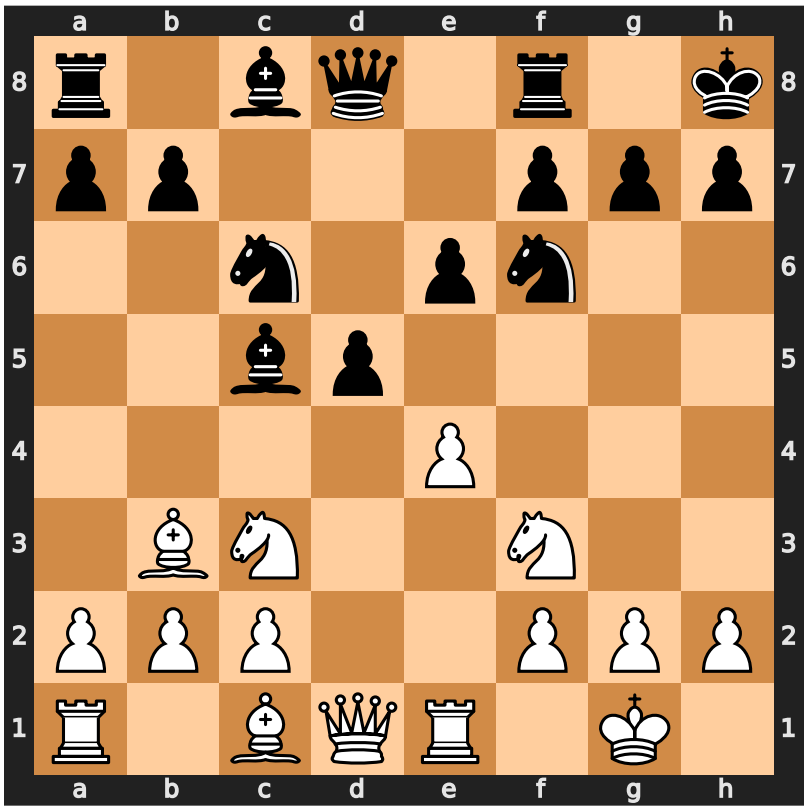

Figure 34.19: Chess Position

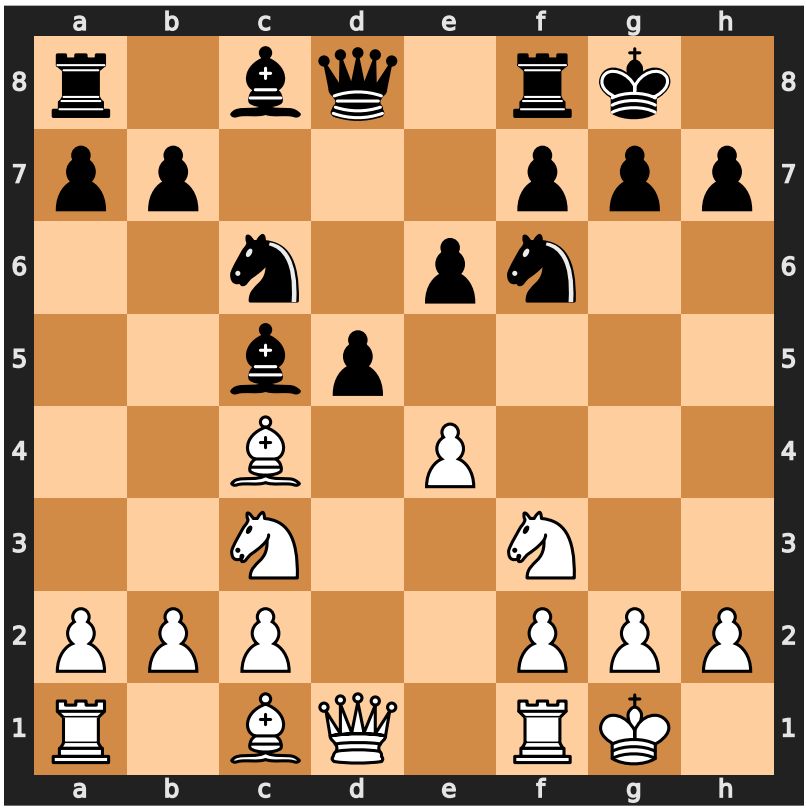

Figure 34.20: Chess Position

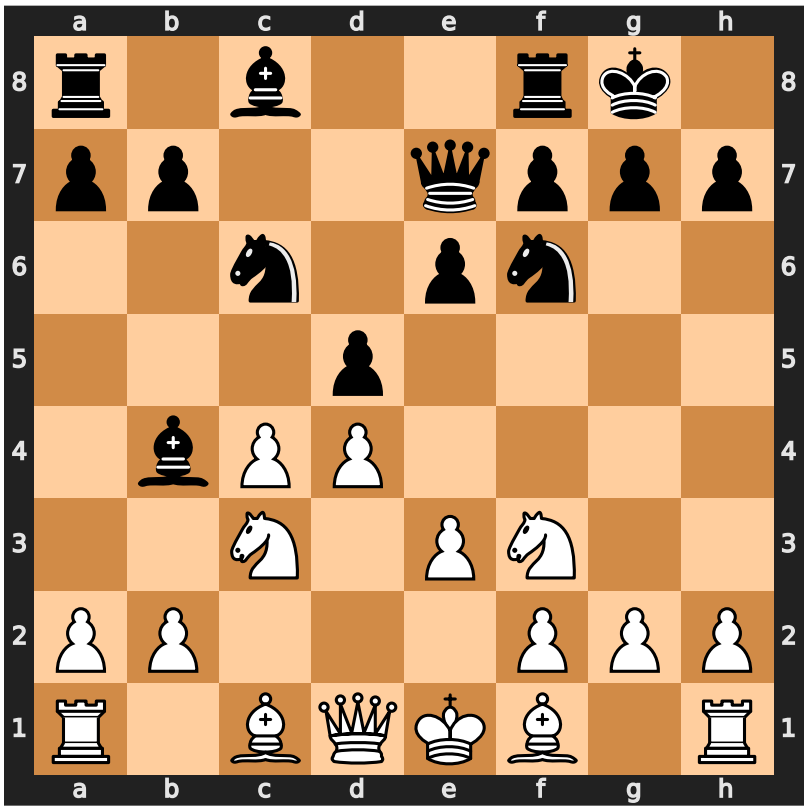

Figure 34.21: Chess Position

attacks the loose bishop and the pinned knight on c6. (3) LPDO: two loose pieces and a double attack wins.

Pattern 29: In-Between Check

Exercise 11.141

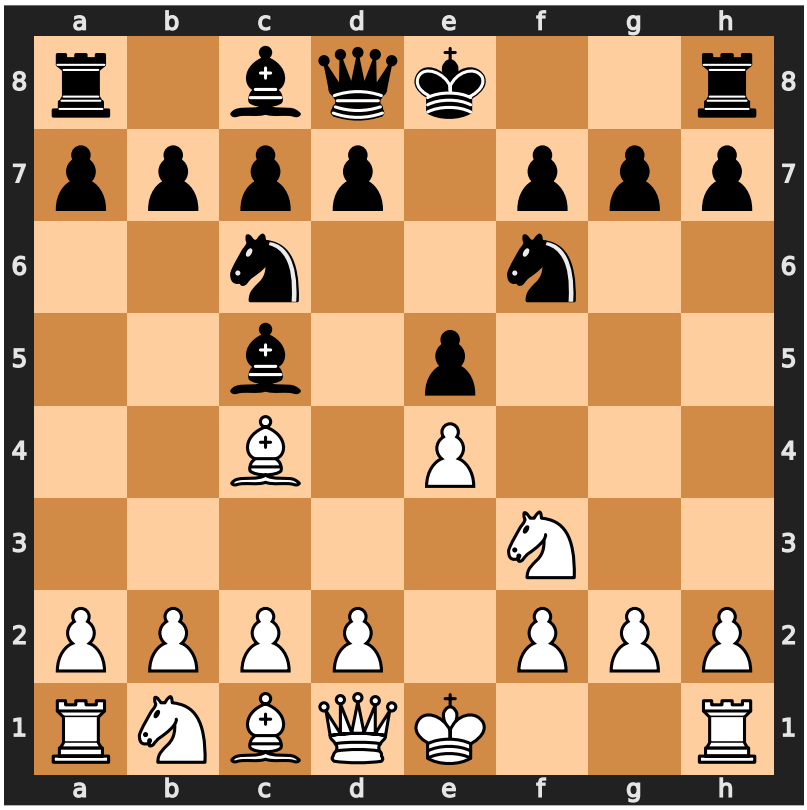

Figure 34.22: Chess Position

White to play. Can you find an in-between check in this opening position? Hints: (1) Bxf7+ is check (in-between before developing). (2) After Ke7 (forced, king displaced), Black has lost castling rights. (3) The in-between check Bxf7+ wins a pawn and disrupts Black's king, even though it gives up the bishop.

Exercise 11.142

White to play. The queen is on g4, bishop on g5 is hanging. Instead of saving the bishop: Hints: (1) Bxf7+ is an in-between check! (2) After Ke7, then save the bishop with Bxf6+ (another check!). (3) Two in-between checks in a row completely change the position.

Exercise 11.143

White to play. An exchange is happening on d5. Instead of simply recapturing: Hints: (1) Nxf6+ is an in-between check before the position settles. (2) After gxf6 (or Qxf6), the kingside is weakened. (3) THEN recapture or continue the attack. The in-between check changed the pawn structure in your favor.

Exercise 11.144

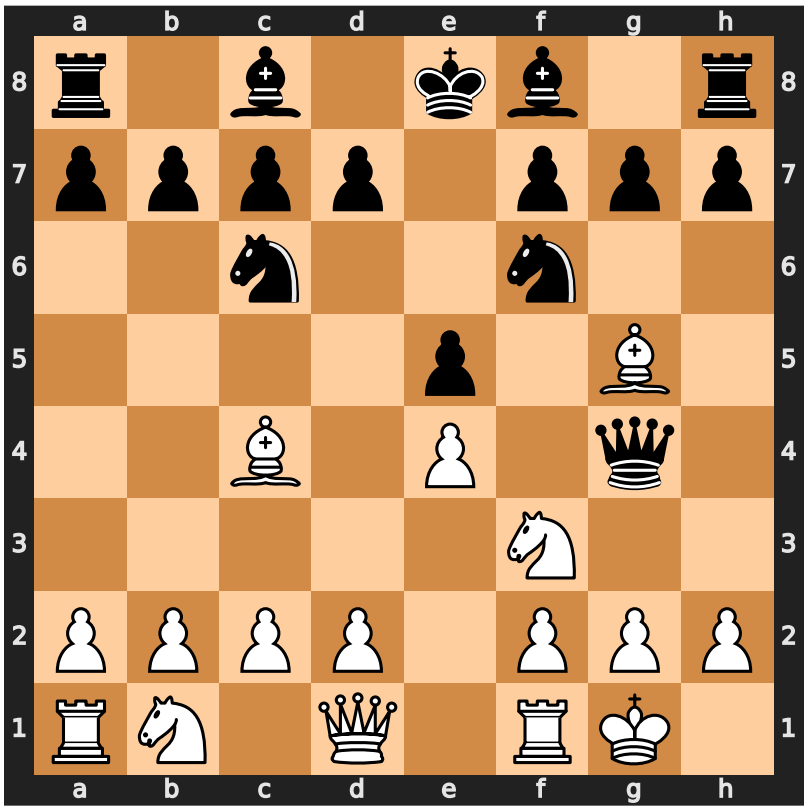

Figure 34.23: Chess Position

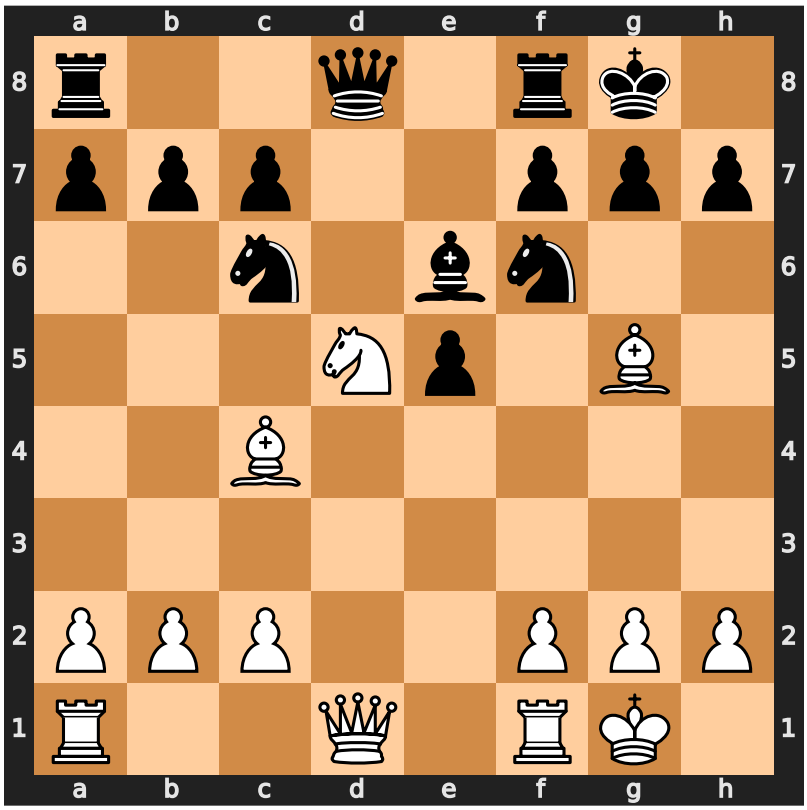

Figure 34.24: Chess Position

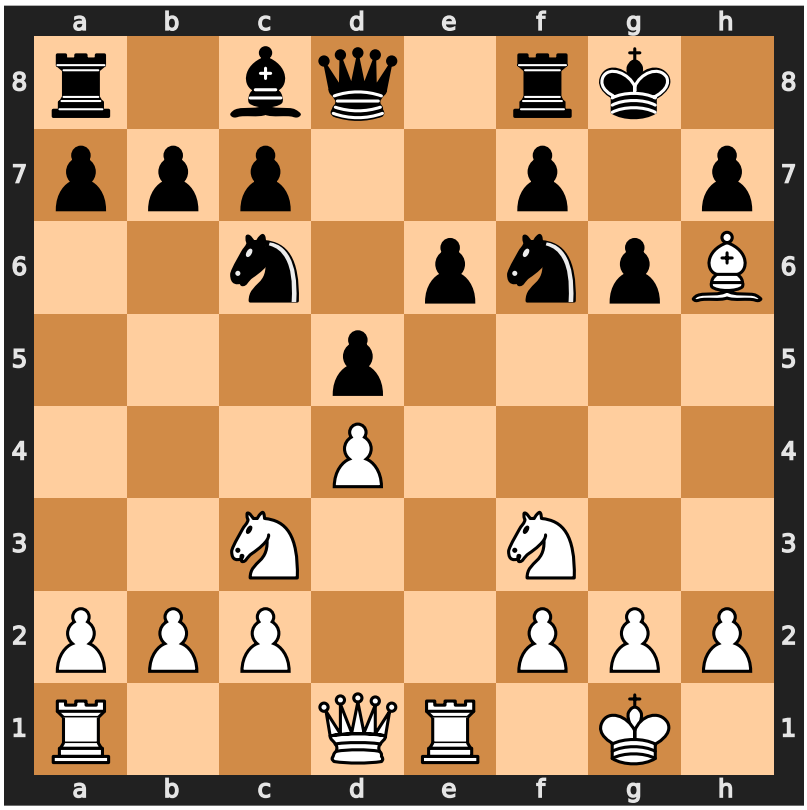

Figure 34.25: Chess Position

White to play. Find the in-between check sequence that wins material. Hints: (1) Bxg6! is a capture, not a check. (2) But after hxg6, the h-file is open. (3) Now Re8+? Is that possible? Hmm, think about whether removing the h-pawn creates a check opportunity. If not a direct in-between check, the concept of inserting a strong move before the expected continuation applies.

Exercise 11.145

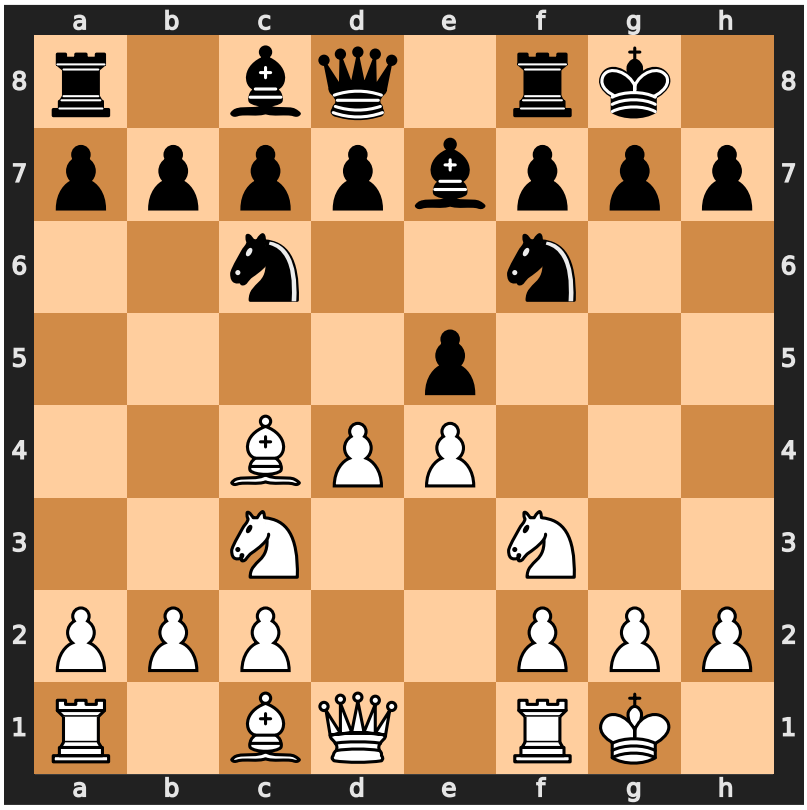

Figure 34.26: Chess Position

White to play. Find the best in-between move (it might be a check, or it might be a zwischenzug that happens to be a threat). Hints: (1) dxe5 Nxe5 is a normal exchange. (2) But d5! is a zwischenzug that attacks c6 before Black can recapture. (3) After d5, the knight must move and White gains space. The "in-between pawn advance" is as powerful as an in-between check in some positions.

Pattern 30: Quiet Move

Exercise 11.146

White to play. There is no immediate tactic. Find the best "quiet" improving move. Hints: (1) No checks, captures, or immediate threats are available. (2) Qc2! puts the queen behind the bishop on d3, forming a battery (Pattern 20). (3) This quiet move creates a latent threat (Bxh7+ Greek Gift) without doing anything forcing.

Exercise 11.147

White to play. The position is tense but no immediate tactic is available. Find the quiet strengthening move. Hints: (1) O-O is a quiet move that improves king safety. (2) But is there something

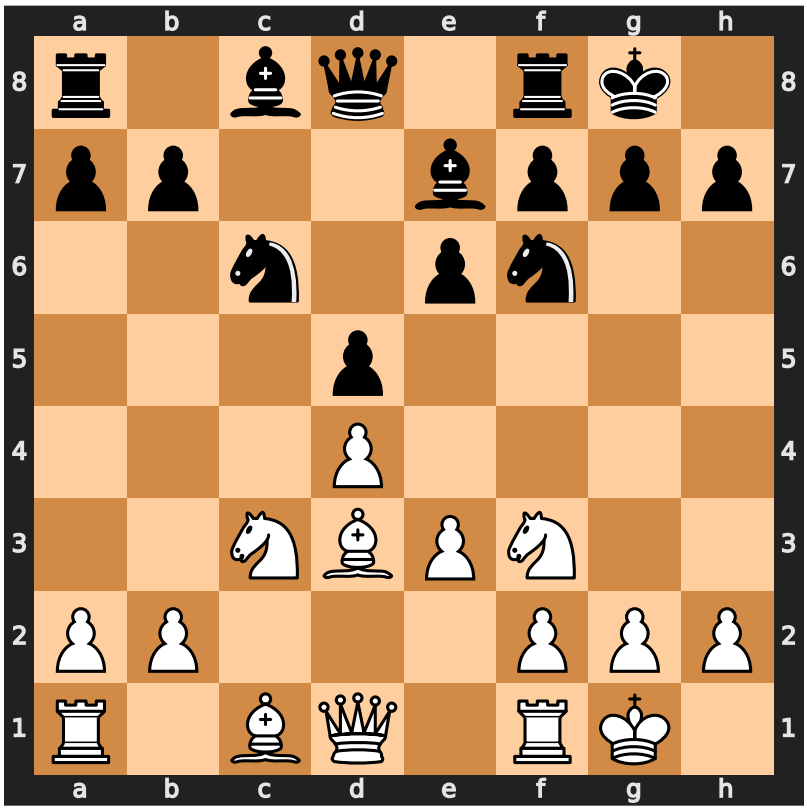

Figure 34.27: Chess Position

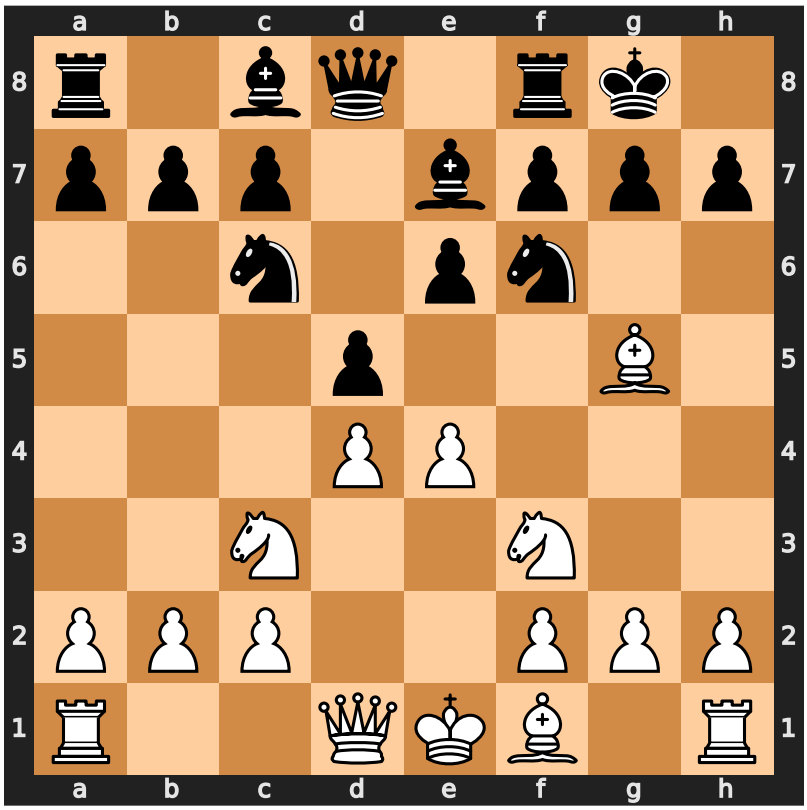

Figure 34.28: Chess Position

even better? Qc2 or Qd3 builds the battery. (3) The quiet move that prepares the MOST threats is the best one.

Exercise 11.148

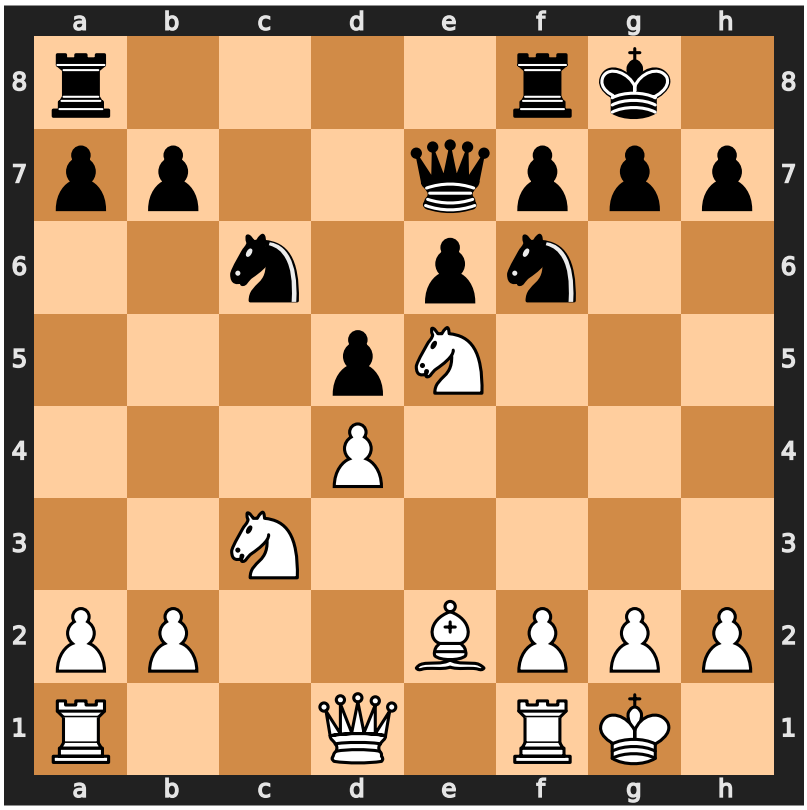

Figure 34.29: Chess Position

White to play. The knight on e5 is strong but attacked. Instead of retreating: Hints: (1) f4! is a quiet pawn move that supports the knight. (2) It is not a check, not a capture, not a threat. (3) But it solidifies the knight on e5, which controls key squares. Sometimes the best "tactic" is making your pieces impossible to dislodge.

Exercise 11.149

White to play. The position is rich with potential. Find the quiet move that creates the most pressure. Hints: (1) Everything is aimed at the kingside. (2) Qd3! aims at h7 through the bishop on e2. Wait, Bd3 would be better but the bishop is on e2. (3) f4 supports e5. Or Re1 strengthens the e-file. The quiet move that coordinates the most pieces wins.

Exercise 11.150

White to play. The Queen-Bishop battery is almost formed (Qc2 + Bd3 would aim at h7). What quiet move completes the setup? Hints: (1) Bd3! places the bishop on the battery diagonal. (2) After Bd3, the battery Qc2 + Bd3 creates the Greek Gift threat (Bxh7+). (3) This quiet developing move transforms the position from "no threat" to "lethal threat." The power of quiet preparation.

Chapter 35

ANNOTATED GAMES

The five games in this section demonstrate the 30 patterns in action at the highest level of chess. Play through each game on your board. When you reach a critical moment, stop and try to find the move yourself before reading the answer.

35.1 Game 21: José Raúl Capablanca vs. Frank Marshall

New York, 1918 Opening: Ruy Lopez, Marshall Attack

This game is one of the most famous defensive displays in chess history. Marshall had prepared a daring pawn sacrifice for years, and Capablanca had to navigate a storm of tactical threats in real time.

1.e4 e5 2.Nf3 Nc6 3.Bb5 a6 4.Ba4 Nf6 5.O-O Be7 6.Re1 b5 7.Bb3 O-O 8.c3 d5!?

Marshall's prepared gambit. Black sacrifices a pawn to open lines against the White king. This was the debut of the Marshall Attack, now one of the most respected lines in the Ruy Lopez.

9.exd5 Nxd5 10.Nxe5 Nxe5 11.Rxe5 Nf6

Black has given up a pawn but has active piece play. The bishop on e7 can reach d6, the f6 knight eyes d5 and g4, and the c8 bishop will come to b7 or g4.

12.Re1 Bd6 13.h3 Ng4!?

Marshall plays aggressively. The knight eyes f2 and e3.

14.Qf3!

Tactical moment (Patterns 6 and 26: Removing the Defender, Counting). Capablanca moves the queen to f3, defending against Nf2 threats and keeping control. He COUNTS: how many pieces attack f2, and how many defend it? This calm counting prevents panic.

14...Qh4 15.d4 Nxf2?

Marshall goes for the attack. The knight sacrifice opens lines.

16.Re2!

A quiet defensive move (Pattern 30). Instead of panicking, Capablanca calmly defends. The rook guards f2 and the second rank. This is the hallmark of a great defender: finding the quiet move that holds everything together.

16...Bg4 17.hxg4 Bh2+ 18.Kf1 Bg3 19.Rxf2 Qh1+ 20.Ke2 Bxf2 21.Bd2!

Another quiet move that defends everything. Capablanca demonstrates Pattern 30 at the highest level: in the middle of chaos, the quiet move that stabilizes the position.

Key Lesson: Tactical defense requires the same patterns as tactical attack. Counting, quiet moves, and calm assessment save games that look lost.

35.2 Game 42: Robert James Fischer vs. Bent Larsen

Denver Candidates Semifinal, 1971 (Game 1) Opening: Sicilian Defense, Sozin Attack

Fischer won this match 6-0, one of the most dominant performances in chess history. This first game demonstrates relentless tactical pressure.

1.e4 c5 2.Nf3 d6 3.d4 cxd4 4.Nxd4 Nf6 5.Nc3 Nc6 6.Bc4 e6 7.Bb3 Be7 8.Be3 O-O 9.Qe2 a6 10.O-O-O Qc7 11.g4!

Fischer launches a kingside pawn storm. This is preparation for a Battery (Pattern 20) on the g-file with Rdg1 and the queen.

11...Nd7 12.h4 Nc5 13.Bxe6!

Tactical moment (Pattern 19: Clearance Sacrifice). Fischer sacrifices the bishop to clear the e6 square and open lines. After fxe6, the e6 pawn is weak and the f-file is opened for White's attack.

13...fxe6 14.Nxe6 Nxe6 15.Qxe6+ Kh8

Fischer has won a pawn and opened the position. His pieces are more active, and the Black king is exposed on h8.

16.g5!

Another pawn advance (Pattern 23: Pawn Fork ideas). The g-pawn storms forward, restricting Black's knight and opening lines for the rook.

16...Rf5 17.Rd5!

A quiet move (Pattern 30) in the middle of an attack. The rook occupies the center powerfully, attacking d6 and supporting the e6 queen.

Key Lesson: Fischer combined clearance sacrifices, pawn storms, batteries, and quiet moves into a smooth attacking sequence. No single tactic won the game. It was the COMBINATION of patterns that created overwhelming pressure.

35.3 Game 55: Lajos Portisch vs. Robert James Fischer

Havana Olympiad, 1966 Opening: English Opening

Fischer demonstrates tactical precision against one of the strongest positional players of the era.

1.c4 g6 2.Nc3 Bg7 3.g3 c5 4.Bg2 Nc6 5.Nf3 e6 6.O-O Nge7 7.d3 O-O 8.Bd2 d5 9.a3 b6 10.Rb1 Bb7 11.b4 cxb4 12.axb4 dxc4 13.dxc4 Rc8

A quiet positional opening. Both sides maneuver. But Fischer is building toward tactical operations.

14.c5? bxc5 15.bxc5 Na5!

Fischer spots a loose pawn on c5 (Pattern 27: Hanging Pieces). The knight heads to c4, hitting the weak c5 pawn and the d2 bishop.

16.Na4 Bxf3! 17.Bxf3 Nac4

Tactical moment (Pattern 6: Removing the Defender). Fischer exchanged his bishop for the f3 knight, removing a key defender. Now the knight invades c4, attacking the bishop on d2 and the pawn on c5 simultaneously (Pattern 1: Double Attack).

18.Bc3 Bxc3 19.Nxc3 Nd5!

Another double attack idea. The knight on d5 is centralized and attacks c3 and multiple squares. Fischer's tactical precision converts the positional advantage into material gain.

Key Lesson: Tactical patterns do not only appear in wild attacks. They appear in quiet positions too. Hanging pieces, removing the defender, and double attacks work just as well in positional play as in sharp gambits.

35.4 Game 64: Judit Polgár vs. Anatoly Karpov

Essent Tournament, Hoogeveen 2003 Opening: Scotch Game

Polgár, the strongest female chess player in history, defeats a former World Champion with aggressive tactical play.

1.e4 e5 2.Nf3 Nc6 3.d4 exd4 4.Nxd4 Nf6 5.Nxc6 bxc6 6.e5 Qe7 7.Qe2 Nd5 8.c4 Ba6 9.b3 g6 10.Ba3!

Polgar develops aggressively, exchanging dark-squared bishops to weaken Karpov's king.

10...Nb4? 11.Qd2!

Tactical moment (Pattern 10: Trapped Piece and Pattern 1: Double Attack). After Nb4, Polgar plays Qd2 which threatens both Qxb4 and a3-bishop ideas. The knight on b4 has ventured too far and now faces trouble retreating.

11...Bg7 12.f4 d5? 13.a3!

The knight on b4 is trapped! (Pattern 10). The knight has no safe squares: c2 loses it, d3 loses it, a6 is where the bishop sits, and d5 hangs to cxd5. Karpov's knight, one of the most legendary positional players' pieces, is stuck.

13...Nc2+ 14.Kf2 Nxa1 15.Bb2!

Polgar sacrifices the exchange but traps the knight on a1 (it will never escape). The bishop pair and active pieces give more than enough compensation.

Key Lesson: Even world champions fall victim to basic patterns. Trapped pieces (Pattern 10) and double attacks (Pattern 1) can defeat the strongest players if they overextend their pieces.

35.5 Game 5 (Author's Choice): Garry Kasparov vs. Veselin Topalov

Wijk aan Zee, 1999 Opening: Pirc Defense

Widely considered one of the greatest games ever played. Kasparov sacrifices a rook and then plays a series of stunning quiet moves to weave an inescapable mating net. This game uses nearly every pattern in this chapter.

1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Be3 Bg7 5.Qd2 c6 6.f3 b5 7.Nge2 Nbd7 8.Bh6 Bxh6 9.Qxh6 Bb7 10.a3 e5 11.O-O-O Qe7 12.Kb1 a6 13.Nc1 O-O-O 14.Nb3 exd4 15.Rxd4 c5 16.Rd1 Nb6 17.g3 Kb8 18.Na5 Ba8 19.Bh3 d5 20.Qf4+ Ka7 21.Re1 d4 22.Nd5 Nbxd5 23.exd5 Qd6

The game reaches a critical moment. Kasparov is about to unleash a combination that stuns the chess world.

24.Rxd4!!

Pattern 19: Clearance Sacrifice. Kasparov sacrifices the entire rook to clear the d4 square and open lines. This is not a simple exchange sacrifice. It opens the floodgates for a mating attack.

24...cxd4 25.Re7+!

Pattern 3: Discovered Attack / Pattern 4: Check. The rook enters the seventh rank with check. Kasparov keeps the pressure relentless.

25...Kb6 26.Qxd4+ Kxa5 27.b4+!

Pattern 23: Pawn Fork / Check. The pawn advances with check, driving the king further into the open.

27...Ka4 28.Qc3!

Pattern 30: The Quiet Move. This is the move that made this game immortal. After three consecutive checks and a rook sacrifice, Kasparov plays a QUIET move. No check. No capture. No immediate threat that is obvious. But the queen on c3 creates an inescapable mating net. The king on a4 has no safe squares, and Qb3 mate (or Qa1 mate) cannot be prevented.

28...Qxd5 29.Ra7! Bb7 30.Rxb7

The attack rolls on. Kasparov's combination spans seven moves and uses clearance sacrifice, discovered attack, pawn fork, and the quiet move. The game is widely considered the greatest attacking game of the twentieth century.

Key Lesson: The greatest combinations use multiple patterns in sequence. Kasparov did not rely on one trick. He used a clearance sacrifice to open lines, a rook invasion with check, a pawn fork, and then the stunning quiet move to complete the mating net. When you learn all 30 patterns, you can combine them the way a musician combines notes into a symphony.

Chapter 36

EXERCISE SOLUTIONS

Solutions are organized by exercise number. For each exercise, the main solution is given first, followed by analysis of common wrong moves.

11.1: Qxf7#. The queen captures f7 with checkmate. The bishop on c4 supports the queen. Wrong move: Qf7+? Same move, it IS checkmate. If you played Bxf7+ Kf8, you only won a pawn.

11.2: Qd5! attacks the undefended knight on e4 AND threatens Qxf7 checkmate. Black cannot save both. Wrong move: Nxe5? This wins the pawn back but misses the bigger double attack.

11.3: Bxf6! exploiting the pin. After gxf6 (or Bxf6), d4 is strengthened and the kingside is weakened. Wrong move: dxe5? dxe5 does not exploit the pin.

11.4: Bb5+! develops with check and attacks the queen indirectly through the pin on c6. Wrong move: Bc4 is fine but does not create a double threat with tempo.

11.5: Nf5! attacks the bishop on g7 AND the loose bishop on g4 simultaneously. Wrong move: Nxc6 bxc6 does not attack the g4 bishop.

11.6: Nxf7 or Nd7, winning material via discovered attack from the queen behind the knight. The queen on d1 sees through to d7 or f7. Wrong move: Nc4 is decent but does not create a discovered attack.

11.7: Nxe5! captures the pawn, and the bishop on a4 now looks at e8 (discovered pressure on the knight on c6 and the king). Wrong move: Bxc6 trades the strong bishop too early.

11.8: d3 followed by Nd5 sets up a future discovered attack from the bishop on c4 through the knight on d5. Wrong move: immediate Nd5 does not work yet because the knight can be captured.

11.9: Nxd7! Qxd7 and the bishop on f4 now has a clear line toward c7. Wrong move: Nc6? The knight on e5 does not reach c6 in one move from e5.

11.10: Nxf7! Rxf7 and the rook on e1 now attacks e6 with devastating effect. The discovered attack wins the e6 pawn at minimum. Wrong move: Nxc6 bxc6, Bxe6 fxe6 also wins but is slower.

11.11: Nxf7! discovered check from the bishop on c4 to the king on e8. Wait, does the bishop check? From c4 through d5, e6, f7… f7 is where the knight landed. Actually, Nd7! picks up the queen (the queen on e7 is attacked by the knight). The bishop on c4 pressures f7. Best: Nd7 or Nf7 winning the exchange. Wrong move: Nc6 is decent but the queen escapes.

11.12: Black plays Bxf2+! an in-between check (zwischenzug). After Ke2 (or Kf1), Black recaptures the knight. The in-between check saves the day. Wrong move: Rf8? passively defending allows White to consolidate.

11.13: Knight moves off e5 to any square, discovering check from Re2. Best: Nc6 or Nd7, improving the knight's position while checking. Wrong move: Any square works for the discovered check, but choose one with purpose.

11.14: Nxc6! opens the diagonal for the bishop on e2 and wins material. After bxc6, the bishop on e2 has activity on the a6-f1 diagonal. Wrong move: Nc4 does not exploit the geometry as effectively.

11.15: Nxf6+! gxf6 and the rook on e1 now X-rays through to e8 (discovered attack). The g-file is opened for a future attack. Wrong move: Ne7+? forces the king to the corner but does not open the g-file.

11.16-11.20: These exercises involve setting up double checks. The key principle: find the square where both the moving piece AND the revealed piece give check simultaneously. If no double check exists, look for the best discovered check instead.

11.21: Bxf7+! Rxf7, THEN dxe5. The zwischenzug Bxf7+ wins a pawn before the normal exchange. Wrong move: dxe5 immediately is playable but misses the extra pawn.

11.22: Look for an intermediate move like Qa4 or Na4 before recapturing on d5. The zwischenzug gains time. Wrong move: Immediate recapture on d5 is safe but passive.

11.23: Nb5! threatens Nc7+ forking king and rook. Black must deal with this before doing anything else. Wrong move: Normal development misses the tactical opportunity.

11.24: Bxf6! first (zwischenzug), THEN continue with the plan. After Bxf6 gxf6, the kingside is weakened. Wrong move: Completing the planned captures without Bxf6 first.

11.25: Bxf6! gxf6, THEN dxe5 fxe5, and Black's kingside is ruined. The in-between capture changed the pawn structure first. Wrong move: dxe5 first allows Black to recapture with better structure.

11.26-11.30: Removing the Defender exercises. The key: identify what defends the target, then eliminate the defender. The target falls on its own.

11.31: Re8+! Rxe8 and then Rd8! (if you had a second rook or queen). If only one rook, Re8+ forces a trade and simplifies. The overloaded rook on d8 cannot do both jobs. Wrong move: random rook moves that do not exploit the overloading.

11.32-11.35: Overloaded piece exercises. Find the piece doing two jobs, then force it to choose. The other job goes unfinished.

11.36: Re8+! deflects the king, winning material. Wrong move: Re1 trades rooks but does not exploit the position.

11.37: Ng5! threatens f7 and forces the bishop off e6. After the bishop moves, d5 falls. Wrong move: Nd4 does not threaten f7.

11.38: Bc4! attacks the queen, forcing it off d5. After the queen moves, Rd8+ is checkmate on the back rank. Wrong move: Rd5 pins the queen but does not force it away.

11.39-11.40: Deflection exercises requiring calculation. Force the defending piece away, then strike.

11.41: Qf8+! Kxf8 decoys the king. The king is now on f8 instead of g8. Wrong move: None, this is a straightforward decoy.

11.42: Rd8+ Rxd8 (rook decoyed to d8), now Bxf7+ picks up material. Wrong move: Bxf7+ first does not win as much.

11.43-11.45: Decoy exercises. The sacrifice lures the piece to the wrong square.

11.46: The queen on d5 is exposed but not yet trapped. Nc3 forces it to move. This teaches awareness of trap potential. Wrong move: thinking the queen is already lost.

11.47-11.50: Trapped piece exercises. Count escape routes. Then close them.

11.51: Ra8+ and if the rook is the only defender, it is a back rank threat. Actual checkmate depends on the specifics. Wrong move: random rook moves.

11.52: This is a TRICK exercise. Re8+ is check, but after Rxe8, White has no follow-up. You need two heavy pieces for a back rank mate. Recognizing when a pattern does NOT work is just as important as recognizing when it does.

11.53: Rd8+! Rxd8, Rxd8#. The classic two-rook back rank mate. Wrong move: Rbd8+?? blocks your own rook.

11.54: Direct Rd8 does not work cleanly. You may need to create the weakness first (remove defenders or create luft problems). Not every position has a tactic. Wrong move: forcing a tactic that is not there.

11.55: Rd8+! Rxd8, Re8+! Rd back, Rxd8#. The double rook sacrifice on the back rank. Wrong move: Qe3 is too slow.

11.56: Nh6+ Kh8, Qg8+! Rxg8, Nf7#. Classic smothered mate. Wrong move: Qg8 first does not work (the king escapes to f7 area).

11.57: The knight needs to reach g5 first (Ng5), then continue toward the mating pattern. This requires planning, not immediate execution. Wrong move: random knight moves without a plan.

11.58: Nf6+ Kh8 (gxf6 opens the g-file dangerously), then Qh5 threatens Qxh7 mate. Wrong move: Nf6+ gxf6 is fine for White too but the smothered mate pattern requires Kh8.

11.59: Without a queen, smothered mate is impossible. Know when the pattern cannot work. Wrong move: trying to force a mate that requires a piece you do not have.

11.60: Bxh7+ Kxh7, Ng5+ Kg8 (or Kg6), Qh5 with a powerful attack. The smothered mate is a THREAT that wins material even if it is not executed. Wrong move: Ng5 first without Bxh7+ removes the element of surprise.

11.61: Bxh7+! Kxh7, Ng5+ Kg8 (or Kg6), Qh5 with winning attack. All three conditions met. Wrong move: Ng5 first allows h6 kicking the knight.

11.62: Check whether the knight on d7 can come to f8 or f6 to defend. If it can, the sacrifice may not work. Calculate before sacrificing. Wrong move: blindly sacrificing without checking defensive resources.

11.63-11.65: Greek Gift judgment exercises. Sometimes the sacrifice works, sometimes it does not. The three conditions are necessary but not always sufficient.

11.66: Ra8#. Checkmate. The knight on f6 controls g8 and h7. Wrong move: none, this is direct.

11.67: Nh6 first, then Ra8#. But Black has a move in between. If Black plays Kg7, does the pattern still work? Calculate. Wrong move: Ra8+ immediately (king escapes to f7).

11.68: Ra8+ but Kf7 escapes. Arabian Mate requires the king on h8 (corner). Wrong move: assuming the pattern works when it does not.

11.69: Rg8#! The rook checks from g8, and the knight on f6 controls h7. Checkmate. Wrong move: keeping the rook on g7 (not check).

11.70: You need to remove the Black rook from a8 first. This requires extra moves. Wrong move: Rxa8+ allows Kf7 escape.

11.71: Rh1#. Checkmate. The knight on e7 seals all escapes. Wrong move: Re8 is also strong but Rh1 is immediate mate.

11.72-11.75: Anastasia's Mate setups requiring multiple-move calculation. Find the path to Rh1 + Knight controlling escape squares.

11.76-11.100: Geometric pattern exercises. The solutions follow the same principles: line up pieces (batteries), exploit X-ray relationships, use interference and clearance to open lines.

11.101: Bxf7+! is the desperado. The bishop was hanging anyway, so it strikes first. After Ke7 or Kxf7, White recaptures on g4 and is ahead. Wrong move: saving the bishop passively when it was going to be lost anyway.

11.102: Bxf7+ is debatable. It wins a pawn but displaces White's bishop. Evaluate whether the material is worth the loss of development. Sometimes the desperado is premature. Wrong move: assuming all desperado captures are good.

11.103: Bxf7+! Ke7, Nxc6+! forking king and queen. Double desperado. Wrong move: defending passively when attacking first is better.

11.104-11.105: Complex desperado sequences. Always calculate the ORDER of captures when multiple pieces are hanging.

11.106: c4! undermines d5. After dxc4, Bxc4 and the center opens favorably. Wrong move: passively allowing d5 to stand.

11.107-11.110: Undermining exercises. Attack the pawn foundation, and the pieces on top become unstable.

11.111: d5! forks the c6 knight. Simple but effective. Wrong move: e5 is also reasonable but d5 gains more space.

11.112-11.115: Pawn fork exercises. Look for pawn advances that attack two targets.

11.116: The fork on d5 is a long-term plan: O-O, c3, d4, then Nd5. Wrong move: rushing Nd5 before the position supports it.

11.117: Nd5 creates more immediate threats than Nf5 in most positions. Wrong move: neither is wrong, but Nd5 forks more targets.

11.118: Bxf7+! Kxf7, Ng5+ forks king and queen. Classic setup sacrifice for a knight fork. Wrong move: Ng5 first allows f6 defense.

11.119-11.120: Advanced knight fork positions requiring multi-move planning.

11.121: Bg5! pins the f6 knight to the queen. Wrong move: any move that does not create the pin.

11.122: e5! exploits the pin. The knight cannot move to d7 or e4. Wrong move: moving pieces randomly when the pin should be exploited.

11.123-11.125: Advanced pin exploitation. Pile on pinned pieces or create second pins.

11.126: d5 is safe to play. Count: 1 attacker (e4 pawn), 1 defender (d7 pawn support). After exd5, Qxd5 is equal materially. Wrong move: fearing d5 when counting shows it is safe.

11.127: Nxe5 is safe because after d4 the knight retreats. Count carefully. Wrong move: avoiding Nxe5 out of fear.

11.128: exd5 is a trade, not a winning capture. The count shows equal exchanges. Wrong move: thinking exd5 wins material.

11.129-11.130: Advanced counting exercises. Count becomes harder with more pieces on the board.

11.131: The e4 pawn is defended (by the d-pawn, or is it?). Scan carefully. Wrong move: assuming pieces are defended without checking.

11.132: The e5 pawn is defended by Nc6. Not hanging. Wrong move: Nxe5 thinking it wins a free pawn.

11.133-11.135: Systematic hanging-piece scans. Practice this in every game.

11.136-11.140: LPDO exercises. Two or more loose pieces = look for the combination.

11.141: Bxf7+! Ke7 (king displaced, castling rights lost). The in-between check changes the position fundamentally. Wrong move: normal development without Bxf7+.

11.142: Bxf7+! Ke7, Bxf6+! another in-between check. Two checks in a row completely change the position. Wrong move: saving the g5 bishop passively.

11.143: Nxf6+ gxf6, then continue with the plan. The in-between capture weakens the kingside first. Wrong move: recapturing on d5 without Nxf6+ first.

11.144-11.145: Advanced zwischenschach exercises. Insert the check or strong threat before the expected continuation.

11.146: Qc2! forms the battery (Qc2 + Bd3 on the b1-h7 diagonal). This quiet move creates the Greek Gift threat without making any forcing move. Wrong move: random moves that do not improve the position.

11.147: O-O or Qc2. The quiet move that prepares the most threats. Wrong move: premature attacks without proper preparation.

11.148: f4! supports the knight on e5 quietly. Wrong move: retreating the knight when you can anchor it.

11.149-11.150: The final exercises. Find the quiet move that transforms the position. Bd3! (Exercise 11.150) completes the Greek Gift battery. The position goes from "no threats" to "unstoppable attack" with one quiet move. Wrong move: any move that does not complete the setup.

Chapter 37

KEY TAKEAWAYS

1. **Tactics are patterns, not magic.** Every combination in chess is built from a small set of recognizable patterns. You now know 30 of them.
2. **Forcing moves control the game.** Check, then capture, then threat. Always consider moves in this order. The most forcing move is usually the most important to calculate first.
3. **Count before you capture.** The simplest tactical habit (Pattern 26) prevents the most blunders. It costs five seconds and saves entire games.
4. **Loose pieces drop off (LPDO).** When your opponent has undefended pieces, a tactic almost certainly exists. Scan for loose pieces after every move.
5. **Quiet moves win games.** The flashiest tactic is not always the strongest. Sometimes the quiet move that creates an unstoppable threat is more powerful than a showy sacrifice.
6. **Every pattern connects to every other pattern.** A Greek Gift (Pattern 13) combines a Battery (Pattern 20), a Clearance Sacrifice (Pattern 19), and a Knight Fork (Pattern 24). The patterns are building blocks. The combinations are the structures you build with them.

Chapter 38

PRACTICE ASSIGNMENT

For the next two weeks, do the following:

1. **Daily tactics puzzle (10 minutes).** Use any puzzle book or online trainer. Before solving, name the pattern you think is involved. "This looks like a discovered attack." "This could be a back rank mate." Naming the pattern before solving trains your recognition.
2. **Play one game per day.** After each game, go through it and find at least one position where a pattern from this chapter applied. Did you see it during the game? If not, could you see it now?
3. **Re-read one group per day.** Monday: Group 1. Tuesday: Group 2. And so on. By the end of two weeks, you will have read each group three times. Repetition builds pattern recognition.
4. **Set up the positions on a physical board.** Every position in this chapter should be set up at least once on a real board. The tactile experience of moving pieces builds stronger memories than screen-based study.

Chapter 39

PROGRESS CHECK

Answer these questions honestly:

- ☐ Can you name all six pattern groups from memory?
- ☐ Can you explain the difference between deflection and decoy?
- ☐ Can you list the three conditions for a Greek Gift sacrifice?
- ☐ Can you describe a smothered mate in your own words?
- ☐ Have you completed at least 100 of the 150 exercises?
- ☐ Can you find a zwischenzug in your own games?

If you checked four or more boxes, you are ready for Chapter 12: Calculation Training.

If you checked fewer than four, spend more time with the exercises. There is no rush. The patterns will still be here next week.

Rest here. Chapter 11 is the longest chapter in this volume. You have earned a real break. Come back to Chapter 12 with fresh eyes, a full glass of water, and the confidence that you now think about tactics differently than you did before.

Your tactical vocabulary is no longer basic. It is *rich.* Use it well.

Chapter 11 complete. 30 patterns. 150 exercises. 5 annotated games. Volume II: The Club Player - The Grandmaster Codex By Kit Olivas and Dr. Ada Marie

Chapter 40

CHAPTER 12

40.1 Calculation Training: Candidate Moves (The Kotov Method)

Volume II: The Club Player | Rating Range: 1000–1600 Pages: 45 | Exercises: 80 | Annotated Games: 3

> *"You must take your opponent into account. He too has a brain."* — Alexander Kotov, *Think Like a Grandmaster*

40.1.1 What You'll Learn

- What calculation actually means, and why it is a skill you can train
- The Kotov Method: a step-by-step system for choosing moves
- How to identify candidate moves in any position
- How to build and prune a "tree of analysis" in your head
- Visualization exercises to strengthen your board sight
- The most common calculation mistakes and how to avoid them
- A practical pre-move checklist you can use in every game

40.2 SECTION 1: What Is Calculation?

Here is a question most chess books never bother to answer:

What does it actually mean to "calculate" in chess?

You hear it constantly. "Calculate deeper." "I miscalculated." "She calculated twenty moves ahead." But nobody stops to define the word.

So let's define it right now.

Calculation is the ability to visualize a sequence of moves in your mind, yours and your opponent's, and evaluate the resulting position without moving any pieces on the

board.

That is it. Nothing magical. Nothing reserved for geniuses. You picture a move. You picture the reply. You picture your next move. You keep going until you reach a position you can evaluate. Then you ask: "Is this good for me, bad for me, or about equal?"

If you can do that for one move ahead, you can calculate.

If you can do it for two moves ahead, you are already stronger than most beginners.

If you can do it for three to five moves ahead with accuracy, you are playing at club level or beyond.

The entire game of chess comes down to this skill, combined with pattern recognition. Patterns tell you *where* to look. Calculation tells you *what you find when you look there.*

40.2.1 Seeing vs. Calculating

There is an important difference between *seeing* and *calculating*, and understanding it will save you a lot of frustration.

Seeing is instant recognition. You glance at a position and the move jumps out at you. "Oh, there's a fork on c7." That is pattern recognition. Your brain has stored thousands of positions, and when it recognizes a familiar shape, it fires a signal. You "just see it."

Calculating is deliberate. You do not recognize the answer. You work it out. You ask: "What if I play this? Then what does my opponent do? Then what do I do?" You follow the chain of moves until you reach a conclusion.

Here is the key insight:

Strong players do not calculate more than you do. They calculate *less*, because their pattern recognition handles most of the work.

A Grandmaster looking at a complex position does not calculate every possible move. That would take hours. Instead, their trained eye instantly filters out most moves and identifies two or three that "look right." Then they calculate only those two or three moves deeply.

This is what you are building in this chapter: the system for finding the right two or three moves to calculate, and the discipline to calculate them properly.

40.2.2 Calculation Is Trainable

Some people believe you are either born with calculation ability or you are not. This is wrong.

Calculation is a skill. Like any skill, it improves with practice and weakens with neglect. A violinist who stops practicing loses dexterity. A chess player who stops calculating loses visualization accuracy.

The exercises at the end of this chapter are not optional. They are the point. Reading about calculation is useful. Doing calculation is where the growth happens.

If you work through even half of the exercises in this chapter, your board vision will be noticeably sharper within a month. That is not a promise. It is a pattern observed in thousands of improving players over more than a century of chess instruction.

Pause here. That is the foundation: calculation is seeing moves ahead in your mind, it works alongside pattern recognition, and it is a trainable skill. If that makes sense, continue. If it feels shaky, reread this section. There is no rush.

40.3 SECTION 2: The Kotov Method

In 1971, the Soviet Grandmaster Alexander Kotov published a book called *Think Like a Grandmaster*. It became one of the most influential chess books ever written, and one chapter in particular changed how chess players think about calculation.

Kotov proposed a structured method for choosing moves. It is not the only method, and modern players have refined it, but the core framework remains powerful. If you learn nothing else from this chapter, learn this:

The Kotov Method has four steps.

40.3.1 Step 1: Survey the Position

Before you calculate anything, stop and look. Ask yourself:

- Whose turn is it?
- What just happened? (What did my opponent's last move do?)
- What is the material balance? (Am I up, down, or equal in pieces?)
- Where are the kings? (Safe, exposed, castled, in the center?)
- What are the pawn structures? (Open files, weak pawns, passed pawns?)
- What pieces are active? What pieces are passive?
- Are there any immediate threats I need to deal with?

This takes ten to thirty seconds in a real game. It is not wasted time. It is the foundation that makes everything else possible.

Think of it like a pilot scanning instruments before takeoff. You do not fly the plane first and then check the gauges. You check the gauges so you know how to fly.

The survey tells you what kind of position you have. Is it sharp and tactical? Quiet and strategic? Are you attacking or defending? The answer to these questions determines what kind of candidate moves you should look for.

40.3.2 Step 2: Identify Candidate Moves

This is the heart of the method.

After your survey, you generate a short list of moves worth calculating. Kotov called these **candidate moves**. The list should contain three to five moves. Not one. Not fifteen. Three to five.

Why three to five?

- Fewer than three and you risk missing something important.
- More than five and you will not have time to calculate them all properly. Your mental energy is finite.

How do you choose which moves belong on the list? We will cover this in detail in Section 3. For now, the principle is: **choose the moves that change the position the most.** Forcing moves. Active moves. Moves that create threats or solve problems.

Write down your candidates mentally (or physically, if you are training at home; there is no shame in writing them down on paper while you learn).

40.3.3 Step 3: Calculate Each Candidate to Its Conclusion

Now you take each candidate move, one at a time, and follow it forward.

You ask: "If I play Move A, what is my opponent's best reply?" Then: "After that reply, what do I play?" You keep going until you reach a position you can evaluate.

This chain of moves is called a **variation** or a **line**. The collection of all your variations for all your candidate moves forms a shape that Kotov called the **tree of analysis.** The candidate moves are the main branches. The opponent's replies create sub-branches. And so on.

The discipline here is critical. You calculate Candidate A all the way to its conclusion. Then you evaluate: "This looks good / bad / unclear." Then you move on to Candidate B. Calculate it. Evaluate it. Then Candidate C.

You do NOT jump back and forth. You do not calculate two moves of Candidate A, get nervous, switch to Candidate B, get confused, switch back to Candidate A and forget where you were.

That is the most common calculation error in chess. And Kotov made it a rule:

40.3.4 Kotov's Cardinal Rule

Calculate each candidate move ONCE, to its conclusion. Do not go back.

This sounds rigid, and modern players have softened it a bit (sometimes new information from Candidate B genuinely changes your evaluation of Candidate A, and you need to recheck). But for developing players between 1000 and 1600, Kotov's rule is gold.

The reason? Going back and forth wastes time and creates confusion. You start mixing up lines. You remember a piece on e5 that was only there in Candidate A's variation, but now you are calculating Candidate B and you "see" the phantom piece. This leads to blunders.

One at a time. All the way through. Evaluate. Move on.

40.3.5 Step 4: Compare Evaluations and Choose

You have now calculated three to five candidates, each to its conclusion. You have an evaluation for each: "good," "bad," "equal," "unclear."

Now you compare.

Which candidate leads to the best result? Play that one.

If two candidates look equally good, prefer the simpler one. The one with fewer things that can go wrong. The one that keeps the position under your control.

If ALL candidates look bad, you may need to reassess. Perhaps you missed a candidate move. Perhaps the position is worse than you thought, and your job is to find the move that limits the damage.

Let's put it all together:

Step	Action	Time (approximate)
1	Survey the position	10–30 seconds
2	List 3–5 candidate moves	10–20 seconds
3	Calculate each candidate to conclusion	1–5 minutes total
4	Compare evaluations, choose the best	10–20 seconds

That is the Kotov Method. Four steps. Survey. Candidates. Calculate. Choose.

You will not use this method on every single move. In quiet positions where the best move is obvious, you can play more quickly. But on **critical moves**, when the position is sharp, when there is a big decision to make, when the game could swing in either direction, this is your system.

Rest marker. You have learned the four-step Kotov Method. That is a complete unit. If you need a break, take one. Come back with fresh eyes.

40.4 SECTION 3: Identifying Candidate Moves

The hardest part of the Kotov Method is Step 2: coming up with the right candidate moves. If your candidates are wrong (if the best move is not on your list), then it does not matter how deeply you calculate. You will miss it.

So how do you build a good list?

40.4.1 The Forcing Move Priority

There is an order of priority that strong players use, sometimes without even thinking about it:

1. Checks 2. Captures 3. Threats

This is sometimes called the "CCT" rule: Checks, Captures, Threats.

Why this order?

- **Checks** are the most forcing moves in chess. Your opponent MUST respond to a check. That means you control the conversation. When you give check, your opponent's options shrink dramatically.
- **Captures** are the next most forcing. Your opponent has just lost material (or you have traded). The position changes. Your opponent's replies are limited because they must deal with the material imbalance.
- **Threats** are moves that promise something on the next move. They are not immediately forcing, but they put your opponent under pressure. "I threaten mate on h7. What are you going to do about it?"

When you survey a position and start looking for candidates, always ask these three questions first:

1. Can I give check? If so, what happens?
2. Can I capture something? If so, what happens?
3. Can I create a strong threat? If so, what happens?

This will catch the majority of tactical opportunities in your games.

40.4.2 Quiet Candidate Moves

Here is where it gets harder.

Not every good move is a check, capture, or threat. Sometimes the best move is a quiet repositioning. A knight moving to a better square. A rook swinging to an open file. A pawn push that restricts the opponent's pieces.

Quiet moves are the hardest to find because they do not grab your attention the way a check or capture does. But they are often the difference between a good player and a strong player.

When you are building your candidate list, after you have looked at checks, captures, and threats, ask one more question:

"Is there a move that makes my position better without forcing anything?"

This might be: - Improving your worst-placed piece - Gaining control of an important square - Preparing a future pawn break - Putting a piece on a square where it serves two purposes at once

If such a move exists and the position is not immediately tactical, it belongs on your candidate list.

40.4.3 When to Include "Weird" Moves

Every so often, a position calls for a move that looks wrong. A retreat when you expected to attack. A sacrifice that seems to give away material for nothing. A move that violates the principles you have learned.

These moves are the hardest to find because your brain is trained to reject them. "That can't be right. I'm moving my knight backward."

Here is the guideline: **If a "weird" move is a check, a capture, or creates a forcing threat, always consider it.** No matter how strange it looks. Your job in Step 2 is to generate candidates, not to judge them. Judgment happens in Step 3, when you calculate. In Step 2, be open-minded.

Some of the most beautiful moves in chess history looked absurd at first glance. They only made sense after calculation proved them right.

40.4.4 Practice: Find the Candidates

Here is a habit that will accelerate your improvement faster than almost anything else:

Before you read the analysis of any position in this book, stop. Look at the diagram. And write down YOUR candidate moves.

Not the "right answer." Not what you think the book wants you to say. YOUR candidates.

Then read the analysis and compare. Did the best move appear on your list? If yes, good. If no, ask: "Why did I miss it? Was it a check I overlooked? A quiet move I did not consider? A 'weird' move I rejected too quickly?"

This habit of self-questioning builds stronger calculation instincts than any amount of passive reading.

Pause and look. Before continuing, practice right now. Turn to any exercise in this chapter, look at the diagram, and list three candidate moves before reading anything else. Just do it once. That is all. Then continue reading.

40.5 SECTION 4: The Tree of Analysis

When you calculate a candidate move, you are building a tree in your mind. It starts with your move (the trunk). Your opponent's replies are the main branches. Your responses to those replies create smaller branches. And so on.

Let's look at what this tree looks like in practice.

40.5.1 A Simple Tree

Imagine you have three candidate moves: A, B, and C.

For Candidate A, your opponent has two reasonable replies: A1 and A2.

- After A1, you play A1a. Evaluate: slightly better for you.
- After A2, you play A2a. Evaluate: equal.

For Candidate B, your opponent has one clear reply: B1.

- After B1, you play B1a. Evaluate: clearly better for you.

For Candidate C, your opponent has two replies: C1 and C2.

- After C1, you play C1a. Evaluate: worse for you.
- After C2, you play C2a. Evaluate: slightly better for you.

Your tree looks like this:

```
Position
  Candidate A
      A1 → A1a → slightly better
      A2 → A2a → equal
  Candidate B
      B1 → B1a → clearly better
  Candidate C
       C1 → C1a → worse
       C2 → C2a → slightly better
```

Now you compare. Candidate B leads to a clearly better position and the opponent has only one reasonable reply. That makes it the safest and strongest choice.

But wait: what about Candidate A? The worst case is "equal" and the best case is "slightly better." That is also solid.

Candidate C is risky because one of the opponent's replies leads to a worse position for you.

Decision: Play Candidate B. It gives the best result with the least risk.

This is what calculation looks like in practice. It is not about seeing twenty moves ahead. It is about seeing two or three moves ahead for each of three to five candidates, and then comparing.

40.5.2 Branch Pruning

You do not need to follow every line to its ultimate conclusion. If you calculate two moves of a variation and realize it is clearly bad (you are losing your queen for nothing), you can stop. This is called **pruning.**

Pruning keeps the tree manageable. Without it, the number of possible variations explodes. After just three moves by each side, there can be thousands of possible positions. No human being calculates all of them. You prune the bad branches and focus your energy on the promising ones.

How to prune wisely:

- If a line results in obvious material loss with no compensation, stop calculating it.
- If a line leads to a position you have seen before and know is bad, stop.
- If a line requires your opponent to make a mistake to work, be suspicious. Assume they will find the best reply.

How to prune badly (avoid this):

- Stopping a line because it "feels" wrong without actually checking.

- Pruning a line because the first move looks weird, even though it might work.
- Assuming your opponent will play a weak move because "they probably won't see it."

40.5.3 Depth vs. Breadth

This is one of the most practical decisions in calculation:

Should you calculate one line very deeply, or should you calculate several lines to a moderate depth?

The answer depends on the position.

Go deep when: - The position is forcing (lots of checks, captures, and threats) - You are considering a sacrifice and need to verify it works - There is one critical line that determines whether your plan succeeds

Stay broad when: - The position is quiet and strategic - There are several reasonable plans, and you need to compare them - No single move is forcing, and you are choosing between "good" and "slightly better"

Most of your games will require breadth more than depth. At the 1000–1600 level, games are decided by finding the right plan among several options, not by calculating fifteen-move forced variations. Save your deep calculation energy for the moments that demand it.

40.5.4 The Horizon Effect

The **horizon effect** is when you stop calculating just before the critical move.

It happens to everyone. You calculate a line: "I play this, they play that, I play this, and… the position looks fine." You play the move. And then your opponent plays one more move that you did not consider, and everything falls apart.

The position was NOT fine. You just stopped looking one move too early.

This is one of the most frustrating errors in chess, and it has a simple (though not easy) fix:

When you reach the end of a line and evaluate it as "fine," ask one more question: "What does my opponent do NEXT?"

If their next move changes your evaluation (if it creates a threat you cannot handle), then you have not finished calculating. Go one move deeper.

This habit of asking "and then what?" is the single most powerful anti-blunder tool in chess.

Pause and look. The tree of analysis is a framework, not a cage. You do not need perfect trees. You need functional ones. A messy tree with the right answer beats an elegant tree with the wrong answer every time.

40.6 SECTION 5: Visualization Training

Calculation depends on visualization. You need to be able to "see" positions in your head, to track where pieces are after imaginary moves without touching the board.

This is a learnable skill. Here are four types of exercises that build it. Start with the first and work your way up.

40.6.1 Exercise Type 1: "What's on e4?"

Set up any position on your physical board. Study it for thirty seconds. Then look away.

Now ask yourself: "What piece is on e4?" (Or any square you choose.) Answer without looking.

Check. Were you right?

Repeat with different squares. Start with five squares per session. Work up to ten, then fifteen.

This exercise builds your ability to hold a snapshot of the board in your memory. It is the foundation for everything else.

Progression: - Week 1: 5 squares per session, simple positions (few pieces) - Week 2: 8 squares per session, middlegame positions - Week 3: 10 squares per session, complex positions - Week 4: 12–15 squares, any position

---

40.6.2 Exercise Type 2: Color of Squares

Without looking at a board, answer: **What color is the square f3?**

If you do not have a trick for this, here is one: the a1-square is dark. Squares alternate colors along rows and columns. So a1 is dark, a2 is light, a3 is dark, and so on. If you count the file letter (a=1, b=2, c=3…) and the rank number, add them together: if the sum is even, the square is dark. If the sum is odd, the square is light.

f3: f is the 6th file, rank is 3. 6 + 3 = 9 (odd). So f3 is a light square.

Practice this until it is instant. Why? Because in calculation, you need to know if a bishop can reach a certain square. Bishops stay on one color. If you know the color of every square without thinking, you can track bishop movement in your head effortlessly.

40.6.3 Exercise Type 3: Blind Positions

Set up a position. Study it. Now make a move IN YOUR HEAD. Do not touch the board.

Question: "After 1. Nf3, where are all the pieces?"

Rebuild the entire position from memory, including the new move, without looking. Then check.

Start with one move. When you can do that reliably, try two moves. Then three.

This is hard. Do not be discouraged if you make mistakes. Everyone does. The point is not to be perfect. The point is to train.

A useful sub-exercise: after making the imaginary move, ask specific questions.

- "Is the queen still defended?"
- "Which squares does the knight now control?"
- "Has this move created any new threats?"

These targeted questions are easier than reconstructing the entire board and they build the same skills.

40.6.4 Exercise Type 4: Progressive Depth Training

This is the full workout.

Set up a tactical position from the exercises at the end of this chapter. Without moving pieces:

- **Level 1:** Calculate one move ahead. "If I play Nf3, what does my opponent play?"
- **Level 2:** Calculate two moves ahead. "After 1. Nf3 d5, what do I play?"
- **Level 3:** Calculate three moves ahead. Follow the full sequence.
- **Level 4:** Calculate four or five moves ahead in a forcing line.

When you can reliably calculate three moves ahead (your move, opponent's reply, your move, opponent's reply, your move), you are ready for most tactical situations at the club level.

Do not rush to Level 4. Accuracy at Level 2 is worth more than sloppy guessing at Level 4.

Training Schedule (suggested):

Week	Drill	Time
1–2	"What's on e4?" + Color of squares	10 min/day
3–4	Blind positions (1-move) + the above	15 min/day
5–6	Blind positions (2-move) + progressive depth Level 2	15 min/day
7–8	Progressive depth Level 3 + full exercises	20 min/day

Rest marker. Visualization training is tiring. That is normal. Your brain is building new pathways. If you are done for today, stop here. You have earned it.

40.7 SECTION 6: Common Calculation Errors

Everyone makes calculation mistakes. Even Grandmasters. The difference between a strong player and a developing one is not that strong players never err. It is that they know WHERE errors tend to happen and they double-check those spots.

Here are the six most common calculation errors. Learn them. Watch for them. And when you catch yourself making one, do not feel bad. Feel proud that you noticed.

40.7.1 Error 1: Forgetting the Opponent's Best Reply

This is the most common error at every level, and it has a simple cause: **you are so excited about your own move that you forget your opponent gets to play too.**

You find a beautiful attack. You see a sacrifice that leads to a mating pattern. You play it. And your opponent makes a calm, quiet move that defends everything, and suddenly your attack is gone and you are down material.

The fix: After every candidate move you calculate, ask: "What is the BEST thing my opponent can do in response?" Not the move you hope they will play. The move that hurts you the most. If your plan survives their best reply, it is a good plan. If it does not, it is not a plan. It is a wish.

40.7.2 Error 2: Calculating Only Your Moves

This is a milder version of Error 1. You calculate a sequence ("I play here, then here, then here") and you are moving your own pieces through four or five moves without once stopping to ask what your opponent does in between.

Your visualization shows YOUR pieces gliding into perfect positions. Your opponent's pieces sit frozen in place like spectators.

This is called **hope chess.** You are hoping your opponent sits there and lets you execute your plan uninterrupted.

The fix: Force yourself to alternate. "I play this. THEY play this. I play this. THEY play this." Every single time. No exceptions. If you catch yourself skipping the opponent's moves, stop and restart the line.

40.7.3 Error 3: The "Hope Chess" Trap

Dan Heisman, the famous chess teacher, coined this term. **Hope chess** is when you make a move and HOPE your opponent does not see the problem with it, instead of VERIFYING that your move is safe.

"I'll play here and hope they don't notice that my bishop is hanging."

This is not chess. This is gambling. And like gambling, it works just often enough to become a habit, until it stops working and you wonder why you keep losing.

The fix: Before every move, complete the Blunder Check (see Section 7). The check takes ten seconds. It catches ninety percent of blunders. There is no reason not to do it.

40.7.4 Error 4: Missing Intermediate Moves (Zwischenzugs)

A **zwischenzug** (German for "in-between move") is a move that interrupts the expected sequence. You expect your opponent to recapture, but instead they play a check, or make a threat somewhere else, and THEN recapture.

Example: You capture a pawn. You expect your opponent to recapture. Instead, they give check. You deal with the check. THEN they recapture the pawn, but now they have gained a tempo and their pieces are better placed.

Zwischenzugs are among the most commonly missed moves in chess.

The fix: After every capture or exchange you calculate, ask: "Does my opponent have a stronger move BEFORE recapturing?" Especially look for in-between checks. Checks always take priority because they must be answered.

40.7.5 Error 5: Phantom Pieces

This is a visualization error. During your calculation, you move a piece in your mind. Several moves later, you "see" that piece on its original square, forgetting that it has already moved.

Example: You calculate a line where your knight moves from f3 to e5. Five moves later, you evaluate the position and think: "My knight on f3 controls d4." But the knight is not on f3 anymore. It is on e5. The d4 square is unguarded. Your evaluation is wrong.

This gets worse as you calculate deeper, because you are tracking more mental changes.

The fix: At each step of your calculation, quickly verify the piece you are thinking about. "Where is my knight? Right, I moved it to e5 three moves ago." This takes practice. The visualization exercises in Section 5 are specifically designed to strengthen this skill.

40.7.6 Error 6: Stopping Too Soon

We covered this in Section 4 as the "horizon effect," but it deserves emphasis here because it causes more lost points than any other error for improving players.

You calculate a three-move sequence. The final position looks fine. You play the first move. Two moves later, your opponent makes a fourth move that refutes everything.

The fix: When a line looks "fine," calculate one move further. Just one. Ask: "What does my opponent do next?" If the answer does not change your evaluation, you can stop with confidence. If it does, keep going.

Pause and look. You now know the six most common errors. Pick the one you think you make most often. Just one. Focus on fixing that one first. When you have it under control, come back and work on the next one.

40.8 SECTION 7: Practical Calculation Tips

Theory is useful. Practice is essential. But there is a middle ground: practical habits that you can adopt right now, in your very next game, that will immediately reduce your blunders and improve your move selection.

40.8.1 Tip 1: Take Your Time on Critical Positions

Not every move deserves five minutes of calculation. Some moves are obvious. Play them and save your time.

But some moves are critical. The position is sharp. Material is at stake. Your king is exposed. There is a sacrifice that might work.

On critical moves, slow down. Use the full Kotov Method. Survey. Candidates. Calculate. Compare. Then, and only then, move.

How do you know a position is critical? Here are the signals:

- You are considering a sacrifice or a pawn break
- Your opponent has just created a threat
- The evaluation of the position could swing drastically depending on your next move
- Multiple pieces are in contact (captures are available for both sides)
- Your instinct says "this feels important" (trust that instinct; it is often right)

40.8.2 Tip 2: The Blunder Check

This is the single most important habit in this entire chapter.

Before you make your move, after you have decided what to play, do one final check.

Ask three questions:

1. **"Does this move hang a piece?"** (Am I leaving anything undefended?)
2. **"Does this move allow a check?"** (Can my opponent give check after I play this?)
3. **"Does this move allow a capture?"** (Am I allowing my opponent to take something for free?)

This check takes ten seconds. It catches the majority of blunders.

Many players do this automatically at higher levels. At the 1000–1600 level, you need to do it deliberately. Make it a habit. Tattoo it on the inside of your eyelids if you have to.

Piece → Check → Capture. Three questions. Ten seconds. Ninety percent of your blunders gone.

40.8.3 Tip 3: The Complete Process

Here is the full pre-move process, from start to finish:

1. **Survey** the position (what is going on?)
2. **Identify** 3–5 candidate moves
3. **Calculate** each candidate to its conclusion
4. **Evaluate** each line
5. **Decide** on the best move
6. **Blunder check** (Piece? Check? Capture?)
7. **Move**

Steps 1–5 are the Kotov Method. Step 6 is the safety net. Step 7 is when you touch the piece.

You will not do all seven steps on every move. In quiet positions, you might go straight from Step 1 to Step 7. But for critical positions, this is the process. Learn it. Use it. Trust it.

40.8.4 Tip 4: Write It Down

When you are training at home (not in a tournament), try writing down your candidate moves and calculations on paper before you look at the answer.

This sounds old-fashioned, but it works. Writing forces you to commit to your thinking. You cannot be vague on paper. You have to state: "My candidates are 1. Nf3, 2. d4, and 3. Bg5." Then: "For Nf3, the main line is…" And so on.

When you compare your written analysis to the book's analysis, you can see EXACTLY where your thinking went wrong. Did you miss a candidate? Did you calculate a line incorrectly? Did you evaluate a final position too optimistically?

This targeted feedback is how you improve fastest.

40.8.5 Tip 5: Do Not Be Afraid of Mistakes

Calculation errors are normal. You will make them. Everyone does.

The goal is not perfection. The goal is to make fewer errors this month than last month. And fewer still next month.

If you solve an exercise incorrectly, that exercise just taught you more than the ones you got right. The wrong answer shows you where your blind spots are. That is valuable information.

40.9 ANNOTATED GAMES

The following three games illustrate calculation in action. In each game, pay attention to the critical moments where calculation, not just intuition, determined the result.

For each game, the key positions are marked. When you reach a marked position: **STOP.** Cover the next line. Find YOUR candidate moves. Calculate. Then compare your analysis to what happened.

40.9.1 Game 1: The Power of Candidate Moves

José Raúl Capablanca vs. Aron Nimzowitsch New York 1927

Capablanca was known for his crystal-clear calculation. He rarely made mistakes because he always considered the right candidate moves, and he calculated them with mechanical precision.

Set up your board:

Opening: 1. c4 Nf6 2. Nf3 e6 3. d4 d5 4. e3 Be7 5. Bd3 O-O 6. O-O c5

This is a Queen's Gambit Declined structure. Both sides develop sensibly. Capablanca has the white pieces and a slight spatial advantage.

7. dxc5 Bxc5 8. Nc3 Nc6 9. a3 a6 10. b4 Ba7 11. Bb2 Qe7

Stop here and survey the position.

White has a queenside majority and active piece development. The bishop pair aims at the kingside and the long diagonal. Black's pieces are solidly placed but slightly passive. The bishop on a7 is temporarily out of the game.

Capablanca's candidate moves at move 12:

1. Qe2: Connecting rooks, overprotecting e4
2. Rc1: Placing a rook on the half-open c-file
3. cxd5: Opening the position to exploit the bishop pair

Capablanca chose: 12. cxd5!

Why? Because after 12…exd5 (forced, since 12…Nxd5? 13. Nxd5 exd5 14. Bxh7+ wins a pawn with attack), White achieves a classic IQP (isolated queen's pawn) structure for Black. The pawn on d5 becomes a target.

This is calculation in the service of strategy. Capablanca did not calculate twenty moves of tactics. He calculated two or three moves to confirm the pawn structure would be favorable, then played the move that created the right kind of position, one where his bishop pair and piece activity would dominate.

12…exd5 13. Be2!

Not the more natural Bf5 or staying on d3. Capablanca repositions the bishop to a square where it can later come to f3 or g4, pressuring d5 more effectively.

13…Bg4 14. Nd4 Bd7 15. Rc1 Rac8 16. Bf3

Now the bishop reaches the diagonal it wanted, and d5 is under enormous pressure. Every white piece has a purpose. Nothing is wasted.

The game continued with Capablanca methodically increasing the pressure until Nimzowitsch's position collapsed. The lesson: **accurate candidate move selection at move 12 set the stage for everything that followed.**

Key Takeaway from Game 1: Calculation is not always about finding brilliant sacrifices. Sometimes it is about calculating two or three moves to confirm that a strategic decision is sound. Capablanca calculated just enough to know 12. cxd5 was right, and then his positional understanding did the rest.

40.9.2 Game 2: Calculation Under Fire

Bobby Fischer vs. Reuben Fine New York 1963 (Skittles game)

Fischer was a ferocious calculator who could see deeply into tactical positions. This game shows what happens when one player calculates better than the other in a sharp position.

Set up your board:

Opening: 1. e4 e5 2. Nf3 Nc6 3. Bc4 Bc5 4. b4

The Evans Gambit. Fischer loved this opening because it creates sharp, forcing positions that reward accurate calculation.

4…Bxb4 5. c3 Ba5 6. d4 exd4 7. O-O dxc3 8. Qb3

White has sacrificed a pawn (and will sacrifice more material) for rapid development and an attack on f7. This is exactly the type of position where the Kotov Method shines: forcing moves everywhere, multiple candidate moves, and the need to calculate deeply.

8…Qe7 9. Nxc3

Critical position. Stop here if you are Black. What are your candidate moves?

Black must decide: develop, defend, or try to hold the extra material?

Fine played 9…Nf6, which is natural but allows White to build an overwhelming initiative.

10. Nd5! Nxd5 11. exd5 Ne5 12. Nxe5 Qxe5 13. Bb2

Now every white piece is developed and aimed at the black king, which is still in the center. Fine's extra pawn is meaningless against this kind of development lead.

13…Qg5 14. h4! Qxh4 15. Bxg7 Rg8 16. Rfe1+ Kd8 17. Qg3

White's attack is overwhelming. Fischer calculated this entire sequence before playing 10. Nd5. He saw that the piece activity and the exposed black king would be worth far more than the sacrificed material.

Key Takeaway from Game 2: In sharp positions, the player who calculates more accurately wins. Fischer's calculation was concrete: he verified that after the sacrifices, Black's king had no safe square. This is the Kotov Method in its purest form: identify forcing candidates, calculate each to its conclusion, and trust the result.

40.9.3 Game 3: When Calculation Meets Creativity

Mikhail Tal vs. Vasily Smyslov Candidates Tournament 1959

Tal was the supreme calculator-artist of chess. Where others saw confusion, Tal saw combinations. This game shows his ability to find candidate moves that other players would never consider.

Set up your board:

The position arose from a Sicilian Defense. By move 17, Tal had already sacrificed a pawn for attacking chances.

Position after 17...Qb6 (key moment):

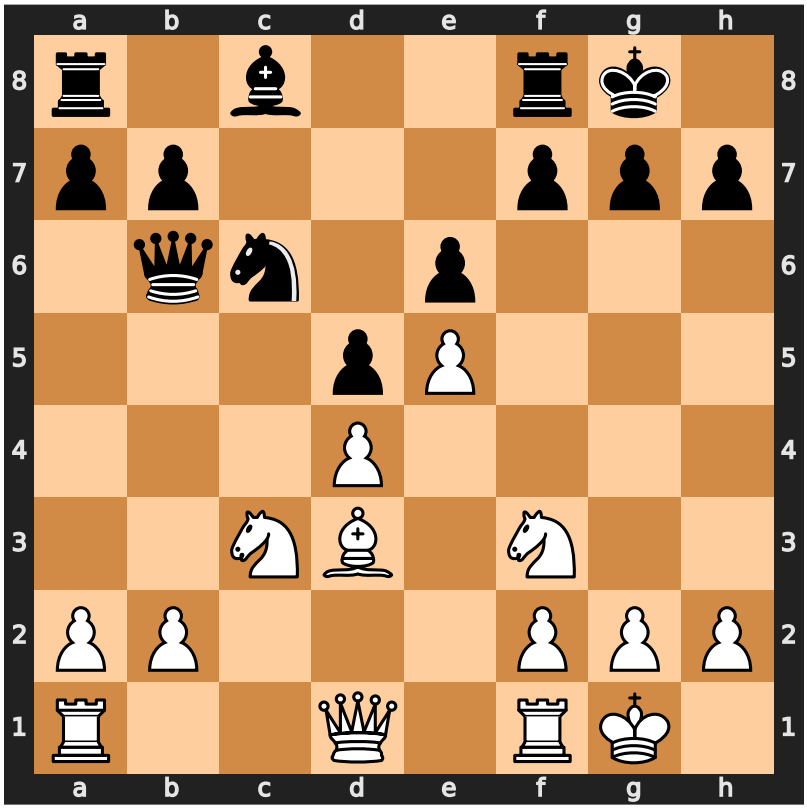

Figure 40.1: Chess Position

Set up your board. White has a bishop on d3, knights on c3 and f3, pawns on d4 and e5. Black has a queen on b6, a knight on c6, pawns on d5 and e6.

Stop. Find YOUR candidate moves for White before reading on.

The position looks quiet. Most players would consider Qe2, a3, or Rb1, all reasonable developing moves.

Tal's candidate list was different. He looked at the position and asked: "Can I break through?"

18. Nxd5! exd5 19. e6!

A stunning pawn sacrifice. The e-pawn charges forward, opening lines toward the black king. After 19...fxe6, White plays 20. Bg6! and the h7 pawn becomes a target. The bishop on d3 was sleeping,

and now, two moves later, it is the most dangerous piece on the board.

This is what calculation plus creativity looks like. Tal did not just find the "normal" candidates. He included a sacrifice on his list, a "weird" move that most players would dismiss, and then he calculated it thoroughly enough to prove it worked.

Key Takeaway from Game 3: Your candidate list should include moves that scare you. If a sacrifice is a check or creates a forcing threat, it belongs on the list. You do not have to play it. But you must consider it. Tal's genius was not that he saw things nobody else could see. It was that he was willing to LOOK where others refused to.

Rest marker. You have studied three annotated games. That is serious work. If your brain feels full, stop here. The exercises are not going anywhere.

40.10 EXERCISES

80 exercises in four groups. Work through them at your own pace.

Some of these will take you two minutes. Some will take you ten. That is normal. The difficulty is not constant. It builds. Start with the exercises you can solve and push into the ones you cannot. Growth lives at the edge of your ability.

For every exercise: 1. Set up the position on your physical board 2. List your candidate moves BEFORE calculating 3. Calculate each candidate to its conclusion 4. Compare your answer to the solution

Solutions, hints, and wrong-move analysis are collected at the end of the volume.

40.10.1 Group A: Find the Candidate Moves (Exercises 12.01–12.20)

For each position, list the three best candidate moves. You do not need to calculate deeply. Just identify the right candidates. Difficulty: to

---

Exercise 12.01

White to move. A standard opening position after 1. e4 Nf6 2. Nf3 Nc6. List three candidate moves.

~2 min

Hint 1: Think about controlling the center. Hint 2: White wants to occupy or support the d4 and e4 squares. What moves accomplish this? Hint 3: The three strongest candidates are d4, Nc3, and Bb5. Explain why each is reasonable.

Exercise 12.02

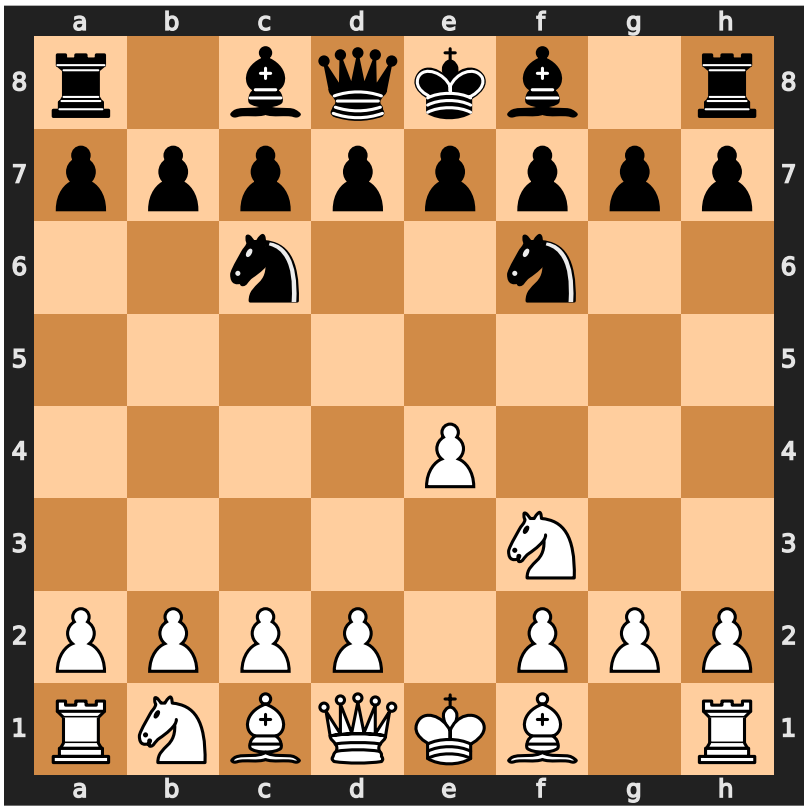

Figure 40.2: Chess Position

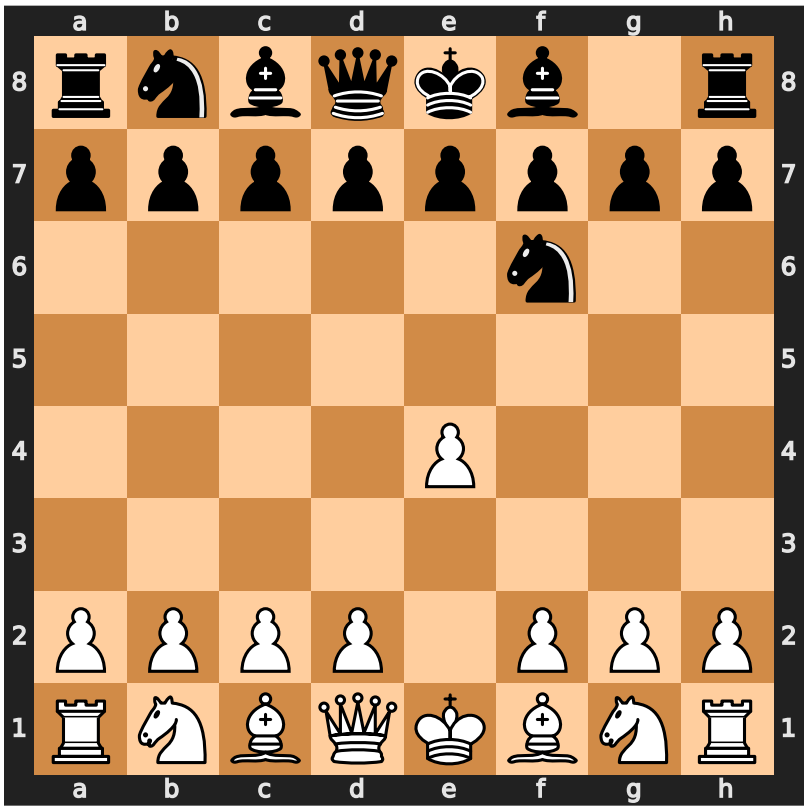

Figure 40.3: Chess Position

White to move. After 1. e4 Nf6 (the Alekhine Defense). List three candidate moves.

~2 min

Hint 1: Black's knight is on f6, attacking the e4 pawn. What do you do about it? Hint 2: You can defend e4, advance e5 to chase the knight, or ignore the threat and develop. Hint 3: The main candidates are e5, Nc3, and d3. Each leads to a different type of game.

Exercise 12.03

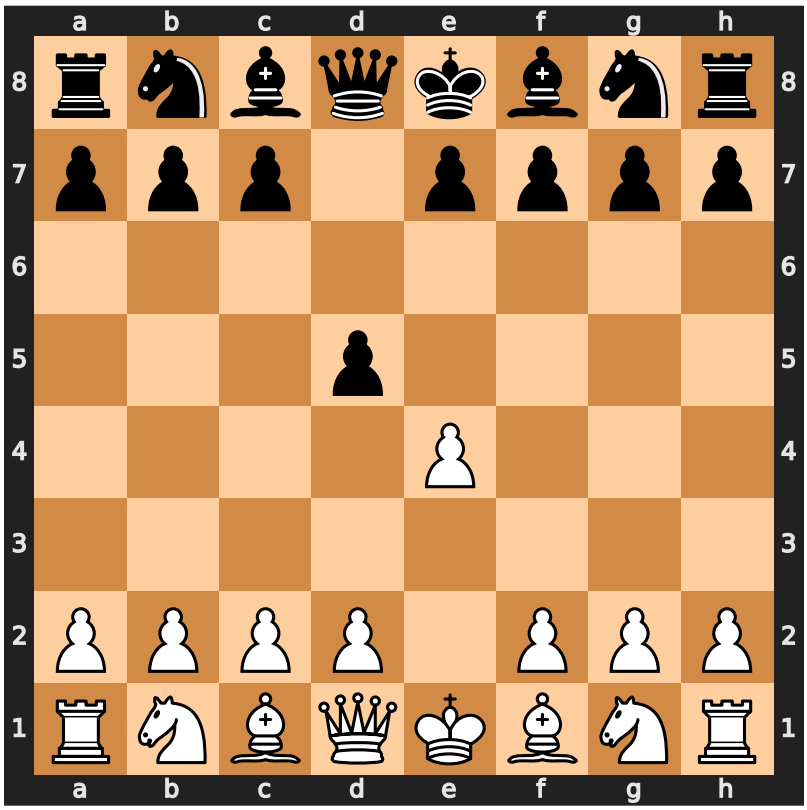

Figure 40.4: Chess Position

White to move. After 1. e4 d5 (the Scandinavian Defense). List three candidate moves.

~2 min

Hint 1: There is a capture available. Should you take it? Hint 2: After exd5, Black must recapture. How? And what does that give you? Hint 3: The candidates are exd5 (most popular), Nc3, and e5. Each has a clear purpose.

Exercise 12.04

White to move. A standard position after 1. e4 e5 2. Nf3 Nc6. List three candidate moves.

~2 min

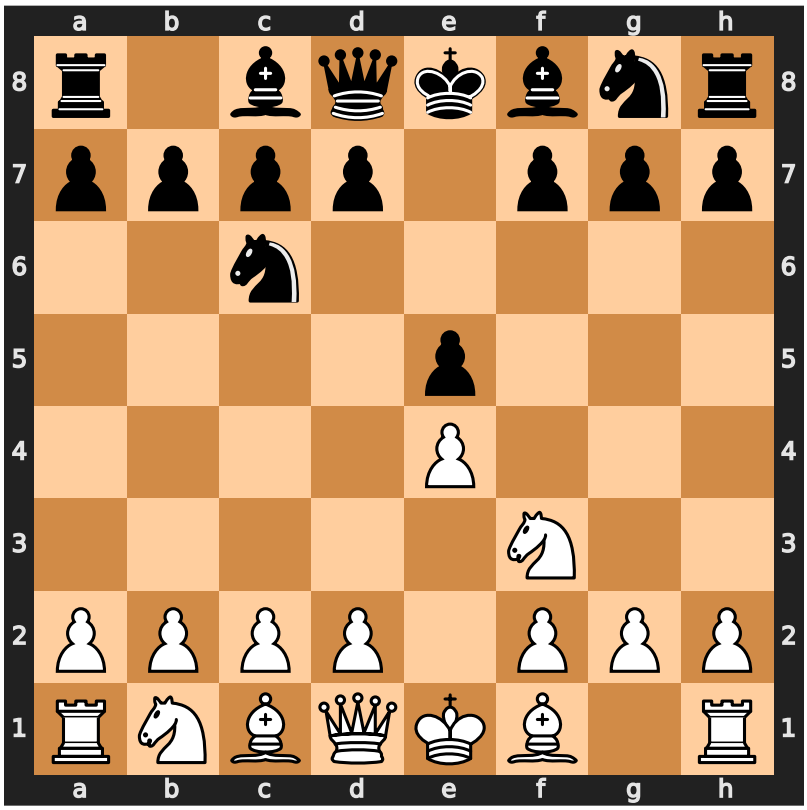

Figure 40.5: Chess Position

Hint 1: This is one of the most studied positions in chess. Three classical moves stand out. Hint 2: Think about developing a piece to attack the knight on c6, or controlling d4. Hint 3: The three main candidates are Bb5 (Ruy Lopez), Bc4 (Italian Game), and d4 (Scotch Game).

Exercise 12.05

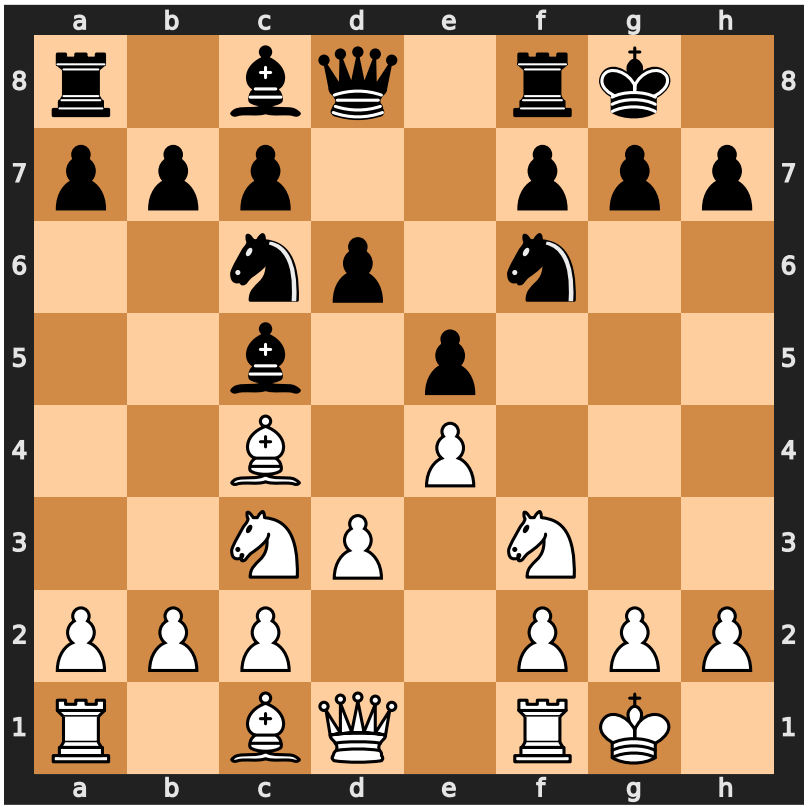

Figure 40.6: Chess Position

White to move. Italian Game, Giuoco Piano. Both sides are developed and castled. List three candidate moves and briefly explain why each is worth considering.

~3 min

Hint 1: Think about pawn breaks and piece repositioning. Hint 2: The three main candidates involve d4 (pawn break), a4 (queenside expansion), and Bg5 (piece pressure). Hint 3: The strongest is d4! It opens the center and activates all of White's pieces.

Exercise 12.06

White to move. Italian Game, Hungarian Defense setup. List three candidate moves.

~3 min

Hint 1: White needs to develop and fight for the center. What are the most active options? Hint 2: Consider d4, O-O, and c3 (preparing d4). Which comes first? Hint 3: The classical approach is d4 immediately, but c3 (preparing a strong d4) and O-O (safety first) are both sound.

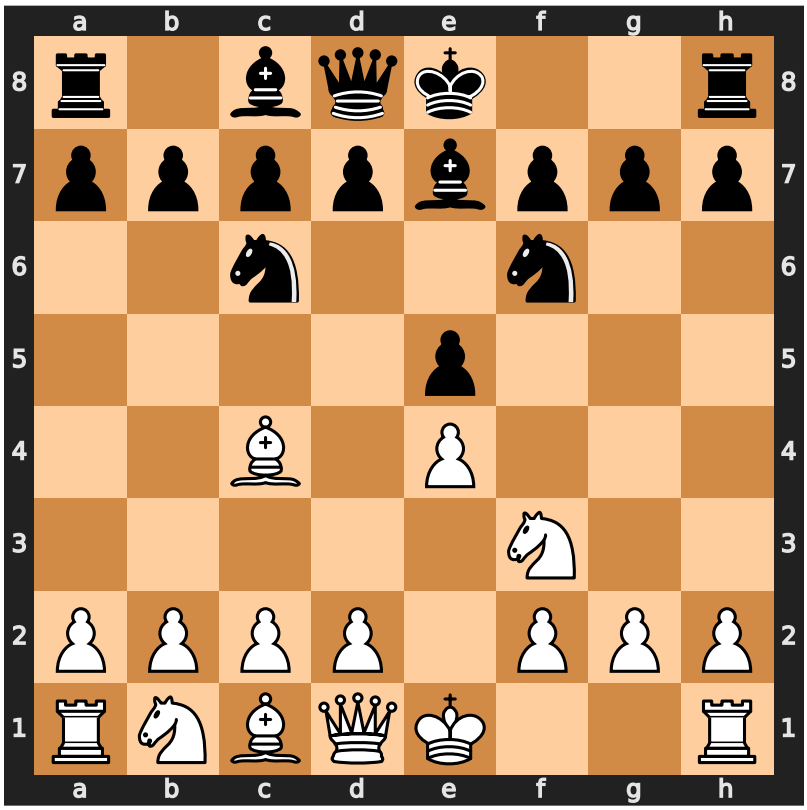

Figure 40.7: Chess Position

Exercise 12.07

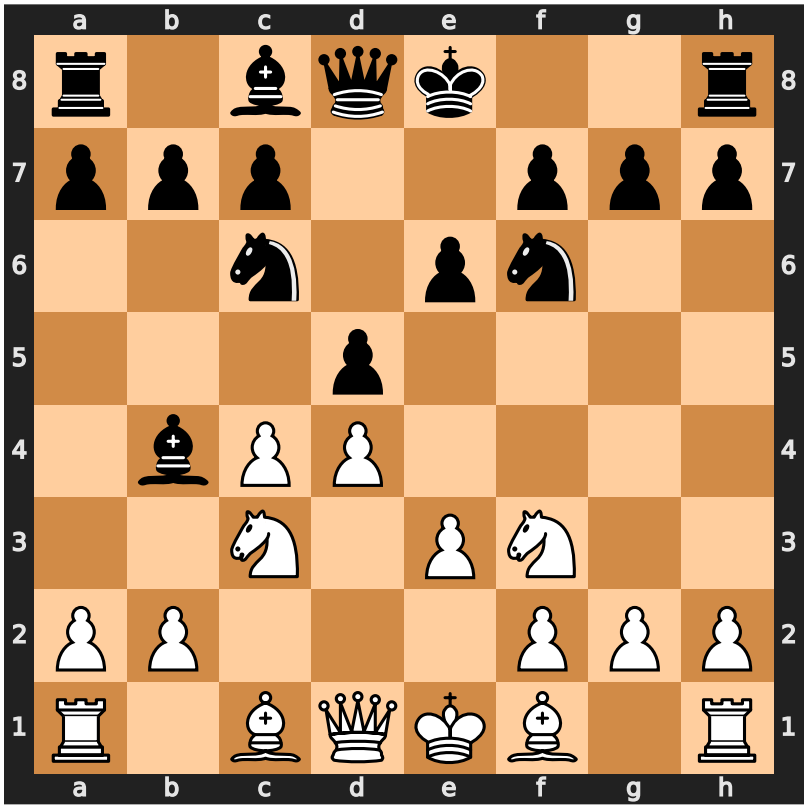

Figure 40.8: Chess Position

White to move. Nimzo-Indian Defense structure. Black has pinned the knight on c3 with the bishop on b4. List three candidate moves.

~3 min

Hint 1: The pin on c3 is annoying. How can White deal with it or ignore it? Hint 2: Consider Bd3, a3, and Qc2. Each responds to the pin differently. Hint 3: Bd3 develops while overprotecting e4. a3 asks the bishop to commit (take or retreat). Qc2 prepares to recapture on c3 with the queen.

Exercise 12.08

White to move. London System. White has developed the bishop to f4 and the knight to f3. List three candidate moves.

~3 min

Hint 1: White's development is nearly complete. What is the best way to finish it? Hint 2: Consider Be2, Bd3, and h3. Each completes development in a different way. Hint 3: Bd3 is the most active. It develops toward the kingside and supports e4 ideas. Be2 is solid. h3 prevents Bg4 but is slower.

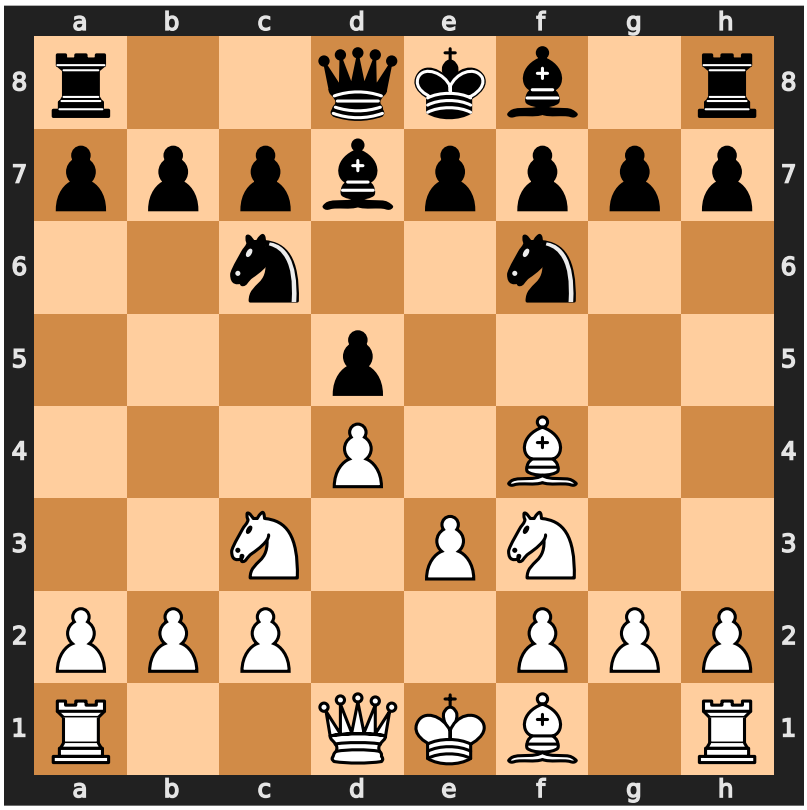

Figure 40.9: Chess Position

Exercise 12.09

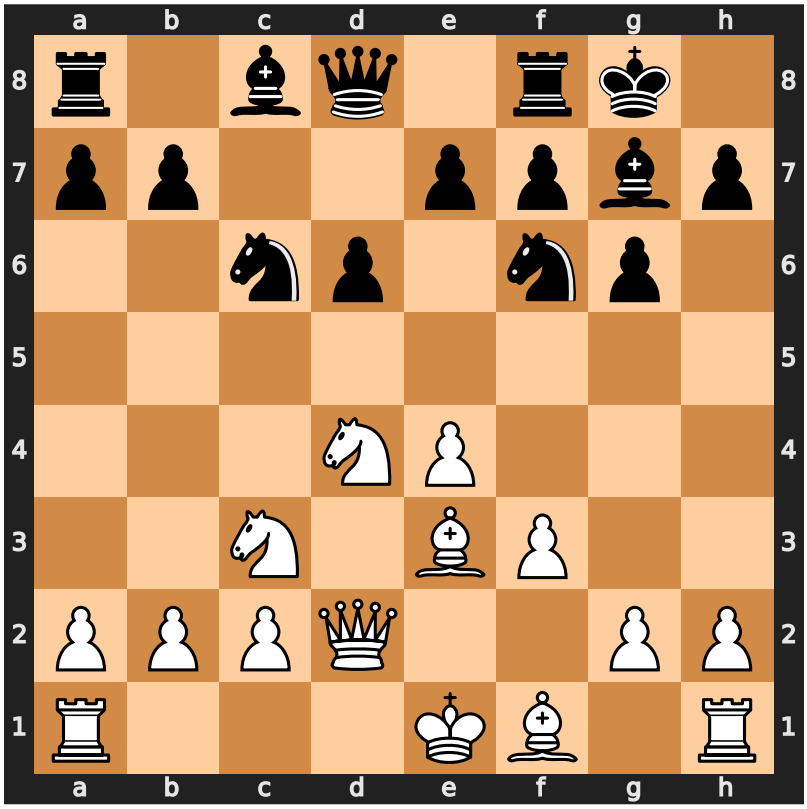

Figure 40.10: Chess Position

White to move. King's Indian / Pirc structure. Black has fianchettoed the bishop on g7. List three candidate moves.

~3 min

Hint 1: White's king is still in the center. What is the priority? Hint 2: Consider O-O-O, Bc4, and g4. Each leads to a very different type of game. Hint 3: O-O-O is the most common. It castles queenside and prepares a kingside pawn storm. Bc4 develops aggressively. g4 starts the attack immediately.

Exercise 12.10

White to move. King's Indian Defense setup. List three candidate moves.

~3 min

Hint 1: White is almost fully developed. What is the natural next step? Hint 2: O-O, Be3, and h3 are all reasonable. Explain the purpose of each. Hint 3: O-O is almost always correct here. Complete development before starting active operations.

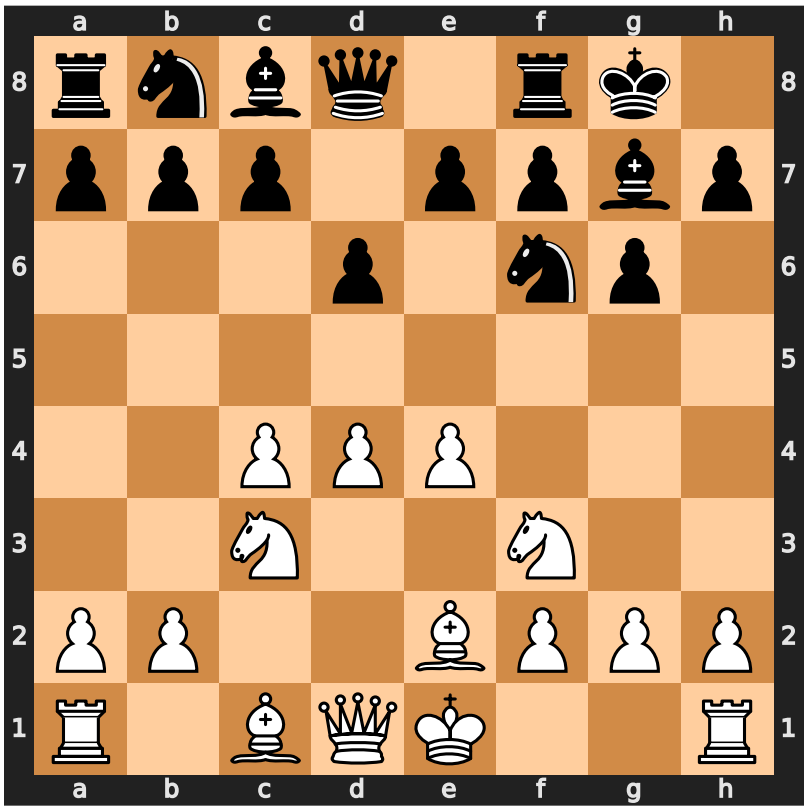

Figure 40.11: Chess Position

Exercise 12.11

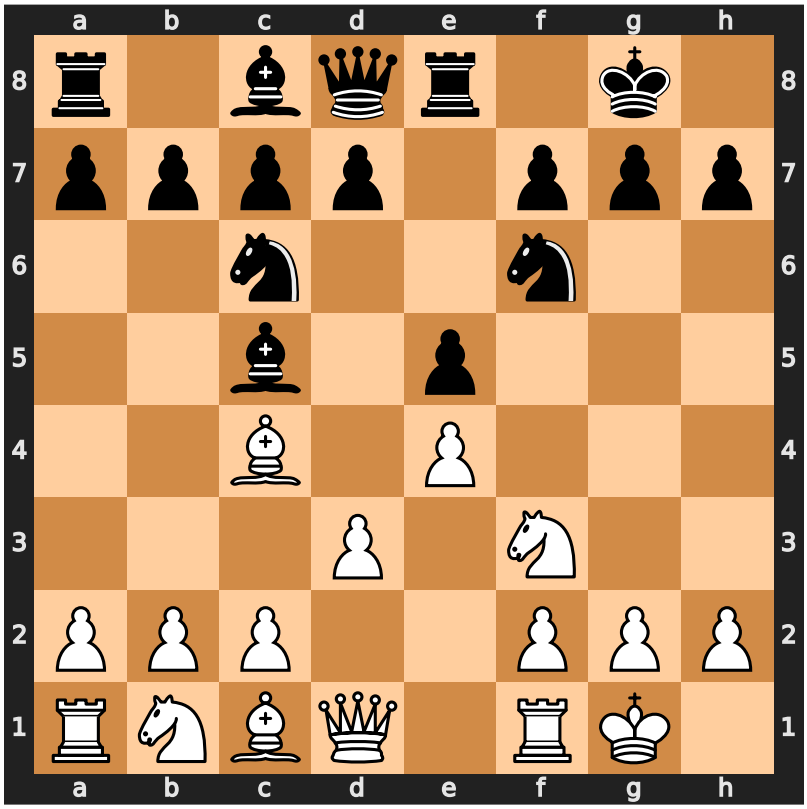

Figure 40.12: Chess Position

White to move. Italian Game structure, Black has played Re8 early. List three candidate moves.

~3 min

Hint 1: Black's rook on e8 supports e5. How does this change White's plans? Hint 2: Consider Nc3, a4, and Bg5. Each develops a piece or creates a new threat. Hint 3: Nc3 is development. a4 prevents b5 and gains space. Bg5 pins the f6 knight and pressures e5 indirectly.

Exercise 12.12

White to move. English Opening structure. Black has an early queen sortie to a5. List three candidate moves.

~3 min

Hint 1: The queen on a5 looks active, but is it really threatening anything immediately? Hint 2: Consider Bg2, d4, and a3. Each continues White's development while addressing the queen. Hint 3: Bg2 is the most natural. It completes the fianchetto and aims at the center. The queen on a5 is not a serious threat yet.

Exercise 12.13

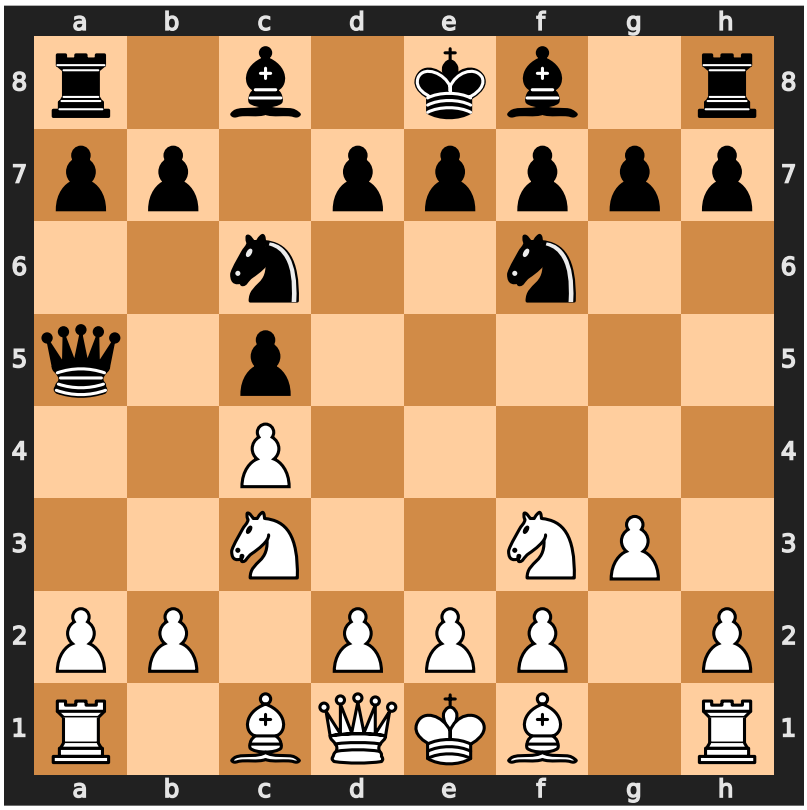

Figure 40.13: Chess Position

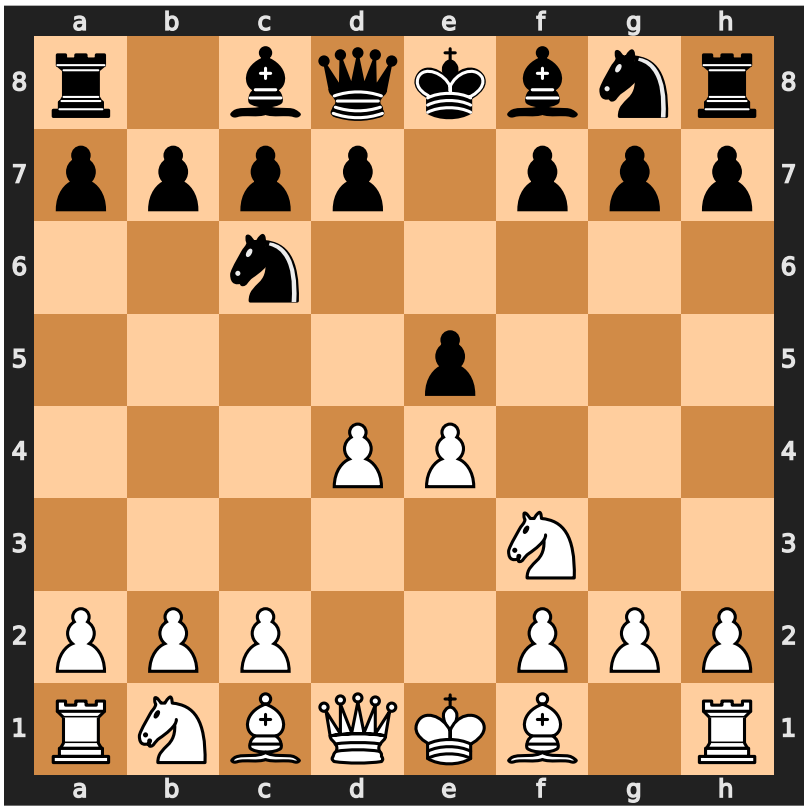

Figure 40.14: Chess Position

Black to move. After 1. e4 e5 2. Nf3 Nc6 3. d4 (Scotch Game). List three candidate moves for Black.

~3 min

Hint 1: White is attacking the e5 pawn with d4. What should Black do about it? Hint 2: Consider exd4, d6, and Nf6. Each handles the central tension differently. Hint 3: exd4 is the most popular. It gives up the center but opens lines. d6 is solid. Nf6 counterattacks e4.

Exercise 12.14

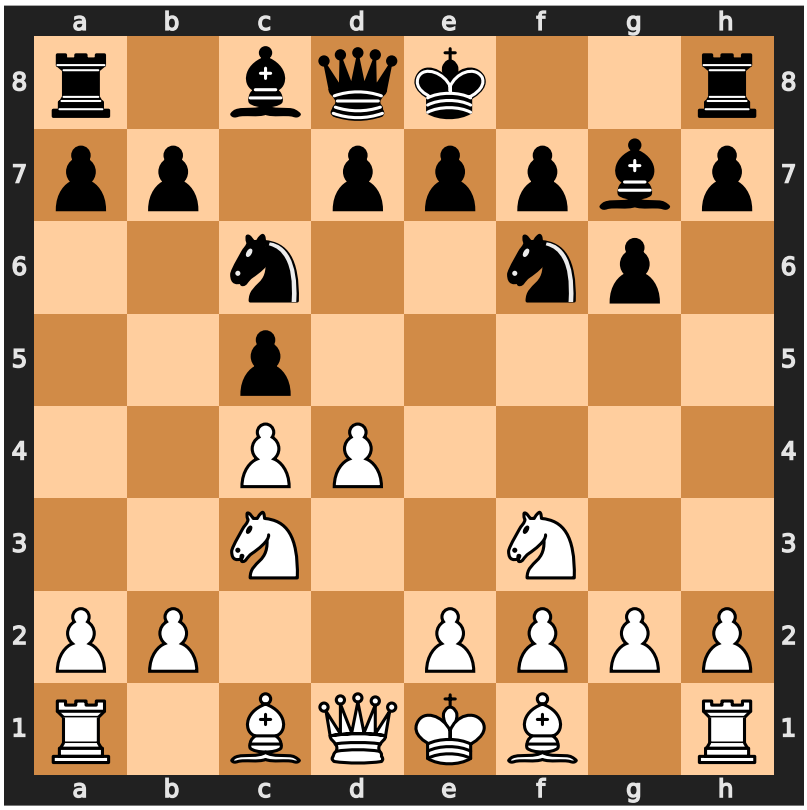

Figure 40.15: Chess Position

White to move. Symmetrical English / Sicilian reversed. List three candidate moves.

~3 min

Hint 1: The center is balanced. White needs a plan. Hint 2: Consider e4, d5, and g3. Each leads to a completely different pawn structure. Hint 3: e4 grabs the center aggressively. d5 pushes Black's knight back. g3 prepares a fianchetto for a long strategic game.

Exercise 12.15

White to move. King's Indian setup where White has pushed d5. List three candidate moves.

~3 min

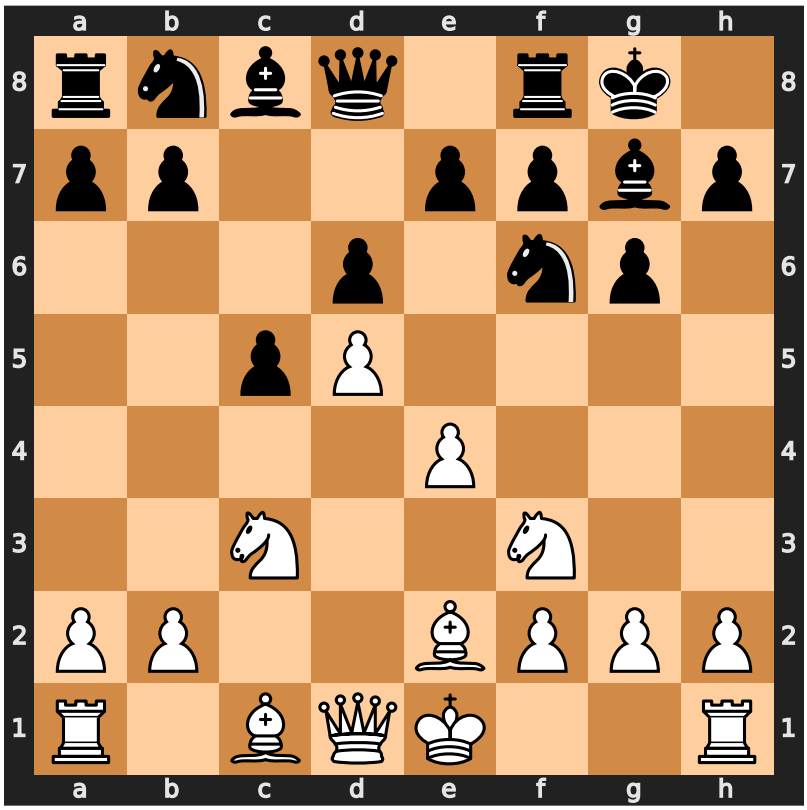

Figure 40.16: Chess Position

Hint 1: The center is closed (pawn on d5 vs. d6). What kind of plans work in closed positions? Hint 2: Consider O-O, Bg5, and a4. The first completes development; the other two start flank operations. Hint 3: O-O is almost always correct before launching any plan. Safety first.

Exercise 12.16

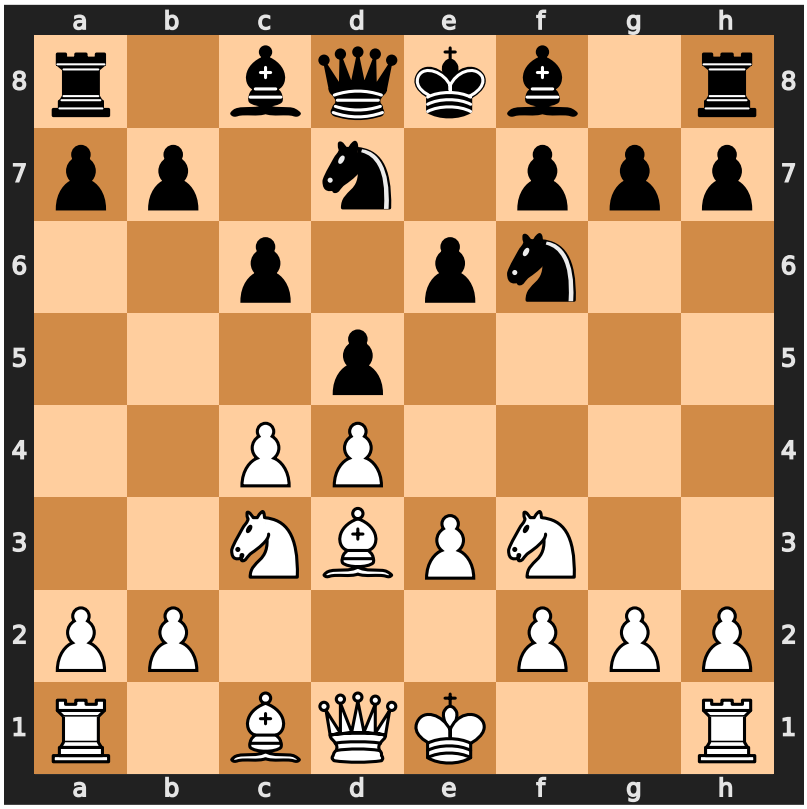

Figure 40.17: Chess Position

White to move. Semi-Slav structure. List three candidate moves.

~3 min

Hint 1: Black has a solid pawn chain (e6-d5-c6). How does White challenge it? Hint 2: Consider O-O, e4, and Qc2. Each prepares for the central battle differently. Hint 3: O-O is safe. e4 is the thematic break but may be premature. Qc2 supports e4 while keeping options open.

Exercise 12.17

White to move. Queen's Gambit Declined, Nimzo-Indian hybrid. List three candidate moves.

~3 min

Hint 1: Black's bishop on b4 pins the knight on c3, again. This is a recurring theme. Hint 2: Consider O-O, a3, and cxd5. Castling for safety, asking the bishop to commit, or resolving the center. Hint 3: O-O first, then deal with the pin. The king's safety is more urgent than the bishop question.

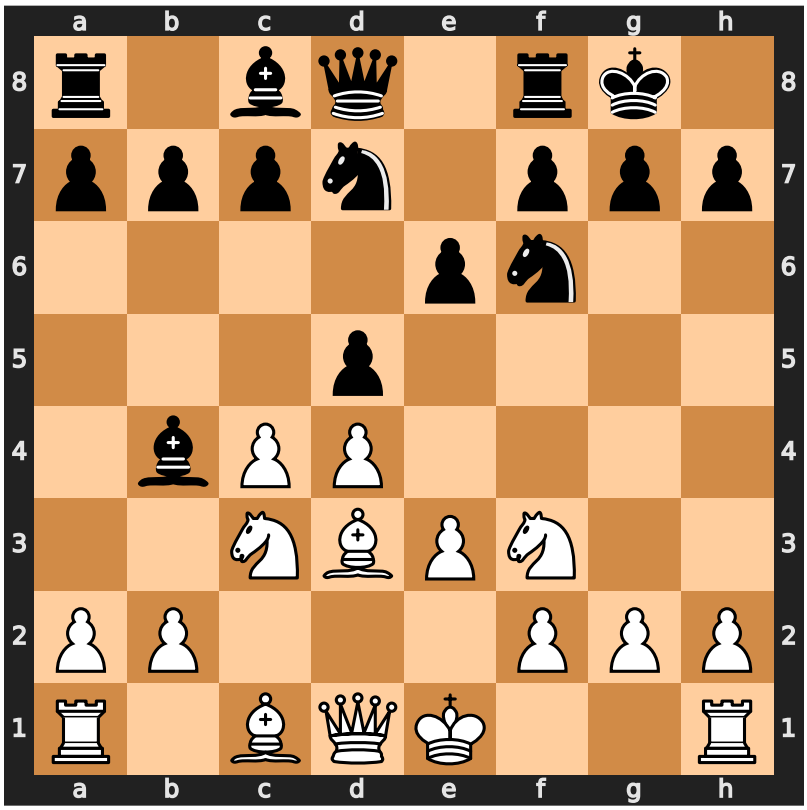

Figure 40.18: Chess Position

Exercise 12.18

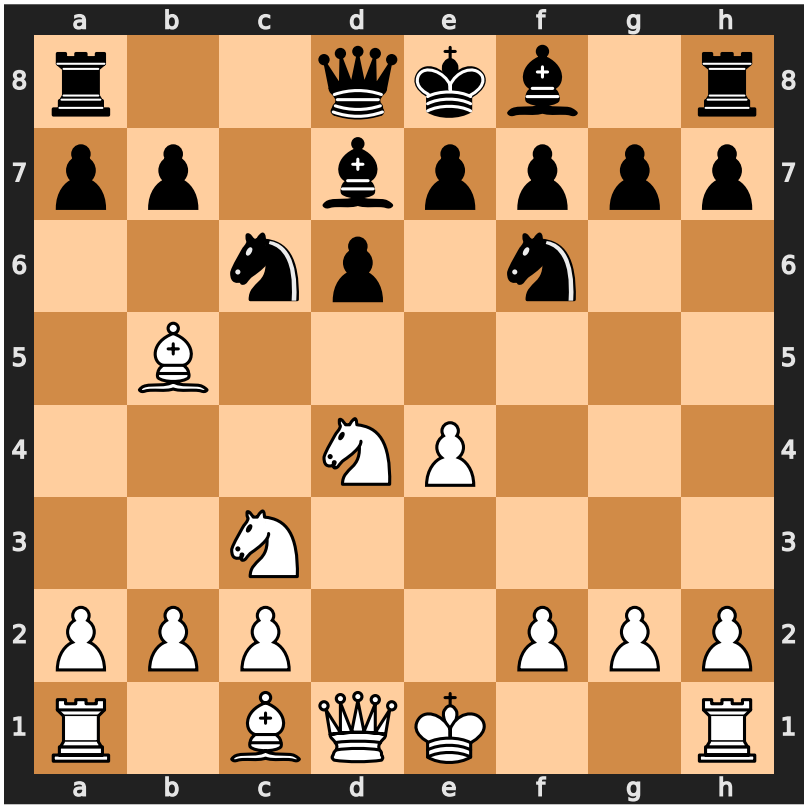

Figure 40.19: Chess Position

White to move. Sicilian Defense, Rossolimo-like structure. List three candidate moves.

~3 min

Hint 1: The bishop on b5 is actively placed but potentially vulnerable. What is White's priority? Hint 2: Consider O-O, Bxc6, and f3. Each addresses the position differently. Hint 3: Bxc6 doubles Black's pawns and is a common strategic idea. O-O completes development. f3 supports e4 but weakens the kingside.

Exercise 12.19

White to move. French Defense structure with e5 push. List three candidate moves.

~3 min

Hint 1: White's pawn on e5 restricts the f6 knight. What should White do next? Hint 2: Consider Bf4, Nbd2, and Re1. Each supports the e5 pawn or prepares kingside play. Hint 3: Bf4 develops and supports e5. Nbd2 reroutes the knight toward the kingside. Re1 puts a rook behind the advanced pawn.

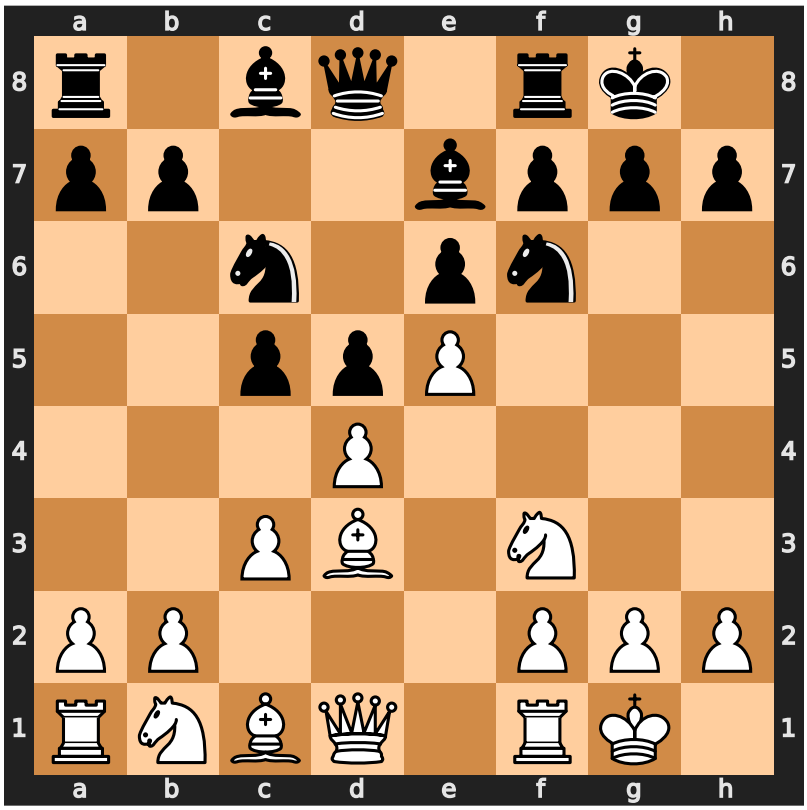

Figure 40.20: Chess Position

Exercise 12.20

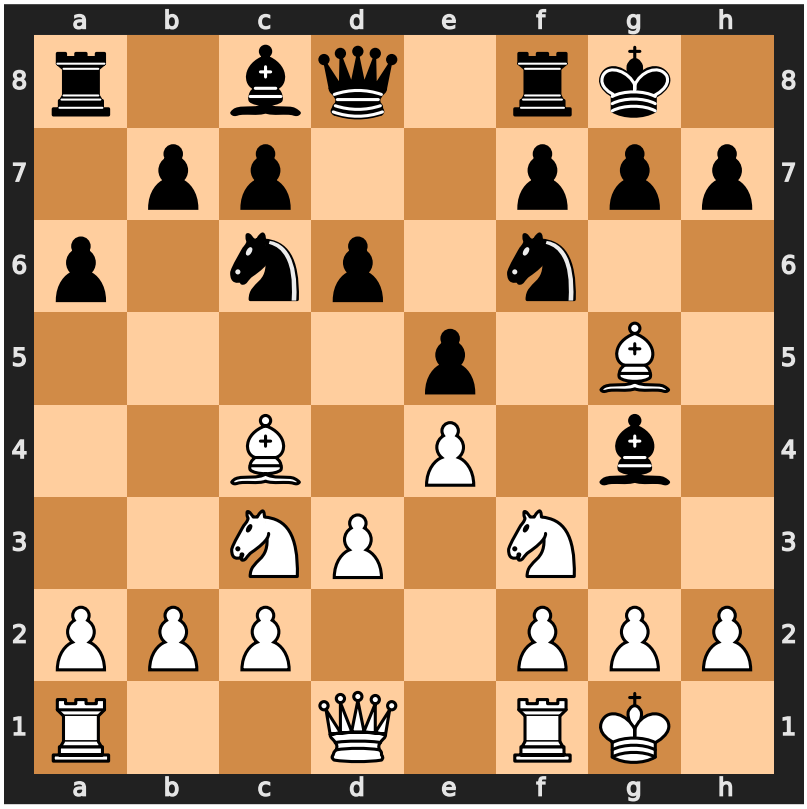

Figure 40.21: Chess Position

White to move. Ruy Lopez-like middlegame. Both sides have developed. List three candidate moves.

~4 min

Hint 1: There are pins and counter-pins on the board. How does White exploit the situation? Hint 2: Consider Nd5, h3, and Bxf6. Each forces a decision from Black. Hint 3: Nd5 is the most active. It attacks the queen and the f6 knight simultaneously. h3 asks the bishop on g4 to declare its intentions. Bxf6 simplifies.

40.10.2 Group B: Calculate to the End (Exercises 12.21–12.40)

For each position, find the best move AND calculate the main variation to its conclusion. Show the full line. Difficulty: to

---

Exercise 12.21

Black to move. White has just played the Scholar's Mate attempt Qxf7+. But wait, this is a different position. White already has the queen on f7 and the bishop on c4. Black's king is on e8. Can Black survive? Calculate.

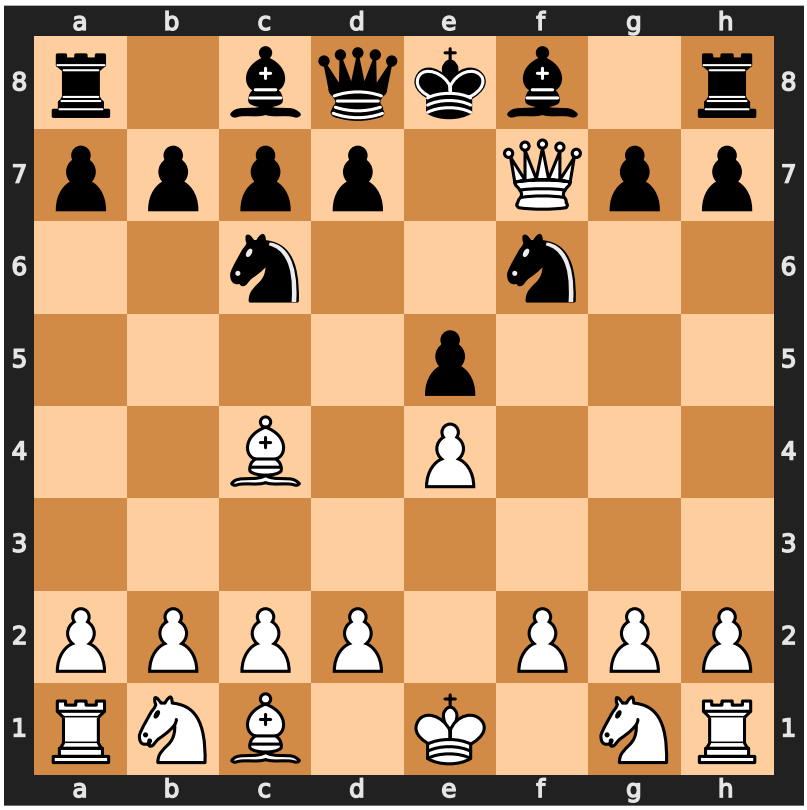

Figure 40.22: Chess Position

~5 min

Hint 1: Black is in check. What are the possible replies? Hint 2: Kd8 is the only legal move (Ke7 is not possible with the queen on f7). After Kd8, is Black lost or can Black fight back? Hint 3: This is actually a lost position for Black. The key line involves Qf8# or winning the rook. Calculate the consequences.

Exercise 12.22

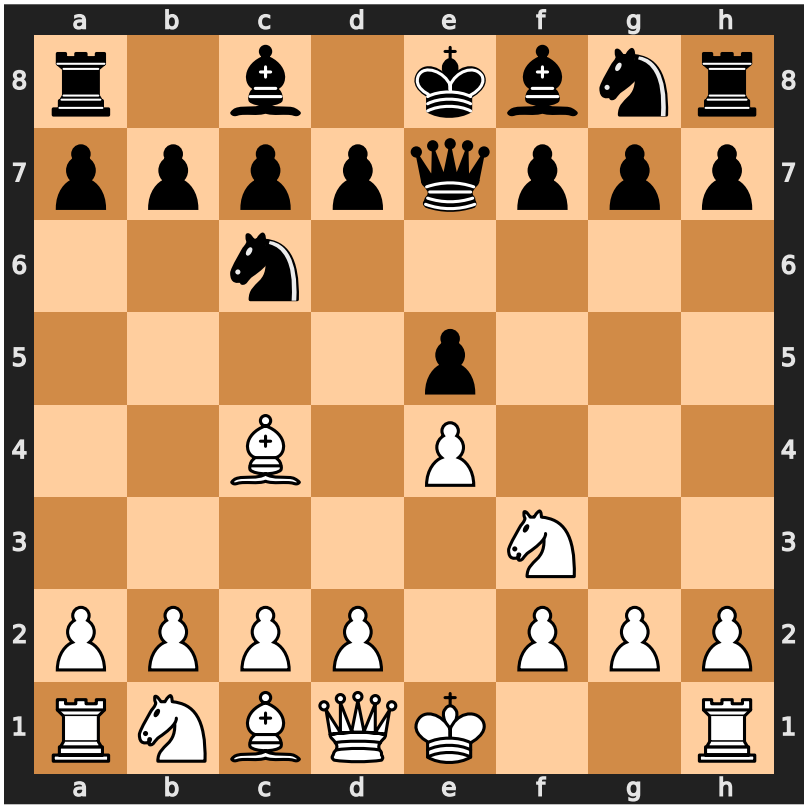

Figure 40.23: Chess Position

White to move. Black has played Qe7, blocking the bishop and defending e5. What is White's best continuation? Calculate three moves deep.

~5 min

Hint 1: Black's queen on e7 is solid but blocks the f8 bishop. How can White exploit this? Hint 2: Consider O-O (development), d4 (center), and Nc3 (development). Calculate each. Hint 3: O-O is safest and strongest. After O-O, White can follow with d4 next move when Black's bishop is still stuck.

Exercise 12.23

White to move. Philidor Defense structure. Find the strongest continuation and calculate three moves deep.

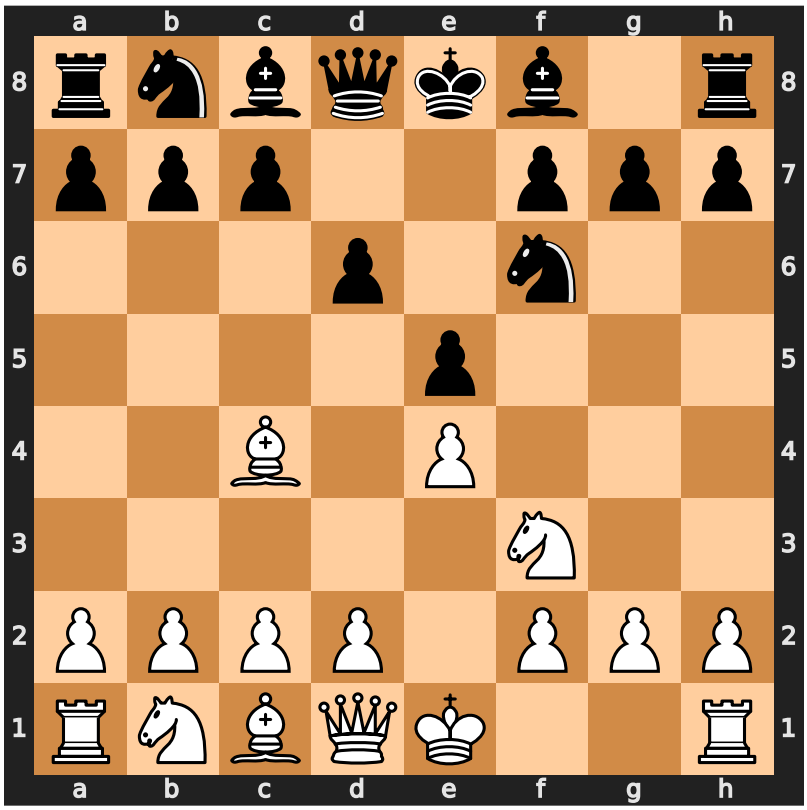

Figure 40.24: Chess Position

~5 min

Hint 1: Black's pawn on d6 is solid but passive. How does White fight for the center? Hint 2: d4 is the main move. Calculate what happens after d4 exd4 and after d4 Nbd7. Hint 3: After d4 exd4 Nxd4, White has a strong center and active pieces. Calculate one more move in each line.

Exercise 12.24

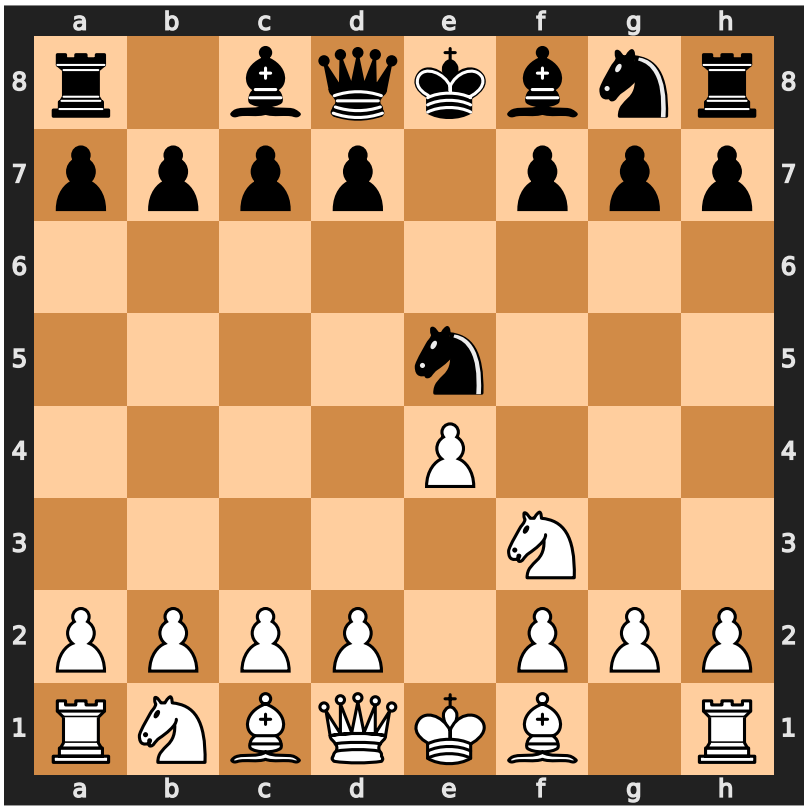

Figure 40.25: Chess Position

White to move. After 1. e4 e5 2. Nf3 Nc6 3. Nxe5 Nxe5. White has won a pawn, but can it be held? Calculate.

~5 min

Hint 1: White took on e5 and Black recaptured. White is up a pawn. But is the e4 pawn safe? Hint 2: After d4, White solidifies the center and keeps the extra pawn. Calculate Black's best response. Hint 3: d4 is strong. After d4 Nc6 (or Ng6), White plays d5 or develops with Bd3. White keeps a healthy extra pawn.

Exercise 12.25

White to move. Italian Game with an early c3. Calculate the consequences of d4.

~5 min

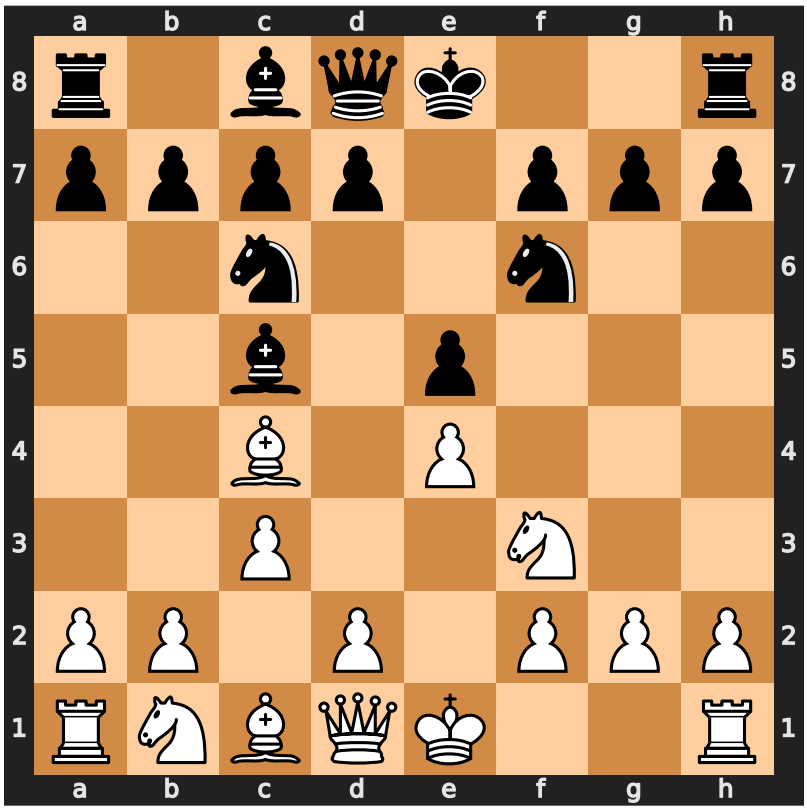

Figure 40.26: Chess Position

Hint 1: c3 was played to support d4. Now it is time to push. What happens? Hint 2: After d4 exd4 cxd4, calculate Black's best reply and where the pieces go. Hint 3: After d4 exd4 cxd4 Bb4+ (or Bb6), White plays d5 or Bd2. Calculate both.

Exercise 12.26

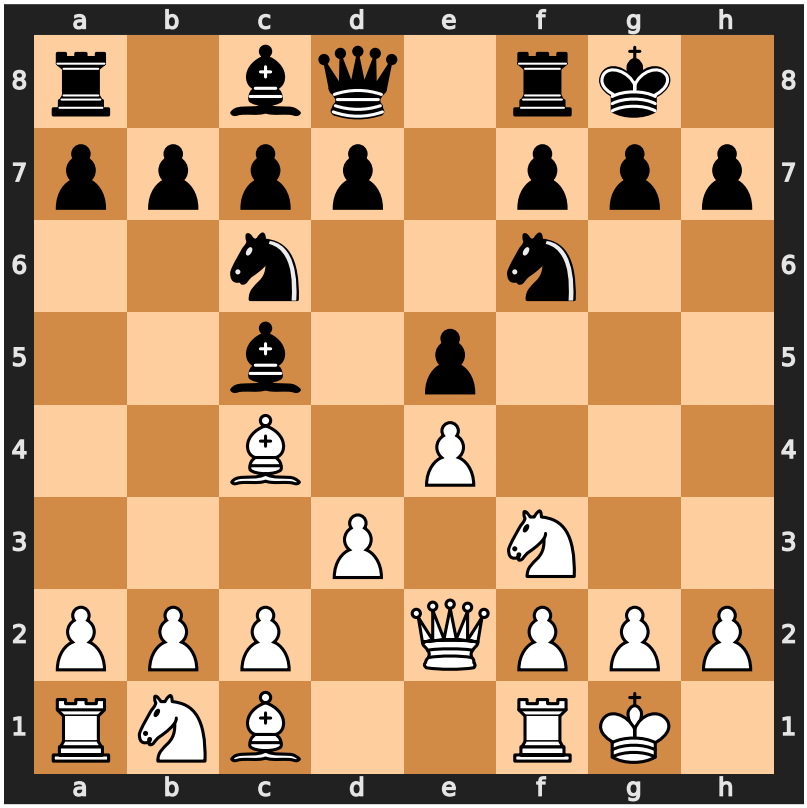

Figure 40.27: Chess Position

White to move. Quiet Italian position. White has Qe2 and a knight on f3. Find the best plan and calculate four moves deep.

~8 min

Hint 1: The position is quiet. Think about piece repositioning rather than forcing moves. Hint 2: Consider c3 (preparing d4), Nbd2 (supporting e4 and heading to f1-g3), or a4 (queenside space). Hint 3: c3 followed by d4 is the most principled plan. Calculate: c3 d6, d4 Bb6, and then evaluate.

Exercise 12.27

White to move. Four Knights / Italian hybrid. Black has Bb4 pinning the knight. Calculate the consequences of Nxe5.

~8 min

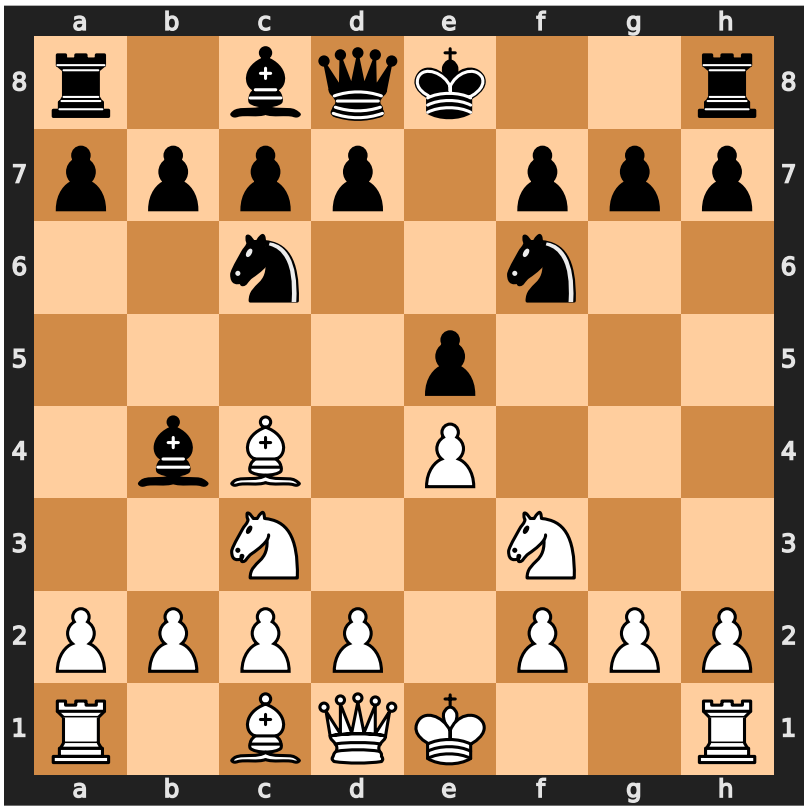

Figure 40.28: Chess Position

Hint 1: Nxe5 is a tactical try. After Nxe5 Nxe5, is d4 possible? Hint 2: After Nxe5 Nxe5 d4, Black can play Bxc3+ or Nc6. Calculate both. Hint 3: After Nxe5 Nxe5 d4 Nc6 (or Bxc3+), the position opens favorably for White. Calculate the full sequence.

Exercise 12.28

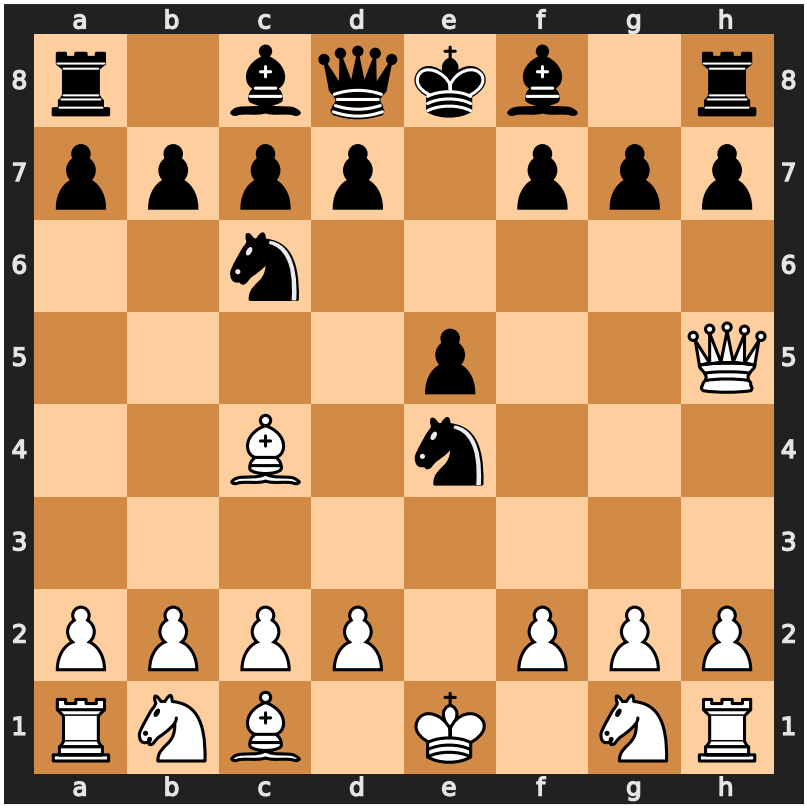

Figure 40.29: Chess Position

White to move. A classic position from the Italian Game. White has Qh5 and Bc4, targeting f7. Black has played Nxe4. Can White win material? Calculate.

~8 min

Hint 1: White is threatening Qxf7 mate. But Black just took on e4. Is there a way to win? Hint 2: Consider Qxf7+. After Qxf7+ Ke7 (forced), what comes next? Hint 3: After Qxf7+ Ke7, White needs to keep the pressure. Look at d4, trying to open lines. Or Qf5, keeping threats alive.

Exercise 12.29

White to move. Scotch Four Knights with Bg5. Calculate what happens after Nd5.

~8 min

Hint 1: Nd5 attacks the knight on f6 and the bishop on b4. What must Black do? Hint 2:

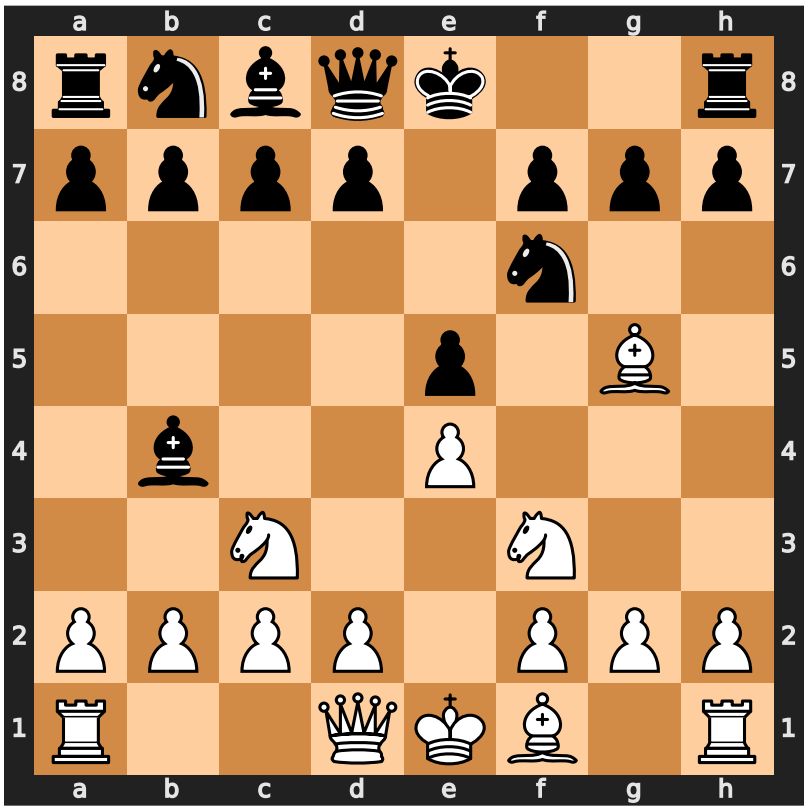

Figure 40.30: Chess Position

After Nd5, Black can play Nxd5, Be7, or Ba5. Calculate each. Hint 3: After Nd5 Nxd5 exd5, the position opens and White's bishops become powerful. Calculate one more move.

Exercise 12.30

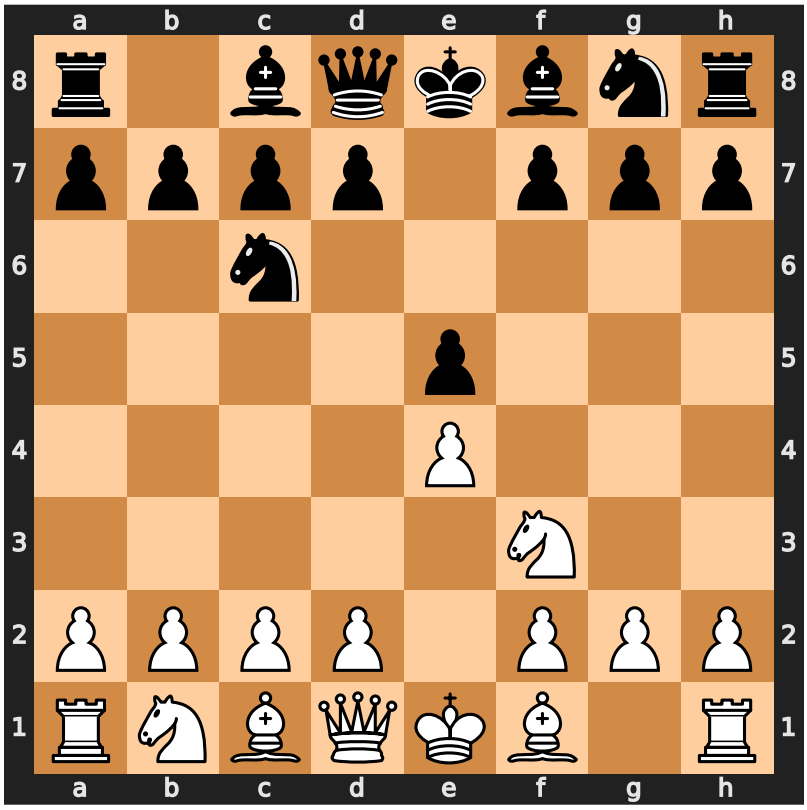

Figure 40.31: Chess Position

White to move. After 1. e4 e5 2. Nf3 Nc6. Calculate the consequences of 3. d4 exd4 4. Nxd4 and three more moves of each side's best play.

~8 min

Hint 1: This is the Scotch Game. After d4 exd4 Nxd4, Black can play Nf6, Bc5, or Nxd4. Hint 2: After 3. d4 exd4 4. Nxd4 Nf6 5. Nxc6 bxc6, evaluate: White has exchanged knights and Black has doubled c-pawns. Is this good for White? Hint 3: After 4. Nxd4 Bc5, the knight on d4 is attacked. Calculate 5. Be3, 5. Nb3, and 5. Nxc6. Which is best?

Exercise 12.31

White to move. After 1. e4 e5 2. Nf3 Nc6 3. Bc4 Nf6 4. O-O Qe7. Black delays castling. Find the strongest continuation and calculate.

~8 min

Hint 1: Black's queen on e7 blocks the bishop. This is a developmental problem. How do you exploit it? Hint 2: d4 is thematic. After d4, what happens if Black takes? What if Black does

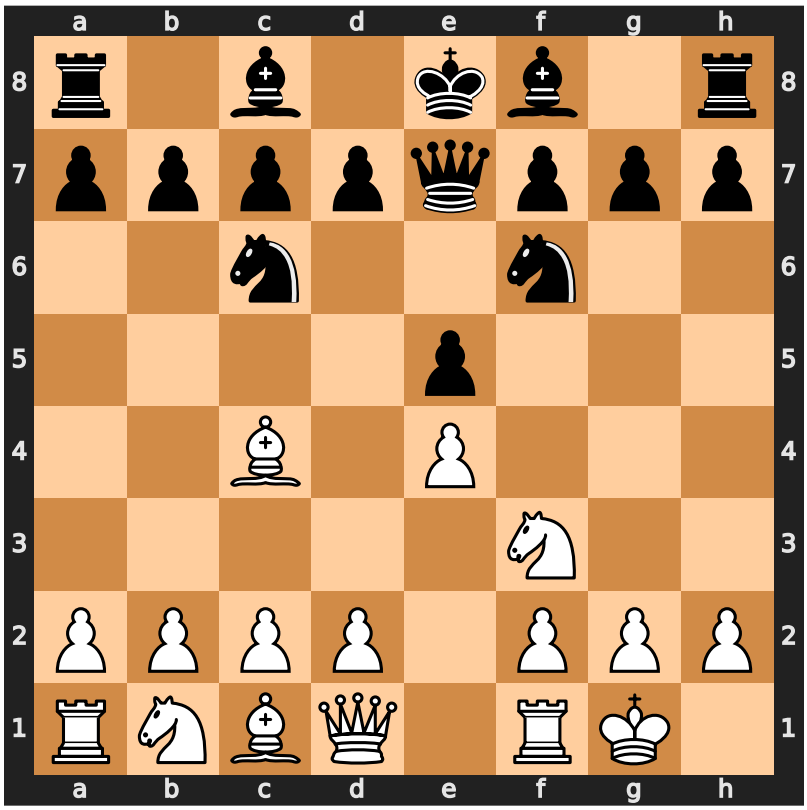

Figure 40.32: Chess Position

not take? Hint 3: After d4 d6 (defending e5), White plays d5! gaining space and kicking the knight. Calculate the consequences.

Exercise 12.32

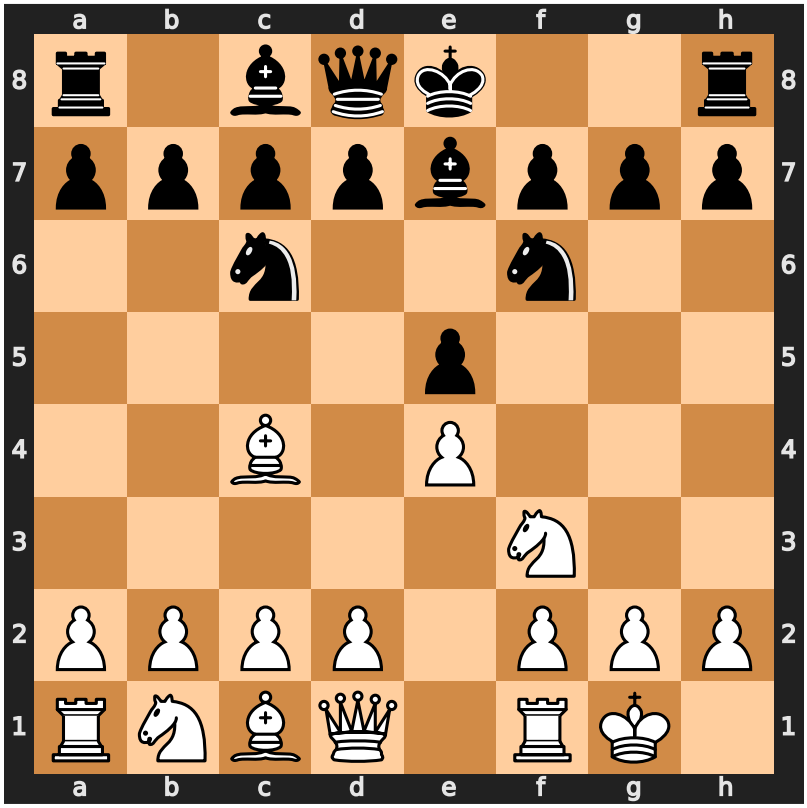

Figure 40.33: Chess Position

White to move. Italian Game, Classical setup. Black has Be7 instead of Bc5. Find the best plan and calculate.

~8 min

Hint 1: With the bishop on e7 instead of c5, Black is playing more solidly. White needs an active plan. Hint 2: d4 is again the key break. Calculate d4 d6 and d4 exd4. Hint 3: After d4 d6 d5 Nb8 (the knight retreats), White has a large space advantage. This is the key position to evaluate.

Exercise 12.33

White to move. Semi-Slav Defense. Calculate the consequences of the thematic central break with e4 or the developing move Bd3.

~8 min

Hint 1: e4 and Bd3 are both logical. Which should come first? Hint 2: Bd3 is more flexible. It develops a piece and prepares e4 for later. Calculate Bd3 dxc4 Bxc4. Hint 3: After Bd3, if

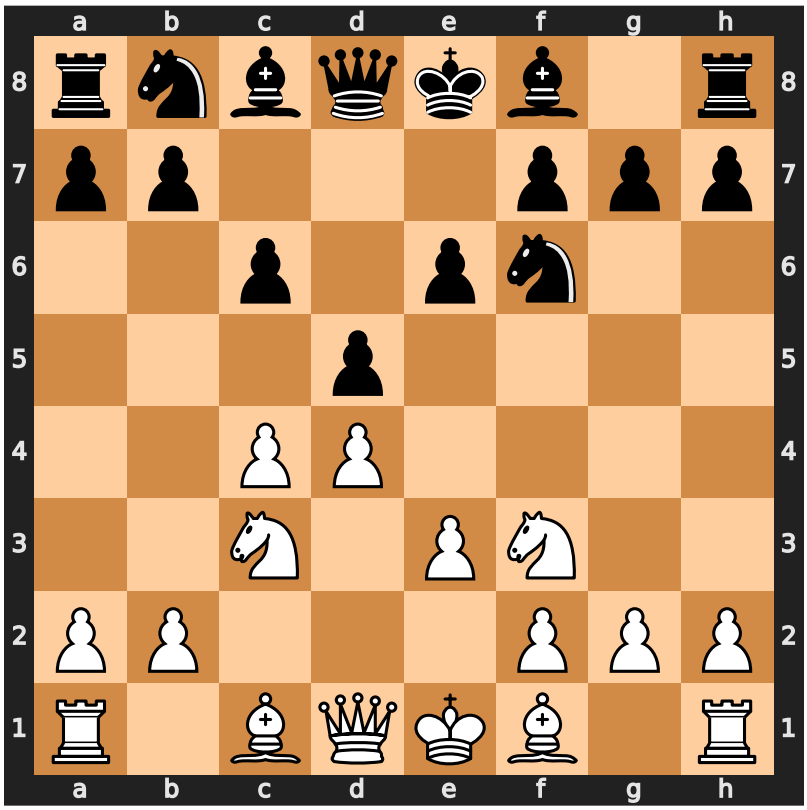

Figure 40.34: Chess Position

Black plays dxc4 Bxc4, White has an active position. But if Black plays Nbd7 instead, White can push e4 under better circumstances.

Exercise 12.34

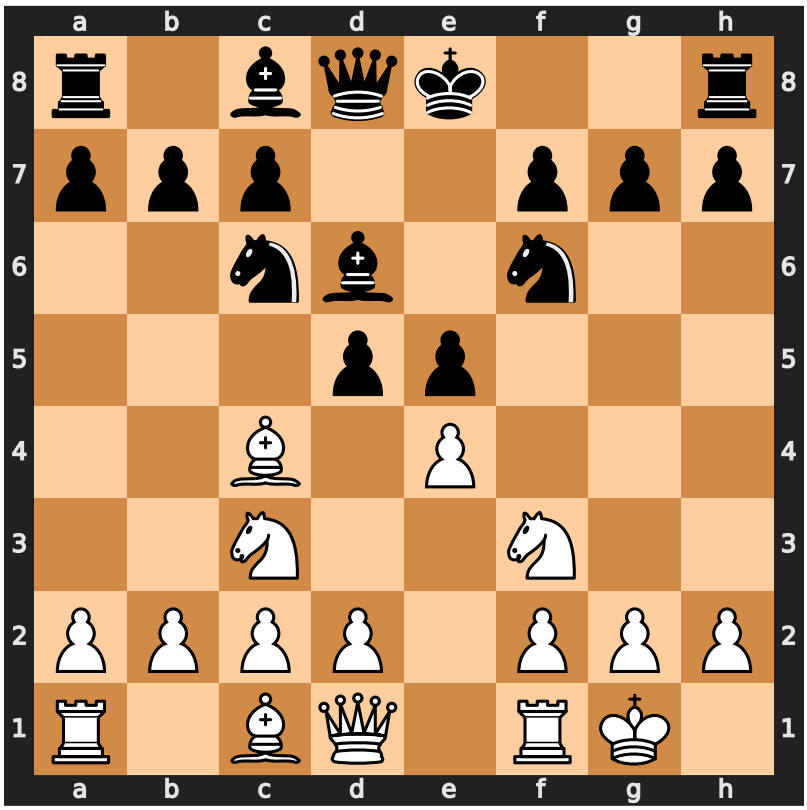

Figure 40.35: Chess Position

White to move. A tactical position. Black has played d5 aggressively. Is there a tactic? Calculate.

~8 min

Hint 1: Black's d5 pawn attacks the bishop on c4 and the pawn on e4. But has Black left anything undefended? Hint 2: Look at exd5 and then check if Nxd5 leads to anything. Hint 3: After exd5 Nxd5 Nxd5 Qxd5, the queen is exposed. Can White exploit this with Bb5+ or a similar move?

Exercise 12.35

White to move. Sicilian Defense with an early Qb6. Calculate three candidates each to depth 3.

~8 min

Hint 1: Black's queen is on b6, eyeing b2. Does White need to defend b2? Hint 2: Consider d4, e5, and Rb1. Calculate each to its conclusion. Hint 3: d4 opens the center and ignores the queen's pressure. After d4 cxd4 Nxd4, White has rapid development. Is b2 really hanging?

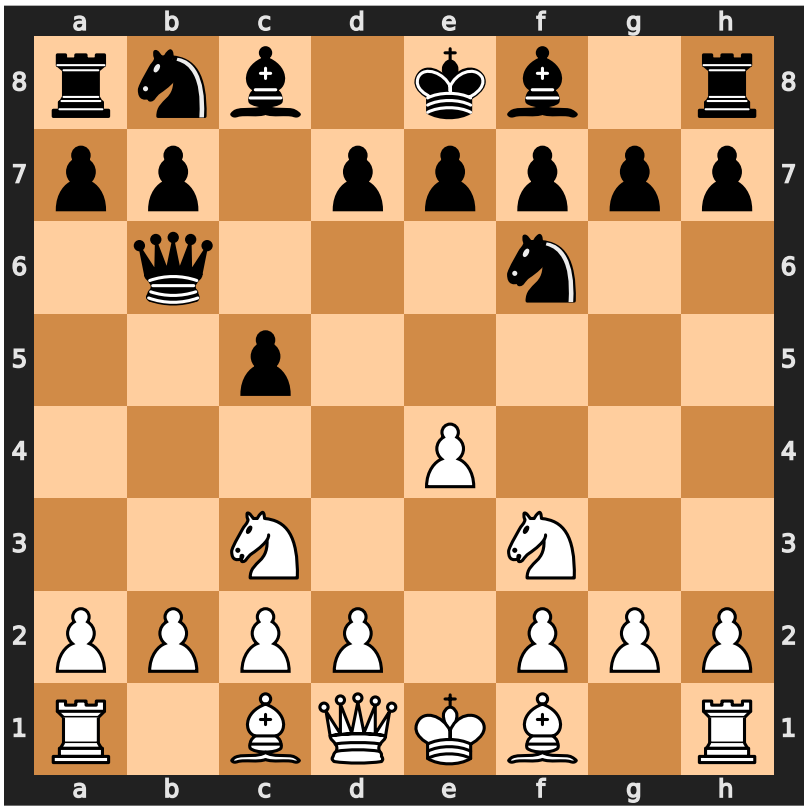

Figure 40.36: Chess Position

Exercise 12.36

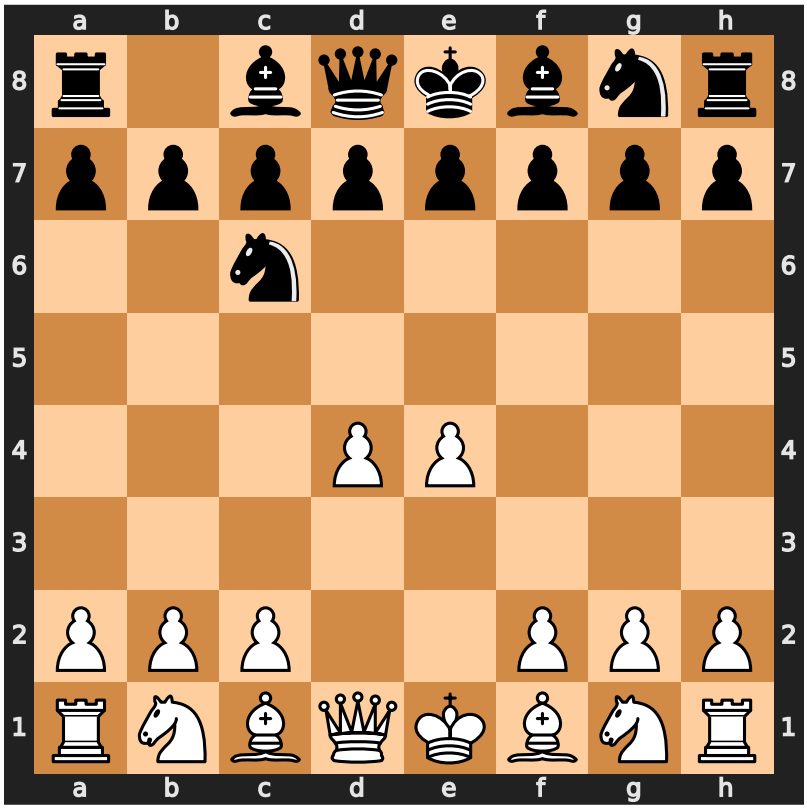

Figure 40.37: Chess Position

Black to move. After 1. d4 Nc6 2. e4. An unusual opening. List candidates for Black and calculate each.

~8 min

Hint 1: White has a big center. Black needs to challenge it or develop and prepare to challenge it. Hint 2: Consider d5, e5, and Nf6. Each fights the center differently. Hint 3: e5 is the most active. It directly attacks d4. After e5 d5 Nce7, Black will reroute the knight to g6.

Exercise 12.37

White to move. Italian Game, Black has played Ne7 instead of Nf6. Calculate d4 and its consequences.

~8 min

Hint 1: d4 strikes at the center. After d4 exd4 cxd4, the bishop on c5 must retreat. Hint 2: After d4 exd4 cxd4 Bb6, White has a strong center. What is the next step? Hint 3: After d4 exd4 cxd4 Bb6 d5 Na5, White has gained significant space. Evaluate this position.

Exercise 12.38

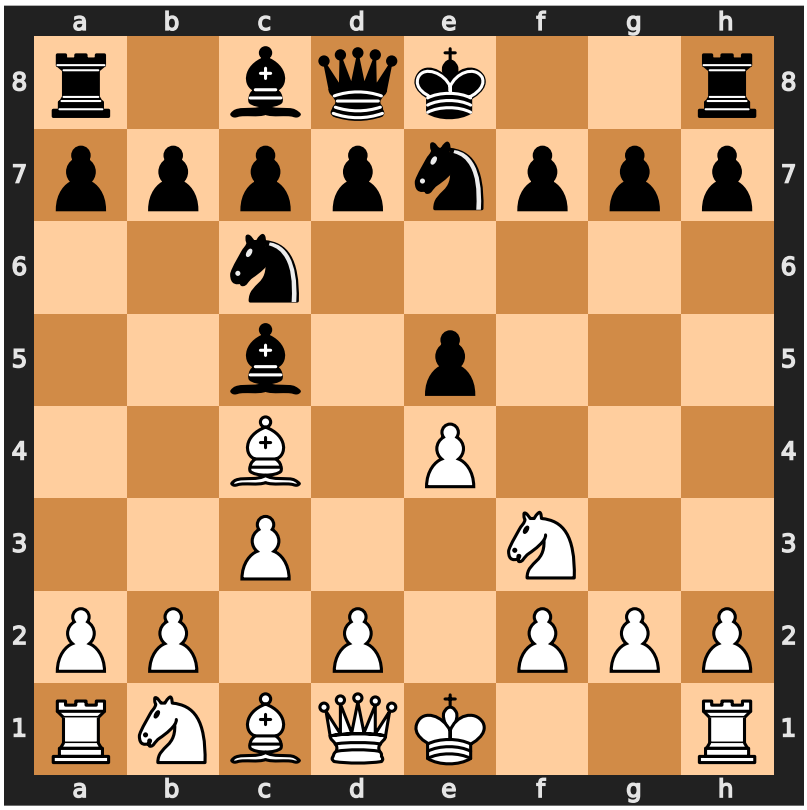

Figure 40.38: Chess Position

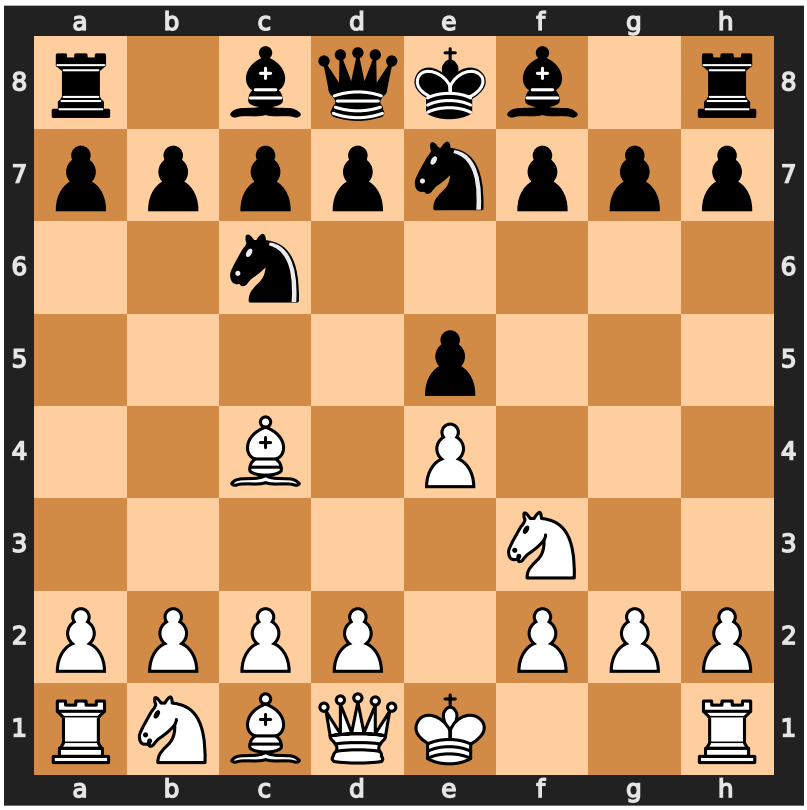

Figure 40.39: Chess Position

White to move. Black has played Ne7 early. Calculate two different plans for White: aggressive (d4) and quiet (O-O), each to depth 3.

~8 min

Hint 1: Ne7 is unusual. It blocks the f8 bishop. White should try to punish the slow development. Hint 2: d4 exploits the lead in development. After d4 exd4 Nxd4, White stands well. But what about O-O followed by d4? Hint 3: Both plans are strong, but d4 is more energetic. Calculate: d4 exd4 Nxd4 Nxd4. Then what?

Exercise 12.39

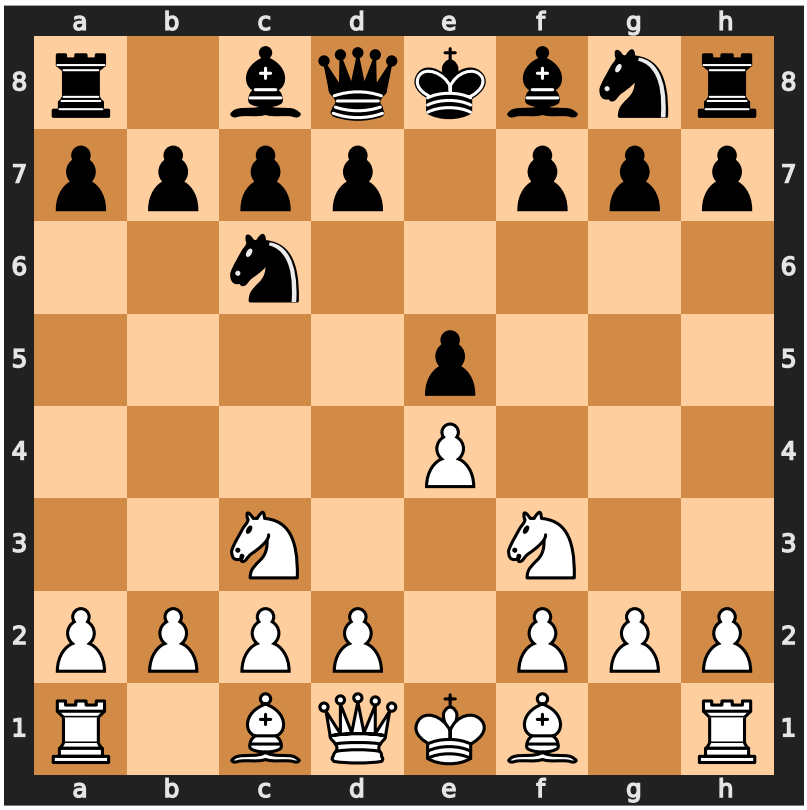

Figure 40.40: Chess Position

White to move. Three Knights Game. Calculate two plans: d4 (Scotch-like) and Bb5 (Ruy Lopez-like), each to depth 3.

~8 min

Hint 1: Both d4 and Bb5 are strong. Which is more forcing? Hint 2: d4 exd4 Nxd4 leads to a Scotch structure. Bb5 leads to a Ruy Lopez structure but without d4 being played yet. Hint 3: d4 is more forcing and leads to clearer play. After d4 exd4 Nxd4 Nf6 (or Bc5), calculate.

Exercise 12.40

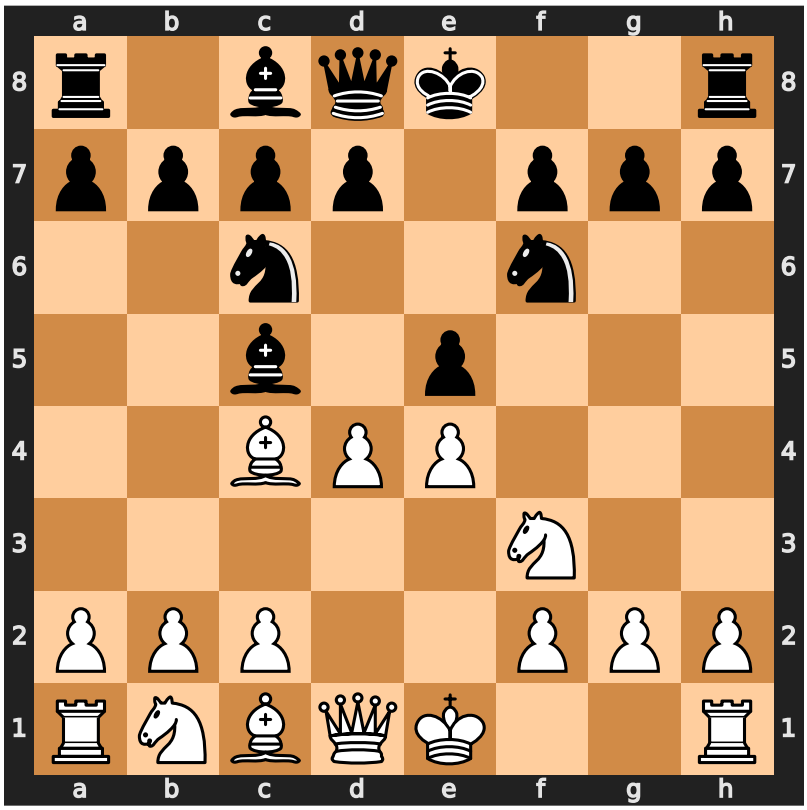

Figure 40.41: Chess Position

Black to move. White has played d4 in the Italian Game. Calculate Black's three main responses: exd4, d6, and Nxe4. Which is best?

~8 min

Hint 1: exd4 opens the center. d6 keeps it closed. Nxe4 is a tactical try. Which suits your style? Hint 2: After exd4 Nxd4, the position is open. After Nxe4, calculate Nxe4 d5! This is a critical trick. Hint 3: exd4 is the safest. After exd4 Nxd4 Nxd4 (or Nf6), calculate two more moves.

40.10.3 Group C: Visualization Drills (Exercises 12.41–12.60)

These exercises train your ability to hold positions in your head. No board required for some, but use one to check your answers. Difficulty: to

---

Exercise 12.41

What color is the square d4?

Answer without looking at a board. Then check.

Hint: d = 4th file. Rank = 4. Sum = 8 (even). What color is an even-sum square?

Exercise 12.42

What color is the square f5?

Hint: f = 6th file. Rank = 5. Sum = 11 (odd). What color is an odd-sum square?

Exercise 12.43

What color is the square a1?

Hint: This is the corner square. It is the reference square for the entire board.

Exercise 12.44

What color is the square h1?

Hint: h = 8th file. Rank = 1. Sum = 9. Light or dark?

Exercise 12.45

What color is the square c7?

Hint: c = 3rd file. Rank = 7. Sum = 10. Even or odd?

Exercise 12.46

Set up your board: Place a White knight on e4. No other pieces.

Question: Without moving the knight, list every square it can reach in one jump. You should find eight squares. Write them down. Then check.

Hint 1: A knight moves in an L-shape: two squares in one direction, one square perpendicular. Hint 2: From e4, the knight can reach: d2, f2, c3, g3, c5, g5, d6, f6. Hint 3: Count to make sure you have eight. If you have fewer, you missed one of the L-shapes.

Exercise 12.47

Set up your board: Place a White bishop on d4. No other pieces.

Question: Without moving the bishop, list every square on the a1-h8 diagonal that the bishop controls. Then list every square on the g1-a7 diagonal.

Hint 1: The a1-h8 diagonal goes through a1, b2, c3, d4, e5, f6, g7, h8. Hint 2: The g1-a7 diagonal goes through g1, f2, e3, d4, c5, b6, a7. Hint 3: The bishop controls all these squares (minus d4 itself, where it sits).

Exercise 12.48

Set up your board with the following position:

White king on d5, Black king on g2. No other pieces.

Question: Can the White king reach f7 in three moves? Calculate without moving pieces.

Hint 1: From d5, the king can move one square in any direction per move. Hint 2: d5-e6-f7 is two moves, but you need to check if Black's king interferes. Hint 3: Black's king on g2 is far away. Yes, Ke6-Kf7 is easily achieved in two moves. Three moves gives even more options.

Exercise 12.49

Mental exercise (no board needed):

Imagine the starting position of a chess game. Now play the following moves in your head:

1. e4 e5 2. Nf3 Nc6 3. Bb5

Question: Where is every piece on the board after these three moves? List all 32 pieces and their squares.

~3 min

Hint 1: Only five pieces have moved from their starting squares: e-pawns, the f1-bishop, the g1-knight, and the b8-knight. Hint 2: White pieces that moved: pawn from e2 to e4, knight from g1 to f3, bishop from f1 to b5. All other white pieces are on their starting squares. Hint 3: Black pieces that moved: pawn from e7 to e5, knight from b8 to c6. All other black pieces are on their starting squares.

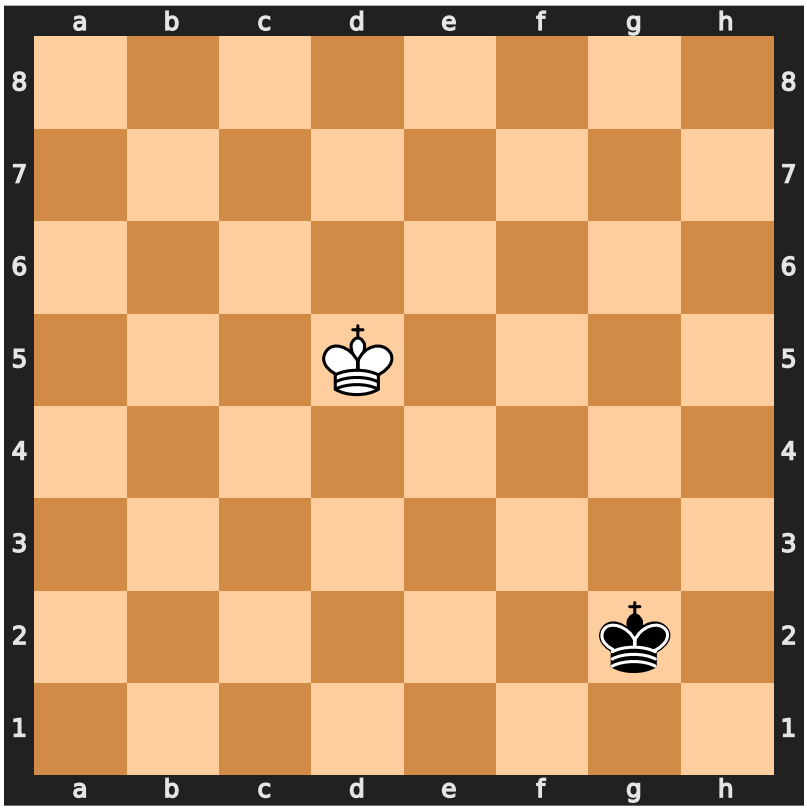

Figure 40.42: Chess Position

Exercise 12.50

Mental exercise:

From the starting position, play: 1. d4 d5 2. c4 e6 3. Nc3 Nf6

Question: What pieces are on the third rank? List them all.

~3 min

Hint 1: Only knights are typically on the third rank this early. Hint 2: White has a knight on c3. Black has a knight on f6 (which is the sixth rank from White's perspective, or the third from Black's). Hint 3: Nc3 for White, Nf6 for Black. No other pieces are on the third or sixth ranks.

Exercise 12.51

Set up your board:

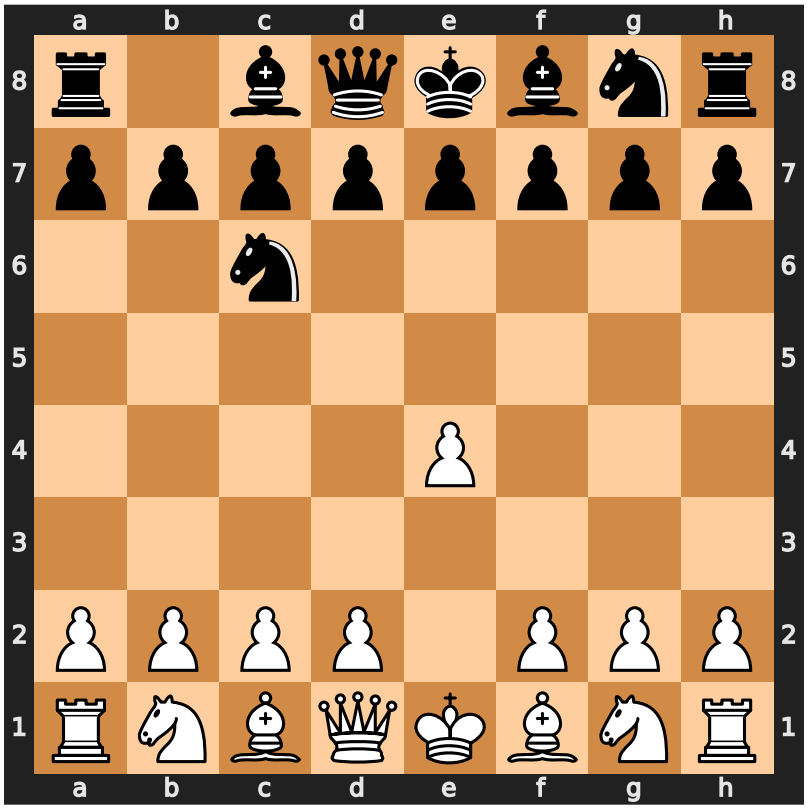

Figure 40.43: Chess Position

After 1. e4 Nc6. Look at the position for 30 seconds. Then look away.

Question: What square is the Black knight on? What is the color of that square? What squares does the knight control from there?

Hint 1: The knight went to c6. Hint 2: c = 3, rank = 6. Sum = 9 (odd). Light square. From

c6, the knight controls: a5, b4, d4, e5, e7, d8, b8, a7. Hint 3: Wait, b8 and d8 are occupied (or were originally). The knight CONTROLS those squares even if pieces are on them.

Exercise 12.52

Mental exercise:

From the starting position, play: 1. e4 e5 2. Nf3 Nc6 3. Bc4 Bc5 4. O-O

Question: Where is White's king after 4. O-O? Where is White's rook? Answer without a board.

Hint 1: Castling kingside moves the king from e1 to g1 and the rook from h1 to f1. Hint 2: King is on g1, rook is on f1. The rook on a1 has not moved.

Exercise 12.53

Set up your board:

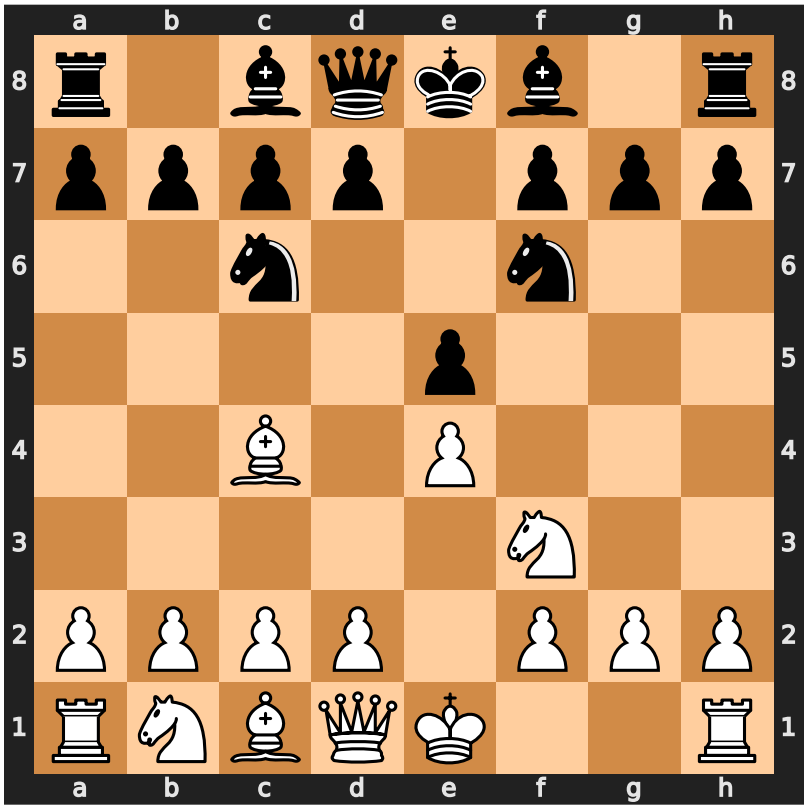

Figure 40.44: Chess Position

Study the position for 30 seconds. Look away.

Question: Now play 4. d4 in your mind. After 4. d4 exd4 5. Nxd4, describe the complete position: all pieces and pawns for both sides.

~5 min

Hint 1: Track what moved: White's d-pawn is gone (captured), Black's e-pawn is gone (captured on d4, then White's knight recaptured). Hint 2: After these exchanges, White has: Ke1, Bc4, Nd4, Bc1, Nb1, Ra1, Rh1, Qd1, pawns on a2, b2, c2, e4, f2, g2, h2. Hint 3: Black has: Ke8, Bc8, Nc6, Bf8, Ra8, Rh8, Qd8, Nf6, pawns on a7, b7, c7, d7, f7, g7, h7.

Exercise 12.54

Mental exercise:

From the starting position: 1. e4 c5 2. Nf3 d6 3. d4 cxd4 4. Nxd4

Question: How many pawns does each side have? Where are White's pawns? Where are Black's? Answer without a board.

~4 min

Hint 1: White started with 8 pawns and pushed e4 and d4. The d4-pawn was captured and recaptured by the knight. Hint 2: White has 7 pawns: a2, b2, c2, e4, f2, g2, h2. The d-pawn was captured. Hint 3: Black has 7 pawns: a7, b7, d6, e7, f7, g7, h7. The c-pawn was captured on d4.

Exercise 12.55

Set up your board:

Look at the position for 30 seconds. Look away.

Now play the following sequence in your head: 5. d4 d6 6. O-O O-O

Question: After 6. O-O O-O, describe the position. Where are both kings? Are both rooks on f1 and f8?

~5 min

Hint 1: Both sides castle kingside. White's king goes to g1, rook to f1. Black's king goes to g8, rook to f8. Hint 2: The d-pawn has been pushed to d4 and Black responded d6. So White has a pawn on d4, Black has a pawn on d6. Hint 3: Full description: White king g1, rook f1, rook a1. Pawn on d4 added. Black king g8, rook f8, rook a8. Pawn on d6 added. All other pieces in their previous positions.

Exercise 12.56

Mental exercise:

From the starting position: 1. d4 Nf6 2. c4 g6 3. Nc3 Bg7 4. e4 d6

Question: Name every piece that is NOT on its starting square. What square is it on?

~4 min

Hint 1: Count the moves. Eight half-moves have been played. That means eight pieces/pawns have moved from their starting positions. Hint 2: White: d-pawn to d4, c-pawn to c4, Nc3,

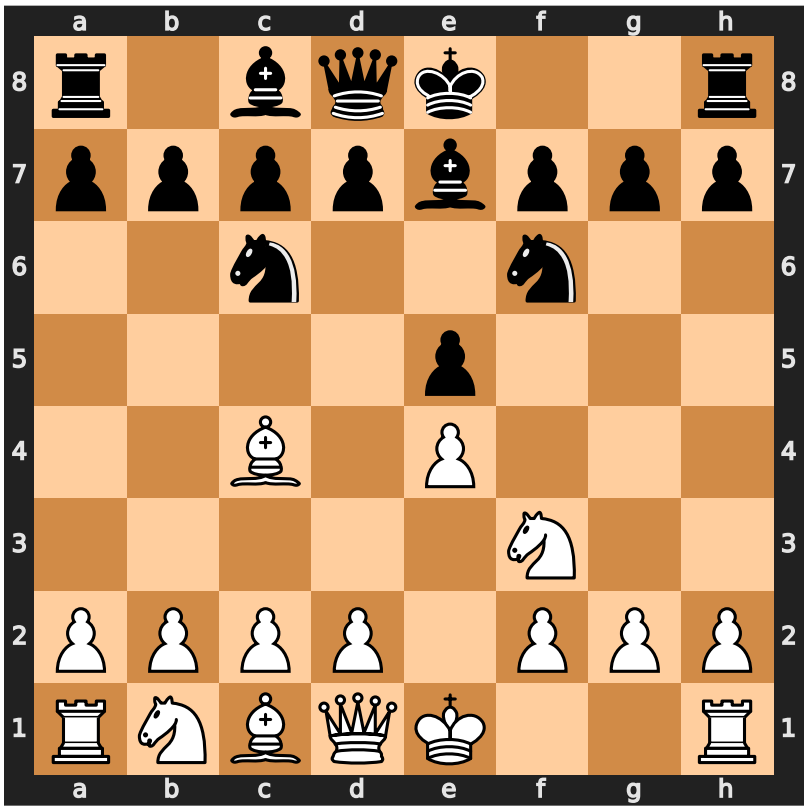

Figure 40.45: Chess Position

e-pawn to e4. Black: Nf6, g-pawn to g6, Bg7, d-pawn to d6. Hint 3: Eight units have moved. Everything else is on its original square.

Exercise 12.57

Set up your board:

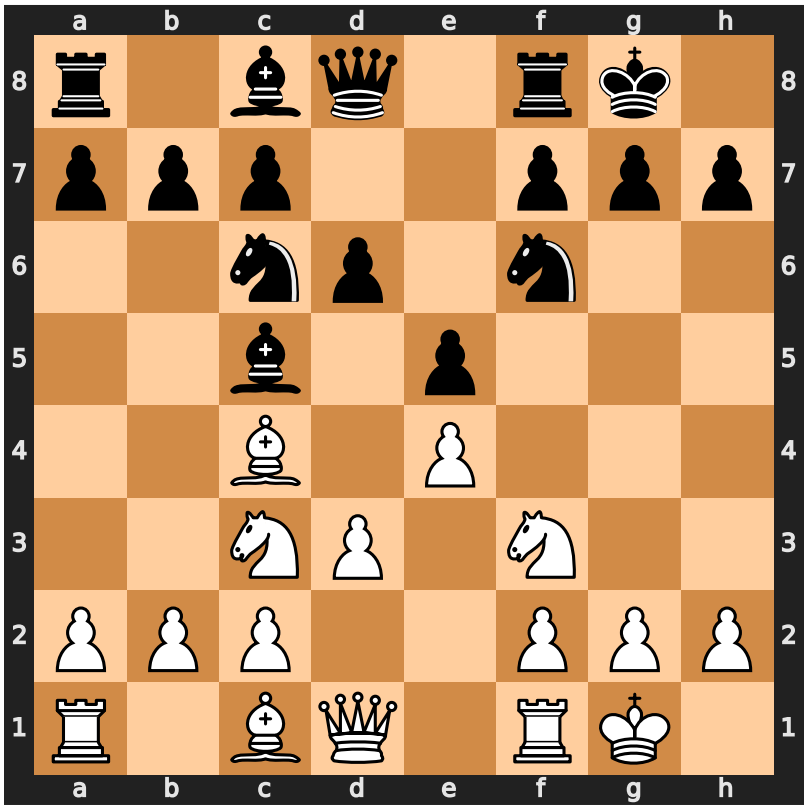

Figure 40.46: Chess Position

This is the key position from Exercise 12.05. Study it for 30 seconds. Look away.

Now calculate in your head: 1. d4 exd4 2. Nxd4 Nxd4 3. Qxd4

Question: After 3. Qxd4, what does the position look like? Describe: where is the queen? What has changed? How many knights does each side have?

~5 min

Hint 1: Track the exchanges. d4 was pushed and captured. The f3 knight recaptured on d4. Black's knight captured on d4. White's queen recaptured. Hint 2: After these exchanges: White lost the d-pawn (traded), the f3-knight (traded for Black's c6-knight via d4). White's queen is now on d4. Hint 3: White has one knight (on c3) and a queen on d4. Black has one knight (on f6) and no queen… wait, Black's queen is still on d8. Each side has lost one knight in the exchange.

Exercise 12.58

Mental exercise:

A White bishop is on c1. Can it reach h6 without being blocked, assuming no other pieces are on the board?

Question: What is the shortest path? How many moves does it take?

Hint 1: The c1 bishop is on a dark square. Is h6 a dark square? Hint 2: h = 8, rank = 6. Sum = 14 (even). Dark square. Yes, the bishop can reach it. Hint 3: c1-d2-e3-f4-g5-h6 is one path (5 moves). But the bishop can also go c1-f4-h6 (wait, f4 to h6 is not a legal bishop move). Shortest: c1-e3-h6? No, e3 to h6 is not a diagonal. The shortest is: c1 to d2 to h6 in… let's see. c1 to h6: they share the c1-h6 diagonal? c1, d2, e3, f4, g5, h6. Yes! That IS a single diagonal. So the bishop goes from c1 to h6 in ONE move.

Exercise 12.59

Set up your board:

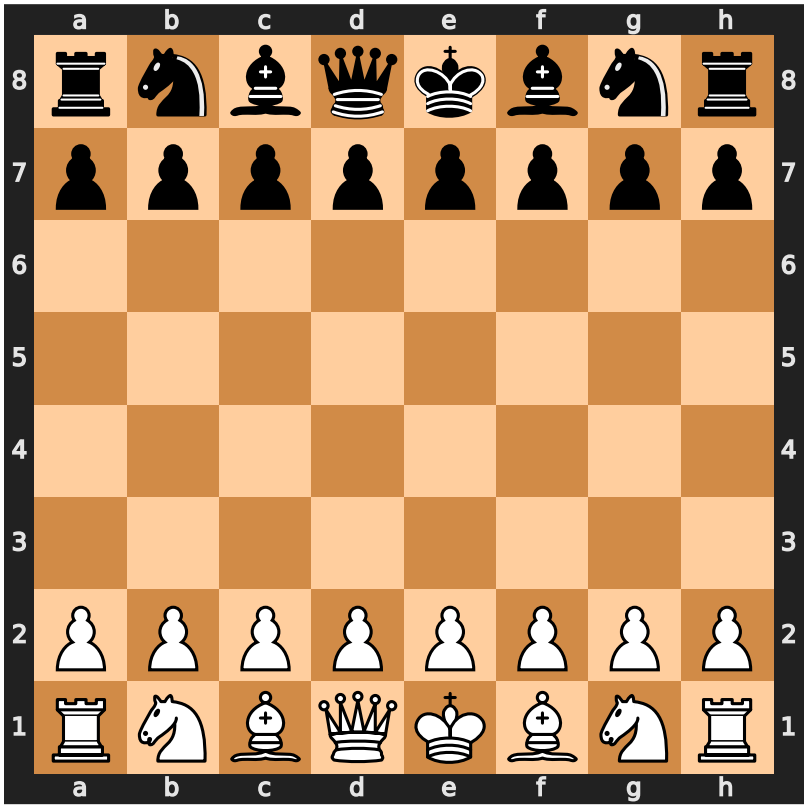

Figure 40.47: Chess Position

Starting position. Play the following in your head: 1. e4 e5 2. Nf3 Nc6 3. Bb5 a6 4. Ba4 Nf6 5. O-O Be7 6. Re1 b5 7. Bb3 O-O

Question: This is the Ruy Lopez, Closed Defense. Without a board, answer: Where are White's bishops? Where is Black's a-pawn? Where is Black's b-pawn?

~5 min

Hint 1: The bishop went from f1 to b5 to a4 to b3 (after Black pushed it with a6 and b5). The other bishop is still on c1. Hint 2: Black's a-pawn is on a6 (played on move 3). Black's b-pawn is on b5 (played on move 6). Hint 3: White's bishops: Bb3 (light-squared) and Bc1 (dark-squared, undeveloped). White should plan to develop this bishop soon.

Exercise 12.60

Mental exercise:

Without a board, answer: If a knight starts on a1, what is the minimum number of moves to reach h8?

Hint 1: a1 is a dark square. h8 is a dark square. Knights alternate colors with each move. So after an even number of moves, the knight is back on a dark square. Hint 2: The knight needs to cross the entire board. The most direct path: a1-b3-c5-d7-f8-h7… that does not quite reach h8. Hint 3: The minimum is 6 moves. One path: a1-b3-c5-e6-f8-g6-h8. But try to find a 6-move path yourself before checking.

40.10.4 Group D: Full Calculation Practice (Exercises 12.61–12.80)

For each position, apply the complete Kotov Method. Survey the position. List candidate moves. Calculate each. Choose the best move. Explain your reasoning. Difficulty: to

---

Exercise 12.61

White to move. Italian Game, Giuoco Piano. Apply the full Kotov Method. Survey. List at least three candidates. Calculate each to depth 3. Choose the best.

~10 min

Hint 1: Survey first: material is equal, both sides are developed, both kings are safe. The position is roughly symmetrical. Who has more options? Hint 2: Candidates: d4 (central break), a4 (queenside expansion), Bg5 (piece pressure). Calculate each. Hint 3: d4 is the strongest because it opens lines for White's pieces, especially the bishops. After d4 exd4 Nxd4, evaluate the resulting position.

Exercise 12.62

White to move. Queen's Gambit Declined structure. Apply the full Kotov Method.

~10 min

Hint 1: Survey: Black has a solid but passive setup. The pawn chain e6-d5 (wait, d5 is not there; d6 is) limits Black's bishop on c8. White should aim to exploit the extra space. Hint 2: Candidates: e4 (central break), Qe2 (supporting e4), and b3 (developing the c1-bishop to b2). Calculate each. Hint 3: e4 is the thematic break but must be calculated carefully. After e4 dxc4 Bxc4, White opens lines. But what if Black plays e5 instead?

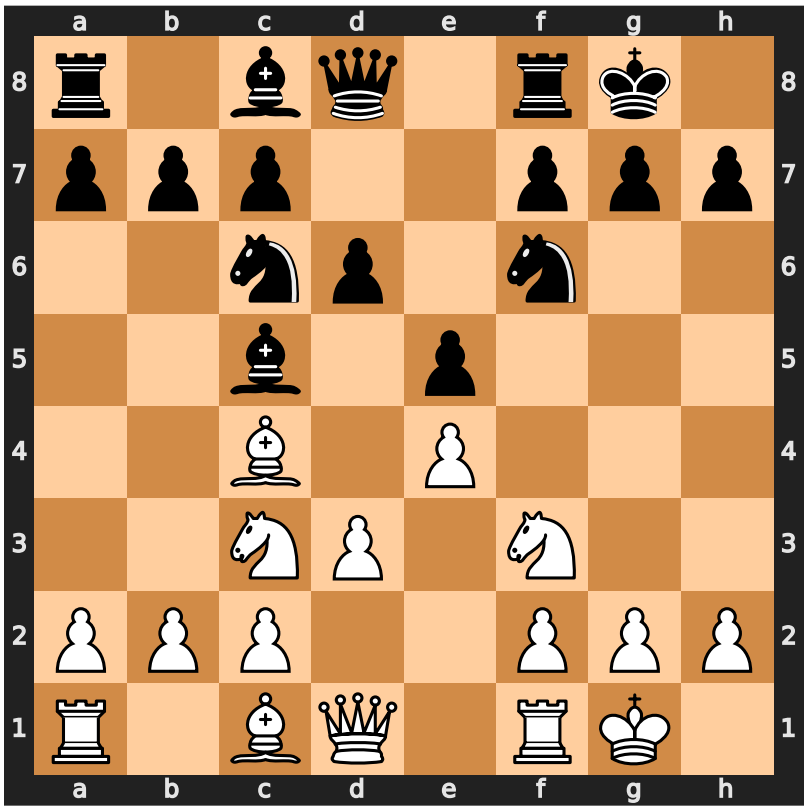

Figure 40.48: Chess Position

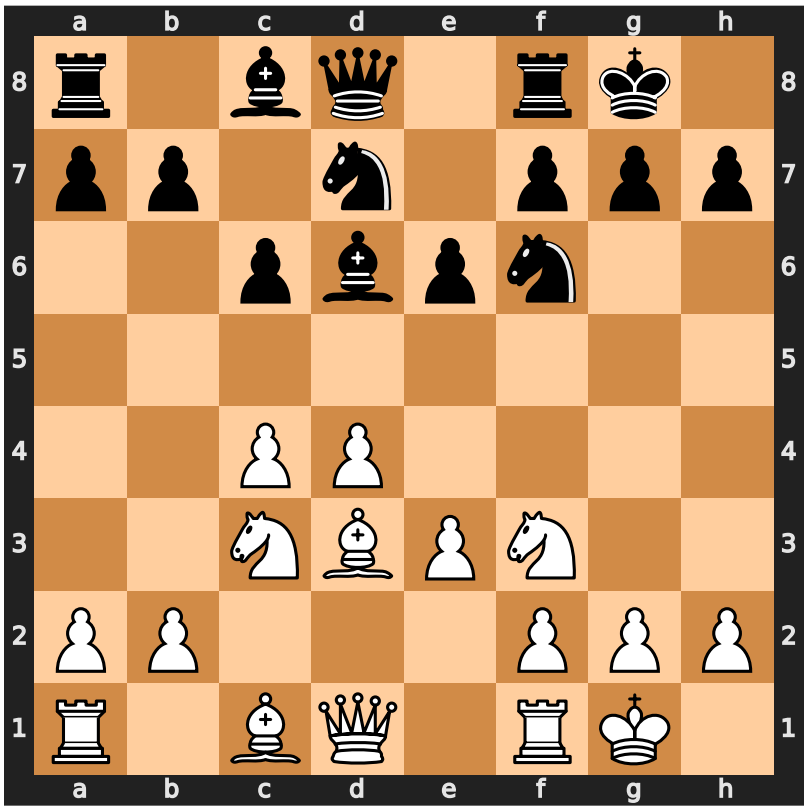

Figure 40.49: Chess Position

Exercise 12.63

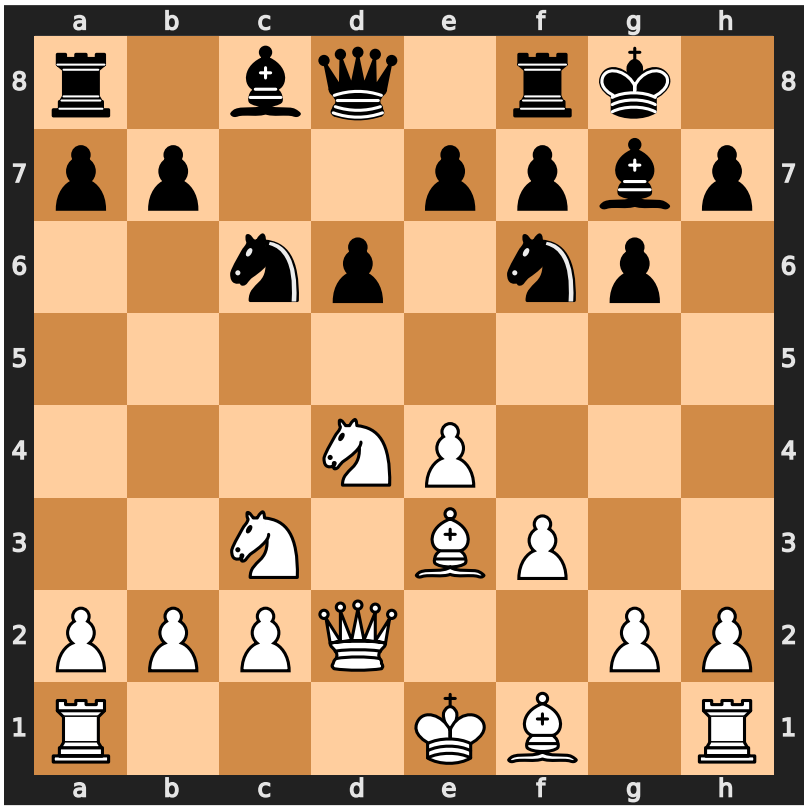

Figure 40.50: Chess Position

White to move. King's Indian / Pirc position. White has not yet castled. Apply the full Kotov Method.

~10 min

Hint 1: Survey: White's king is in the center. This is the top priority. Castling must be considered. Hint 2: Candidates: O-O-O (castle queenside and prepare kingside attack), Bc4 (active development), Be2 (safe development). Calculate each. Hint 3: O-O-O is the most ambitious. After O-O-O, White can launch g4-g5 pawn storms against Black's king. Calculate Black's counterplay with a5 or b5.

Exercise 12.64

White to move. London System. Both sides have developed bishops to f4/f5. Apply the full Kotov Method.

~10 min

Hint 1: Survey: symmetrical bishop development. White needs to complete development and find a plan. Hint 2: Candidates: Bd3 (challenging the f5 bishop), Be2 (safe), and Ne5 (aggressive centralization). Calculate each. Hint 3: Bd3 is the most interesting. It forces Black to make a

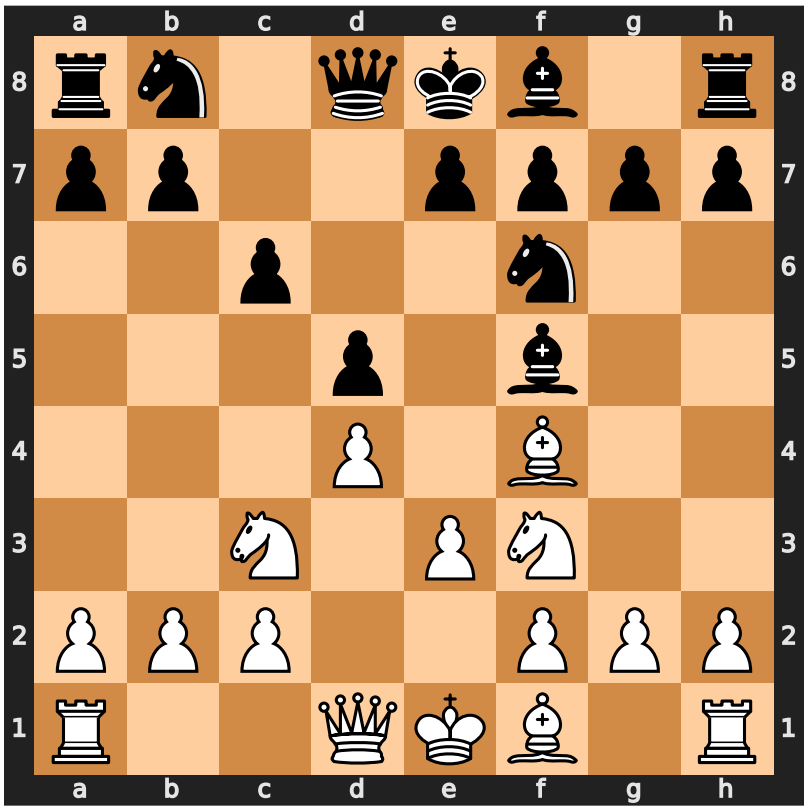

Figure 40.51: Chess Position

decision about the bishop on f5. After Bd3 Bxd3 Qxd3, White has a small advantage due to better piece placement.

Exercise 12.65

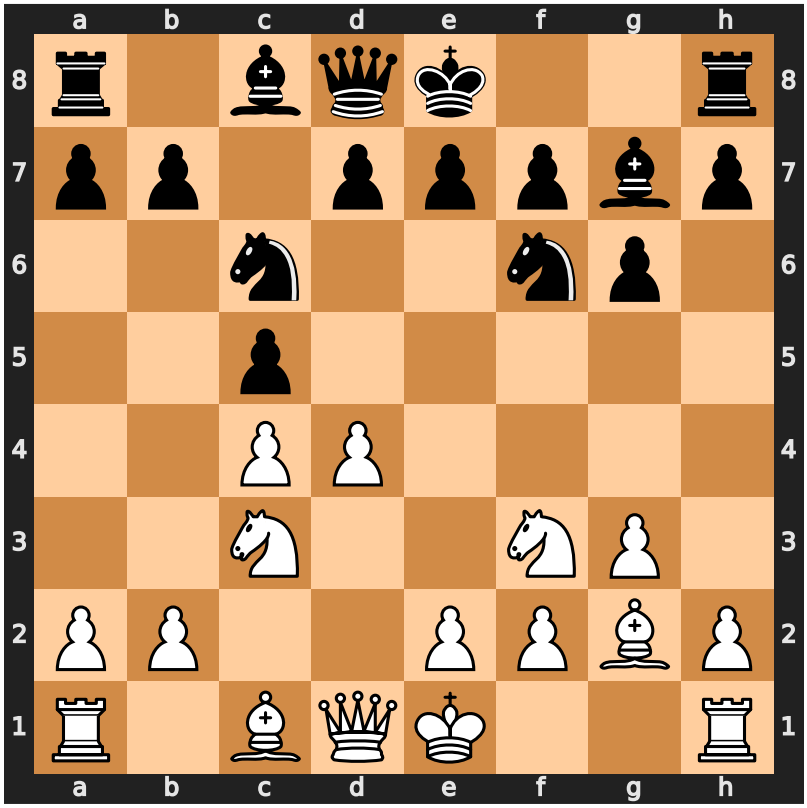

Figure 40.52: Chess Position

White to move. English Opening / King's Indian reversed. Apply the full Kotov Method.

~10 min

Hint 1: Survey: both sides have fianchettoed. The center is contested (d4 vs. c5). Material is equal. Plans revolve around the central tension. Hint 2: Candidates: d5 (closing the center), dxc5 (exchanging), and O-O (safety first). Calculate each. Hint 3: O-O first is the safest and most flexible approach. After O-O O-O, White can choose between d5 and dxc5 with better information.

Exercise 12.66

White to move. Queen's Gambit, Tartakower-like structure. The queen has come to b3 early. Apply the full Kotov Method with extra depth (4 moves per line).

~12 min

Hint 1: Survey: White's queen on b3 puts pressure on d5 and b7. Black is solidly developed. The position requires strategic maneuvering. Hint 2: Candidates: cxd5 (resolve the center), Bd3

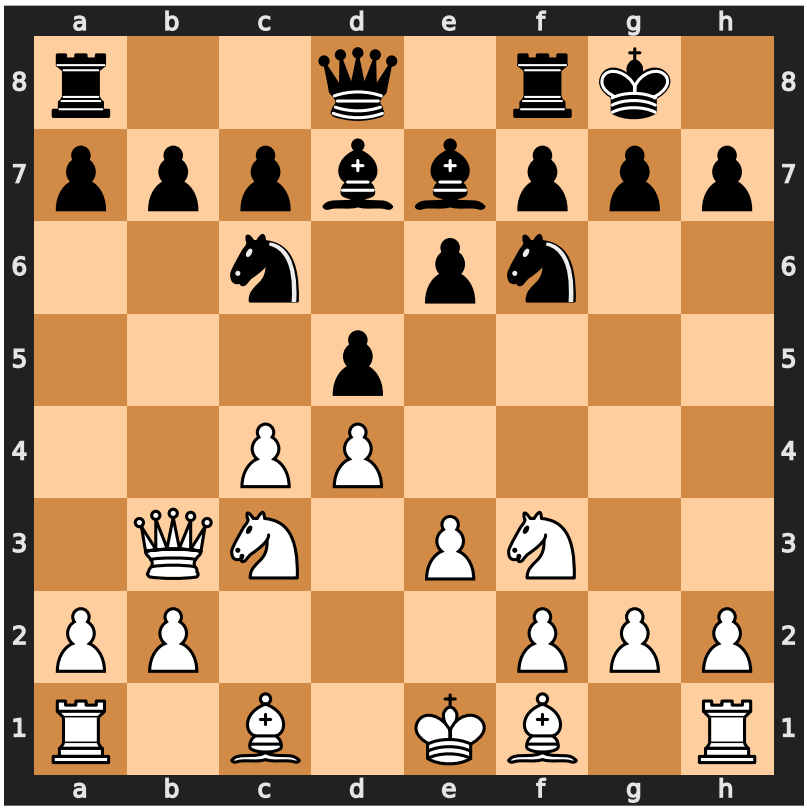

Figure 40.53: Chess Position

(develop), Be2 (develop). Each has different strategic implications. Hint 3: cxd5 exd5 (or Nxd5) changes the pawn structure fundamentally. Calculate both recaptures for Black and evaluate.

Exercise 12.67

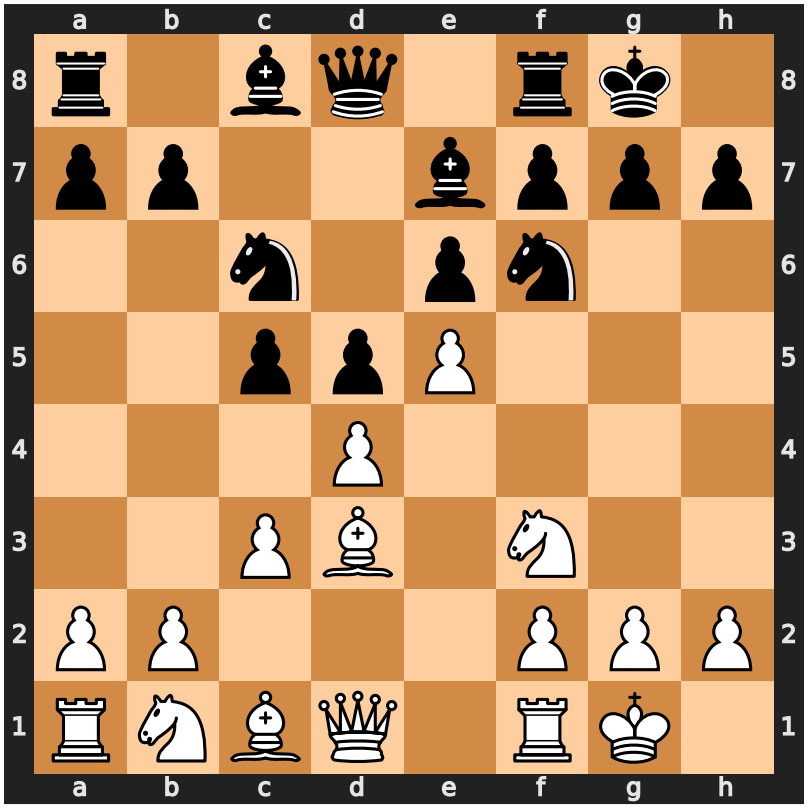

Figure 40.54: Chess Position

White to move. French Defense, advance variation. The pawn on e5 restricts Black. Apply the full Kotov Method with extra depth.

~12 min

Hint 1: Survey: White's e5 pawn is the anchor of the position. It restricts the f6-knight and controls d6. Black will try to undermine it with f6 or c4. Hint 2: Candidates: Bf4 (supporting e5), Nbd2 (heading for f1-g3-f5), and dxc5 (simplifying). Calculate each. Hint 3: Bf4 is the most natural, supporting e5 and developing. After Bf4, calculate Black's plan with c4 (pushing the bishop) and f6 (challenging e5).

Exercise 12.68

White to move. Semi-Slav structure. A dense, strategic position. Apply the full Kotov Method with extra depth.

~12 min

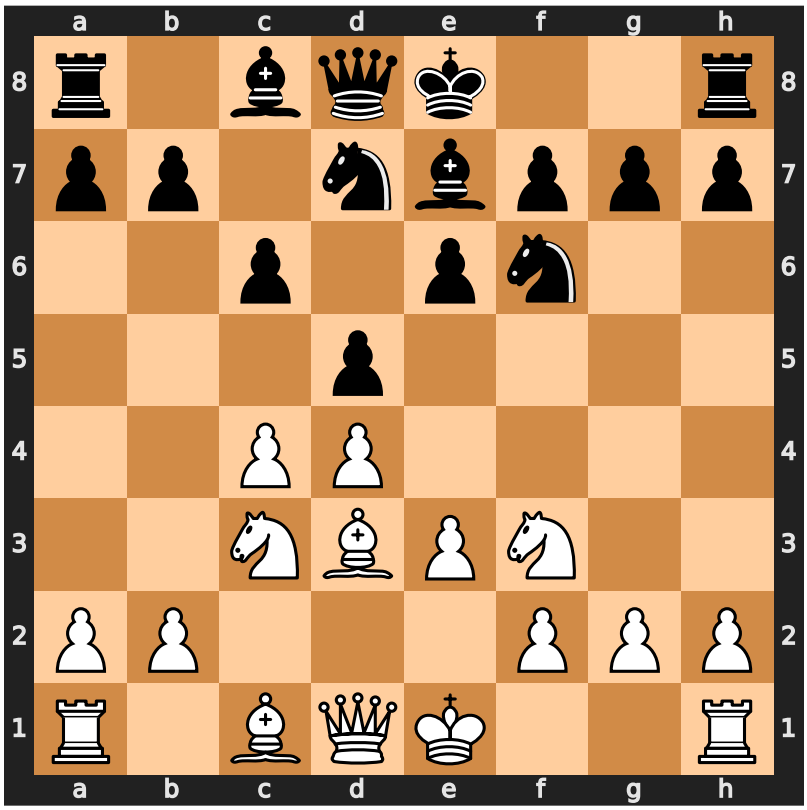

Figure 40.55: Chess Position

Hint 1: Survey: Black has a solid pawn chain (c6-d5-e6). White wants to break through with e4. But is it time? Hint 2: Candidates: O-O (safety), e4 (the break), and Qc2 (preparing e4). Calculate each to depth 4. Hint 3: O-O first, then e4 next move, is the most reliable plan. Premature e4 can be met by dxe4 Nxe4 Nxe4 Bxe4, and Black has equalized.

Exercise 12.69

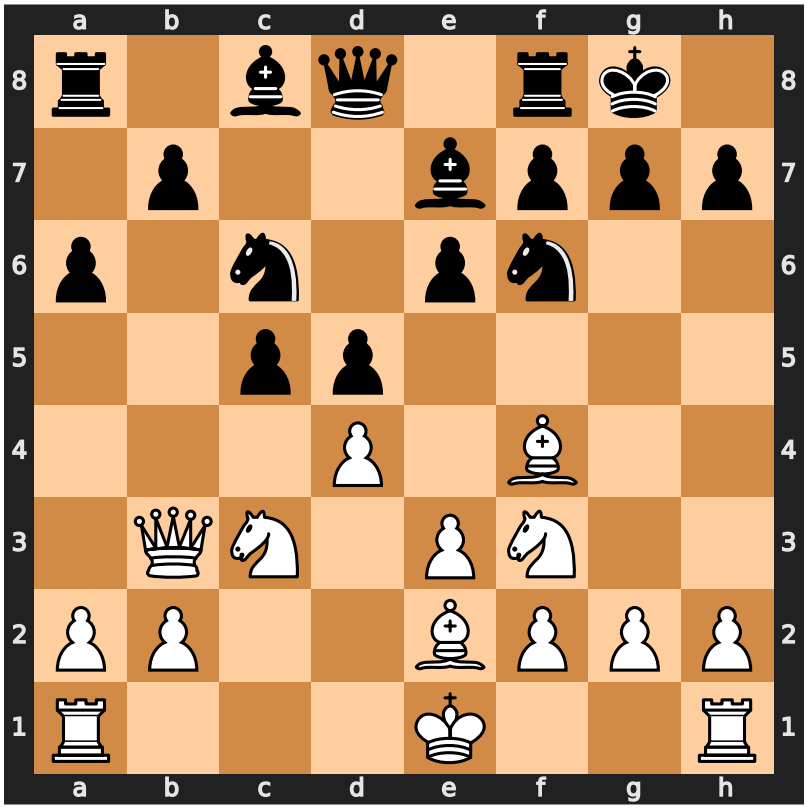

Figure 40.56: Chess Position

White to move. London / Queen's Gambit hybrid. White has not yet castled. Apply the full Kotov Method.

~12 min

Hint 1: Survey: White's king is still in the center. Castling is urgent. But which side? Hint 2: Candidates: O-O (kingside safety), O-O-O (queenside with attacking chances), and dxc5 (simplifying). Calculate each. Hint 3: O-O is the safest. O-O-O is more ambitious but the queen on b3 may be exposed on the queenside. Calculate Black's a5-a4 push after O-O-O.

Exercise 12.70

White to move. A French/London hybrid where Black has a knight on f5. Apply the full Kotov Method.

~12 min

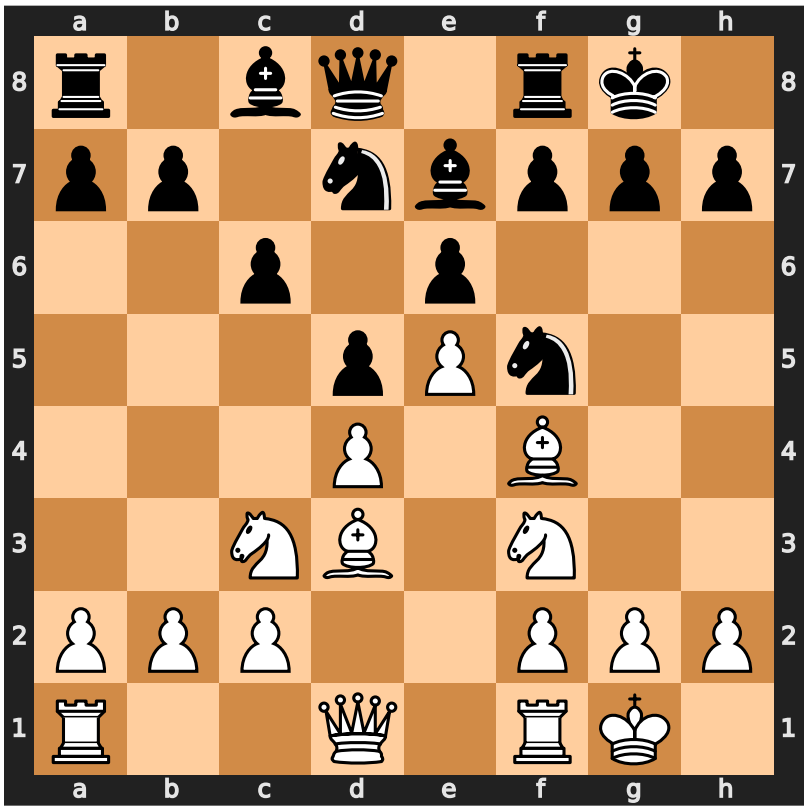

Figure 40.57: Chess Position

Hint 1: Survey: the knight on f5 is well-placed and pressures d4. White must decide whether to challenge it or play around it. Hint 2: Candidates: Bxf5 (eliminating the knight), Qe2 (supporting e5 and preparing action), Ne2 (rerouting to g3 to challenge the knight). Calculate each. Hint 3: Bxf5 exf5 gives Black a strong pawn on f5 and opens the e-file. Is that good for White? Calculate the resulting pawn structure carefully.

Exercise 12.71

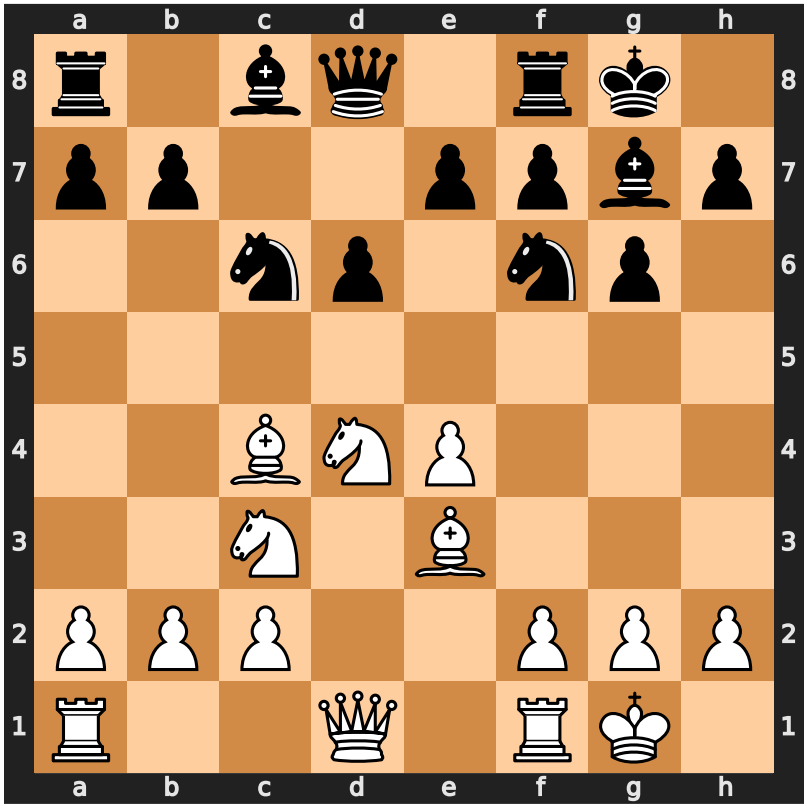

Figure 40.58: Chess Position

White to move. Sicilian Dragon structure. White has the bishop pair and an active position. Apply the full Kotov Method.

~12 min

Hint 1: Survey: the dragon bishop on g7 is Black's pride. White should consider neutralizing it or attacking the kingside. Hint 2: Candidates: f3 (supporting e4 and preparing g4), Qd2 (connecting rooks and preparing Bh6), Bb3 (retreating the bishop to a safer diagonal). Calculate each. Hint 3: f3 followed by Qd2 and Bh6 is a classic anti-Dragon setup. Calculate: f3 first, then if Black plays a5, what does White do?

Exercise 12.72

White to move. Queen's Gambit Declined, Classical. Apply the full Kotov Method.

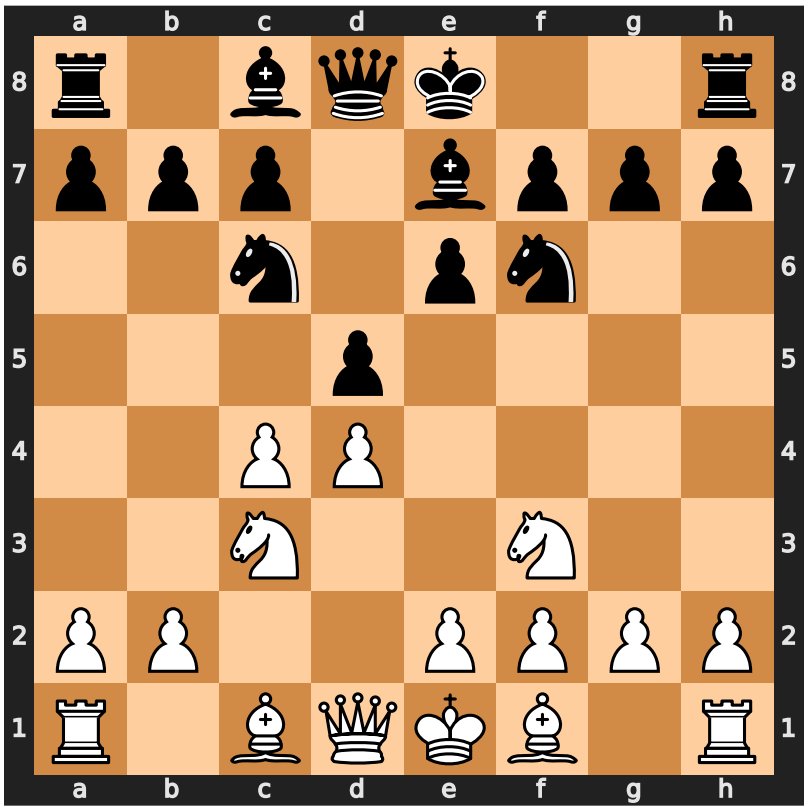

Figure 40.59: Chess Position

~12 min

Hint 1: Survey: a classic QGD position. Black is solid but slightly passive. White's plan is to develop and fight for e4. Hint 2: Candidates: Bg5 (pinning the knight), cxd5 (exchanging), and Bf4 (developing without pinning). Calculate each. Hint 3: Bg5 is the most classic and creates the most pressure. After Bg5, calculate both h6 (kicking the bishop) and O-O (ignoring the pin).

Exercise 12.73

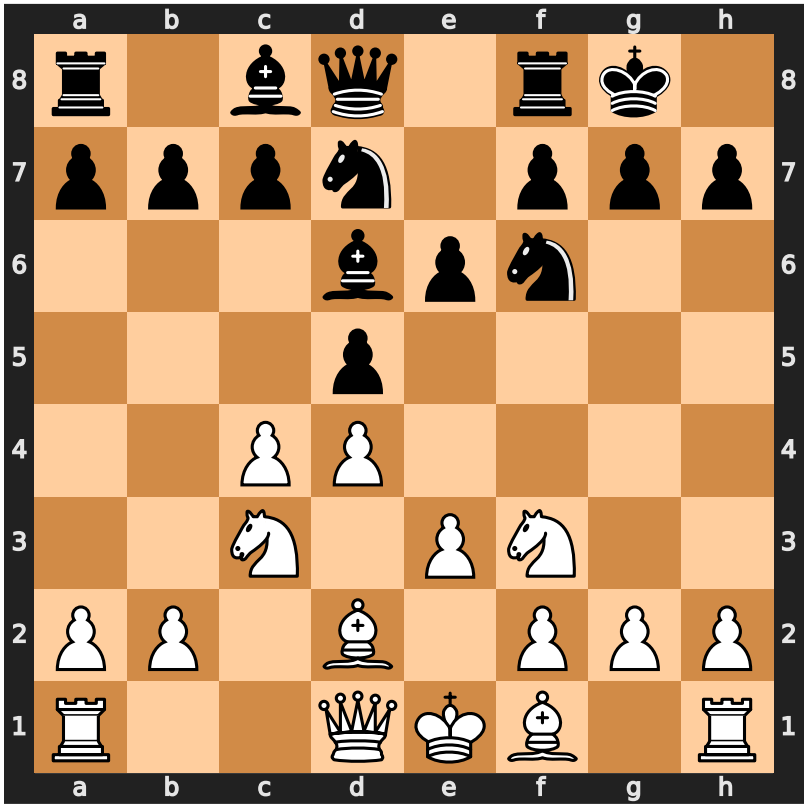

Figure 40.60: Chess Position

White to move. A Colle System position. Apply the full Kotov Method.

~12 min

Hint 1: Survey: White's setup is compact but somewhat passive. The bishop on d2 is not ideally placed. How can White improve? Hint 2: Candidates: Bd3 (developing the last minor piece), Qc2 (preparing e4), and cxd5 (exchanging to open lines). Calculate each. Hint 3: Bd3 is natural. After Bd3, White is fully developed and can prepare the e4 break. Calculate: Bd3 O-O Qc2, and then e4 on the next move.

Exercise 12.74

White to move. London System middlegame. Apply the full Kotov Method.

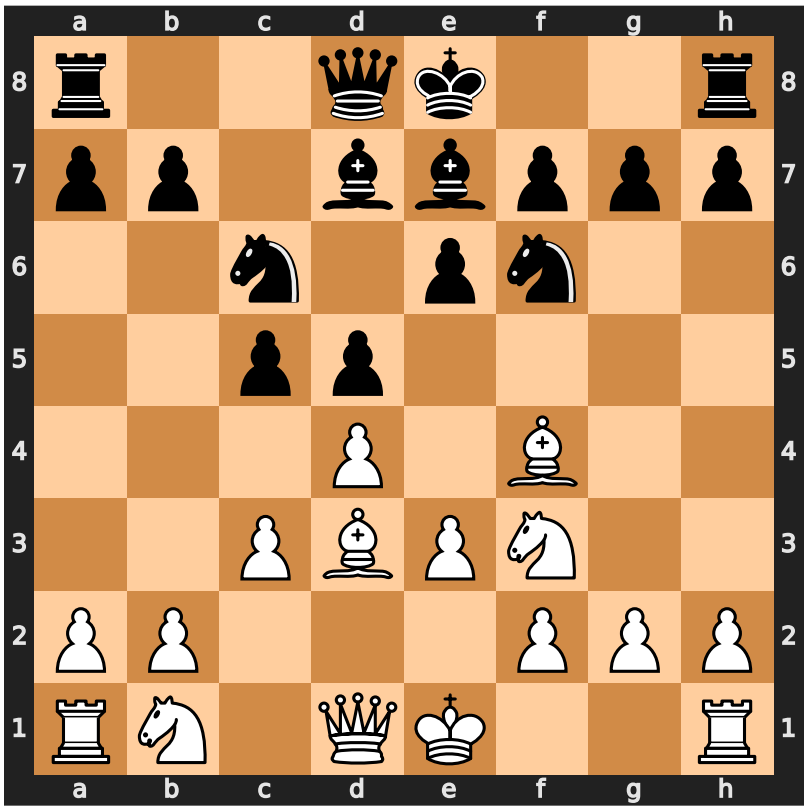

Figure 40.61: Chess Position

~12 min

Hint 1: Survey: White has the London setup (Bf4, Bd3, Nf3, e3). Development is nearly complete. What is the plan? Hint 2: Candidates: Nbd2 (completing development), O-O (king safety), and c3 (supporting the center). Calculate each. Hint 3: O-O first, always. Then Nbd2, then prepare e4 or c4. Calculate: O-O O-O Nbd2 and evaluate.

Exercise 12.75

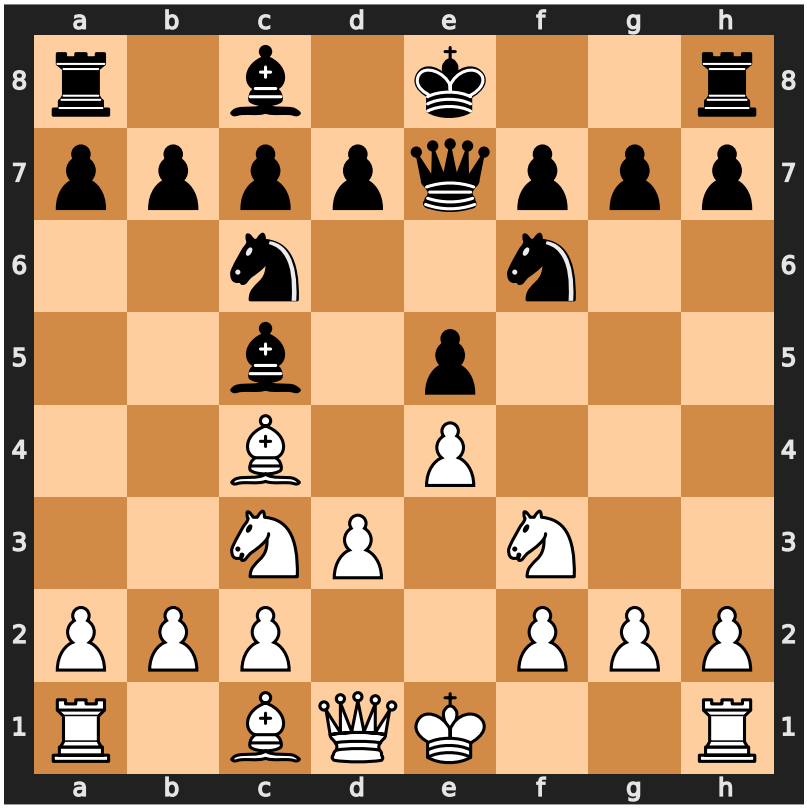

Figure 40.62: Chess Position

White to move. Italian Game where Black has played Qe7 instead of castling. Apply the full Kotov Method. Is there a way to exploit Black's delayed castling?

~12 min

Hint 1: Survey: Black's king is still in the center. The queen on e7 blocks the f8-bishop. This is a developmental disadvantage. Hint 2: Candidates: O-O (complete development, prepare d4), Be3 (develop and prepare d4), and a4 (prevent b5, gain space). Calculate each. Hint 3: O-O followed by d4 is the most energetic. After O-O O-O d4, White opens the center with a lead in development. Calculate: d4 exd4 Nxd4 and evaluate.

Exercise 12.76

White to move. Sicilian Defense, early stage. Apply the full Kotov Method.

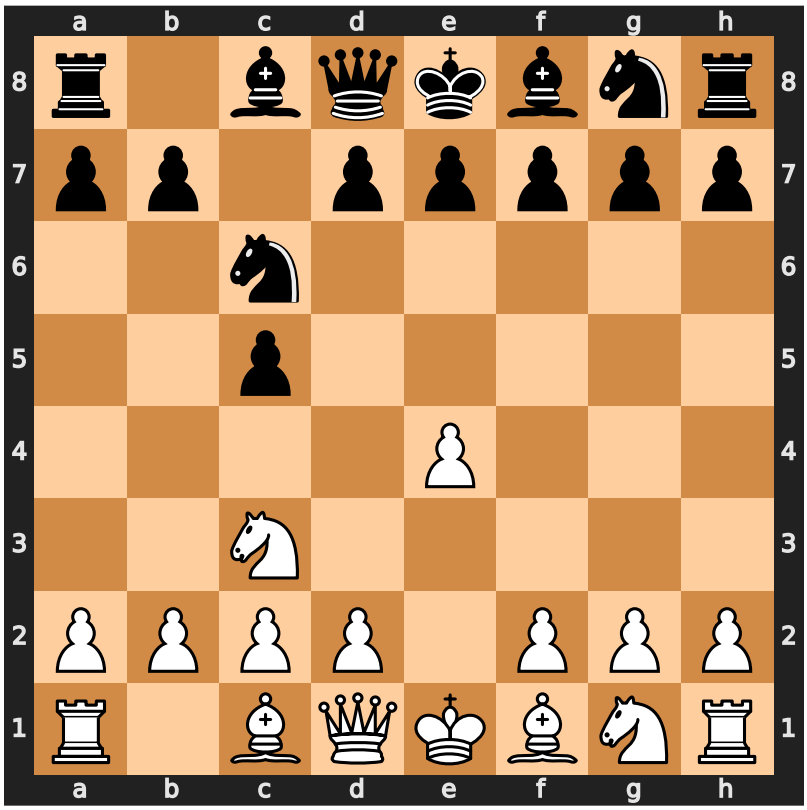

Figure 40.63: Chess Position

~12 min

Hint 1: Survey: an Open Sicilian is on the horizon. White must decide: Nf3 (standard), f4 (Grand Prix Attack), or something else? Hint 2: Candidates: Nf3 (most flexible), f4 (aggressive), and Nge2 (preparing d4 with knight support). Calculate each to depth 3. Hint 3: Nf3 is the most tested and reliable. After Nf3, the game enters well-known Sicilian channels. f4 is more aggressive but commits early. Calculate Nf3 d6 d4 cxd4 Nxd4.

Exercise 12.77

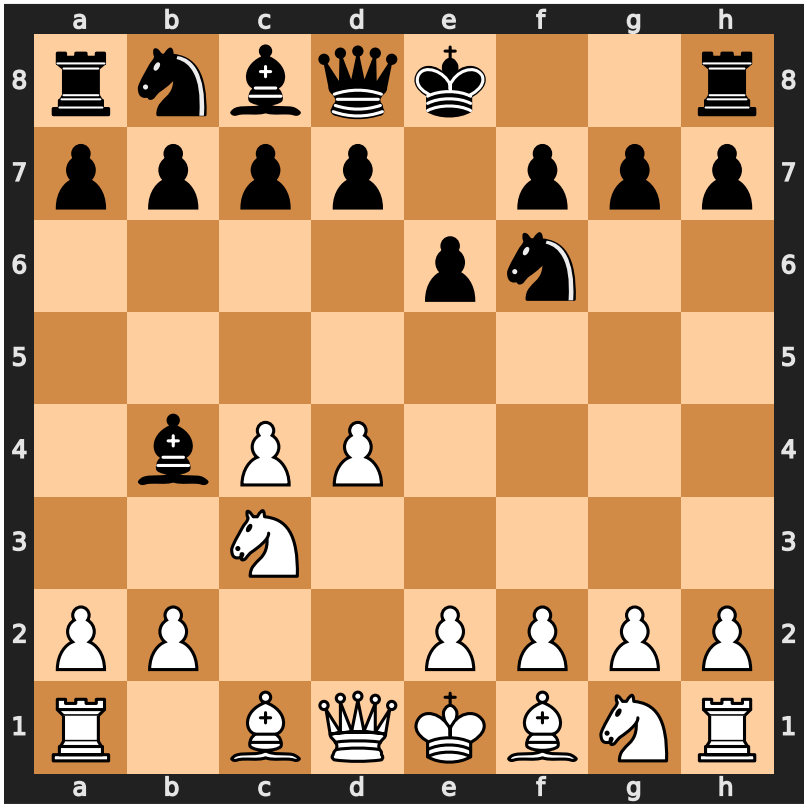

Figure 40.64: Chess Position

White to move. Nimzo-Indian Defense. Black has pinned the knight on c3 with the bishop. Apply the full Kotov Method.

~12 min

Hint 1: Survey: the bishop on b4 pins the c3-knight and challenges White's central control. White must respond to the pin while maintaining development. Hint 2: Candidates: Qc2 (Classical, prevents doubled pawns), e3 (Rubinstein, solid), and f3 (Sämisch, aggressive). Calculate each. Hint 3: Each response leads to a completely different type of game. Qc2 is the most popular at the club level because it is practical and solid. Calculate Qc2 O-O and then evaluate White's plans.

Exercise 12.78

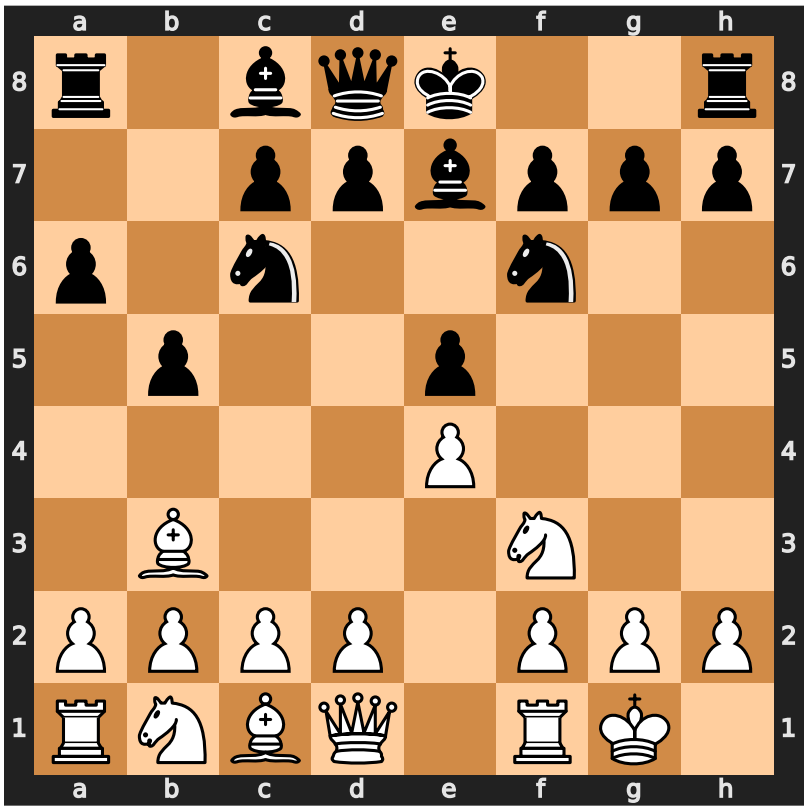

Figure 40.65: Chess Position

White to move. Ruy Lopez, Closed Defense. Black has driven the bishop back with a6 and b5. Apply the full Kotov Method.

~12 min

Hint 1: Survey: the bishop has retreated to b3. Black has a solid position with e5 controlling the center. White needs a long-term plan. Hint 2: Candidates: c3 (preparing d4), d4 (immediate central break), Re1 (supporting e4 and placing the rook on the open file). Calculate each. Hint 3: c3 is the most classic. It prepares d4 under optimal conditions. After c3, White plans d4 with the pawn protected by c3. Calculate c3 d6 d4 and evaluate.

Exercise 12.79

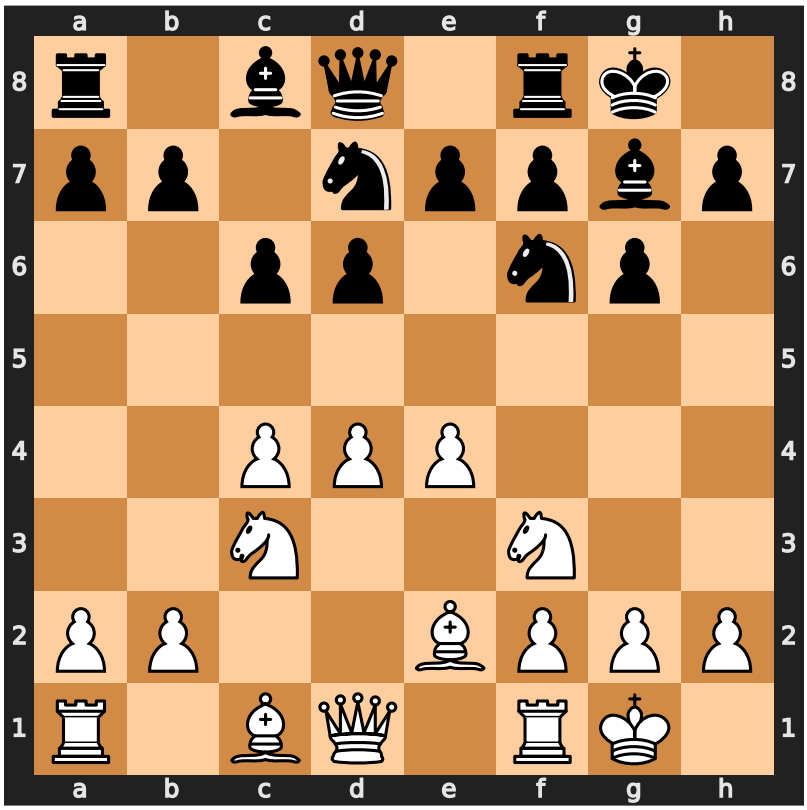

Figure 40.66: Chess Position

White to move. King's Indian Defense, Classical. A rich middlegame is about to begin. Apply the full Kotov Method.

~12 min

Hint 1: Survey: White has a big center (c4, d4, e4). Black has the fianchettoed bishop on g7 and a flexible pawn structure. Both sides have long-term plans. Hint 2: Candidates: Be3 (natural development), d5 (closing the center, which leads to a typical KID pawn race), and h3 (preventing Bg4). Calculate each. Hint 3: Be3 is the most natural and keeps the most options. After Be3, Black usually plays e5 (challenging the center). Then d5 closes the center and the pawn race begins. Calculate Be3 e5 d5 and evaluate the resulting structure.

Exercise 12.80

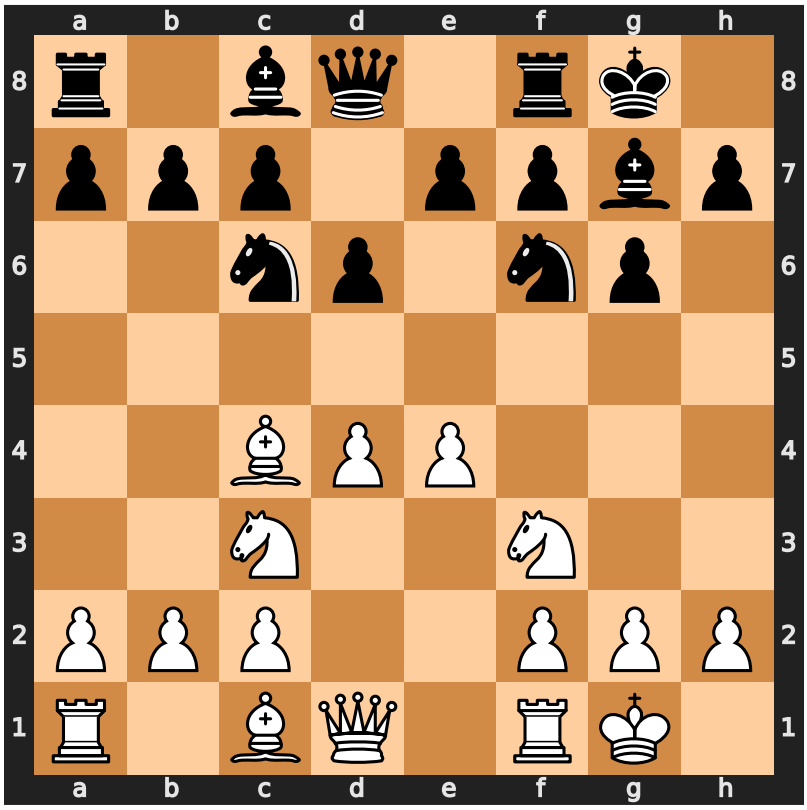

Figure 40.67: Chess Position

White to move. Sicilian Dragon / Pirc structure. A critical position. Apply the full Kotov Method. This is the final exercise. Bring everything together.

~15 min

Hint 1: Survey: White has a strong center (d4, e4) and active pieces. Black has the dragon bishop and a flexible position. The question is: how does White press the advantage? Hint 2: Candidates: Be3 (develop, support d4), Bg5 (pin the f6-knight), and f3 (support e4, prepare the Yugoslav Attack with Be3, Qd2, O-O-O). Calculate each to depth 4. Hint 3: Be3 followed by f3 and Qd2 is the Yugoslav Attack setup, the most aggressive and testing approach against the Dragon. Calculate: Be3 Ng4 (a common trick). What does White do? Bb5 is also worth considering to disrupt Black's coordination.

40.11 Key Takeaways

1. **Calculation = visualization + evaluation.** You picture moves in your head and judge the resulting positions. It is a skill, not a talent.

2. **The Kotov Method gives you structure.** Survey → Candidates → Calculate → Compare → Choose. Use it on every critical move.
3. **The CCT rule finds candidates.** Checks first, then Captures, then Threats. After that, consider quiet improving moves.
4. **Kotov's Cardinal Rule: do not jump between lines.** Calculate each candidate to its conclusion, evaluate it, and move on. Mixing lines causes confusion and blunders.
5. **Prune wisely.** Stop calculating a line when it is clearly losing. But do not prune a line just because the first move looks strange.
6. **Visualization improves with practice.** Start with simple drills ("What's on e4?") and progress to multi-move blind calculation. Ten minutes a day is enough.
7. **The Blunder Check saves games.** Before every move: "Does this hang a piece? Allow a check? Allow a capture?" Ten seconds. Ninety percent of blunders caught.

40.12 Practice Assignment

This week, do the following:

Day 1–2: Complete Exercises 12.01 through 12.10 (candidate moves). Focus on generating three candidates for each position before looking at the hints.

Day 3–4: Complete Exercises 12.21 through 12.30 (calculate to the end). Write down your full calculations before checking.

Day 5–6: Do visualization drills from Exercises 12.41 through 12.50. Spend 15 minutes each day on the "What's on this square?" and square color exercises.

Day 7: Play one slow game (at least 15 minutes per side). In that game, apply the Kotov Method on every move where you spend more than 30 seconds thinking. After the game, review: did you identify the right candidates? Did you calculate accurately? Where did you go wrong?

Ongoing: Before every move in every game, do the Blunder Check. Piece? Check? Capture? Make this automatic.

40.13 Progress Check

Answer honestly. There are no wrong answers here, only useful information about where you are.

- ☐ I can explain the four steps of the Kotov Method from memory
- ☐ I understand the CCT rule (Checks, Captures, Threats) for finding candidate moves
- ☐ I can calculate two moves ahead (my move, their reply, my move, their reply) with reasonable accuracy
- ☐ I know the six common calculation errors and can name at least three
- ☐ I have completed at least 40 of the 80 exercises in this chapter
- ☐ I use the Blunder Check before most of my moves in practice games

☐ I can identify the color of any square without looking at a board

If you checked 5 or more boxes: You have absorbed the core material. Move on to Chapter 13 with confidence.

If you checked 3–4 boxes: You are getting there. Spend another week on the exercises before moving forward. There is no penalty for taking your time.

If you checked fewer than 3: That is fine. This is a dense chapter. Go back to Section 2 (the Kotov Method) and reread it. Then work through the Group A exercises slowly. Calculation takes time to build. You are not behind. You are building the foundation.

Rest marker. You have finished Chapter 12.

This was one of the most important chapters in the entire Codex. The Kotov Method is a tool you will use for the rest of your chess life. It does not expire. It does not go out of style. It works at 1000 and it works at 2600.

Take a break. You have earned it. When you come back, Chapter 13 awaits: **Pawn Structures: The Skeleton of Your Position.**

See you at the board.

"The player who calculates well fears no opponent." — adapted from classical chess wisdom

Chapter 41

Chapter 13: Pawn Structures: The Skeleton of Your Position

Volume II: The Club Player | Rating Range: 1000 - 1600 Pages: 50 | Exercises: 50 | Annotated Games: 5

"Pawns are the soul of chess." – Francois-Andre Danican Philidor (1749)

41.1 What You'll Learn

- How pawn structures define the character of every chess position
- The eight major pawn structure types and how to play with or against each one
- How to recognize key structures that arise from common openings
- How to build a plan based on the pawn skeleton in front of you
- How to convert a structural advantage into a winning position

---

41.2 Part 1: Why Pawns Matter

41.2.1 The Bones of the Position

Here is one of the most important ideas in this entire book:

Pieces come and go. Pawns are forever.

A knight can retreat. A bishop can redeploy. Even a queen can find a new diagonal. But once a pawn advances, it never goes backward. Every time you push a pawn, you are making a permanent decision. That decision shapes everything else on the board.

Think of it this way. Your pawns are the skeleton of your position. Your pieces are the muscles. You can have the strongest muscles in the world, but if the skeleton is crooked, the whole body suffers.

This metaphor runs deep:

- **A strong skeleton supports strong pieces.** Good pawn structure gives your pieces natural outposts, open files, and safe diagonals.
- **A weak skeleton creates lasting problems.** Bad pawn structure gives your opponent targets that never go away.
- **You cannot fix a broken skeleton mid-game.** Unlike pieces, pawns cannot move backward. Structural damage is usually permanent.

Philidor understood this in 1749, and his insight has only grown more powerful with time. Every World Champion since has echoed the same idea: understand the pawns, and you understand the position.

41.2.2 What "Pawn Structure" Means

When we say "pawn structure," we mean the arrangement of pawns on the board *without considering the pieces*. Strip away every piece except the kings and pawns, and what remains is the skeleton.

Two positions with identical pawn structures but different piece placements will share the same fundamental character. The same plans will apply. The same weaknesses will exist. The same breaks will be available.

This is why pawn structure is the single most reliable guide to planning. Pieces change squares constantly. The pawn skeleton tells you what the position *is*.

41.2.3 How to Study This Chapter

This chapter covers a lot of ground. You do not need to absorb it all in one sitting.

Here is a recommended approach:

1. **Read one pawn structure type per session.** There are eight types covered in Part 2. Each one is self-contained.
2. **Set up the example positions on your physical board.** This is not optional. You will remember far more if your hands move the pieces.
3. **Play through the annotated games slowly.** These are masterpieces chosen to illustrate each structure in action.
4. **Do the exercises in small batches.** Five at a time is plenty.

There is no rush. The concepts in this chapter will serve you for the rest of your chess career.

41.3 Part 2: The Eight Pawn Structure Types

41.3.1 Structure 1: The Isolated Pawn (IQP)

Definition: An isolated pawn is a pawn with no friendly pawns on either adjacent file. It cannot be protected by another pawn and must be defended by pieces.

The most important isolated pawn in chess is the isolated queen's pawn, or IQP, which sits on d4 (for White) or d5 (for Black) with no pawns on the c-file or e-file to support it.

Set up your board:

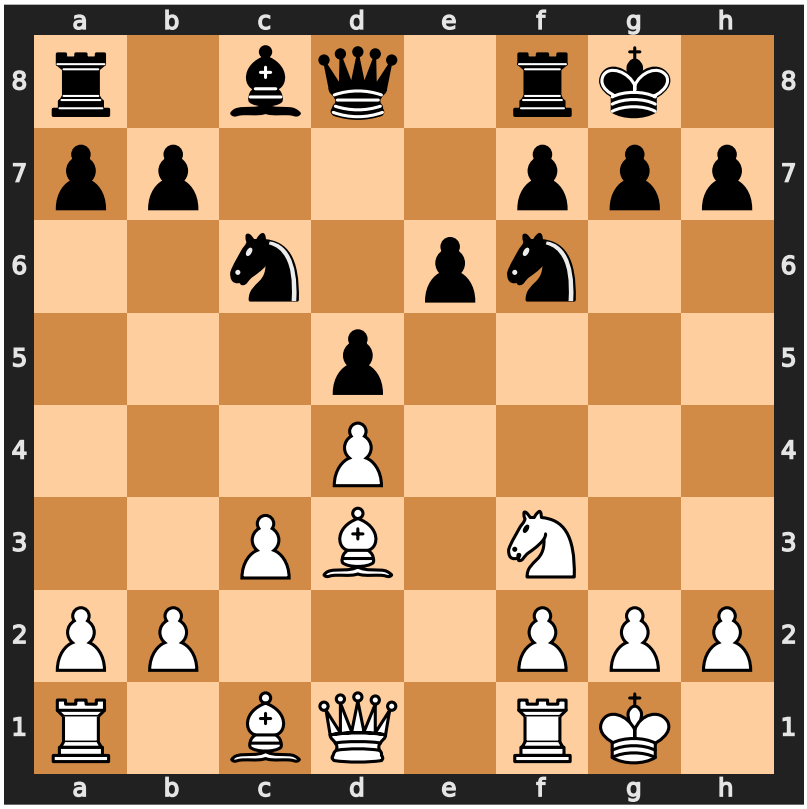

Figure 41.1: Chess Position

White has an isolated pawn on d4. No white pawns stand on c or e to protect it. Study this position carefully before reading on.

Strengths of the Isolated Pawn:

The IQP is not simply "weak." It carries real dynamic potential:

1. **Space advantage.** The pawn on d4 controls the central squares c5 and e5, giving White's pieces room to maneuver.
2. **Open and half-open files.** With no pawn on the c-file or e-file, White's rooks gain natural access to open lines.
3. **The outpost on e5.** A knight planted on e5 in front of an IQP can become a monster. It controls key squares and cannot easily be driven away.
4. **Attacking chances.** The d4-d5 advance can open the position at the right moment, creating tactical opportunities against Black's king.

Weaknesses of the Isolated Pawn:

1. **It needs piece protection.** The pawn on d4 cannot be supported by another pawn. Your pieces must babysit it.
2. **The square in front of it.** The d5 square is a natural blockading square. If Black plants a knight on d5, that knight becomes very powerful.
3. **Endgame liability.** As pieces get traded, the isolated pawn becomes harder to defend and easier to attack. In a pure endgame, it is usually a weakness.

How to play WITH an isolated pawn:

- Keep pieces on the board. Your advantage is dynamic, not static.
- Place a knight on e5 (or c5 for Black's IQP).
- Look for the d4-d5 break to open lines and create tactics.
- Attack the kingside. The open lines favor aggression.
- Avoid unnecessary piece trades. Every trade brings you closer to an endgame where the pawn becomes a target.

How to play AGAINST an isolated pawn:

- Blockade it. Place a piece (ideally a knight) on the square in front of the pawn.
- Trade pieces. Every piece exchange makes the isolated pawn weaker.
- Target the pawn directly with rooks and the queen.
- Head for the endgame. Time is on your side.
- Do not allow the d4-d5 break. If the pawn advances successfully, the dynamic advantages it creates can be decisive.

A helpful rule of thumb: The side with the IQP wants activity. The side against it wants simplification. If you remember nothing else about the isolated pawn, remember this.

Rest here if you need to. One structure per session is a perfectly good pace. Come back fresh for the next one.

41.3.2 Structure 2: Doubled Pawns

Definition: Doubled pawns are two pawns of the same color stacked on the same file. They arise when a pawn captures toward the center (or away from it), landing on a file already occupied by a friendly pawn.

Set up your board:

Now consider a position after Black plays …Bxc3, doubling White's pawns:

White has doubled c-pawns on c2 and c3 after a recapture. Study how this changes the pawn skeleton.

When doubled pawns are BAD:

1. **They cannot protect each other.** Two pawns on the same file are like two soldiers standing in a single-file line. Neither shields the other.
2. **They create a static target.** The opponent can pile pressure on the doubled pawns, especially if they sit on an open or half-open file.
3. **They reduce pawn mobility.** The rear pawn is blocked by the front pawn. You have two pawns but often the flexibility of only one.
4. **They create weak squares.** When pawns double, the adjacent squares they used to control become available to the opponent's pieces.

When doubled pawns are ACCEPTABLE (or even good):

Not all doubled pawns are disasters. Sometimes they bring real advantages:

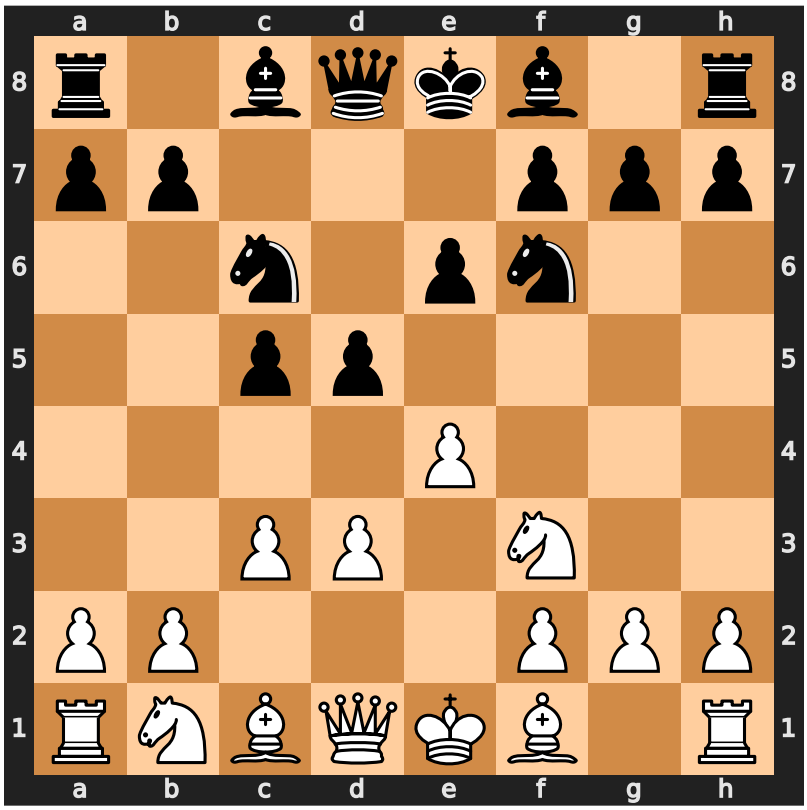

Figure 41.2: Chess Position

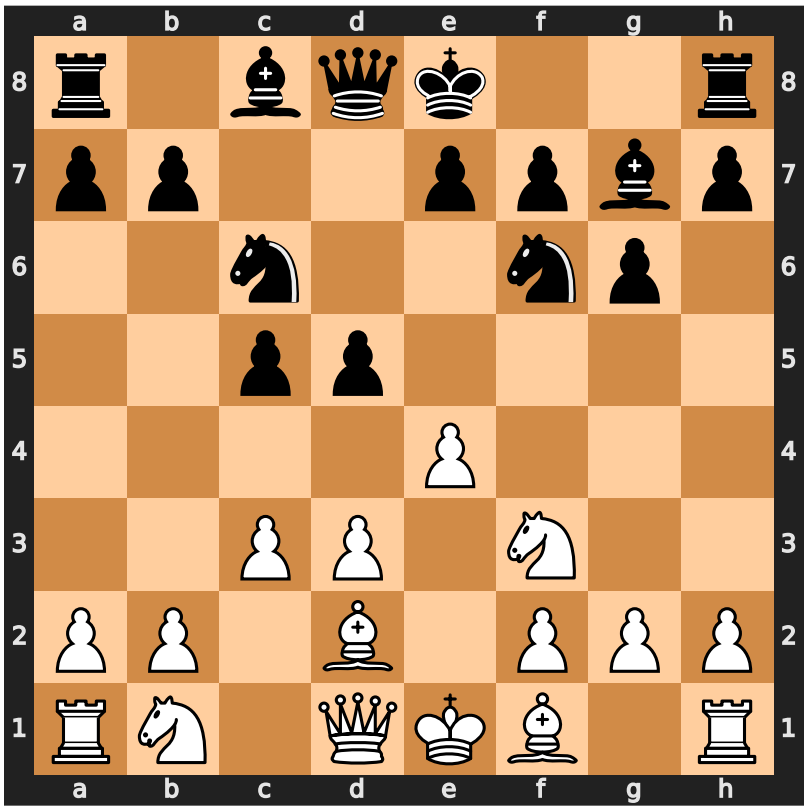

Figure 41.3: Chess Position

1. **Extra open files.** When a pawn captures to create doubled pawns, it opens a file for a rook. In the Nimzo-Indian Defense (after …Bxc3+, bxc3), White often welcomes doubled c-pawns because the b-file opens for the rook.
2. **Extra central control.** Doubled pawns on the c-file (c3 and c4) or e-file (e3 and e4) can control more central squares than two pawns on separate files.
3. **Bishop pair compensation.** Often, doubled pawns arise from a bishop-for-knight trade. The side with the doubled pawns may also have the bishop pair, which compensates in open positions.

How to play WITH doubled pawns:

- Use the open file your rook gained.
- If you have the bishop pair, open the position.
- Advance the front pawn if you can undouble.
- Keep the game dynamic. In quiet positions, the structural weakness will tell.

How to play AGAINST doubled pawns:

- Target them with pieces, especially rooks on the open or half-open file.
- Trade off the opponent's bishop pair if they have one.
- Steer toward the endgame, where static weaknesses matter most.
- Control the squares the doubled pawns can no longer guard.

Key insight: Whether doubled pawns are a strength or a weakness depends on the pieces remaining on the board and the character of the position. There is no universal rule. You must evaluate each case on its own merits.

41.3.3 Structure 3: The Backward Pawn

Definition: A backward pawn is a pawn that cannot advance because the square in front of it is controlled by an enemy pawn, and it has no friendly pawn on an adjacent file that could advance alongside it or protect it. It is "left behind" by its neighbors.

Set up your board:

Look at Black's pawn on e6. If Black has played …d5 and the e-pawn sits on e6, that pawn can become backward. It cannot advance to e5 (White controls that square with the d4 pawn), and the d-pawn has already advanced past it.

A clearer illustration:

Here Black's e6 pawn is backward on the half-open e-file. White can target it with Re1, and the square e5 is a natural outpost.

Strengths of this structure: (for the side exploiting the backward pawn)

1. **The square in front of the backward pawn is an outpost.** A knight on e5, for instance, is beautifully placed and hard to dislodge.
2. **The half-open file targets the pawn.** A rook on the e-file points directly at e6, creating pressure.
3. **It restricts the opponent's plans.** The backward pawn ties pieces down to its defense.

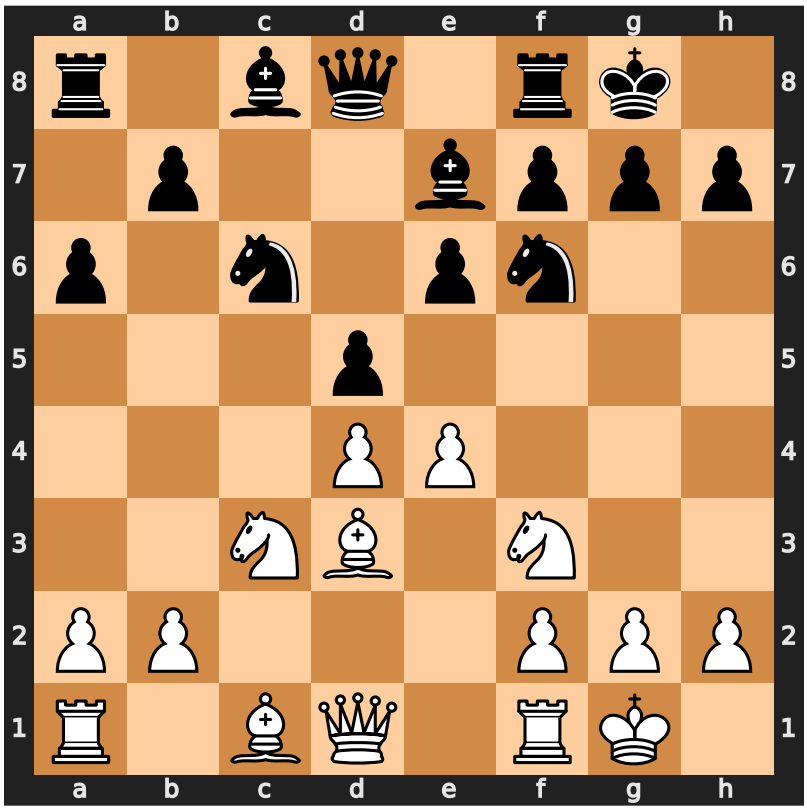

Figure 41.4: Chess Position

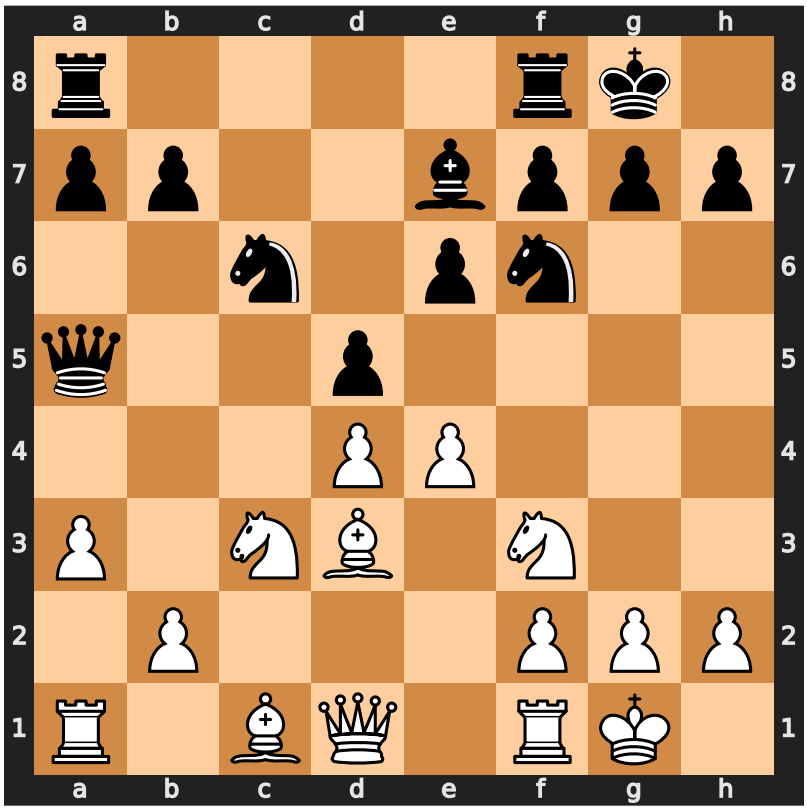

Figure 41.5: Chess Position

Weaknesses of having a backward pawn:

1. **Permanent target.** The backward pawn sits on a half-open file and cannot advance. It requires constant piece protection.
2. **Lost outpost.** The square in front of the backward pawn belongs to the opponent's pieces. You cannot contest it with a pawn.
3. **Passive piece placement.** Your pieces may be stuck defending the backward pawn instead of pursuing active plans.

How to play WITH a backward pawn (when you have one):

- Try to advance it! If you can push e6-e5 (or wherever it sits), the weakness disappears.
- Generate counterplay elsewhere on the board. Do not let the opponent focus solely on the backward pawn.
- Trade the piece that blockades the square in front of it.
- Keep enough pieces to defend it without becoming passive.

How to play AGAINST a backward pawn:

- Occupy the square in front of it with a strong piece, ideally a knight.
- Apply pressure down the half-open file with a rook.
- Prevent the pawn from advancing. If it never moves, it stays weak forever.
- Combine pressure on the backward pawn with threats elsewhere.

41.3.4 Structure 4: The Passed Pawn

Definition: A passed pawn is a pawn with no enemy pawn in front of it on the same file or on either adjacent file. Nothing can stop it from marching to the promotion square except enemy pieces.

Nimzowitsch gave us the perfect image: *"A passed pawn is a criminal that must be watched by the police."* The opponent must assign pieces to stop it, and those pieces cannot do anything else.

Set up your board:

White's d5 pawn is passed. There is no black pawn on the c-file, d-file, or e-file that can block or capture it. It can march to d8 and become a queen, and only Black's pieces can try to stop it.

Strengths of a passed pawn:

1. **It creates a promotion threat.** The further it advances, the more dangerous it becomes.
2. **It ties down enemy pieces.** The opponent must "watch" the criminal. A rook or knight babysitting a passed pawn is a rook or knight not doing anything else.
3. **It becomes stronger as pieces come off.** In the endgame, a passed pawn can be the difference between winning and drawing.
4. **It creates a decoy.** Even if the passed pawn is eventually captured, the opponent's pieces are diverted, and you can strike elsewhere.

Weaknesses of a passed pawn:

1. **It can be blockaded.** A piece (especially a knight) placed directly in front of the passed pawn stops it cold. The blockader also enjoys a stable outpost.

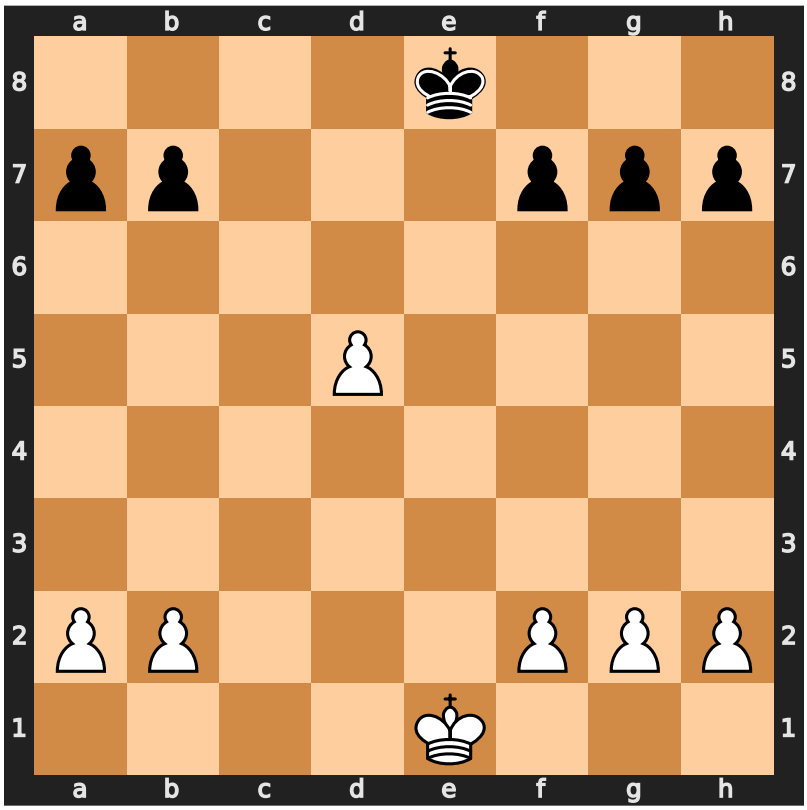

Figure 41.6: Chess Position

2. **It can be weak if not supported.** A passed pawn far from its own pieces can be captured.
3. **Advancing too early can be fatal.** If the pawn charges forward without support, it becomes a target rather than a weapon.

How to play WITH a passed pawn:

- **Support it.** Place a rook behind the passed pawn. As the pawn advances, the rook's power increases.
- **Advance it at the right moment.** Do not rush. Prepare the advance with piece support.
- **Use it as a decoy.** Even if the opponent blockades it, their blockading piece is tied down. Attack elsewhere.
- **Trade pieces, but keep rooks.** Rooks and passed pawns are a deadly combination.
- **In king and pawn endgames, the passed pawn wins games.** Always calculate whether advancing it will cost your opponent more than it costs you.

How to play AGAINST a passed pawn:

- **Blockade it immediately.** Place a piece on the square in front of it. A knight is the ideal blockader because it still controls important squares while blocking.
- **Attack it from the front, not the side.** A rook in front of a passed pawn stops it and pins it down.
- **Eliminate it if possible.** Trading it off removes the threat entirely.
- **Do not let it advance to the sixth rank.** A passed pawn on the sixth rank is extremely dangerous. Stop it earlier.

A useful saying: "Every pawn is a potential queen." Treat your passed pawns with respect, and treat your opponent's passed pawns with urgency.

Good stopping point. You have learned four structure types. That is a solid session. Take a break and come back for the next four.

41.3.5 Structure 5: Connected Pawns

Definition: Connected pawns are two or more pawns on adjacent files that can protect each other. They form a chain of mutual support.

Set up your board:

White has connected pawns on d5 and e5. Notice that d5 protects the e6 square, and e5 protects the d6 square. If one advances, the other can protect it. They work as a team.

Now compare:

White has pawns on c5 and e5. These are NOT connected. There is a gap on d5. Neither pawn protects the other. They must fend for themselves.

Strengths of connected pawns:

1. **Mutual protection.** Each pawn guards the advance square of the other. This makes them very hard to stop, especially in the endgame.

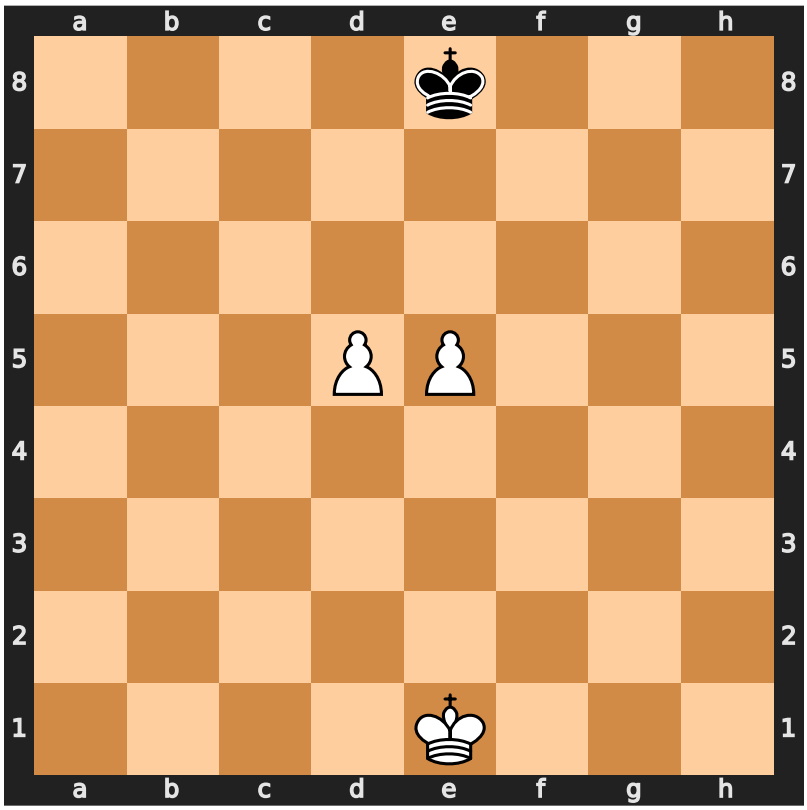

Figure 41.7: Chess Position

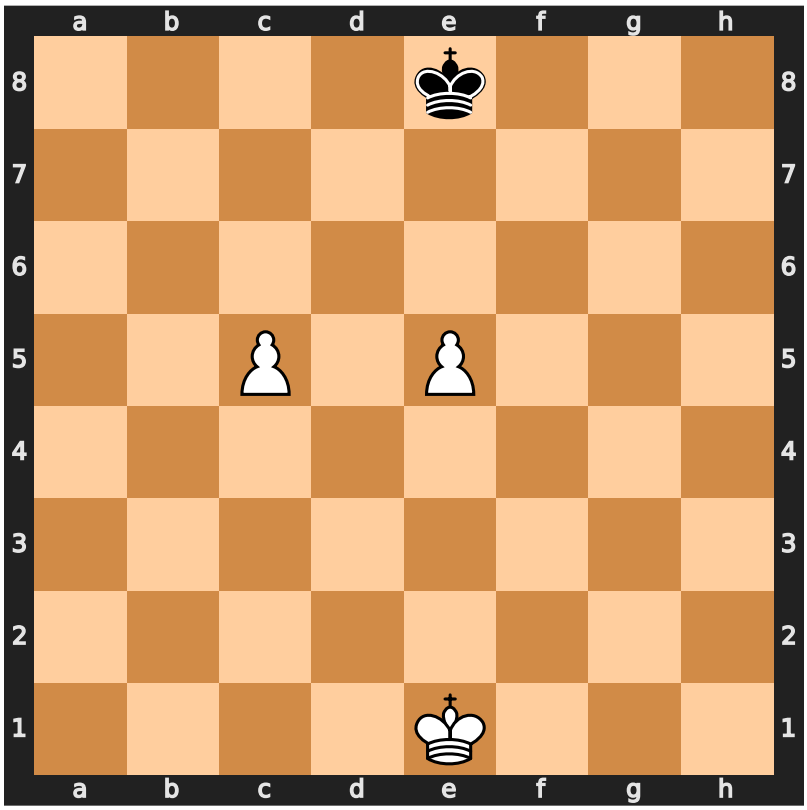

Figure 41.8: Chess Position

2. **Control of a broad front.** Two connected pawns on the fifth rank control four squares on the sixth rank. That is a lot of territory.
3. **Advancing power.** Connected passed pawns rolling down the board are one of the most dangerous forces in chess. Two connected passed pawns on the sixth rank can defeat a rook.
4. **Flexibility.** You can choose which pawn to advance based on the situation.

Weaknesses of connected pawns:

1. **They can become targets if overextended.** Connected pawns pushed too far from their own pieces can be attacked and picked off.
2. **Blockade is still possible.** If the opponent places pieces in front of both pawns, their advance can be stopped.

How to play WITH connected pawns:

- Advance them together. Do not leave one behind.
- Support them with pieces from behind or beside.
- In the endgame, march them toward promotion. Connected passed pawns on the fifth or sixth rank are often unstoppable.
- Use the threat of one pawn's advance to create tactical opportunities for the other.

How to play AGAINST connected pawns:

- Blockade them with pieces. Place a piece in front of each pawn.
- Attack them from the side or rear with rooks.
- Eliminate one of the pair. Once one is captured, the surviving pawn is just an ordinary pawn.
- Do not let them reach the sixth rank together. Stop the advance early.

41.3.6 Structure 6: Hanging Pawns

Definition: Hanging pawns are a specific type of connected pawn pair, typically on the c-file and d-file (c4 and d4 for White, or c5 and d5 for Black), sitting on the fourth rank with no friendly pawns on adjacent files. They hang in the center without pawn support from either side.

Set up your board:

After a sequence of trades in the Queen's Gambit, White might end up with pawns on c4 and d4 with no pawn on b or e. These are hanging pawns.

A more typical hanging pawn position:

White's c4 and d4 pawns are hanging. They control the center but have no pawn neighbors.

Strengths of hanging pawns:

1. **Central control.** The pawn pair covers four key central squares (c5, d5, e5 for d4, and b5, c5, d5 for c4). That is a lot of territory.
2. **Dynamic potential.** Either pawn can advance (c4-c5 or d4-d5), opening lines for a piece attack.
3. **Piece activity.** The open lines beside the hanging pawns give rooks and bishops natural activity.

Weaknesses of hanging pawns:

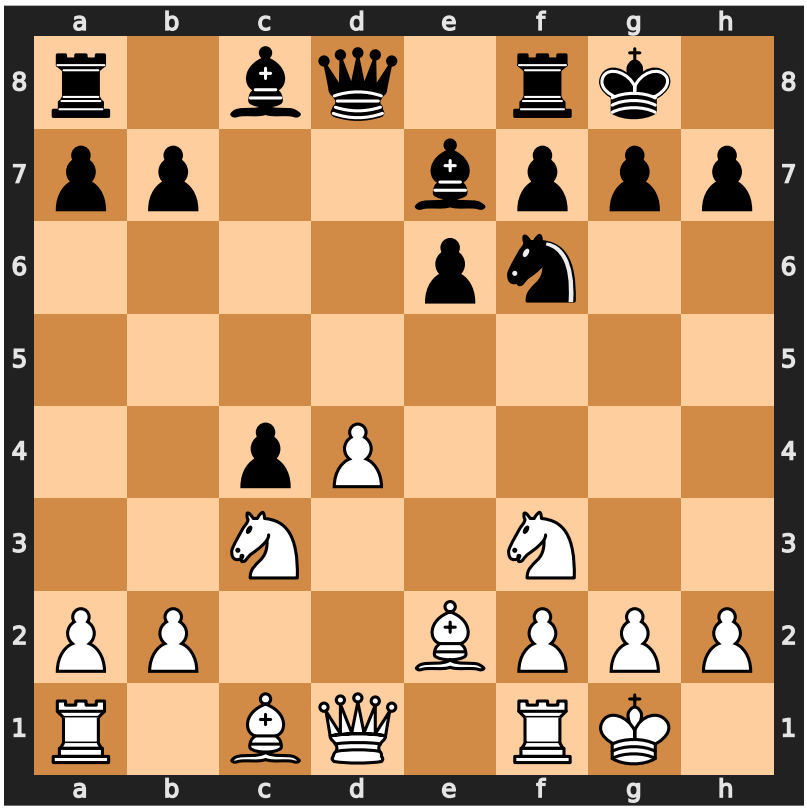

Figure 41.9: Chess Position

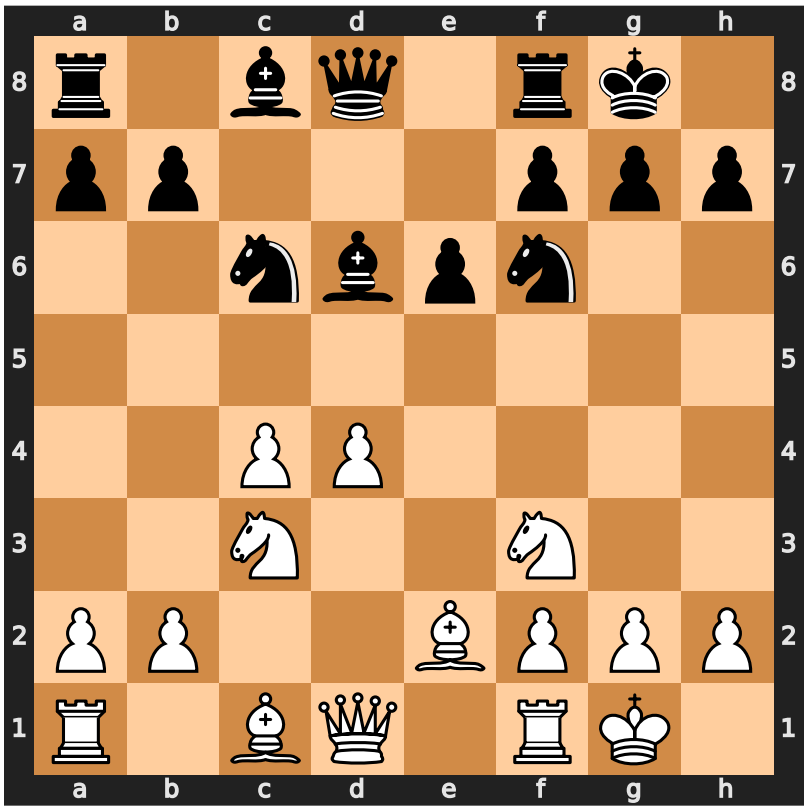

Figure 41.10: Chess Position

1. **They can become targets.** If the opponent prevents both pawns from advancing, they become static weaknesses that must be defended by pieces.
2. **Advancing one weakens the other.** If d4-d5 is played, the c4 pawn becomes an isolated pawn. If c4-c5 is played, the d4 pawn becomes isolated.
3. **Pressure freezes them.** A well-placed knight or bishop in front of the hanging pawns can paralyze the entire center.

How to play WITH hanging pawns:

- Maintain the tension. Do not advance prematurely.
- Wait for the right moment to push d4-d5 or c4-c5 with maximum effect.
- Keep your pieces active. Hanging pawns shine in dynamic positions with many pieces.
- Look for tactical opportunities that arise when you advance one pawn.

How to play AGAINST hanging pawns:

- Apply pressure to both pawns simultaneously. Force the opponent to defend them.
- Provoke one pawn to advance, then target the remaining isolated pawn.
- Blockade the pawns. Place pieces on d5 and c5 (or the equivalent squares for Black).
- Trade off attacking pieces. Without piece activity, hanging pawns are just weaknesses.

The fundamental tension of hanging pawns: They are either a strength or a weakness, and the line between those two states is razor-thin. This makes hanging pawn positions among the most interesting in all of chess.

41.3.7 Structure 7: The Pawn Chain

Definition: A pawn chain is a diagonal line of pawns, each protecting the one in front of it. The pawn at the back of the chain is called the *base*. The pawn at the front is the *tip* or *head*.

Set up your board:

This is the French Defense structure after 1.e4 e6 2.d4 d5 3.e5. White has a pawn chain running from d4 to e5. Black has a pawn chain running from d5 to e6.

Study the chains carefully:

- **White's chain:** d4 (base) protects e5 (tip). The base on d4 is the vulnerable point.
- **Black's chain:** e6 (base) protects d5 (tip). The base on e6 is less exposed because it sits further from the action, but the d5 pawn is locked and cannot advance.

Nimzowitsch's Rule: Attack the base of the chain.

This is one of the most powerful strategic principles in chess. The tip of the chain is well-protected by the pawn behind it. The base is the weakest link because it has no pawn supporting it from behind. Attack the base, and the entire chain may crumble.

In the French structure above, Black will typically play …c7-c5 to strike at d4, the base of White's chain. White might play f4-f5 to attack e6, the base of Black's chain.

Strengths of a pawn chain:

1. **Space advantage.** The side with the further-advanced chain controls more territory.

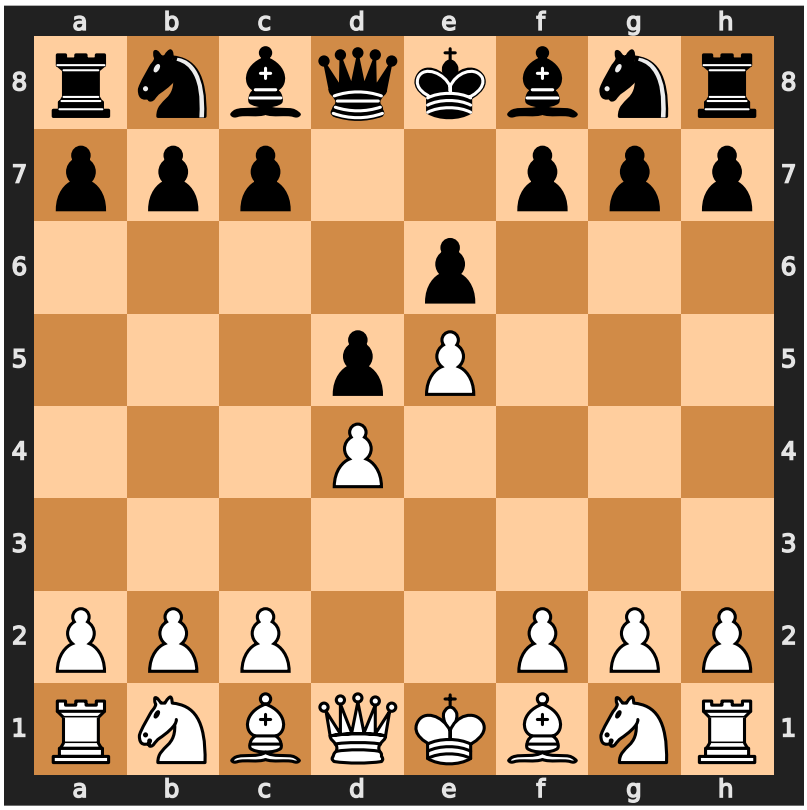

Figure 41.11: Chess Position

2. **Piece shelter.** Pieces behind the chain are protected from frontal attacks.
3. **Directional guide.** The chain tells you where to attack: on the side where your chain points.

Weaknesses of a pawn chain:

1. **The base is vulnerable.** Without pawn protection, the base depends entirely on piece defense.
2. **Reduced mobility.** Pawns locked in a chain cannot advance. The position becomes static.
3. **Bad bishop problem.** The bishop on the same color as the chain is often blocked by its own pawns.

How to play WITH a pawn chain:

- Attack on the side your chain points toward. If your chain points kingside (like e5 in the French), attack the kingside.
- Support the base. Do not let the opponent undermine it.
- Use the space advantage to maneuver pieces to strong squares.
- Activate the bishop that is NOT blocked by the chain.

How to play AGAINST a pawn chain:

- Attack the base. Nimzowitsch's rule is your guide.
- Undermine the chain with pawn breaks. In the French, …c5 is Black's primary weapon.
- Exchange the "bad bishop." If your bishop is blocked by the chain, look to trade it or fianchetto it to a better diagonal.
- Do not attack the tip. The tip is the strongest point. Attacking it wastes time and effort.

41.3.8 Structure 8: Pawn Islands

Definition: A pawn island is a group of connected pawns separated from other friendly pawns by at least one empty file. The fewer pawn islands you have, the healthier your pawn structure.

Set up your board:

Count White's pawn islands: - Island 1: a2, b2 (connected pawns on adjacent files) - Island 2: d2 (alone) - Island 3: g2, h2 (connected pawns on adjacent files)

White has **three pawn islands.** The d2 pawn is the most vulnerable because it is completely isolated.

Now count Black's pawn islands: - Island 1: a7, b7 (connected) - Island 2: f7 (alone) - Island 3: h7 (alone)

Black also has **three pawn islands.** Both f7 and h7 are isolated.

In a position with equal material and three vs. two pawn islands, the side with fewer islands usually has a structural advantage.

Why fewer pawn islands are better:

1. **Fewer targets.** Each isolated island is a potential weakness. Fewer islands mean fewer weaknesses.

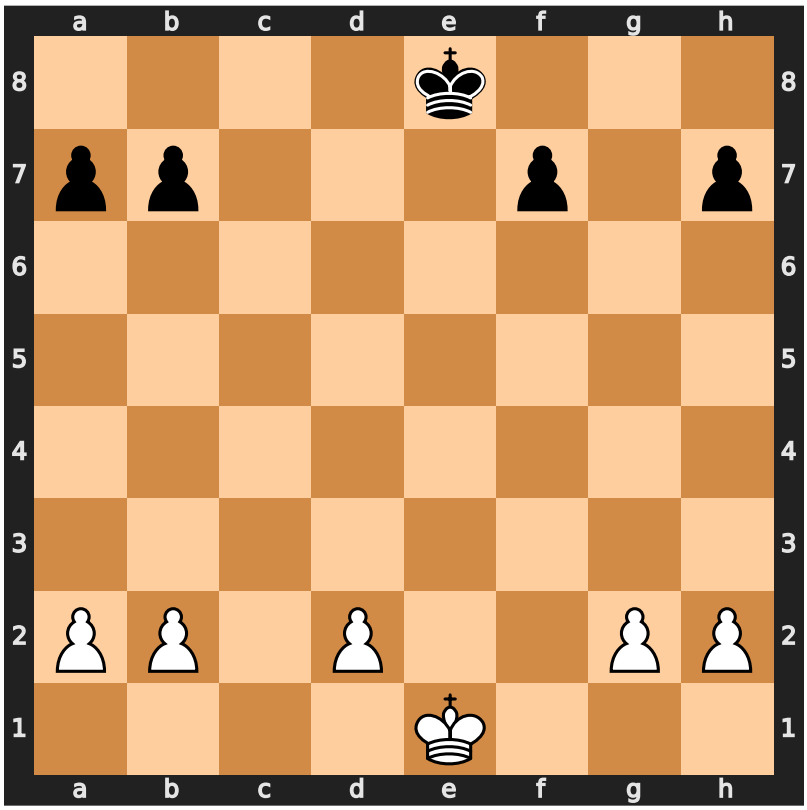

Figure 41.12: Chess Position

2. **Easier defense.** Connected pawns defend each other. Isolated islands each need piece protection.
3. **Greater flexibility.** A single group of connected pawns can advance as a team. Scattered islands lack coordination.

How to use pawn islands in your thinking:

When evaluating a trade or a pawn capture, count the resulting pawn islands for each side. If a trade gives your opponent more pawn islands than you, it is probably favorable for you structurally.

This is a simple rule with deep consequences. Many grandmasters use pawn island counts as a quick structural evaluation tool.

Example evaluation:

Before a trade: White has 2 islands, Black has 2 islands. Equal. After a trade: White has 2 islands, Black has 3 islands. White is structurally better.

That extra island may not win the game on its own, but in an endgame, it can be decisive.

You have now learned all eight pawn structure types. That is a significant milestone. Take a break. You have earned it. When you return, we will see how these structures arise from real openings.

Milestone: You have learned 8 of 8 pawn structure types. Well done.

41.4 Part 3: Key Pawn Structures from Common Openings

Understanding pawn structures in the abstract is valuable. But real chess positions arise from specific openings, and each opening produces its own characteristic skeleton. Once you learn to recognize these skeletons, you will know what to do in the middlegame before you even finish your development.

41.4.1 The Carlsbad Structure

Arises from: Queen's Gambit Declined, Exchange Variation; Slav Defense

Set up your board:

The Carlsbad structure appears after White plays cxd5 and Black recaptures with …exd5. The result is a symmetric pawn center with White's pawns on d4/e3 and Black's pawns on d5/e6 (or similar configurations).

Key features:

1. **Symmetric center.** Both sides have a pawn on d4/d5 and a pawn further back on e3/e6.
2. **Half-open c-file.** White typically has a half-open c-file after cxd5.
3. **The minority attack.** White's primary plan is to advance the queenside pawns (a4, b4, b5) to undermine Black's pawn structure. This is the famous *minority attack*, and we will study it in detail in Part 4.

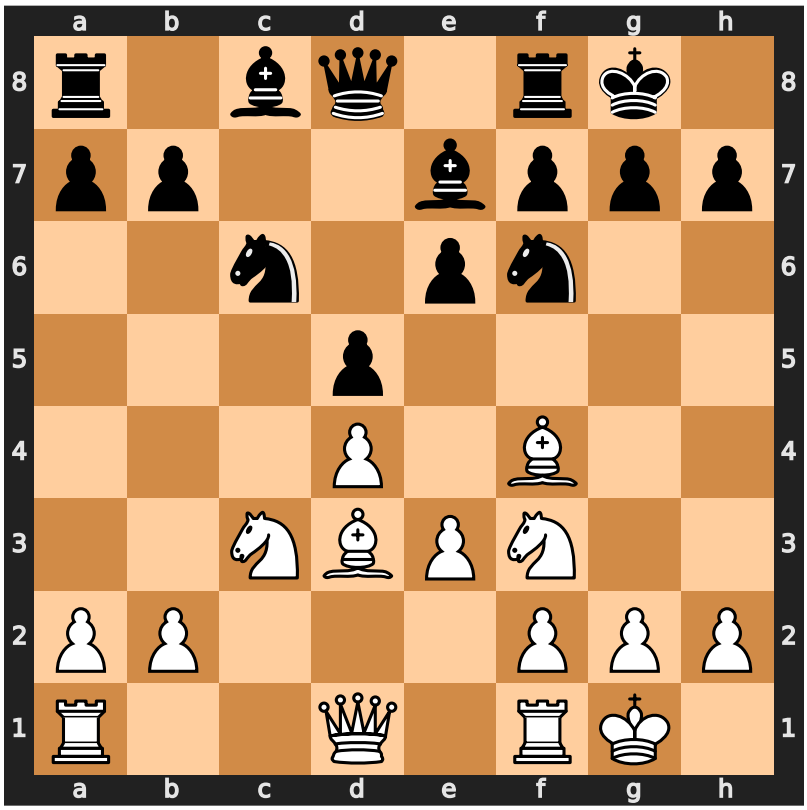

Figure 41.13: Chess Position

4. **Black's kingside chances.** While White attacks on the queenside, Black often seeks counterplay by advancing on the kingside or building pressure in the center.

How to play this structure as White:

- Execute the minority attack: a2-a4, b2-b4, b4-b5.
- The goal is to exchange your b-pawn for Black's c-pawn, leaving Black with a weak, isolated pawn on d5 or a backward pawn on c6.
- Place rooks on the c-file after the queenside pawn exchange.
- Be patient. The minority attack is a slow plan, but it is very effective.

How to play this structure as Black:

- Consider …Ne4 to establish a central outpost before White finishes the minority attack.
- Prepare …f5 to generate kingside play.
- Use the semi-open e-file for rook activity.
- Do not panic when White pushes b4-b5. You have time to generate counterplay.

41.4.2 The French Structure

Arises from: French Defense (1.e4 e6 2.d4 d5 3.e5)

Set up your board:

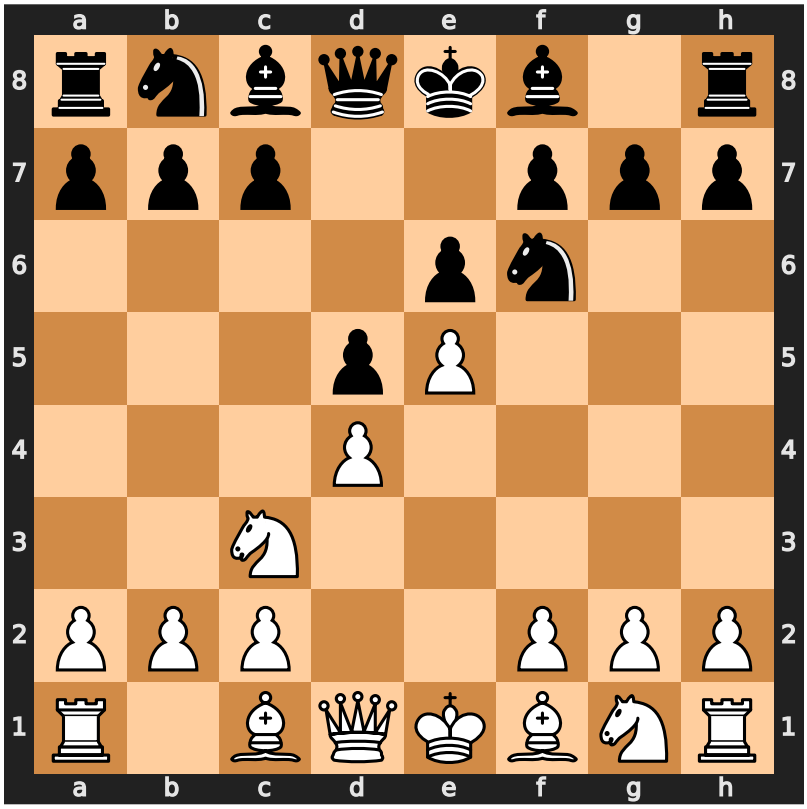

Figure 41.14: Chess Position

This is the classic pawn chain structure we studied earlier. White has pawns on d4 and e5 forming a chain pointing toward Black's kingside. Black has pawns on d5 and e6 forming a chain pointing toward White's queenside.

Key features:

1. **Locked center.** Neither side can easily advance central pawns. The action happens on the flanks.
2. **White attacks kingside.** The e5 pawn supports piece maneuvers toward Black's king. Plans include f4-f5, Qg4, Bd3-h5.
3. **Black attacks queenside.** The classic …c5 break strikes at the base of White's chain (d4). Black may follow with …Nc6, …Qb6, …cxd4 to open lines on the queenside.
4. **The bad bishop.** Black's light-squared bishop (on c8) is blocked by the e6 pawn. Solving this problem is one of Black's central tasks.

Critical pawn breaks:

- **For White:** f2-f4-f5 (attacking the base of Black's chain at e6)
- **For Black:** …c7-c5 (attacking the base of White's chain at d4), and sometimes …f7-f6 (striking at the tip)

41.4.3 The Sicilian Structure

Arises from: Sicilian Defense (1.e4 c5)

Set up your board:

After 1.e4 c5 2.Nf3 d6 3.d4 cxd4 4.Nxd4, the typical Sicilian structure emerges. White has a pawn on e4; Black has a pawn on d6. The c-file is half-open for Black, and the d-file is half-open (or open) for White.

Key features:

1. **Asymmetric center.** White's e4 pawn vs. Black's d6 pawn creates an unbalanced fight. White has more central space; Black has a half-open c-file.
2. **White's space advantage.** The e4 pawn gives White more room on the kingside.
3. **Black's queenside counterplay.** Black typically plays …a6, …b5, and sometimes …b4 to generate queenside activity.
4. **Dynamic imbalance.** Sicilian positions are sharp and tactical. The asymmetric pawn structure guarantees an unbalanced game.

How to play this structure as White:

- Use the space advantage for a kingside attack.
- Control the d5 square. A knight on d5 in the Sicilian is often very strong.
- Develop quickly and castle kingside (in Open Sicilians) or consider the English Attack with Be3, Qd2, O-O-O for a direct kingside pawn storm.

How to play this structure as Black:

- Use the half-open c-file for rook pressure.
- Advance the queenside pawns (…a6, …b5, …b4) to create counterplay.

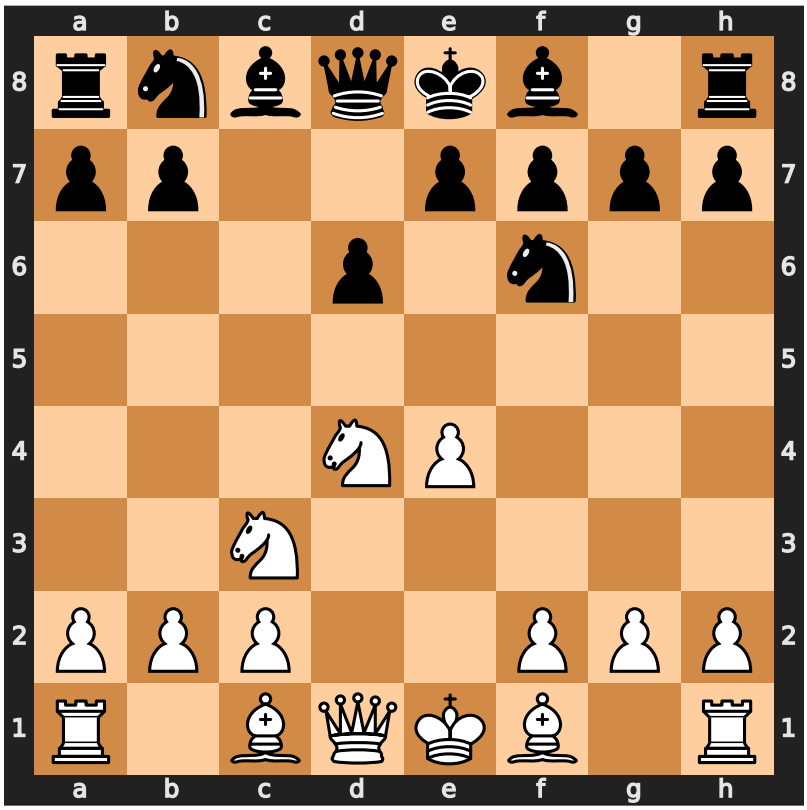

Figure 41.15: Chess Position

- Time the …d5 break carefully. When Black achieves …d5, the position often equalizes or gives Black the advantage.
- Stay alert to tactical possibilities. Sicilian positions reward active play.

41.4.4 The King's Indian Structure

Arises from: King's Indian Defense (1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5 7.d5)

Set up your board:

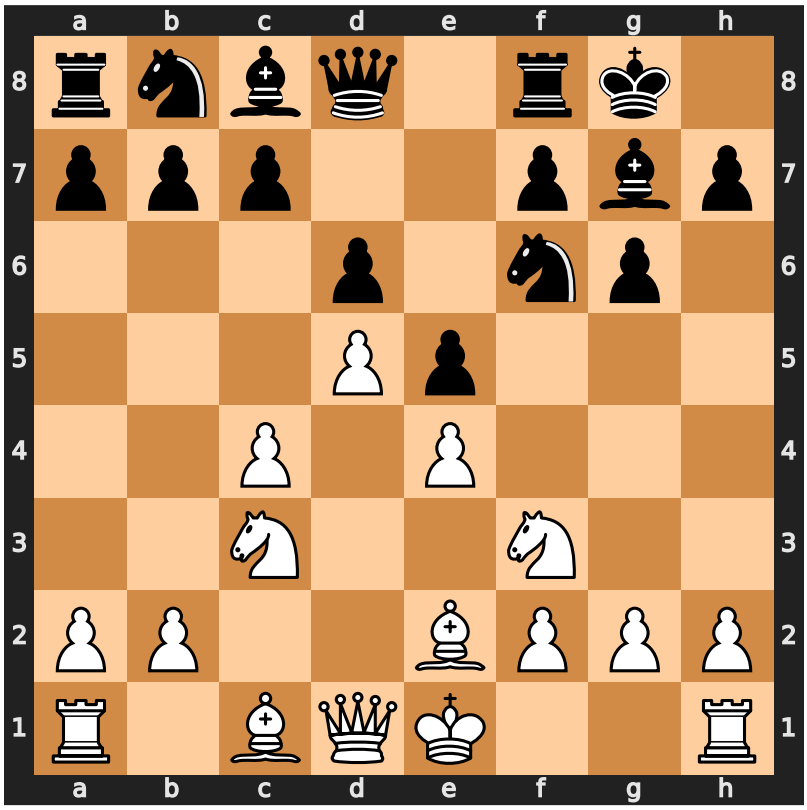

Figure 41.16: Chess Position

After 7.d5, the center locks. White has a pawn chain from c4-d5, pointing queenside. Black has a pawn chain from d6-e5, pointing kingside. The board splits into two battlefields.

Key features:

1. **Closed center.** The d5 and e5 pawns lock against each other. Neither side can easily open the center.
2. **Opposite flank attacks.** White plays on the queenside (c4-c5, a4, b4); Black plays on the kingside (f5, g5, h5, f4).
3. **The f5 break for Black.** Black's main weapon is …f7-f5, striking at White's e4 pawn and opening the f-file for an attack on White's king.
4. **The c5 break for White.** White's main weapon is c4-c5, opening lines on the queenside and undermining Black's d6 pawn.

Critical question: Whose attack arrives first?

King's Indian positions are a race. White attacks on the queenside; Black attacks on the kingside. The player who breaks through first usually wins. This makes the King's Indian one of the most exciting and double-edged structures in chess.

How to play this structure as White:

- Push c4-c5 as quickly as possible. This is your primary break.
- Use the a-file and b-file after the queenside opens.
- Do not get distracted by Black's kingside threats. Your attack should arrive first if you play energetically.
- Consider the f3 pawn to reinforce e4 and support a potential g4 advance.

How to play this structure as Black:

- Push …f7-f5 and aim for …f4 to clamp down on the kingside.
- Once f4 is achieved, the g-file and h-file become your highways to White's king.
- The knight maneuver …Nf6-d7-f6 (via c5 or to support …f5) is standard.
- Trade your dark-squared bishop only if you get something significant in return. It is your best piece on the long diagonal.

41.4.5 The London System Structures

Arises from: London System (1.d4 d5 2.Bf4, or 1.d4 Nf6 2.Bf4)

Set up your board:

The London is a system opening, which means White plays the same setup regardless of Black's responses. The typical pawn structure features:

- White pawns on d4, e3, c3 (the "London pyramid")
- The dark-squared bishop developed outside the pawn chain to f4

After a few more moves, a typical London position looks like this:

Key features:

1. **Solid, compact structure.** The c3-d4-e3 pyramid is extremely sturdy. It is hard to attack and gives White a reliable foundation.
2. **Clear piece development.** Bf4, Nf3, e3, Bd3, Nbd2, O-O. The London setup plays itself, which reduces the need for memorized theory.
3. **Flexibility.** White can choose later whether to play on the kingside (e3-e4), the queenside (c3-c4), or simply maintain the position.
4. **Risk of passivity.** If White plays too cautiously, the structure can become cramped. The e3 pawn blocks the dark-squared bishop's natural retreat.

How to play this structure as White:

- Complete your development before choosing a plan.
- Look for the e3-e4 break. If you can achieve e4 successfully, you gain central space and open lines for your pieces.
- Consider c3-c4 to challenge Black's center.

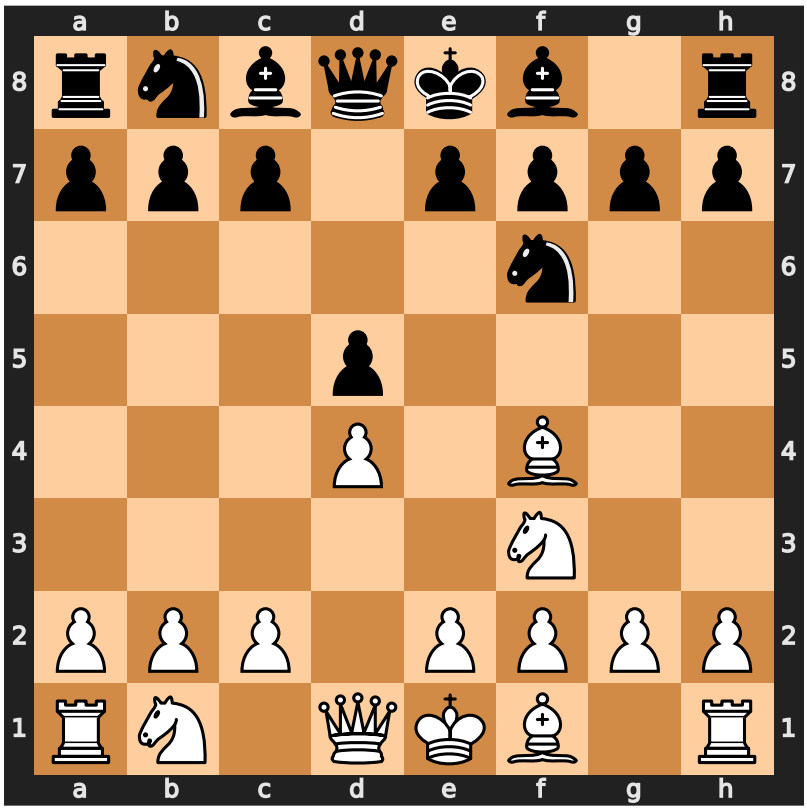

Figure 41.17: Chess Position

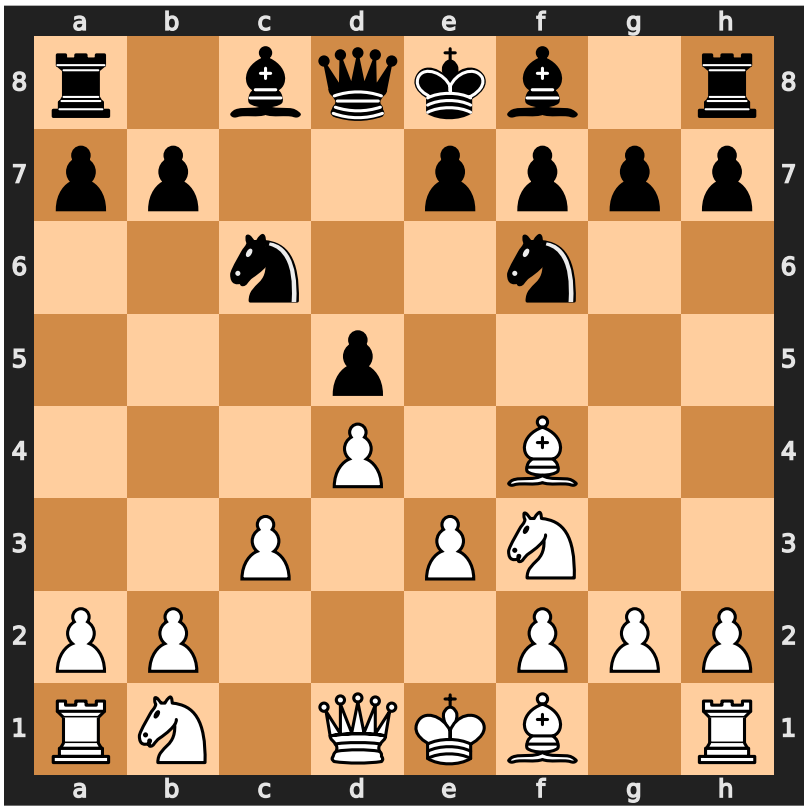

Figure 41.18: Chess Position

- The queen often goes to e2 or c2, supporting the e4 push.
- Connect your rooks and only then commit to a specific plan.

How to play this structure as Black:

- Challenge the center with …c5. This is Black's most important break.
- Consider …Qb6 to hit the b2 pawn and create queenside pressure.
- Develop the light-squared bishop actively (…Bf5 or …Bg4).
- Do not be passive. If you allow White to play e4 undisturbed, the London can become dangerous.

Rest marker. You now understand how the major opening families produce their characteristic pawn skeletons. That is a powerful piece of knowledge. When you return, we will learn how to build plans based on what you see.

41.5 Part 4: Planning Based on Pawn Structure

This is where the chapter comes together. You have learned the eight structure types. You have seen how they arise from common openings. Now we connect structure to *planning*.

The great positional players all share one skill: they look at the pawn skeleton and immediately know what to do. The pawns tell them which pieces to keep, which to trade, where to put the rooks, and where to attack.

You can develop this skill too. Here is a systematic method.

41.5.1 Step 1: Which Pieces to Keep, Which to Trade

The pawn structure determines which pieces are good and which are bad.

Bad bishops: A bishop trapped behind its own pawns is a "bad bishop." In the French structure, Black's light-squared bishop is bad because the e6 and d5 pawns block its diagonal. If you have a bad bishop, consider trading it.

Good knights: A knight with a permanent outpost (a square protected by a pawn, where no enemy pawn can chase it away) is often stronger than a bishop. In positions with a locked center, knights outperform bishops.

Good bishops: In open positions with pawns on both sides of the board, bishops are typically stronger than knights. Their long-range power covers more ground.

The trading principle: Trade your bad pieces for your opponent's good pieces. If you have a bad bishop and your opponent has a good knight, try to exchange them. You improve your position and worsen theirs.

Set up your board:

White's dark-squared bishop (on c1) is hemmed in by the e3 pawn (if it were on e3). Black's dark-squared bishop on e7 is passive. In this type of position, both sides might benefit from trading their passive bishops and keeping their active ones.

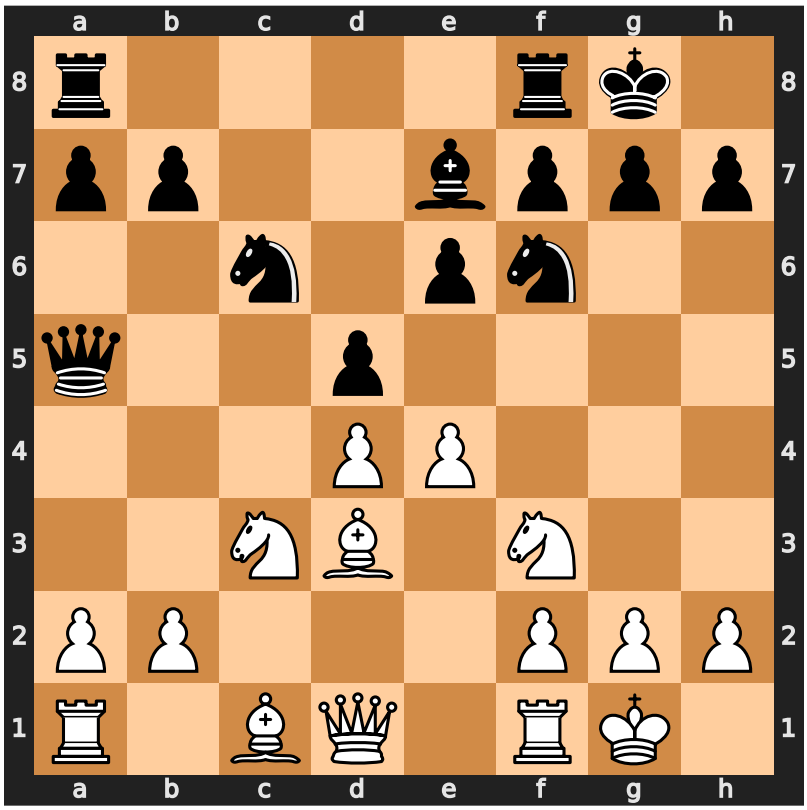

Figure 41.19: Chess Position

A simple test: For each minor piece, ask: "Is this piece working with the pawn structure or fighting against it?" Trade the ones fighting against it. Keep the ones working with it.

41.5.2 Step 2: Where to Place Your Rooks

Rooks need open files. The pawn structure tells you exactly where those files are.

Rule: Place your rooks on open files (no pawns at all) or half-open files (only enemy pawns on the file).

In the Carlsbad structure, White's rooks belong on the c-file (half-open after cxd5). In the Sicilian, Black's rook belongs on the c-file (half-open after …cxd4). In the French, both sides will fight for the c-file and e-file depending on how the pawn tension resolves.

Behind passed pawns: If you have a passed pawn, place a rook behind it (on the same file, further from promotion). As the pawn advances, the rook's scope increases. This is Tarrasch's rule, and it is remarkably reliable.

The seventh rank: A rook on the seventh rank (the second rank for Black) is almost always powerful. It attacks pawns from behind and restricts the enemy king. Look at the pawn structure to see if you can seize the seventh rank.

41.5.3 Step 3: Where to Attack (Pawn Breaks)

A *pawn break* is a pawn advance designed to open lines or destroy the opponent's structure. The pawn skeleton tells you which breaks are available and desirable.

Every pawn structure has characteristic breaks:

Structure	Key Break for White	Key Break for Black
Carlsbad	b4-b5 (minority attack)	…f7-f5 or …e6-e5
French	f2-f4-f5	…c7-c5
Sicilian	f2-f4, d4-d5	…d6-d5
King's Indian	c4-c5	…f7-f5
London	e3-e4	…c7-c5

Timing a pawn break:

Do not play a pawn break too early or too late. Ask yourself:

1. **Are my pieces ready?** A break works best when your pieces are positioned to exploit the lines that open.
2. **Can my opponent punish the break?** If the break leaves you with a weakness and your opponent can exploit it immediately, wait.
3. **Is the break structurally sound?** After the break, will the resulting pawn structure favor you?

If you answer yes to all three questions, play the break. If not, prepare further before committing.

41.5.4 Step 4: The Minority Attack

The minority attack deserves special attention because it is one of the most instructive strategic plans in chess, and it arises frequently in the Carlsbad structure.

The idea: You advance a minority of pawns (usually two pawns on the queenside) against the opponent's majority (usually three pawns). The goal is NOT to win a pawn. The goal is to inflict structural damage.

Set up your board:

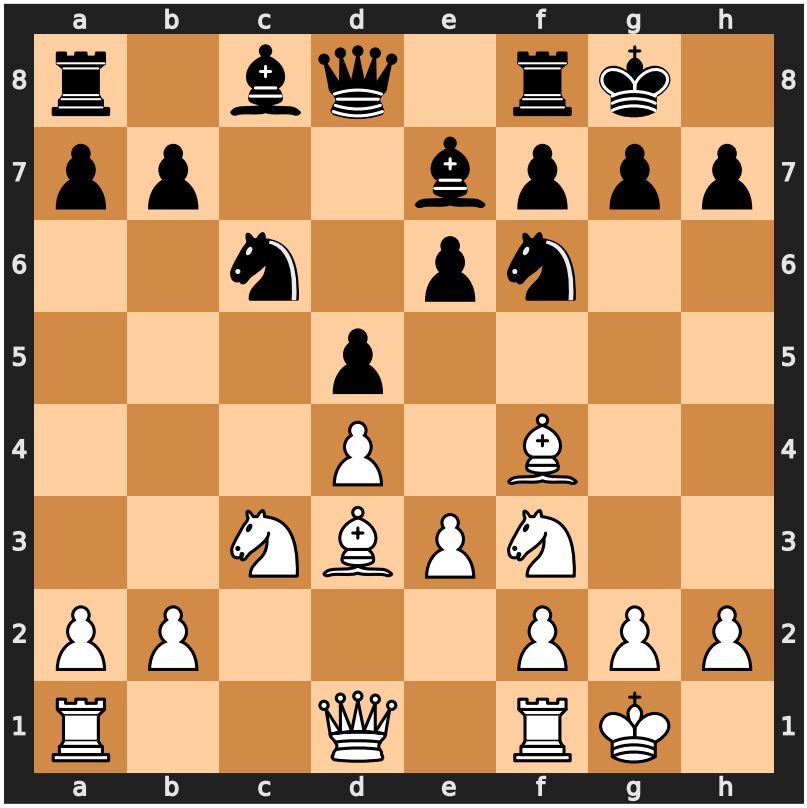

Figure 41.20: Chess Position

White plays a2-a4, then b2-b4, then b4-b5. When White's b-pawn reaches b5, it forces Black to make an uncomfortable choice:

1. **...axb5:** White recaptures with axb5, and now Black's c-pawn is backward on c6 (or c7), sitting on a half-open file. It becomes a permanent target.
2. **...cxb5:** White plays Nxb5, and now Black's d5 pawn is isolated. It becomes a permanent target.
3. **Black ignores it:** White captures on c6, and Black recaptures with …bxc6, creating doubled, isolated c-pawns. Permanent targets.

No matter what Black does, the minority attack creates structural weaknesses. It is slow (taking 5-10 moves to execute), but extremely effective. The resulting weaknesses often decide the game in the endgame.

How to execute the minority attack:

1. Play a2-a4.
2. Play b2-b4.
3. Play b4-b5 when the time is right.
4. Open the a-file and b-file for your rooks.
5. Target the weaknesses that result.

How to defend against the minority attack:

1. Generate kingside counterplay before the attack arrives (…f5, …Ne4, …Bf6).
2. Consider …a5 to prevent b4-b5, though this creates a weakness on b5.
3. Develop active piece play in the center to distract from the queenside.

41.5.5 Step 5: Putting It All Together

Here is a five-step planning process you can use in any position:

1. **Identify the pawn structure.** What type is it? What opening family did it come from?
2. **Evaluate the pieces.** Which pieces are good? Which are bad? What should you trade?
3. **Find the open files.** Where should the rooks go?
4. **Identify the pawn breaks.** What breaks are available? Are your pieces ready for them?
5. **Form a plan.** Combine the above into a concrete sequence of moves.

This process takes practice. At first, it may feel slow. With repetition, it becomes second nature. You will look at a position and immediately see the plan that the pawn structure suggests.

Good stopping point. The theory section of this chapter is complete. When you return, we will see these ideas brought to life in five masterpiece games.

41.6 Part 5: Annotated Games

41.6.1 Game 24: Nimzowitsch vs Saemisch, Copenhagen 1923

Theme: Blockade, Overprotection, and Positional Suffocation

This game is one of the most celebrated positional masterpieces ever played. Nimzowitsch demonstrates his own theories of blockade and overprotection with brutal clarity. Watch how the pawn structure dictates every single decision.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nf3 b6 4.g3 Bb7 5.Bg2 Be7 6.Nc3 O-O 7.O-O d5

Both sides have completed their development. The position is classical and balanced. Black has a solid pawn structure with pawns on d5 and e6.

8.Ne5

A strong centralizing move. The knight on e5 controls critical squares and supports the coming pawn tension. Notice how the pawn structure (White's d4 and c4 against Black's d5 and e6) invites this kind of piece placement. The knight is headed for the heart of the position.

8...c6

Black supports the d5 pawn. This creates a small pawn chain: c6 supports d5, which is the structural anchor. But it also means Black's pieces are becoming a bit passive.

9.cxd5 cxd5

Now look at the structure. White has a pawn on d4; Black has a pawn on d5. The c-file is open. The position has a Carlsbad flavor, and Nimzowitsch is going to demonstrate how to exploit it.

10.Bf4 a6 11.Rc1 b5 12.Qb3 Nc6

Black develops the knight, but White's pieces are already better coordinated. Nimzowitsch's concept of "overprotection" is visible here: White's pieces support each other and control key squares redundantly.

13.Nxc6 Bxc6 14.h3 Qb6 15.Kh2 Rab8

White calmly improves the king's position. There is no rush. The pawn structure is stable, and White can slowly build pressure.

16.Nd1

This looks strange. The knight retreats to d1? But Nimzowitsch has a plan. The knight will reposition to a better square. Patience and maneuvering are the hallmarks of pawn-structure play.

16...Nd7 17.Rxc6! Qxc6

A key exchange. White gives up the rook for Black's active bishop. This looks like it costs material, but Nimzowitsch understands that Black's pawn structure is now rigid and the remaining pieces favor White.

18.Nd2 Nb6 19.e3 Rfc8 20.Be5 f6 21.Bg3 f5 22.f3

White builds a fortress around the center. Every pawn move is designed to control squares and restrict Black's pieces. This is overprotection in action: White's pieces and pawns guard the same key squares multiple times.

22...Rc2 23.Re1 Bf6 24.Bf1 Rbc8 25.Bd3 R2c3 26.Bf2

Black has rooks on open files, but they accomplish nothing. White's structure is airtight. The pawns on d4, e3, f3, g3, and h3 form a wall, and the pieces behind that wall are perfectly coordinated.

26...Nc4 27.Nxc4 bxc4 28.Bc2 Qa4 29.Qb1 Rb3 30.Bb6 1-0

The final move is quiet and devastating. Bb6 traps Black's queen. The rooks cannot help. The queen has no escape. Black resigns.

What this game teaches about pawn structure:

- A stable pawn center allows slow, methodical play
- Overprotection means your pieces support each other and key squares
- When the pawn structure is locked, piece maneuvering decides the game
- Patience is a weapon. Nimzowitsch never hurried.

41.6.2 Game 25: Rubinstein vs Salwe, Lodz 1908

Theme: Isolated Queen's Pawn Exploitation

Many chess historians consider this the finest positional game ever played. Rubinstein takes a position with an isolated queen's pawn for his opponent and demonstrates, move by move, how to convert that structural weakness into a win. The rook maneuver Rd1-d4-h4 is one of the most beautiful ideas in chess history.

Set up your board.

1.d4 d5 2.Nf3 e6 3.e3 c5 4.c4 Nc6 5.Nc3 Nf6 6.dxc5 Bxc5

Black recaptures the pawn, but notice what has happened to the pawn structure. After a future exchange on d5, Black will be left with an isolated pawn on d5. The c-pawn is gone, so nothing on the c-file can support d5.

7.a3 a6 8.b4 Bd6 9.Bb2 O-O 10.Qd2 Qe7

Both sides develop naturally. White is already preparing to target the d5 pawn.

11.Bd3 dxc4 12.Bxc4 b5 13.Bd3 Rd8 14.Qe2 Bb7 15.O-O Ne5

Black tries to activate pieces. The knight on e5 is well-placed and centralized. But the structural weakness on d5 remains.

16.Nxe5 Bxe5 17.f3

White prepares e3-e4, which will challenge Black's central influence and reinforce control of d5. This quiet pawn move is deeply strategic.

17...Rac8 18.e4

Now White has a strong pawn on e4, which does two things: it controls d5 (preventing Black from placing a piece there easily) and it opens lines for White's pieces. Black's pawn structure, with the isolated d5 pawn gone after the earlier exchange, leaves Black without a central pawn presence.

18...Bb8 19.e5 Nd7 20.Qe3 g6 21.Ne4

The knight heads toward d6, a dream outpost. White's pieces are pouring into the gaps created by Black's structural weaknesses.

21...Nf8 22.Nd6 Bxd6 23.exd6 Rxd6 24.Bc3 Rdc6 25.Bf6 Qd7

White has traded the powerful knight for Black's bishop but gained the powerful bishop on f6. The dark squares around Black's king are compromised.

26.Qe5 Rc2 27.Bf5!

A stunning sacrifice. White gives up the bishop to destroy Black's pawn cover.

27...exf5 28.Qxf5 Qxf5 29.Rxf5

Even though queens are off the board, White's position is winning. The rook on f5 dominates, and the bishop on f6 paralyzes Black. This is pawn structure play at its finest: the structural weakness has been converted into a piece activity advantage, which now converts into a material advantage.

29...Nd7 30.Bd4 Nb8 31.Rd1!

Rubinstein's famous rook lift begins. The rook will swing to the fourth rank and then to h4.

31...Rd8 32.Rf6 a5 33.Rd6 Rxd6 34.Rxd6 Rxd2 35.Rxb6 1-0

Black's pawn structure has collapsed. The queenside pawns fall, and the endgame is hopeless.

What this game teaches about pawn structure:

- An isolated queen's pawn is a long-term target
- Piece activity can be used to exploit structural weaknesses
- The transition from middlegame to endgame is where structural advantages cash in
- Rubinstein's patience is the model: he never rushed, he just improved his position one step at a time

---

41.6.3 Game 43: Capablanca vs Spielmann, New York 1927

Theme: Structural Advantage Conversion with Effortless Technique

Capablanca was the most efficient converter of small advantages in chess history. In this game, he turns a tiny structural edge into a winning position with moves that look almost too simple. That simplicity is the point. When the pawn structure favors you, the correct moves are often the obvious ones.

Set up your board.

1.d4 d5 2.Nf3 Nf6 3.c4 e6 4.Nc3 c6 5.e3 Nbd7 6.Bd3 dxc4 7.Bxc4 b5 8.Bd3 a6

A Semi-Slav structure. Black has expanded on the queenside with …b5 and …a6. This gains space but also creates potential weaknesses. The b5 and a6 pawns can become targets if the position opens.

9.e4 c5 10.e5 cxd4 11.Nxb5!

Capablanca strikes. This sacrifice shatters Black's queenside pawn structure. After this move, Black's pawns become scattered and weak.

11...axb5 12.exf6 gxf6

Look at Black's pawn structure now. The pawns on b5, d4, e6, and f6 are a mess. The f-pawns are doubled. The b5 pawn is isolated. The d4 pawn is passed but difficult to support. Black has four pawn islands to White's two.

This is structural devastation. Capablanca did not need to sacrifice a piece for a mating attack. He sacrificed a piece for a *pawn structure* advantage, knowing that his technique would be sufficient to convert it.

13.O-O Qb6 14.Qe2 Bb7 15.a4!

Targeting the weak b5 pawn immediately. White opens lines on the queenside where Black's structure is damaged.

15...Bd5 16.Rd1 bxa4 17.Nd2 f5

Black tries to stabilize, but the structural damage is too severe.

18.Nb3 Bc5 19.Qh5 Rg8 20.Qxf5 Rg6 21.Bxg6 fxg6 22.Qe4 1-0

Spielmann resigns. White is up material and Black's position is riddled with weaknesses. The pawn structure told the story from move 11 onward.

What this game teaches about pawn structure:

- Pawn structure advantages can justify material sacrifices
- Pawn islands matter: four islands against two is a structural disaster
- Capablanca's technique shows that when the structure favors you, simple moves are the strongest moves
- Doubled, isolated, and backward pawns combined create an undefendable position

---

41.6.4 Game 48: Nimzowitsch vs Capablanca, New York 1927

Theme: Simplicity Defeats Complexity

In this game, two of the greatest chess minds of all time clash. Nimzowitsch, the great theorist, brings his complex strategic ideas. Capablanca, the great pragmatist, brings clarity and precision. The result is a masterclass in how clean pawn play defeats complicated plans.

Set up your board.

1.c4 Nf6 2.Nf3 e6 3.d4 d5 4.e3 Be7 5.Nbd2 O-O 6.Bd3 c5

Black immediately challenges the center. This is the most important pawn break in the Queen's Gambit family of structures. By playing …c5, Capablanca opens lines and prevents White from establishing a dominant center.

7.dxc5 Na6 8.O-O Nxc5 9.Bc2 b6 10.b3 Bb7

Black has a harmonious setup. The bishop on b7 aims at the long diagonal. The knight on c5 is well-placed. Black's pawn structure is clean: pawns on b6, d5, and e6 with no weaknesses.

11.Bb2 Rc8 12.Qe2 Qd7 13.Rfd1 Rfd8 14.Rac1 dxc4

Capablanca opens the position at exactly the right moment. The pawn exchange on c4 opens the d-file and gives Black's pieces maximum activity.

15.bxc4 Qe8 16.a3 Nce4

The knight springs to e4, a powerful central outpost. From here it controls critical squares and cannot easily be driven away. This is pawn-structure thinking: the central pawn exchange created the outpost, and Capablanca was the first to occupy it.

17.Nxe4 Nxe4 18.Nd4 Qa4!

The queen enters the game with tempo, attacking the c4 pawn. Nimzowitsch's position, despite looking solid, is under pressure on every front.

19.Bd3 Nc5 20.Bb1 Rxd4!

A beautiful exchange sacrifice, but also a structural one. By removing the knight from d4, Capablanca eliminates the piece that held White's position together.

21.exd4 Nd3 22.Bxd3 Qxd4 23.Be4 Bxe4 24.Qxe4 Qxe4 0-1

White resigns. After the queen trade, Black's endgame is winning. The structural advantage (cleaner pawns, better piece placement, superior coordination) made the tactical blow on move 20 possible.

What this game teaches about pawn structure:

- Clean pawn structure enables tactical opportunities
- Opening the position at the right moment is a structural decision
- Central outposts created by pawn exchanges are powerful
- Simplicity and precision beat complexity when the structure is on your side

---

41.6.5 Game 5 (Bonus): Karpov vs Unzicker, Nice Olympiad 1974

Theme: The Minority Attack in Practice

No chapter on pawn structures is complete without a game showing the minority attack executed to perfection. Karpov was the supreme master of this technique. In this game, he demonstrates how two queenside pawns can dismantle three.

Set up your board.

1.d4 d5 2.c4 e6 3.Nf3 Nf6 4.Nc3 Be7 5.Bg5 O-O 6.e3 h6 7.Bh4 b6 8.cxd5 Nxd5 9.Bxe7 Qxe7 10.Nxd5 exd5

The Carlsbad structure has appeared. White has pawns on d4 and e3; Black has pawns on d5 and e-pawn is now gone. The c-file is half-open. This is the ideal setup for the minority attack.

Count the pawn islands. White has two (a+b+c pawns, and d+e+f+g+h pawns). Black also has two. But the key difference is on the queenside: White has two pawns (a2 and b2) against Black's three (a7, b6, c7). Two against three. The minority is ready to march.

11.Rc1 Be6 12.Qa4 c5 13.Qa3

White immediately targets the c5 pawn. Karpov does not waste a single move.

13...Rc8 14.Bb5 Qb7 15.dxc5 bxc5 16.O-O

Now Black has an isolated pawn on c5 and an isolated pawn on d5. These are the fruits of the minority attack: Black's queenside has been shattered. The c5 pawn is a target on the half-open c-file, and the d5 pawn has lost its neighbor.

16...Nd7 17.Be2 Nb6 18.Rc2 Rc6 19.Rfc1 Rac8 20.Nd2 Nd7 21.Nb3

White piles pressure on c5. Every piece points at the weakness. Black's position is solid but passive; all of Black's energy is devoted to defending the c5 pawn.

21...Nb6 22.Na5 Rc7 23.Nb3 Nc4 24.Qd3 f5

Black tries to generate counterplay, but it is too late. The structural damage is done.

25.Bxc4 dxc4 26.Nxc5 cxd3 27.Nxe6 1-0

The final combination nets White a piece. But the game was won in the pawn structure, not in the tactics. The minority attack created the weakness on c5, and Karpov's patient pressure forced Black into an impossible defensive position.

What this game teaches about pawn structure:

- The minority attack is one of the most reliable strategic plans in chess
- Two pawns advancing against three can create lasting weaknesses
- Patience and precise piece placement convert structural advantage into victory
- The Carlsbad structure is a laboratory for learning positional play

---

All five games complete. Take a moment to appreciate what you have seen. Five different masters, five different structural themes, and all of them decided by the pawn skeleton. When you are ready, the exercises await.

41.7 Part 6: Exercises

How to use these exercises: Attempt each exercise on your physical board before reading the hints. If you get stuck, read Hint 1. Still stuck? Read Hint 2. Only after trying all three hints should you read the solution. There is no shame in using hints. That is what they are for.

Pacing: Do five exercises per session. That is 10 sessions to complete all 50. A sustainable pace.

41.7.1 Section A: Identify the Pawn Structure (Exercises 13.1 - 13.10)

For each position, identify the pawn structure type and state whether the side to move should be happy or concerned about their structure.

Exercise 13.1

White to move. What pawn structure type is present? Is White's structure healthy?

Hint 1: Look at the white pawn on d4. Are there white pawns on the c-file or e-file that could support it? *Hint 2:* The white pawn on e3 is behind the d4 pawn. Does this qualify as an adjacent pawn supporter? *Hint 3:* Consider whether d4 is truly isolated or part of a chain.

Solution: White has a pawn chain (e3 supporting d4). This is NOT an isolated pawn because the e3 pawn sits on an adjacent file and can potentially protect d4 via e3-e4 or simply supports the center from behind. White's structure is healthy. The chain e3-d4 is solid, and White has no pawn weaknesses. The key strategic question is whether White can advance e3-e4 to gain central space.

Exercise 13.2

White to move. Identify the pawn structure.

Hint 1: Count each side's pawn islands. *Hint 2:* Look at White's c3 and d4 pawns. Are they connected? *Hint 3:* How does Black's c5 pawn relate to d5?

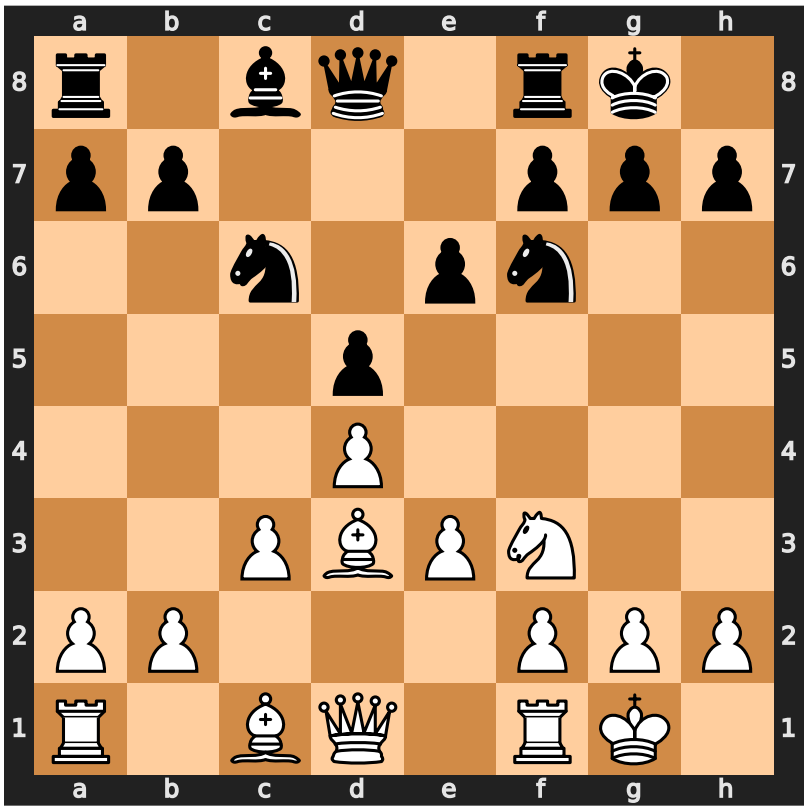

Figure 41.21: Chess Position

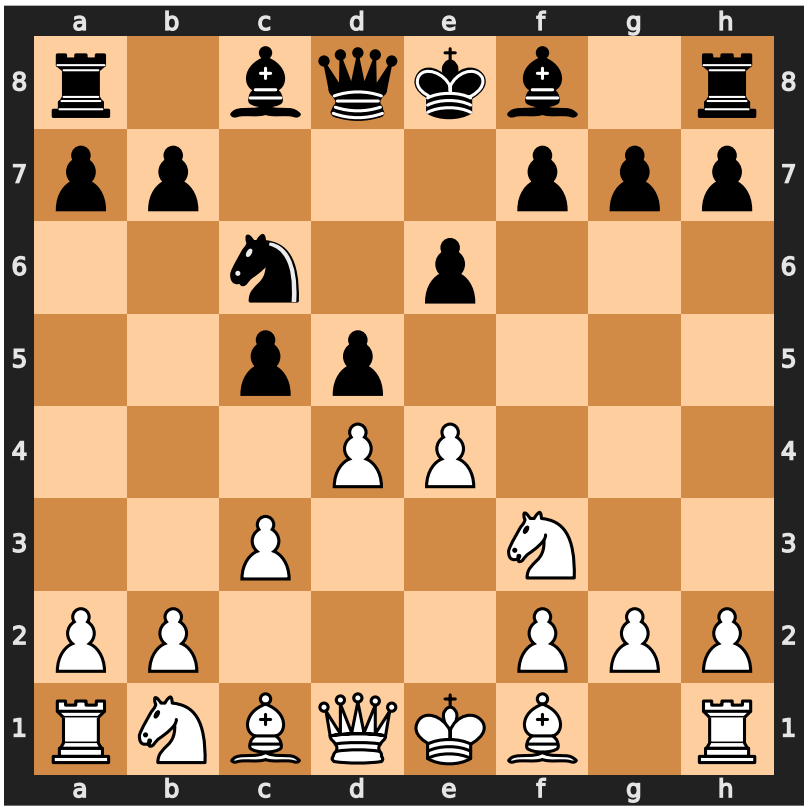

Figure 41.22: Chess Position

Solution: White has pawns on c3, d4, e4. These form a broad center with the c3 pawn supporting d4 and the e4 pawn adjacent. White has two pawn islands (a-b on one side, c-d-e-f-g-h on the other). Black has connected pawns on c5 and d5 challenging the center. This is a dynamic central battle. Black's connected c5-d5 pawns challenge White's center, and the resolution of this tension (whether …cxd4 or …dxe4 happens first) will determine the pawn structure for the rest of the game.

Exercise 13.3

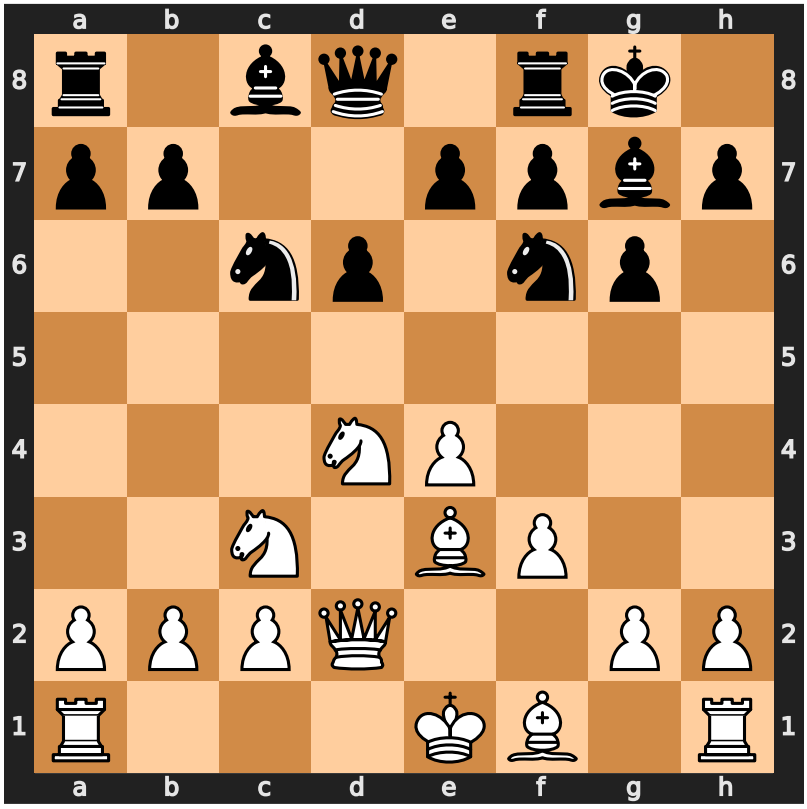

Figure 41.23: Chess Position

White to move. What structure type does Black have?

Hint 1: Focus on Black's pawns. Where are they? *Hint 2:* Is there anything unusual about Black's pawn on d6? *Hint 3:* This structure is characteristic of a specific opening. Which one?

Solution: This is a Sicilian structure. Black has pawns on a7, b7, d6, e7, f7, g6, h7. The key feature is Black's pawn on d6 against White's pawn on e4. The d6 pawn is slightly backward (it cannot easily advance to d5 because White controls that square with e4), but it is also the foundation of Black's position. Black will seek the …d5 break as a liberating move. The half-open c-file (Black's c-pawn was traded for White's d-pawn) gives Black natural counterplay.

Exercise 13.4

White to move. Name the pawn structure and identify the key pawn break for each side.

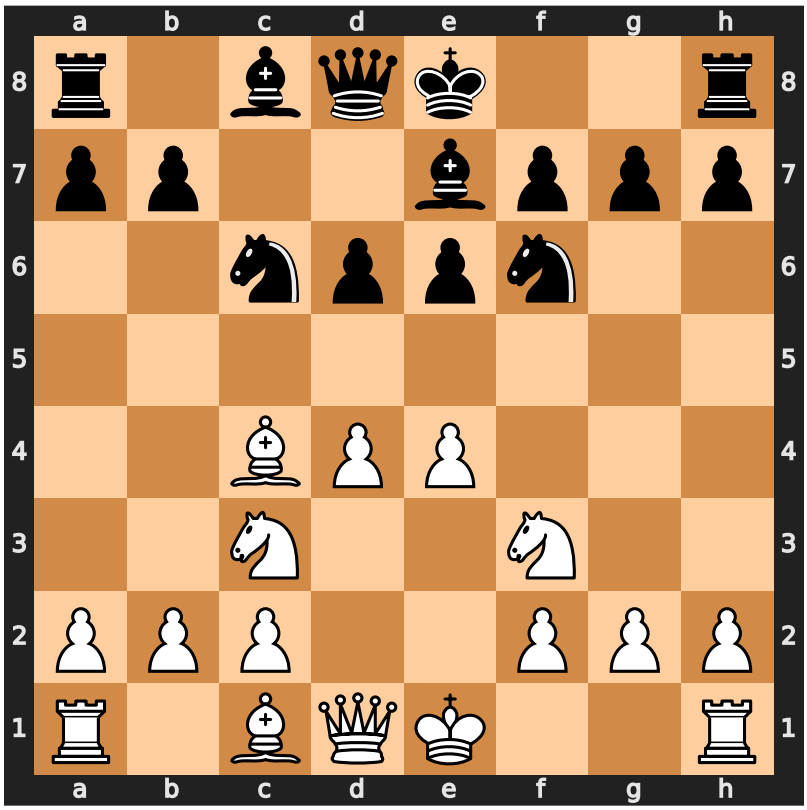

Figure 41.24: Chess Position

Hint 1: Compare White's e4 pawn with Black's d6 and e6 pawns. *Hint 2:* What is the most important pawn advance Black is aiming for? *Hint 3:* What about White? What central pawn advance would give White an advantage?

Solution: This is a classical open-game structure often arising from the Giuoco Piano or Italian Game family. White has the two-pawn center (d4 and e4) against Black's d6 and e6 pawns. Black's key break is …d5, which would challenge White's center directly and free the position. White wants to prevent …d5 or advance d4-d5 to gain space. White's d4-d5 break would lock the center favorably. Black's …d6-d5 break would equalize. The battle revolves around who achieves their break first.

Exercise 13.5

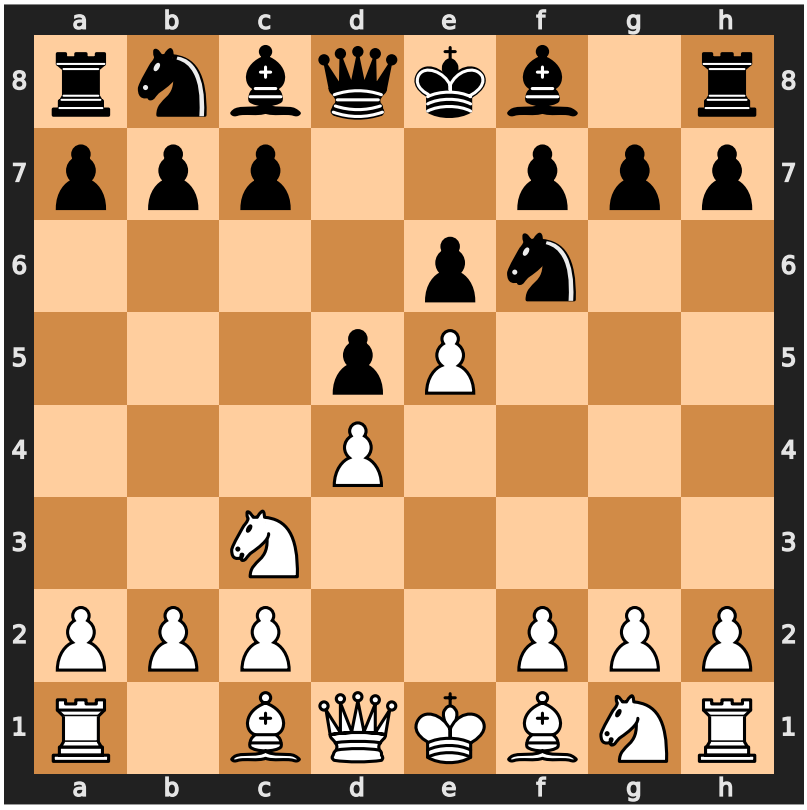

Figure 41.25: Chess Position

Black to move. Name this pawn structure and state the strategic plan for both sides.

Hint 1: Look at the interlocking pawn chains. *Hint 2:* Which side of the board does White's chain point toward? *Hint 3:* What is the base of White's chain? How should Black attack it?

Solution: This is the French structure. White's pawn chain runs d4-e5 (base on d4, tip on e5). Black's chain runs e6-d5 (base on e6, tip on d5). White's plan: attack on the kingside where the chain points (f4, g4, or piece maneuvers to the kingside). Black's plan: attack the base of White's chain with …c5. The classic …c7-c5 break undermines d4 and opens queenside lines for Black's pieces. Black should also solve the problem of the "bad" light-squared bishop blocked by the e6 pawn.

Exercise 13.6

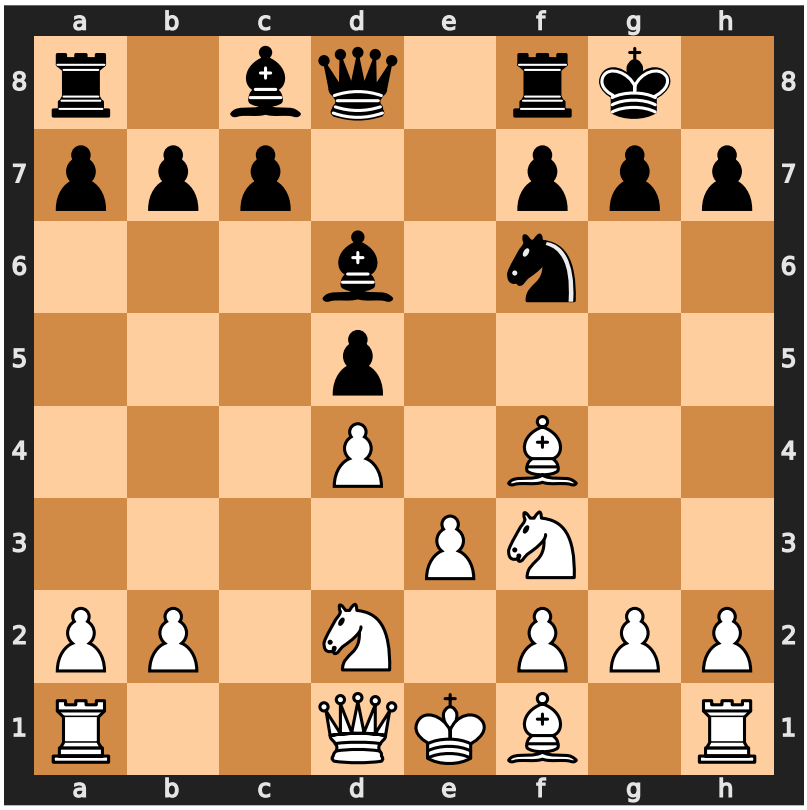

Figure 41.26: Chess Position

White to move. What type of pawn structure is this, and what system does it come from?

Hint 1: Look at White's pawn formation: d4 and e3. And the bishop on f4. *Hint 2:* This is a system opening where White develops the dark-squared bishop before playing e3. *Hint 3:* What is White's main central pawn break in this structure?

Solution: This is the London System structure. White has the characteristic d4-e3 pawn setup with the bishop developed to f4 before the e-pawn moved. White's main plan is to prepare and execute the e3-e4 break, gaining central space. The pyramid structure (if c3 is added: c3-d4-e3) is extremely solid. White should complete development (Bd3, O-O, Qe2 or Qc2) and then look for the right moment to play e4. Black should challenge this plan with …c5 before White completes the setup.

Exercise 13.7

White to move. Count the pawn islands for each side.

Hint 1: Group each side's pawns into connected clusters. *Hint 2:* A pawn island is a group of pawns on adjacent files with no gap. *Hint 3:* Separate islands are separated by at least one empty file.

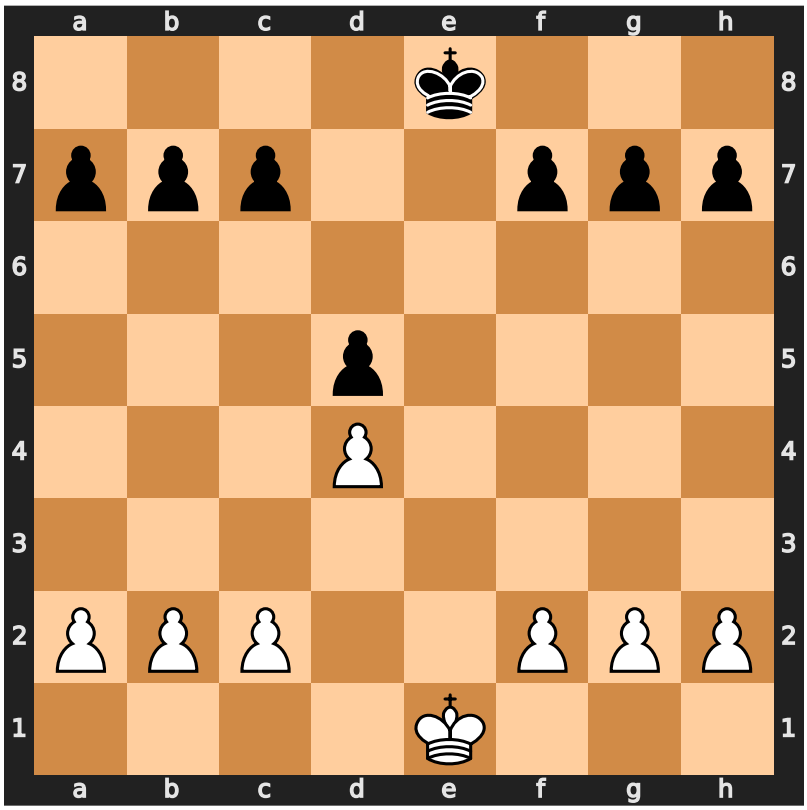

Figure 41.27: Chess Position

Solution: White has two pawn islands: a2-b2-c2 (three connected pawns) and d4-f2-g2-h2 (with a gap where e2 used to be, so d4 is actually isolated from f2). Wait. Let us recount. White's pawns: a2, b2, c2, d4, f2, g2, h2. The gap on e creates two islands: a2-b2-c2-d4 (connected, because c and d are adjacent files) and f2-g2-h2 (connected). White has **two pawn islands**. Black's pawns: a7, b7, c7, d5, f7, g7, h7. Same logic: a7-b7-c7-d5 (connected) and f7-g7-h7 (connected). Black has **two pawn islands**. The structure is symmetric.

Exercise 13.8

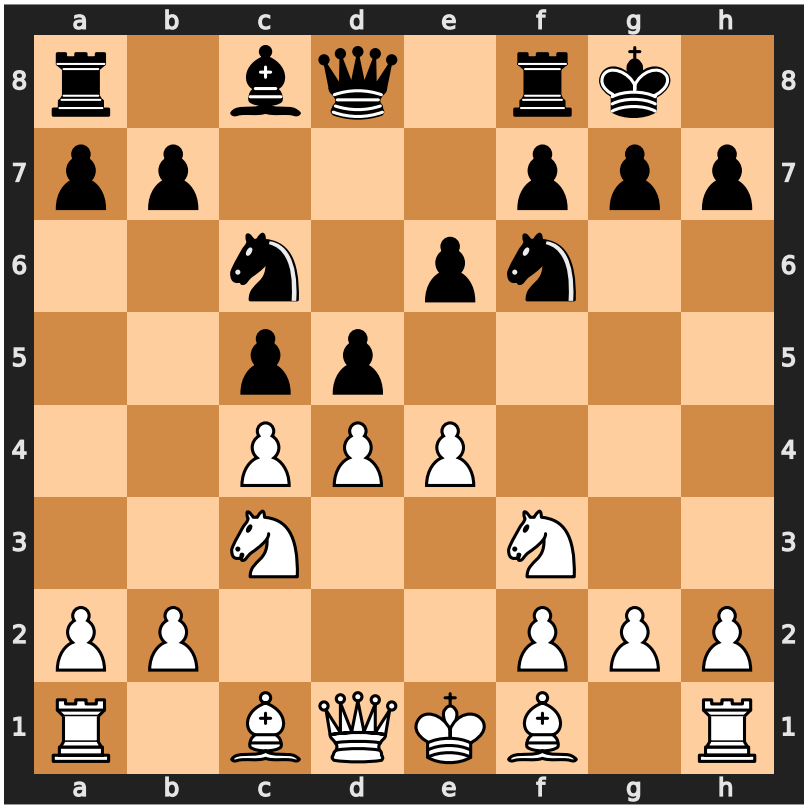

Figure 41.28: Chess Position

White to move. Black has just played …c5 and …d5. What structural tension exists?

Hint 1: White has pawns on c4, d4, and e4. Black has pawns on c5 and d5. Where are the collision points? *Hint 2:* Consider what happens if White plays exd5, cxd5, or dxc5. *Hint 3:* Each capture leads to a fundamentally different pawn structure.

Solution: There are three points of tension: d4 vs c5, c4 vs d5, and e4 vs d5. If White plays **exd5**, Black recaptures …exd5 or …Nxd5, potentially creating a Carlsbad-type structure or an IQP. If White plays **dxc5**, Black gets a half-open d-file and potential central majority. If White plays **cxd5**, the result depends on whether Black recaptures with …exd5 (Carlsbad) or …Nxd5 (different character). Each resolution creates a completely different game. This is why pawn tension is so important: the moment of capture defines the rest of the position.

Exercise 13.9

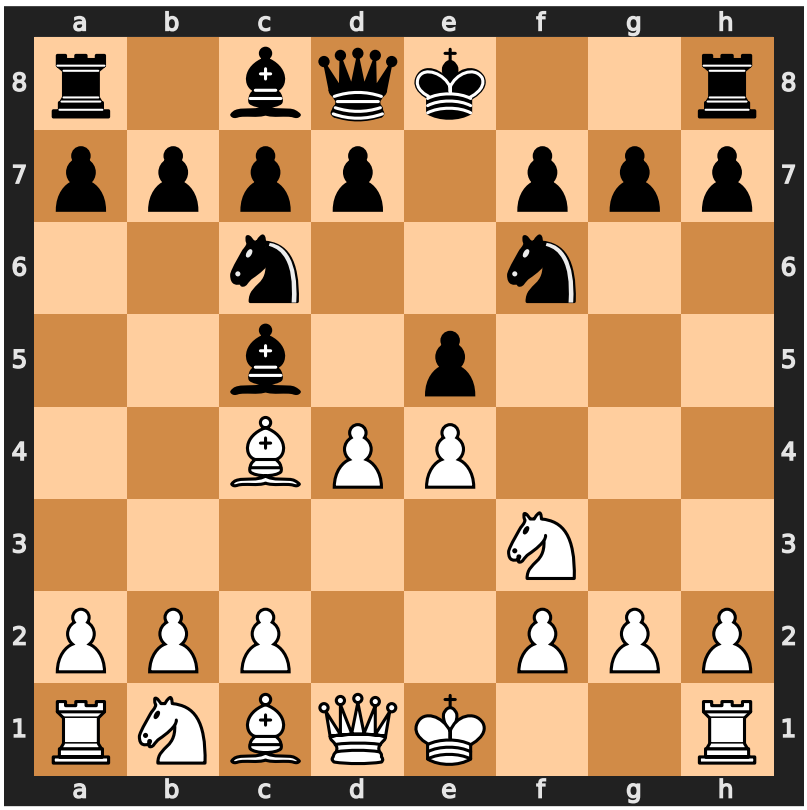

Figure 41.29: Chess Position

White to move. What happens to the pawn structure after 5.d4xe5?

Hint 1: If White captures on e5, which black piece recaptures? *Hint 2:* After …Nxe5, White's e4 pawn is still on the board. What is its status? *Hint 3:* Consider the resulting pawn islands.

Solution: After dxe5 Nxe5, White has pawns on e4 and e5. Wait, that is not right. After dxe5, White has a pawn on e4 and has captured on e5. Black's knight recaptures on e5. So White has: a2, b2, c2, e4, f2, g2, h2 (the d-pawn is gone). White has two pawn islands: a2-b2-c2 and e4-f2-g2-h2. Black has: a7, b7, c7, d7, f7, g7, h7 (the e-pawn was captured). Black has two pawn islands: a7-b7-c7-d7 and f7-g7-h7. The structure is roughly equal in terms of islands, but White has an open d-file and a strong e4 pawn controlling d5. In practice, White usually does not capture this way; instead, White prefers to maintain the tension.

Exercise 13.10

White to move. This position can lead to several major pawn structures depending on White's next move. Name at least two possible structures and the move that creates each one.

Hint 1: What happens after exd5? What about e5? *Hint 2:* After exd5 …Nxd5, we get an open center. After e5, we get a French-like chain. *Hint 3:* Consider also dxc5 and cxd4.

Solution: (1) After **e5**, White creates a French-like pawn chain (d4-e5) with Black's chain on c5-d5. The center locks, and both sides play on opposite flanks. (2) After **exd5 Nxd5**, the center

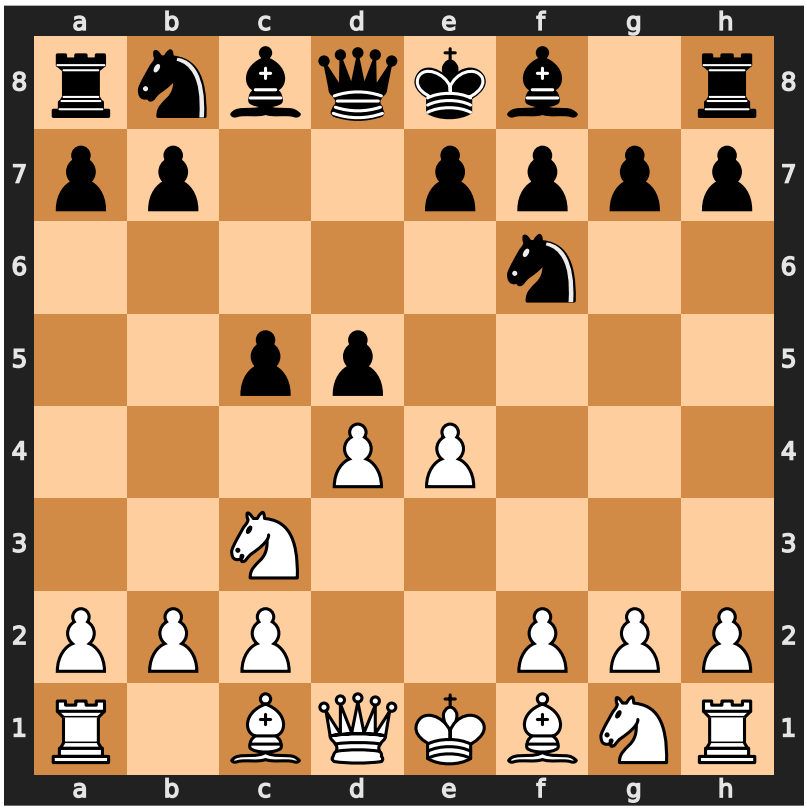

Figure 41.30: Chess Position

opens. White has a single d-pawn against Black's c5, creating a more tactical, open game. (3) After **dxc5**, Black might recapture with …e6 and …Bxc5, potentially reaching an IQP position if …dxe4 follows. Each capture creates a fundamentally different game, which is why understanding pawn structure theory is so powerful: it tells you what kind of game you are creating with each decision.

Rest here. You have completed the first 10 exercises. That is a great start.

41.7.2 Section B: Find the Pawn Break (Exercises 13.11 - 13.20)

For each position, find the correct pawn break and explain why it works.

Exercise 13.11

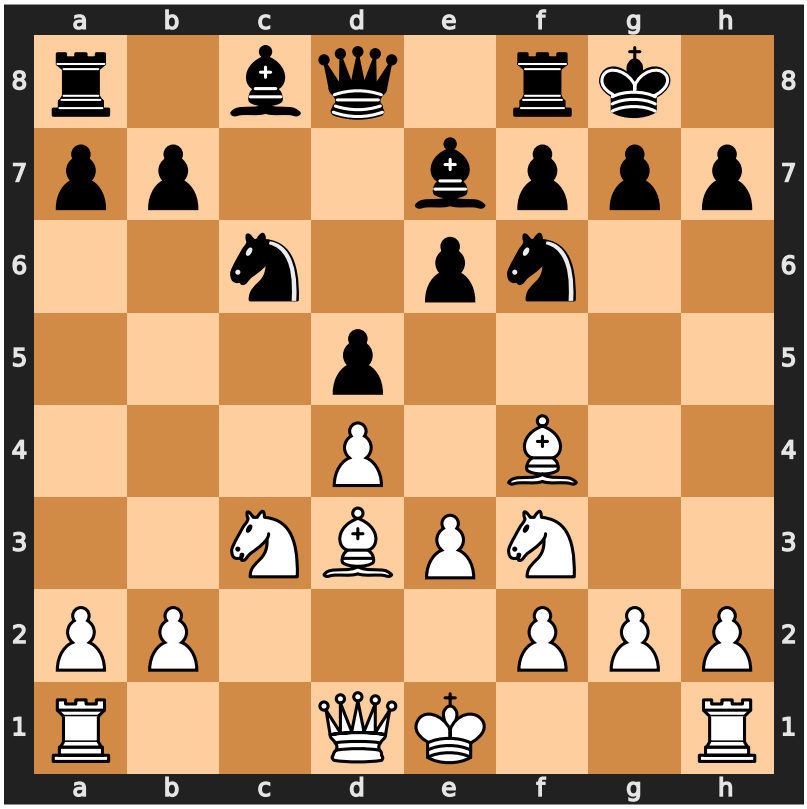

Figure 41.31: Chess Position

White to move. Find the best pawn break.

Hint 1: White's pawns are on d4 and e3. Which pawn can advance to open lines? *Hint 2:* The e3-e4 push challenges Black's center directly. *Hint 3:* Consider what happens after e4 dxe4 Nxe4. How does White's position improve?

Solution: e3-e4! is the key break. After e4 dxe4 Nxe4, White gets a powerful knight on e4, opens the position for the bishops, and gains central control. If Black does not capture (e4 d4?), White

plays e5 with a strong central pawn. The e4 break transforms the London-type structure into an open, dynamic position where White's piece activity matters more than the pawn structure.

Exercise 13.12

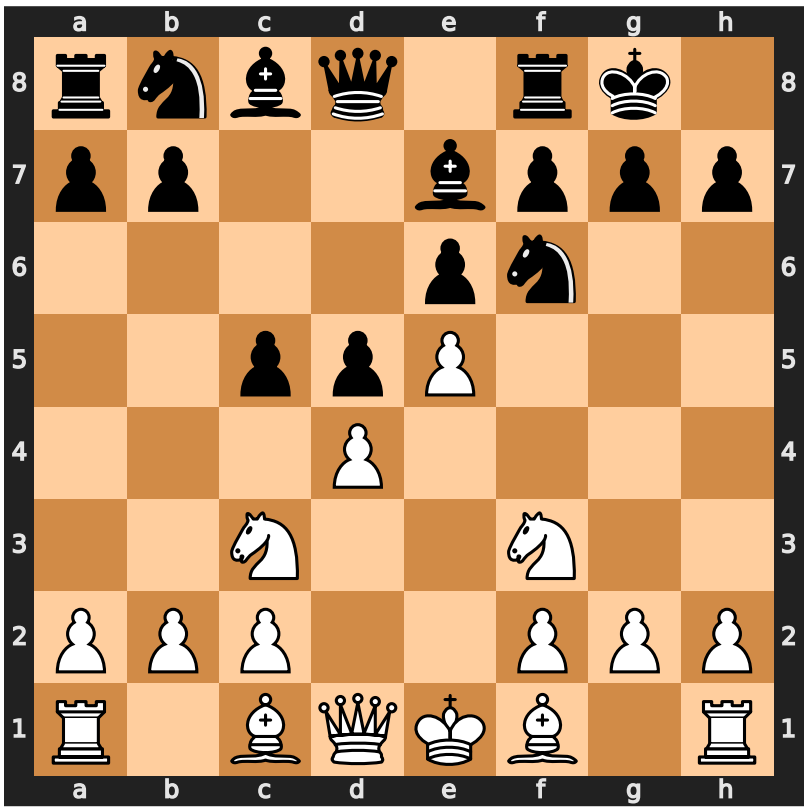

Figure 41.32: Chess Position

White to move. Black has played …c5. What is the best response?

Hint 1: Black is attacking the base of White's chain at d4. *Hint 2:* Should White defend d4 or ignore the attack and counterattack? *Hint 3:* Consider f2-f4 to support the e5 pawn and prepare f4-f5.

Solution: White should play **f2-f4**, reinforcing the e5 pawn and preparing the f4-f5 break to attack the base of Black's chain at e6. This follows Nimzowitsch's principle: when your chain is attacked at the base, reinforce it and attack the opponent's base. After f4, White prepares f5 to undermine e6. If Black captures …cxd4, White recaptures and maintains the strong e5 pawn with an improved position. White should NOT panic about the c5 push; instead, focus on the kingside where the chain points.

Exercise 13.13

White to move. This is a Carlsbad structure. What is White's primary strategic plan?

Hint 1: White has two pawns on the queenside (a2 and b2). Black has three (a7, b7, c6). *Hint 2:*

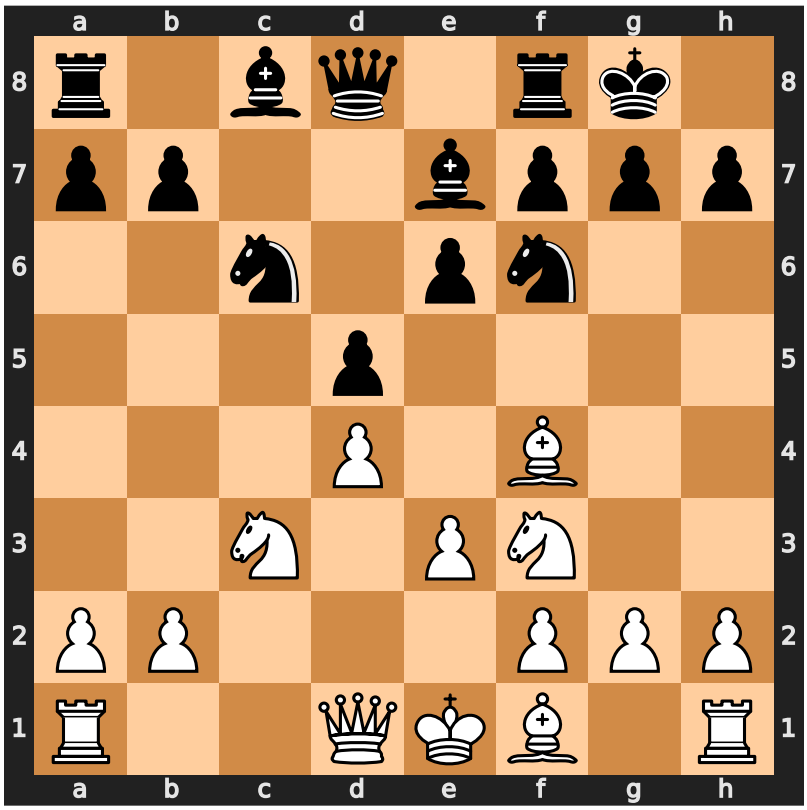

Figure 41.33: Chess Position

What happens when a minority of pawns advances against a majority? *Hint 3:* The plan begins with a2-a4, then b2-b4, then b4-b5.

Solution: The minority attack. White plays a2-a4, b2-b4, and then b4-b5. The b5 advance forces Black into an unpleasant choice: …axb5 (leaving a backward c-pawn), …cxb5 (leaving an isolated d-pawn), or allowing bxc6 (creating doubled c-pawns). All three outcomes create lasting structural weaknesses for Black. White should play this slowly and methodically, preparing with rooks on the c-file and supporting piece placement before the b5 advance.

Exercise 13.14

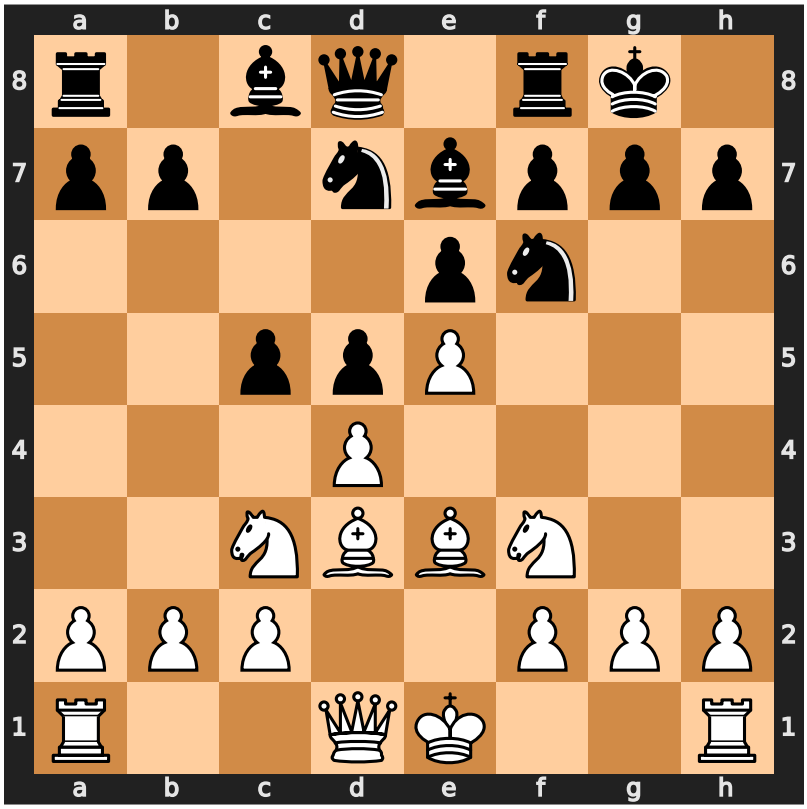

Figure 41.34: Chess Position

White to move. Find the pawn break that targets Black's chain.

Hint 1: Black's chain runs from e6 to d5 to c5. Where is the base? *Hint 2:* Can White directly attack e6? *Hint 3:* Consider f2-f4-f5 as a plan, not a single move.

Solution: White should prepare **f2-f4** followed by **f4-f5**, attacking the base of Black's chain at e6. After f5 exf5, the e5 pawn becomes a powerful passed pawn (or near-passed pawn), and lines open toward Black's king. This is the classic anti-French plan. White does not need to play f5 immediately; preparation with moves like Qd2, O-O, and piece repositioning comes first. The strategic idea is clear: attack the base, undermine the chain.

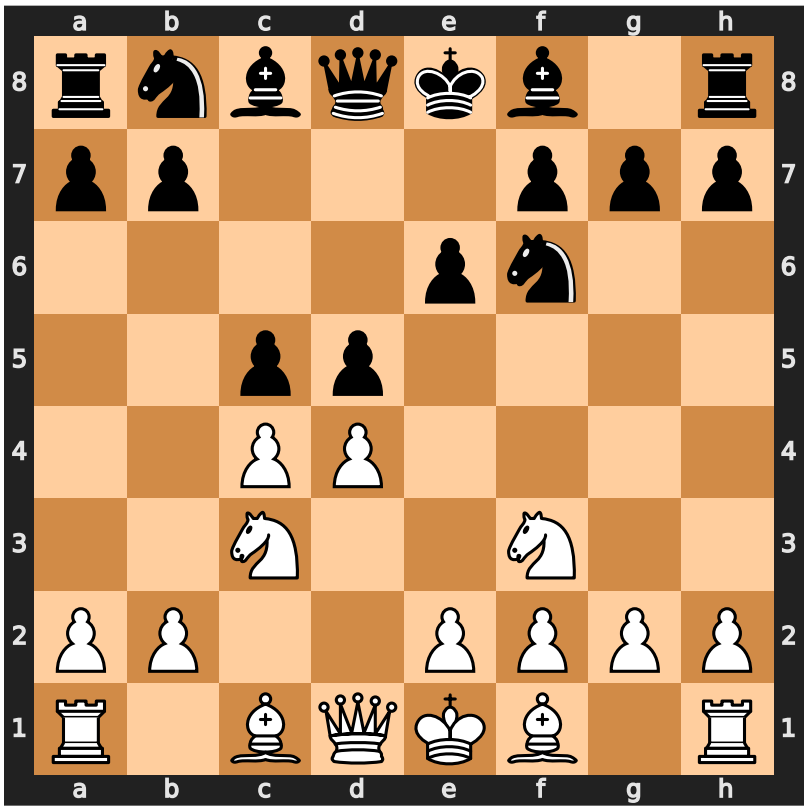

Figure 41.35: Chess Position

Exercise 13.15

White to move. Black has a solid center. Find the pawn break that challenges it.

Hint 1: White's c4 pawn already attacks d5. Can White add more pressure? *Hint 2:* Consider e2-e4. *Hint 3:* After e4 dxe4 Nxe4, how does the center change?

Solution: e2-e4! is the key break, directly challenging Black's d5 pawn. After e4 dxe4 Nxe4, White has a strong centralized knight and open lines. If Black plays …dxc4, White has a strong e4 pawn and open lines. If Black maintains the tension, White has gained space. The e4 break is the most aggressive and principled approach. It transforms a closed position into an open one where White's piece activity can shine.

Exercise 13.16

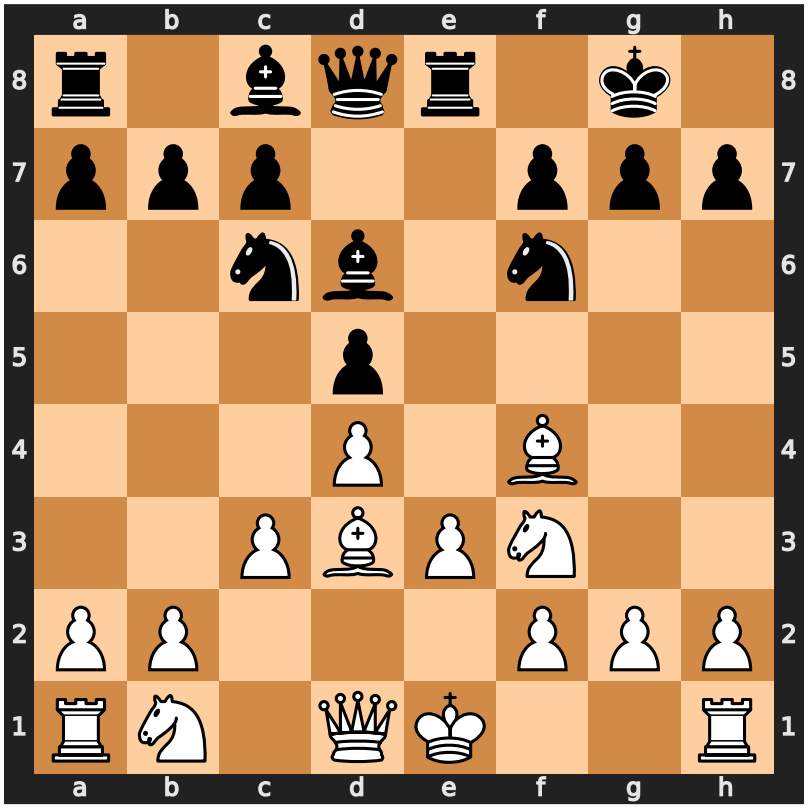

Figure 41.36: Chess Position

White to move. The center is stable. How does White open the position?

Hint 1: White's pawns are on c3, d4, e3. Which can advance? *Hint 2:* The e3-e4 break is the natural central advance. *Hint 3:* Before playing e4, should White develop further? Consider Nbd2 first.

Solution: White should prepare **e3-e4** with moves like Nbd2 followed by e4. After e4, if Black captures dxe4, White recaptures Nxe4 with a strong centralized knight. If Black does not capture, White can push e5 gaining space. The preparation is important: Nbd2 supports the e4 advance

with an extra piece. Playing e4 prematurely (without Nbd2) risks losing the e-pawn if Black has enough pressure on it.

Exercise 13.17

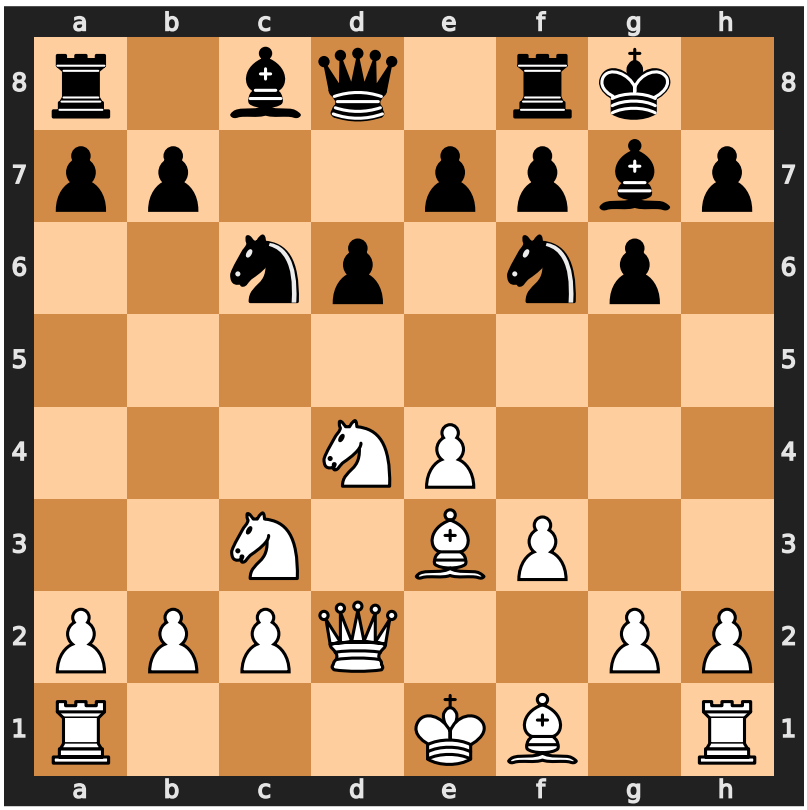

Figure 41.37: Chess Position

White to move. This is a Sicilian structure. What is Black's key pawn break, and how should White prevent it?

Hint 1: Black's most liberating move in the Sicilian is …d5. *Hint 2:* How does White's e4 pawn prevent …d5? *Hint 3:* If White plays f3 (already done) and Be2, how does that help control d5?

Solution: Black's key break is **...d6-d5**. When Black achieves …d5, the game typically equalizes or even favors Black. White prevents this by maintaining the e4 pawn and controlling d5 with pieces (Nc3, possibly Nd5). White has already played f3, which supports e4. White should continue development with Be2, O-O, and maintain a grip on the d5 square. If Black ever plays …d5, White should be prepared to meet it with exd5 followed by occupying d5 with a piece.

Exercise 13.18

White to move. Execute the first move of the minority attack.

Hint 1: The minority attack begins with a pawn advance. *Hint 2:* Which pawn advances first: a2 or b2? *Hint 3:* a2-a4 prepares b2-b4-b5.

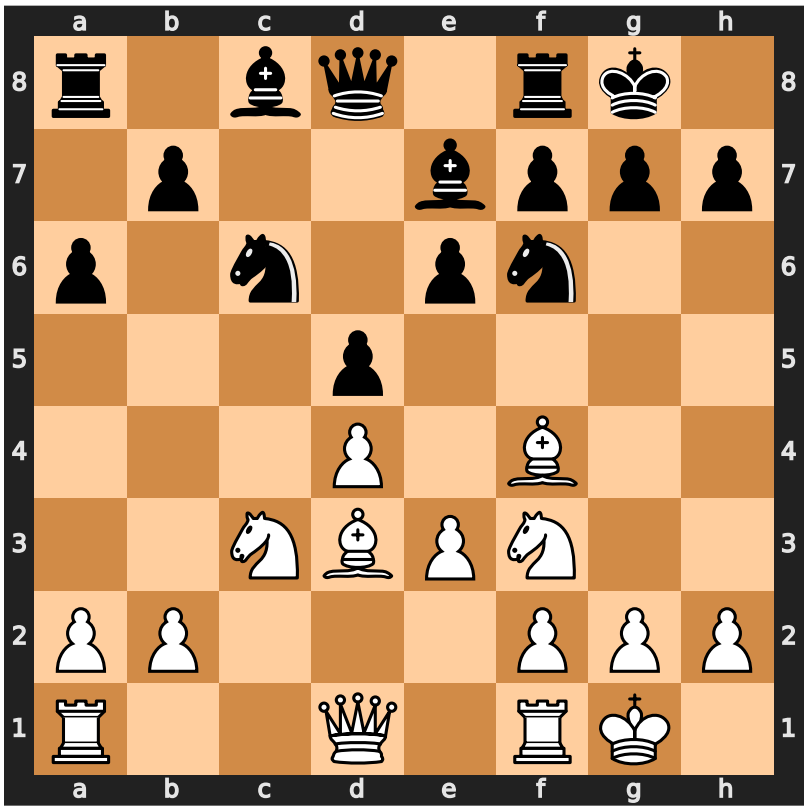

Figure 41.38: Chess Position

Solution: a2-a4! This is the standard first move of the minority attack. It prepares b2-b4 and eventually b4-b5. The a-pawn must advance first because after b2-b4, the a2 pawn needs to support the b4 pawn (or recapture if …axb5 happens). The full plan: a4, then b4, then b5 at the right moment. It is a slow plan that requires patience, but it creates lasting structural damage to Black's queenside.

Exercise 13.19

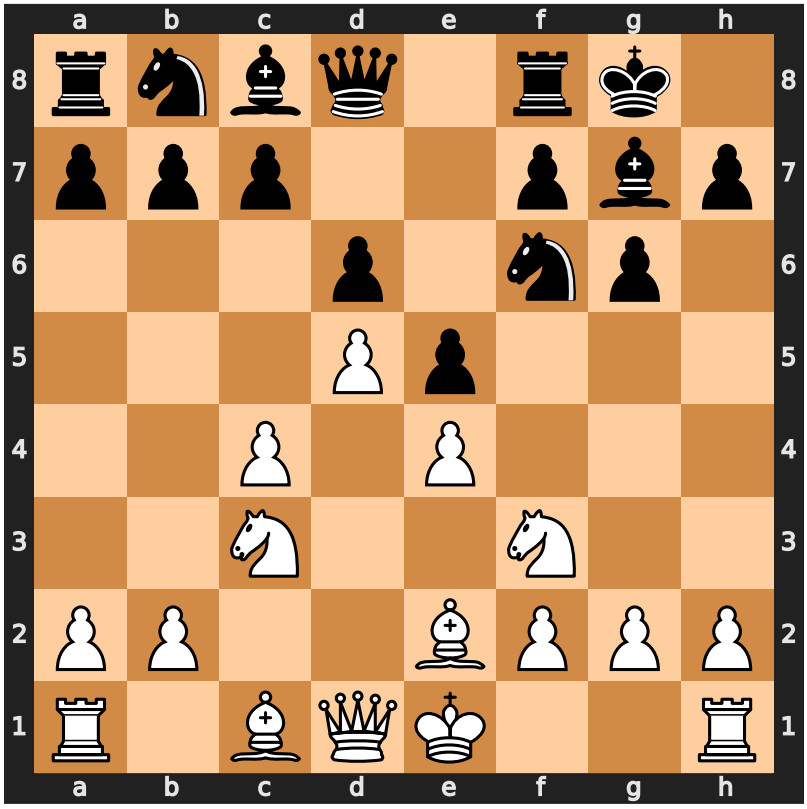

Figure 41.39: Chess Position

Black to move. This is a King's Indian structure. Find Black's key pawn break.

Hint 1: The center is locked. Black's chain points kingside. *Hint 2:* What pawn advance opens the kingside for Black? *Hint 3:* …f7-f5 is the most important move in the King's Indian.

Solution: ...f7-f5! This is the signature break in the King's Indian Defense. It attacks White's e4 pawn, opens the f-file for Black's rook, and prepares a kingside attack with …f4, …g5, …h5, and further advances. After …f5, if White captures exf5, Black recaptures …gxf5 or …Bxf5, opening lines toward White's king. If White does not capture, Black plays …f4 to close the kingside and prepare a pawn storm. This break is the heart of Black's strategy.

Exercise 13.20

White to move. White has just played c4-c5. What did this accomplish, and is it good or bad?

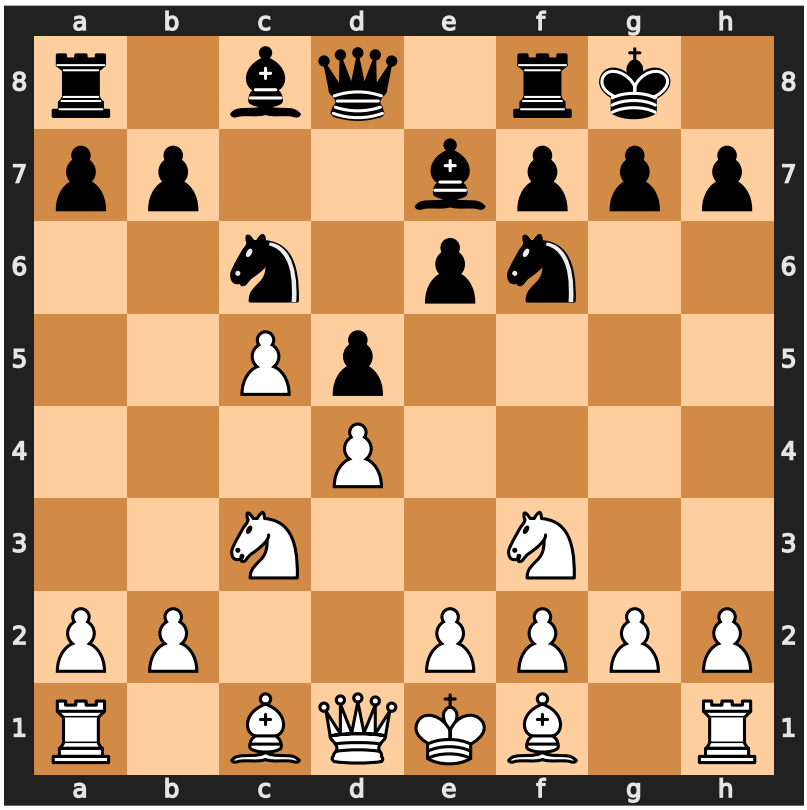

Figure 41.40: Chess Position

Hint 1: After c5, White's c-pawn has advanced past Black's d-pawn. What kind of pawn has it become? *Hint 2:* Does the c5 pawn create a passed pawn? Or does it just gain space? *Hint 3:* Consider whether c5 weakens the d4 pawn.

Solution: The c4-c5 advance is **double-edged**. It gains queenside space and may restrict Black's dark-squared bishop (if on d6 or e7). It also prepares a queenside pawn storm with b4-b5-a4. However, it surrenders control of d5, giving Black a beautiful outpost for a knight. It also leaves the d4 pawn potentially weak since the c-pawn can no longer support it. Whether c5 is good or bad depends on whether White can use the queenside space advantage before Black exploits the d5 outpost. In general, c5 is a committal move that changes the character of the position permanently.

Rest here. Twenty exercises done. You are making excellent progress.

41.7.3 Section C: Which Pieces to Trade? (Exercises 13.21 - 13.30) -

For each position, determine which minor pieces should be traded and which should be kept. Explain your reasoning based on the pawn structure.

Exercise 13.21

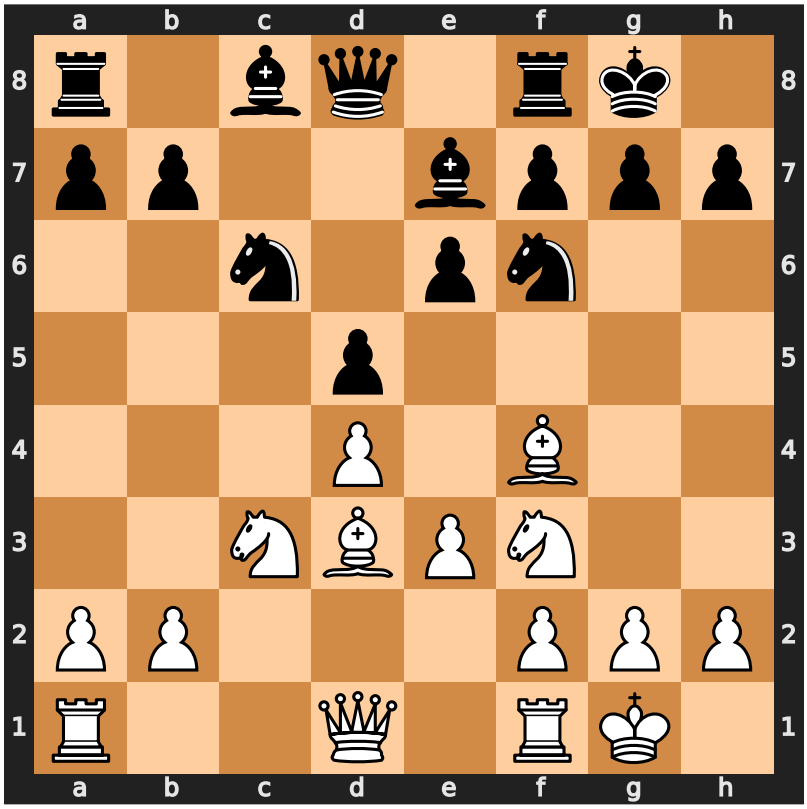

Figure 41.41: Chess Position

White to move. White has a bishop on f4 and a bishop on d3. Black has a bishop on e7 and a knight on f6. Which of White's minor pieces is "bad"?

Hint 1: Look at White's pawns on d4 and e3. What color are those squares? *Hint 2:* White's dark-squared bishop (f4) is outside the pawn chain. Is it blocked? *Hint 3:* White's light-squared bishop (d3) might be blocked if the center closes.

Solution: Neither of White's bishops is truly "bad" in this position because the dark-squared bishop on f4 is already outside the pawn chain (developed before e3 was played, classic London System). The light-squared bishop on d3 aims at Black's kingside and supports the e4 break. White should keep both bishops. If forced to trade one, keep the dark-squared bishop (it is active and outside the chain). The light-squared bishop could be exchanged for Black's knight on f6 if it helps secure a kingside attack, but this should only be done for a specific tactical reason.

Exercise 13.22

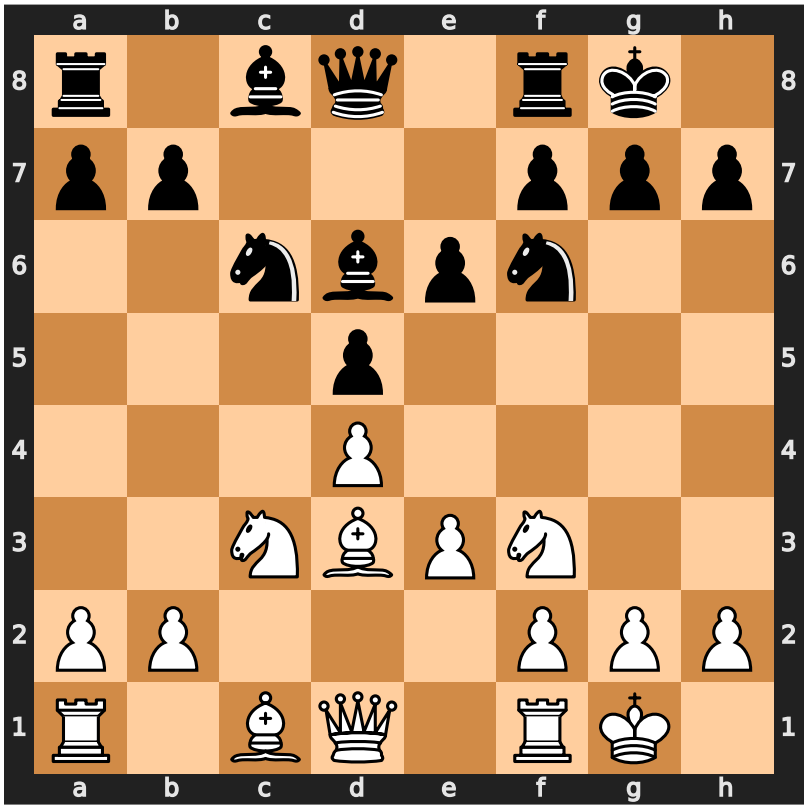

Figure 41.42: Chess Position

White to move. Black's bishop is on d6, aimed at the kingside. White's bishop is on c1, blocked by the e3 pawn. Which side benefits from trading dark-squared bishops?

Hint 1: White's dark-squared bishop is passive behind the e3 pawn. *Hint 2:* Black's dark-squared bishop is active and aims at White's king. *Hint 3:* Trading a bad piece for a good piece improves your position.

Solution: White benefits from the trade. White's dark-squared bishop on c1 is blocked by the e3 pawn and has no active role. Black's bishop on d6 is active and potentially dangerous on the b8-h2 diagonal. If White can trade the passive c1 bishop for Black's active d6 bishop, White removes a

threat while also improving the relative quality of remaining pieces. White might achieve this with moves like Nh4-f5 (trading the knight for the bishop, which is not ideal) or simply maneuvering to force the trade.

Exercise 13.23

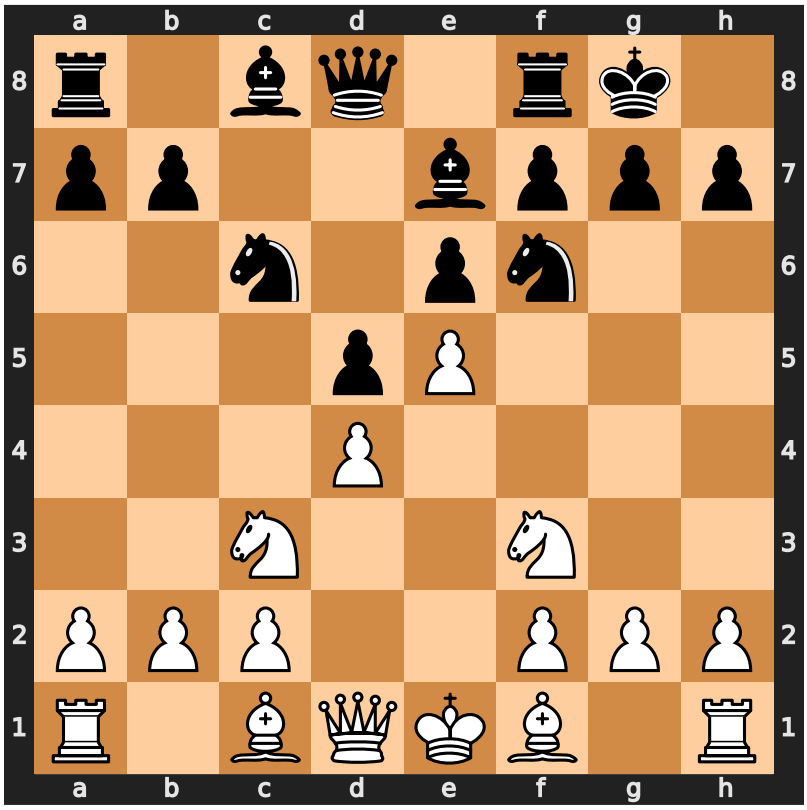

Figure 41.43: Chess Position

White to move. This is a French-type structure. Black has a light-squared bishop still on c8. Should Black trade this bishop or keep it?

Hint 1: Black's pawns are on d5 and e6. What color are those squares? *Hint 2:* The bishop on c8 is blocked by its own pawns. What kind of bishop is this? *Hint 3:* A bad bishop should be traded if possible.

Solution: Black's light-squared bishop on c8 is the classic "French bishop" problem. It is blocked by its own pawns on d5 and e6, both sitting on light squares. This bishop is *bad* and Black should actively seek to trade it. Common methods include …b6 and …Ba6 (trading it for White's light-squared bishop), …Bd7-c6 (though this is passive), or even the maneuver …Nh5-f4 combined with …Bd7-e8-h5 in some variations. Solving the bad bishop problem is one of Black's central strategic tasks in the French structure. White, conversely, should avoid trading light-squared bishops because keeping them on preserves the imbalance.

Exercise 13.24

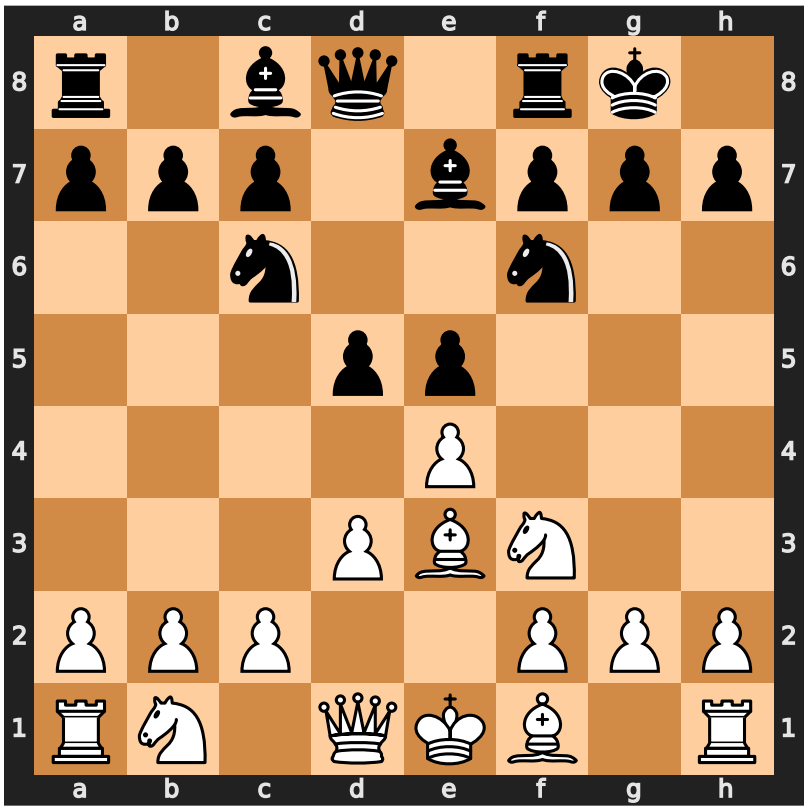

Figure 41.44: Chess Position

White to move. The center is closed (d3 and e4 vs d5 and e5). Which minor piece (bishop or knight) is more valuable for White in this structure?

Hint 1: In closed positions with locked central pawns, which piece navigates better? *Hint 2:* Can White's bishops find open diagonals in this structure? *Hint 3:* Knights jump over pawns. Bishops cannot.

Solution: Knights are more valuable in this closed position. The locked central pawns (d3/e4 vs d5/e5) restrict the bishops' diagonals. White's dark-squared bishop on e3 has limited scope (the e5 and d4 pawns block its best diagonals). White should look for knight outposts (f5, d5 if achievable) and keep the knights. If White can trade a bishop for one of Black's knights (especially a knight heading for a strong outpost), that can be favorable. In closed positions, always prefer knights unless the position is about to open up.

Exercise 13.25

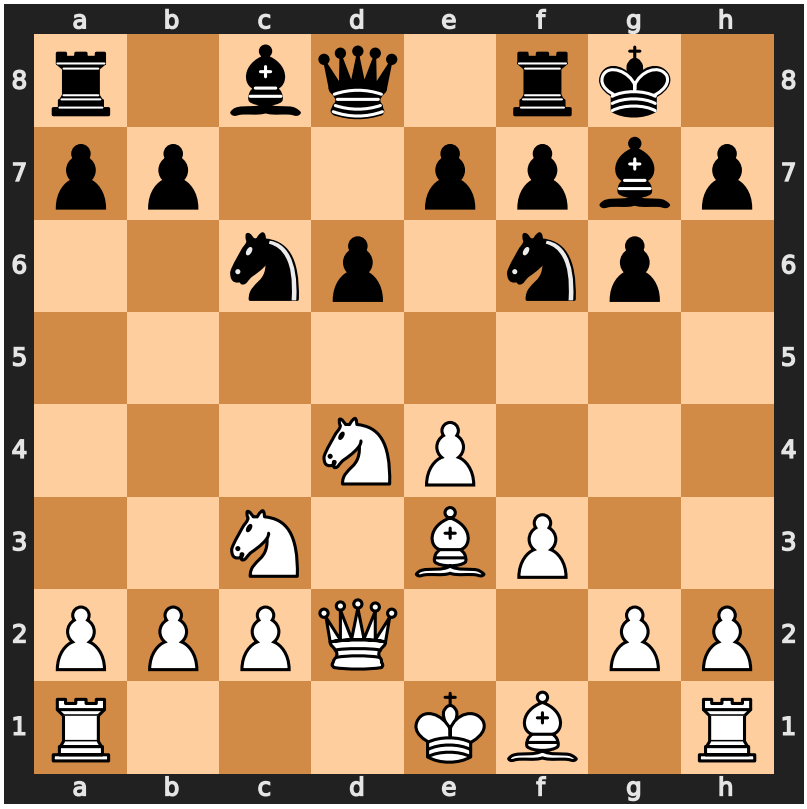

Figure 41.45: Chess Position

White to move. This is a Sicilian Dragon structure. Black has a powerful bishop on g7. Should White trade it?

Hint 1: The g7 bishop controls the long diagonal from a1 to h8. *Hint 2:* In the Dragon, Black's dark-squared bishop is the most valuable piece. *Hint 3:* If White trades this bishop, Black's kingside defense weakens significantly.

Solution: Yes, White should trade it if possible. Black's dark-squared bishop on g7 is the

foundation of Black's defensive setup. It guards the long diagonal, supports the d4 square, and helps protect the king. Trading it (typically with Be3-d4 or Bc4-b3 combined with a kingside attack) removes Black's best defensive piece. In the Yugoslav Attack (Be3, Qd2, O-O-O, Bh6), White specifically aims to exchange this bishop with Bh6. The trade significantly weakens Black's kingside and dark-square control.

Exercise 13.26

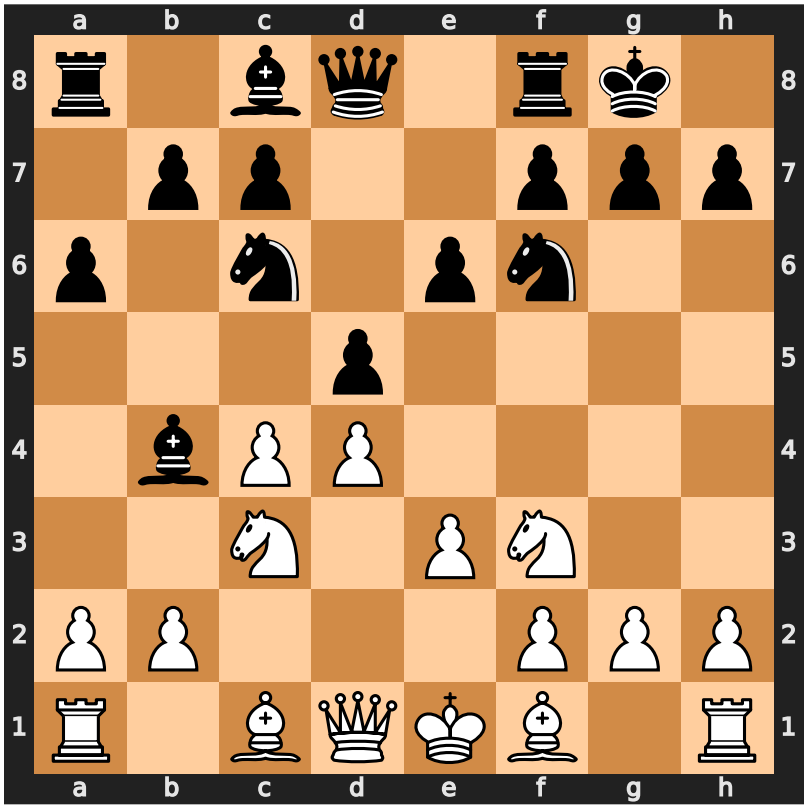

Figure 41.46: Chess Position

White to move. Black has a bishop on b4 pinning the c3 knight. After …Bxc3+, White recaptures bxc3, getting doubled pawns. Should White welcome or avoid this trade?

Hint 1: After bxc3, White has doubled c-pawns but also an open b-file. *Hint 2:* White's pawn center becomes c3-c4-d4-e3. How many central squares does this control? *Hint 3:* This structure appears in the Nimzo-Indian Defense and has been tested thousands of times.

Solution: White should welcome the trade. After …Bxc3+ bxc3, White gets doubled c-pawns but gains significant compensation: (1) the b-file opens for the rook, (2) the pawn pair c3+c4+d4 controls a massive number of central squares (b4, b5, c5, d5, e5), and (3) White often gains the bishop pair. The doubled pawns are not weak targets because they are well-protected and centrally placed. Many strong players (including Botvinnik and Petrosian) preferred this structure. The key: White should play for e3-e4 to open the position for the bishop pair.

Exercise 13.27

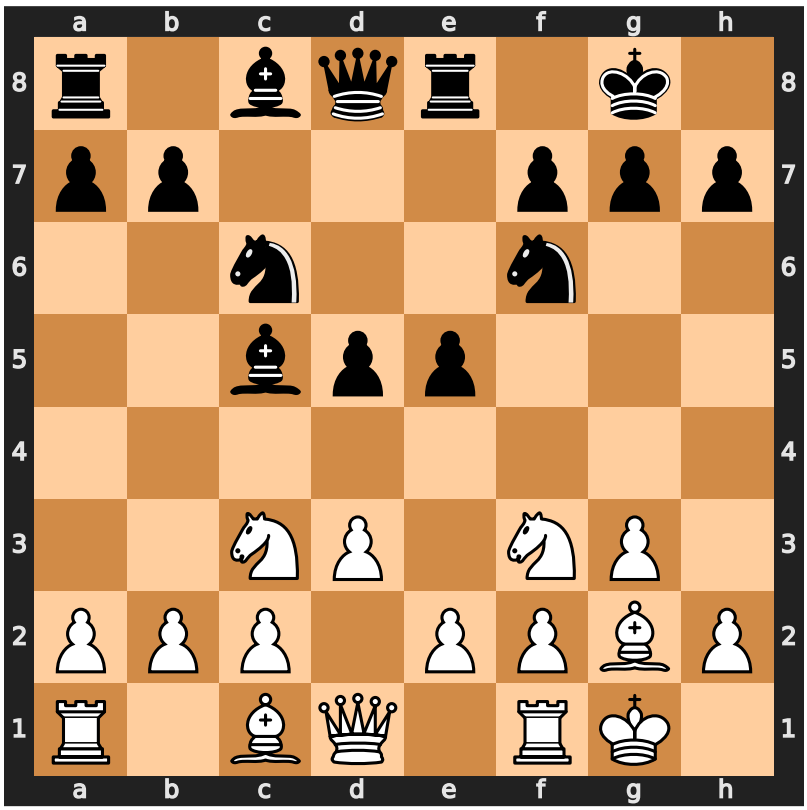

Figure 41.47: Chess Position

White to move. White has a fianchettoed bishop on g2 and a knight on c3. Black has a bishop on c5 and pawns on d5 and e5. Should White trade the g2 bishop for Black's knight?

Hint 1: The g2 bishop is aimed at the center (d5) along the long diagonal. *Hint 2:* Is the g2 bishop currently active or blocked? *Hint 3:* Black's d5 pawn blocks the g2 bishop's diagonal.

Solution: Do not trade the g2 bishop yet. Although the g2 bishop is currently blocked by Black's d5 pawn, it has long-term potential. If the d5 pawn ever moves or is exchanged, the bishop comes alive on the long diagonal. Trading it now would surrender that potential. Instead, White should prepare to challenge Black's center with d3-d4 or f2-f4, which would activate the g2 bishop. The bishop's power is latent, not absent. Be patient with it.

Exercise 13.28

White to move. Both sides have a bishop and a knight. The pawn structure is symmetric (d4 vs d5). Should White seek to trade bishops or knights?

Hint 1: In symmetric positions, which piece tends to be more useful for creating imbalances? *Hint 2:* Consider where White's knight could go. Is there a natural outpost? *Hint 3:* If White trades knights, the position becomes more static (bishop vs bishop). Is that good for White?

Solution: White should keep the knights. In a symmetric structure, knights can create imbalances by occupying outposts (e5 is the natural target for White's knight). Trading knights

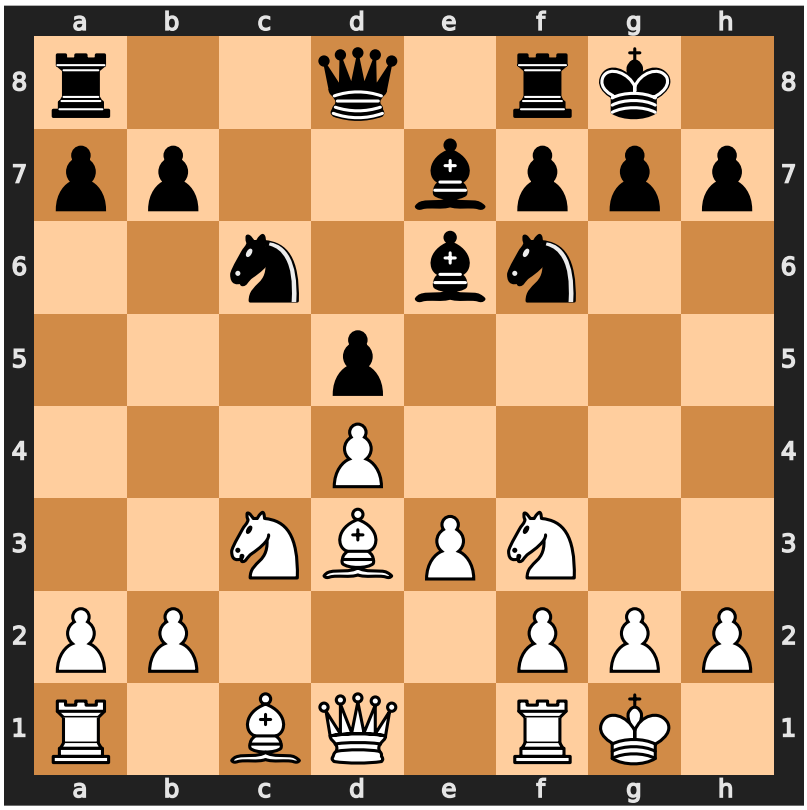

Figure 41.48: Chess Position

leads to a bishop endgame where the symmetric structure often produces a draw. The knight on f3 can reroute to e5 (or d2-f3-e5), creating pressure on Black's position. White's bishop on d3 supports the e4 break and eyes the kingside. Keep pieces on the board to maintain winning chances in an otherwise balanced structure.

Exercise 13.29

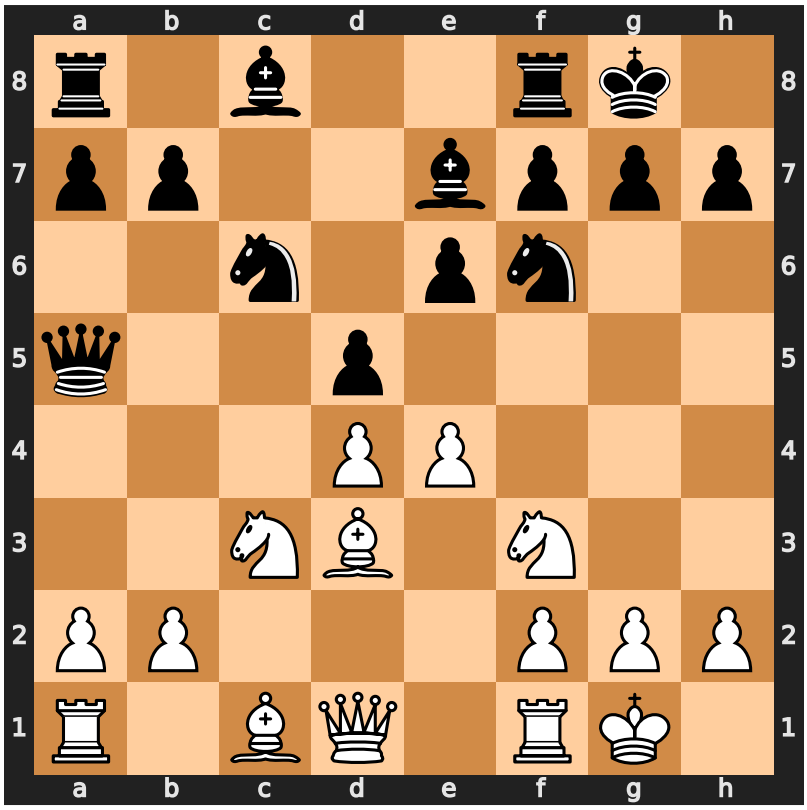

Figure 41.49: Chess Position

White to move. After e4, Black must make a decision. If …dxe4 Nxe4 Nxe4 Bxe4, what pieces have been traded and who benefits?

Hint 1: After these trades, what remains on the board? *Hint 2:* Black traded a knight for White's knight. Both sides still have one knight and two bishops. *Hint 3:* After Bxe4, White's bishop is now on e4, a powerful central square. How does the pawn structure look?

Solution: After the sequence e4 dxe4 Nxe4 Nxe4 Bxe4, White has traded one knight pair. White's bishop on e4 is centrally dominant, aiming at both flanks. The pawn structure now shows Black without a d-pawn and White without an e-pawn. White has a d4 pawn; Black has an e6 pawn. White's structure is slightly better because the d4 pawn controls key central squares and the bishop on e4 is actively placed. The position favors White because the trades have simplified to a structure where White's remaining pieces are more active.

Exercise 13.30

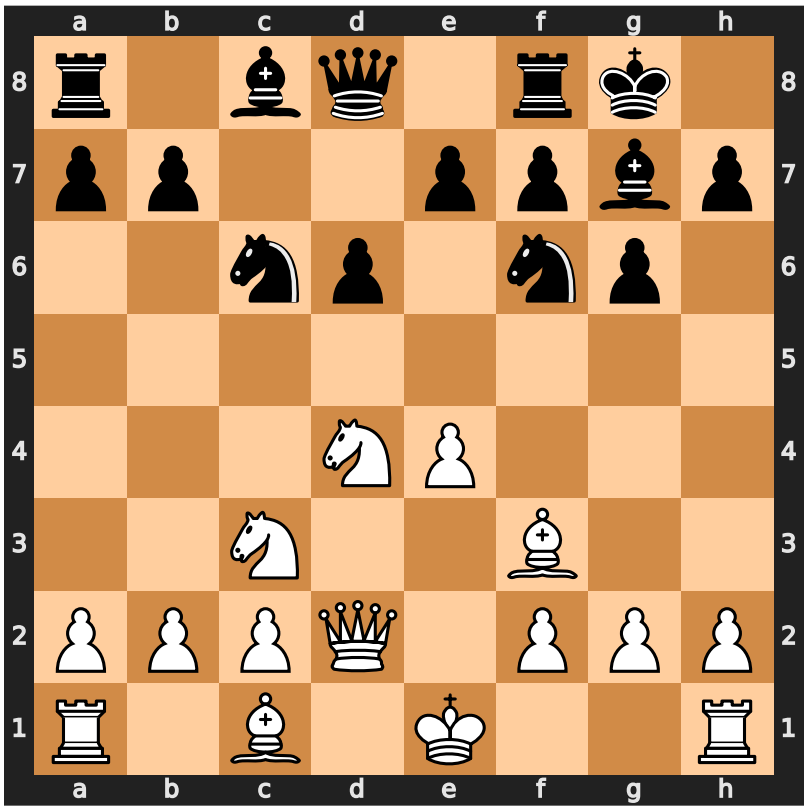

Figure 41.50: Chess Position

White to move. In this Sicilian structure, White has a bishop on f3. Black has a bishop on g7. If White plays Be2, preparing O-O, which bishop is better positioned?

Hint 1: Black's g7 bishop controls the long dark-square diagonal. *Hint 2:* White's bishop on f3 (or e2) is passive compared to Black's fianchettoed bishop. *Hint 3:* Consider trading White's "bad" bishop for Black's "good" bishop.

Solution: Black's g7 bishop is better positioned. It sits on the powerful a1-h8 diagonal, exerting influence across the board. White's bishop on f3 (or e2) is more passive, especially with the e4 pawn blocking its scope on the a8-h1 diagonal. White should consider either (1) trading bishops with Bh6 to eliminate Black's best piece, or (2) repositioning with Bc4 to aim at the f7 point. In Sicilian positions, the battle of the bishops often determines who has the initiative.

Rest here. Thirty exercises complete. You are more than halfway through. Take a real break.

41.7.4 Section D: Plan Based on Structure (Exercises 13.31 - 13.40)

For each position, create a 3-5 move plan based on the pawn structure.

Exercise 13.31

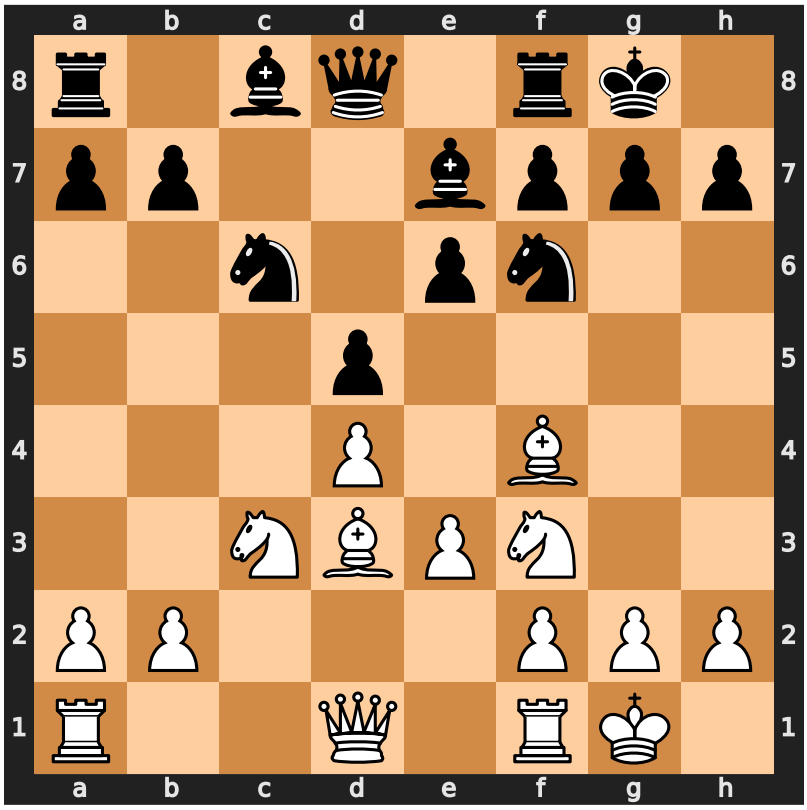

Figure 41.51: Chess Position

White to move. Create a strategic plan based on this Carlsbad structure.

Hint 1: White has two queenside pawns (a2, b2) against Black's three (a7, b7, c6). What does this suggest? *Hint 2:* Outline the minority attack: a4, b4, b5. *Hint 3:* What should White's rooks do during and after the minority attack?

Solution: White's plan: (1) Play **a2-a4**, beginning the minority attack. (2) Play **b2-b4**, continuing the advance. (3) Prepare **b4-b5** by supporting with pieces. (4) After b5, target the resulting weakness on c6 (if …axb5 axb5 Nxb5 or cxb5) by placing rooks on the c-file. (5) Use the a-file and c-file for rook penetration. This is the classic minority attack plan. It takes 8-12 moves to execute, but creates permanent structural damage. White's pieces should support this plan, not distract from it.

Exercise 13.32

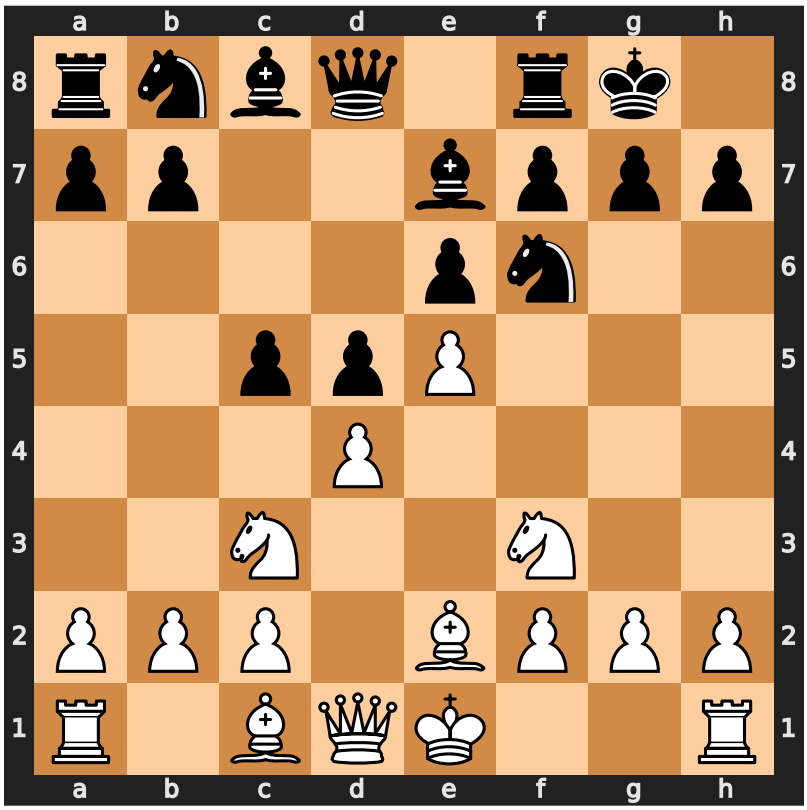

Figure 41.52: Chess Position

White to move. Create a kingside attacking plan based on this French structure.

Hint 1: White's chain (d4-e5) points toward the kingside. This is where White should attack. *Hint 2:* Consider f2-f4-f5 as a long-term plan. *Hint 3:* How can White's pieces support a kingside attack?

Solution: White's plan: (1) Castle kingside with **O-O**. (2) Play **f2-f4** to reinforce e5 and prepare the f5 break. (3) Develop pieces toward the kingside: Bd3 (or Bh5 in some lines), Qe1-g3 or Qe1-h4. (4) When the position is ready, play **f4-f5** to attack the base of Black's chain at e6 and open lines toward Black's king. (5) Look for Nxd5 or Bxh7+ sacrifices if Black's king is exposed. The attack should be methodical, not reckless. White has a structural advantage on the kingside and should use it patiently.

Exercise 13.33

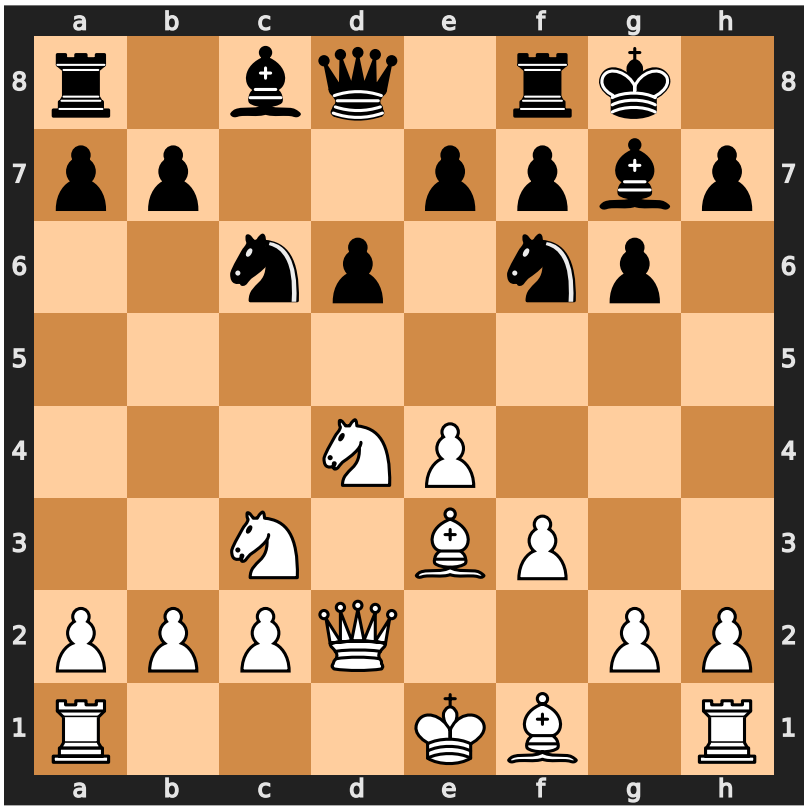

Figure 41.53: Chess Position

White to move. This is a Yugoslav Attack position in the Sicilian Dragon. Create a plan for both sides.

Hint 1: White typically castles queenside and launches a kingside pawn storm. *Hint 2:* Black attacks on the queenside with …a5, …b5, …Rc8. *Hint 3:* Whose attack arrives first is the critical question.

Solution: White's plan: (1) Castle queenside with **O-O-O**. (2) Push **g2-g4** and **h2-h4-h5** to attack Black's kingside pawn shelter. (3) Trade dark-squared bishops with Bh6 to weaken Black's king. (4) Open the h-file with hxg6 and attack on the h-file with Rdg1 or Rh1. **Black's plan:** (1) Play **...Rc8** to pressure the c-file. (2) Advance **...a5** and **...b5** to open lines on the queenside. (3) Play **...b4** to attack the c3 knight. (4) Infiltrate with rooks on the c-file. This is a race. Both plans are correct; execution and timing determine the winner.

Exercise 13.34

White to move. Black has a Nimzo-Indian structure. After …Bxc3+ bxc3, create a plan for White.

Hint 1: After bxc3, White has doubled c-pawns but an open b-file and strong center. *Hint 2:* White's plan should involve e3-e4 to use the bishop pair. *Hint 3:* How should White use the open b-file?

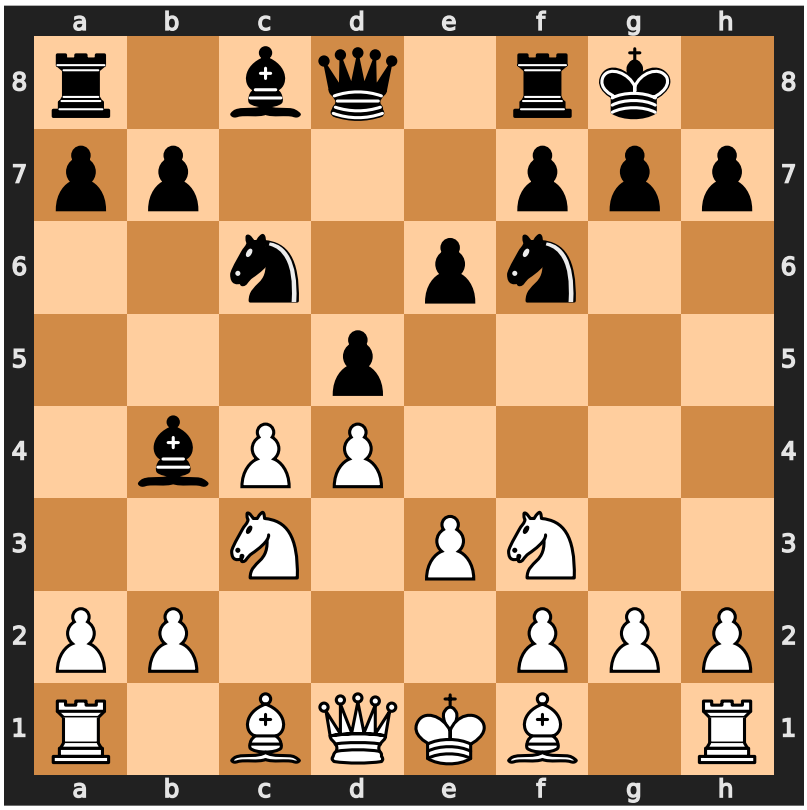

Figure 41.54: Chess Position

Solution: White's plan after …Bxc3+ bxc3: (1) Recapture with **bxc3**, accepting doubled pawns for central control. (2) Play **Bd3** and **O-O**, completing development. (3) Prepare **e3-e4** to open the center for the bishop pair. This is the critical break. (4) After e4, if …dxe4 Bxe4, White has powerful bishops on open diagonals. (5) Use the open b-file with Rb1 to apply queenside pressure. White's doubled c-pawns are a small price for the massive central control and bishop pair.

Exercise 13.35

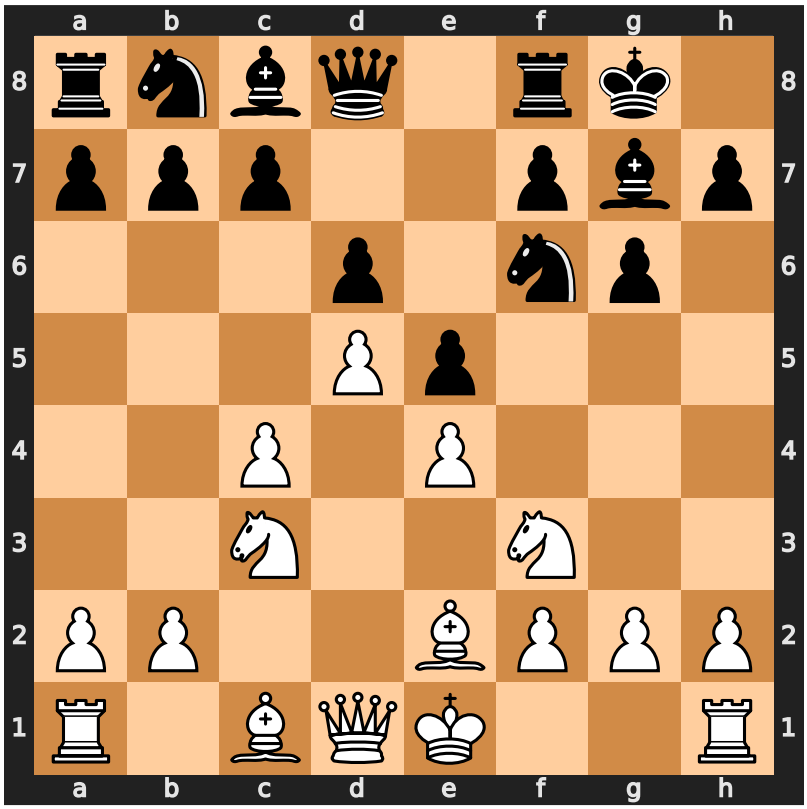

Figure 41.55: Chess Position

White to move. Create a queenside attack plan based on the King's Indian structure.

Hint 1: White's pawn chain (c4-d5) points toward the queenside. Attack there. *Hint 2:* The c4-c5 break is White's primary weapon. *Hint 3:* How should White prepare c5?

Solution: White's plan: (1) Castle with **O-O**. (2) Play **a2-a4** to support the c5 advance. (3) Play **Rb1** or **Ra1-b1** to prepare b2-b4. (4) Play **b2-b4** followed by **c4-c5**, the critical break. (5) After c5, if …dxc5, play bxc5 and use the open b-file and c-file for rook penetration. The c5 break undermines Black's d6 pawn and opens lines on the queenside. White should execute this plan quickly because Black is simultaneously preparing …f5 on the kingside.

Exercise 13.36

White to move. Black has placed a knight on f5. How should White respond based on the pawn structure?

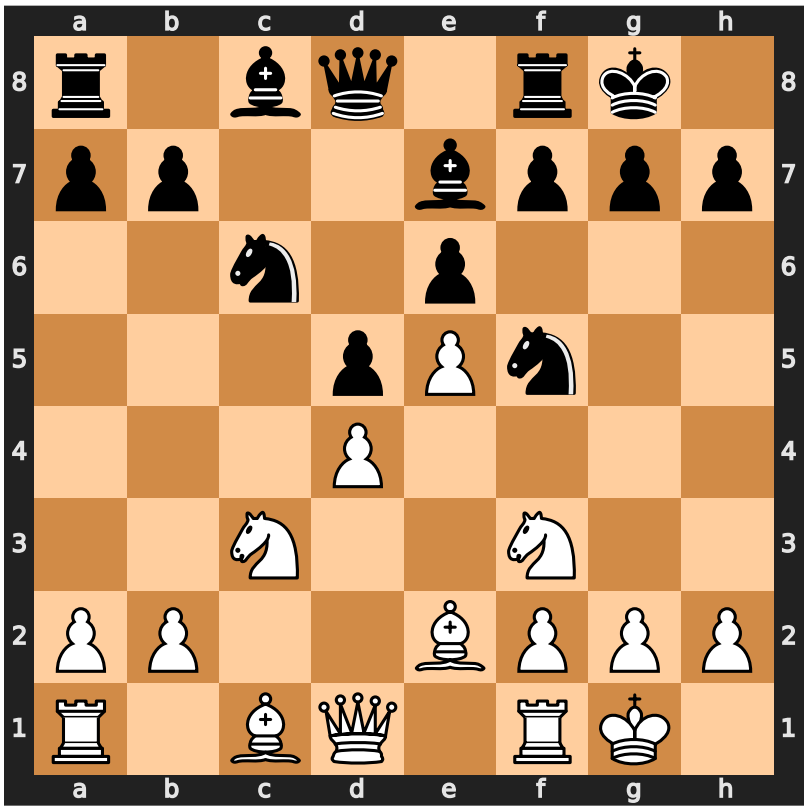

Figure 41.56: Chess Position

Hint 1: The knight on f5 is in front of White's e5 pawn. Is it blockading? *Hint 2:* Should White trade this knight or leave it alone? *Hint 3:* Consider g2-g4 to drive the knight away, or Bd3 to challenge it.

Solution: White should **challenge the knight with Bd3**, preparing to trade it if Black allows it. The f5 knight is well-placed (blockading the e-pawn and eyeing key squares), so White should not ignore it. After Bd3, if …Nxd3 cxd3 (or Qxd3), White has traded a bishop for the knight but has removed the blockader. Alternatively, White can play **g2-g4** to drive the knight away (…Nh4 Nxh4), but this weakens the kingside. The choice depends on whether White wants to maintain pawn structure (Bd3) or create complications (g4). In general, Bd3 is more solid and fits the positional character of the position.

Exercise 13.37

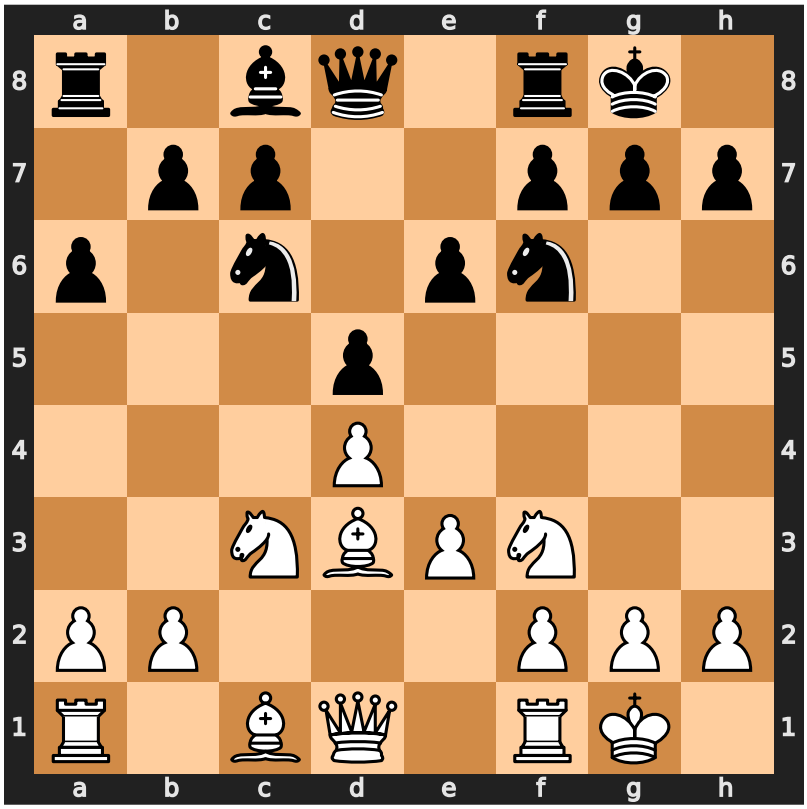

Figure 41.57: Chess Position

White to move. This is a symmetric d4/d5 structure. Create a plan that creates an imbalance.

Hint 1: Symmetric structures often lead to draws unless one side creates an imbalance. *Hint 2:* How can White make the position asymmetric? Consider pawn breaks. *Hint 3:* The minority attack (a4, b4, b5) creates structural asymmetry.

Solution: White's plan: (1) Play **a2-a4**, beginning the minority attack. The symmetric structure means White must create an imbalance, and the minority attack is the proven method. (2) Play **b2-b4** to prepare b5. (3) Execute **b4-b5** to break up Black's queenside. (4) After b5, play for the

resulting weaknesses (backward c-pawn or isolated d-pawn). The minority attack turns a symmetric, potentially drawish structure into one where White has concrete targets. Without this plan (or an analogous kingside plan), the position tends toward equality.

Exercise 13.38

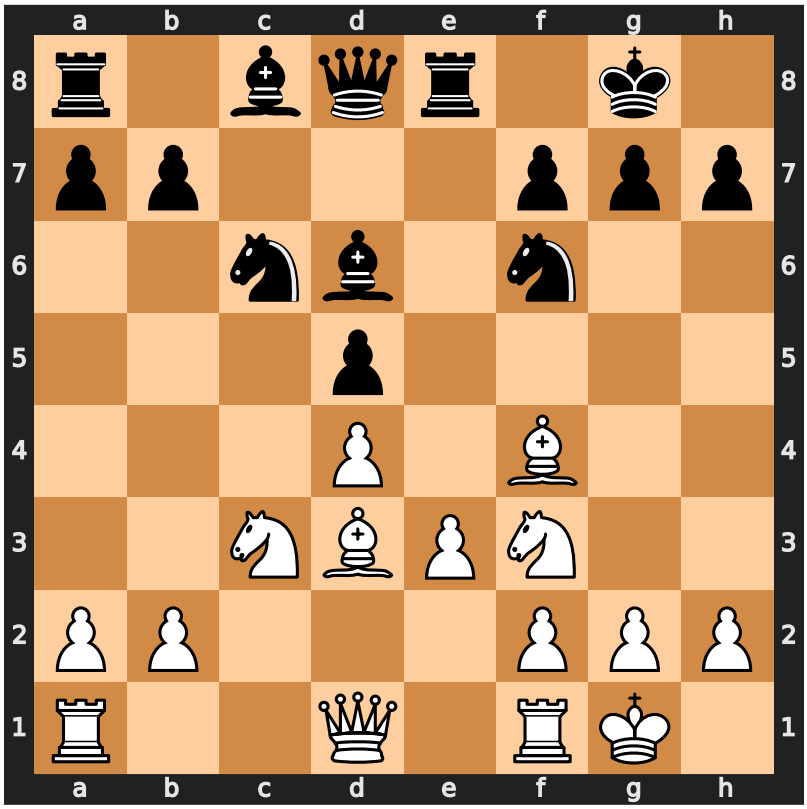

Figure 41.58: Chess Position

White to move. Black has developed the bishop to d6, challenging White's bishop on f4. Should White trade or retreat?

Hint 1: If Bxd6 Qxd6, what has changed structurally? Nothing. But what about piece activity? *Hint 2:* After Bxd6, Black's queen comes to d6 with tempo and centralization. *Hint 3:* Consider Bg3 instead. The bishop retreats but remains on the board.

Solution: White should retreat with Bg3 rather than trade. After Bxd6 Qxd6, Black's queen centralizes powerfully on d6 with tempo (threatening nothing concrete but well-placed). By retreating to g3, White keeps the bishop pair (if White has one) and maintains the option of a later trade on more favorable terms. The g3 bishop also watches the h2-b8 diagonal, which can be important for defense. The pawn structure does not change with either move, but piece activity changes significantly. Bg3 keeps options open; Bxd6 helps Black's development.

Exercise 13.39

White to move. Pawns face off: c4 vs d5 and d4 vs e6. When should White capture cxd5?

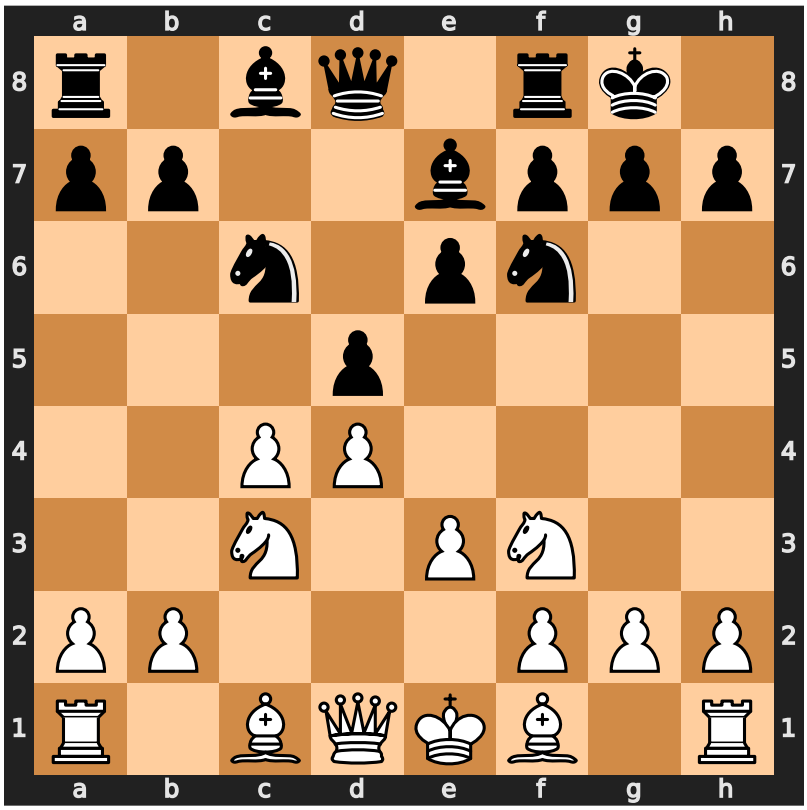

Figure 41.59: Chess Position

Hint 1: If White plays cxd5 exd5, we get the Carlsbad structure. Is that good for White? *Hint 2:* If White plays cxd5 Nxd5, the result is different. How? *Hint 3:* Consider whether White can benefit more by maintaining the tension with a developing move.

Solution: White should usually maintain the tension rather than capture immediately. Playing cxd5 exd5 reaches the Carlsbad (fine for the minority attack but gives Black a clear plan too). Playing cxd5 Nxd5 allows Black a centralized knight. Instead, White can develop with **Bd3** or **Qc2**, maintaining pressure on d5 while keeping options open. The tension in the center is an asset: it forces Black to worry about multiple captures. The principle: do not resolve pawn tension without a concrete reason. Keeping the tension preserves flexibility.

Exercise 13.40

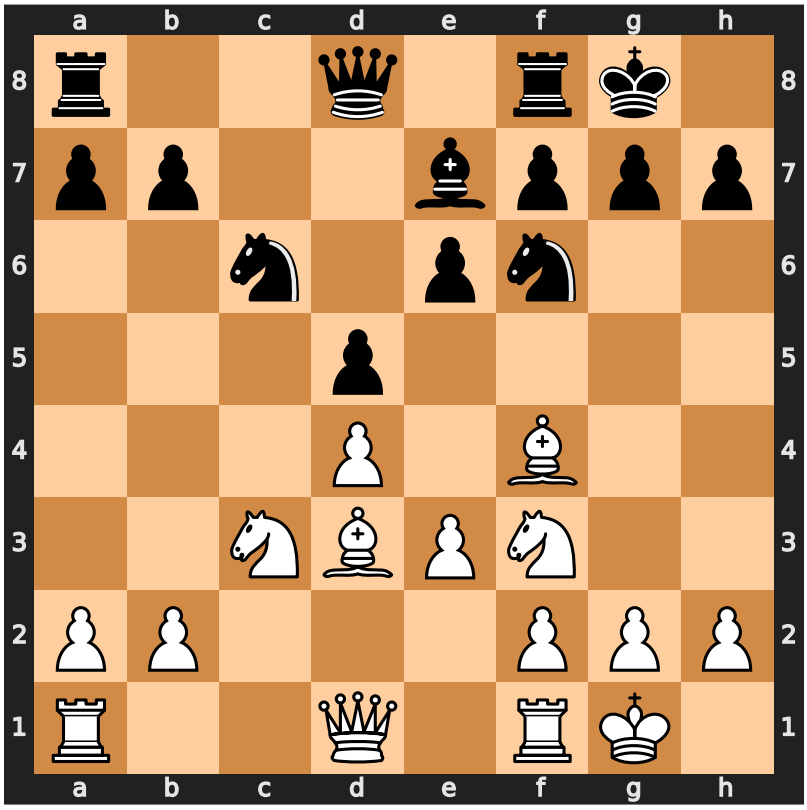

Figure 41.60: Chess Position

Black to move. White has set up a Carlsbad structure and is preparing the minority attack. What is Black's best defensive and counter-attacking plan?

Hint 1: Black cannot prevent the minority attack, but can generate counterplay elsewhere. *Hint 2:* Consider …Ne4 to centralize a knight before White's pawns march. *Hint 3:* …f5 prepares a kingside counter-attack.

Solution: Black's plan: (1) Play **...Ne4** immediately to establish a central outpost. The knight on e4 is powerful and cannot easily be driven away. (2) Prepare **...f7-f5** for a kingside attack. This creates threats against White's king while White is busy on the queenside. (3) If possible, play

…Bd6, challenging White's f4 bishop and aiming at the kingside. (4) Use the e-file for rook activity with …Re8. The idea: counter the minority attack with central and kingside play. Black should not passively wait for White's queenside pawns to arrive.

Rest here. Forty exercises done. Only ten more to go. You are nearly finished.

41.7.5 Section E: Convert Structural Advantage (Exercises 13.41 - 13.50) -

These are the hardest exercises in this chapter. For each position, find the concrete way to convert a structural advantage into a tangible gain (material, attack, or winning endgame).

Exercise 13.41

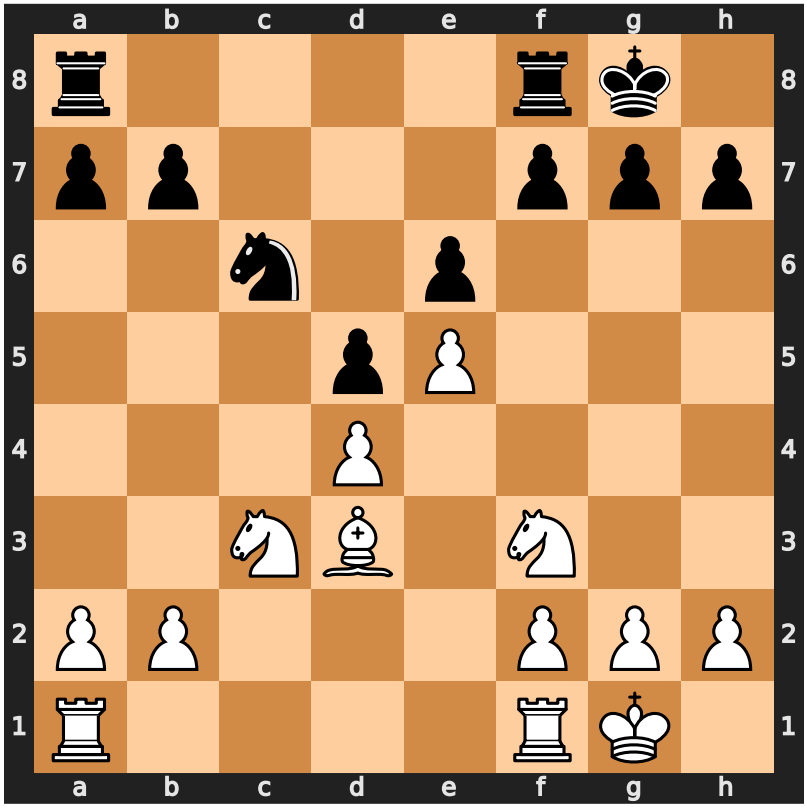

Figure 41.61: Chess Position

White to move. Black has a backward pawn on e6 and White has an advanced e5 pawn. Find a plan to exploit the backward pawn.

Hint 1: The e6 pawn is on a half-open file. Where should White's rook go? *Hint 2:* Can White occupy e5 with a piece as well as a pawn? *Hint 3:* Consider Nd2-f1-e3-d5 or Nf3-d2-e4 to reach strong squares near e6.

Solution: White's plan: (1) Play **Rf1-e1** to target e6 along the e-file. (2) Maneuver a knight to

d5 or f5 to attack e6 with a piece. After **Nd2-e4** or **Nf3-d2-e4**, the knight reaches a powerful square. (3) Double rooks on the e-file with Rae1. (4) The combined pressure on e6 will force Black to defend passively, allowing White to create threats elsewhere or win the pawn. The backward pawn is a permanent weakness, and the systematic pressure will tell in the long run.

Exercise 13.42

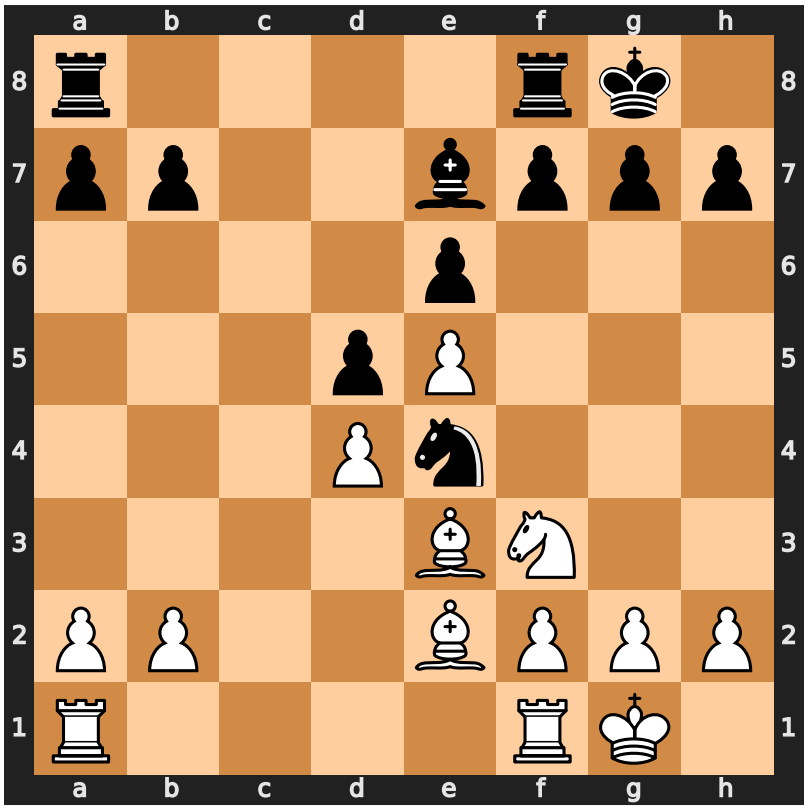

Figure 41.62: Chess Position

White to move. Black has a knight on e4, but White's structure (d4-e5) is strong. How does White convert the structural advantage?

Hint 1: The knight on e4 is centralized but lacks pawn support. Can White challenge it? *Hint 2:* Consider Nd2 to trade the centralized knight. *Hint 3:* After trading knights, the resulting structure favors White.

Solution: White plays **Nd2!** to challenge the knight on e4. After Nxd2 Bxd2 (or Qxd2), the centralized knight is gone and White's structural advantages become clearer: the e5 pawn restricts Black's position, the d4-e5 chain controls the center, and Black's dark-squared bishop on e7 is passive. White can then follow up with f2-f4 (supporting e5), Bf3 (controlling the long diagonal), and eventually a kingside attack or a push on either flank. Without the knight on e4, Black's position is cramped and difficult.

Exercise 13.43

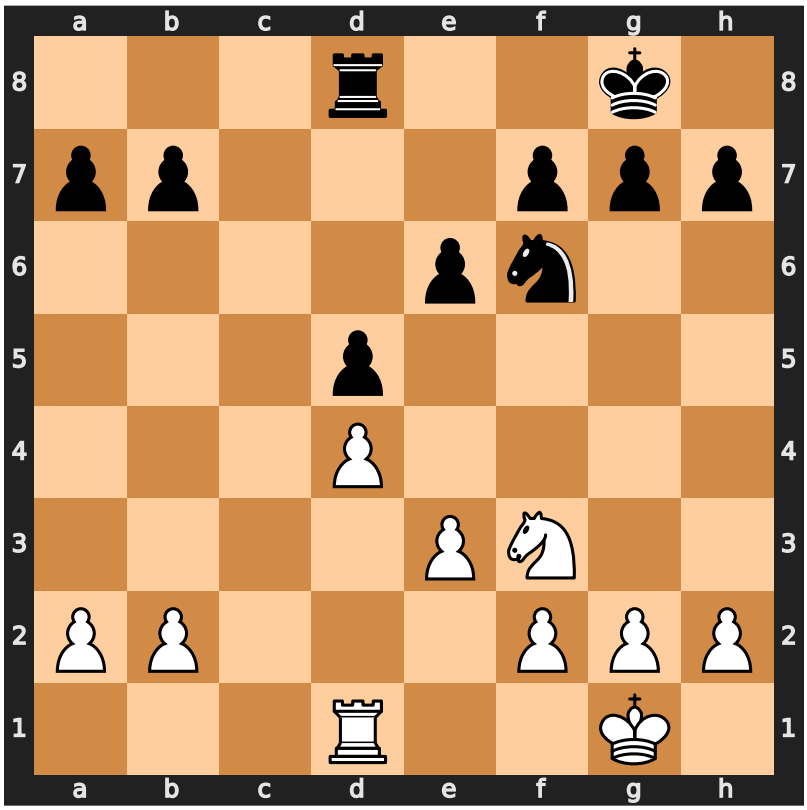

Figure 41.63: Chess Position

White to move. This is a simplified position with a Carlsbad-type structure. White has rooks, Black has rooks. How does White win?

Hint 1: The structure is d4 vs d5, e3 vs e6. It looks symmetric, but is it? *Hint 2:* White's king can march to a better square. Where should the king go? *Hint 3:* Consider the minority attack concept even in the endgame.

Solution: White should activate the king and look for a minority attack even in this simplified position. (1) Play **Kf1-e2-d3** to centralize the king. (2) Play **a2-a4** to begin the minority attack on the queenside. (3) Play **b2-b4** and prepare **b4-b5**. (4) After b5, if …axb5 axb5, White targets c6 (or whatever weakness results). In rook endgames, the minority attack is especially powerful because rooks on open files penetrate easily. The king's activity matters enormously: a centralized king on d3 supports both the d4 pawn and the queenside advance.

Exercise 13.44

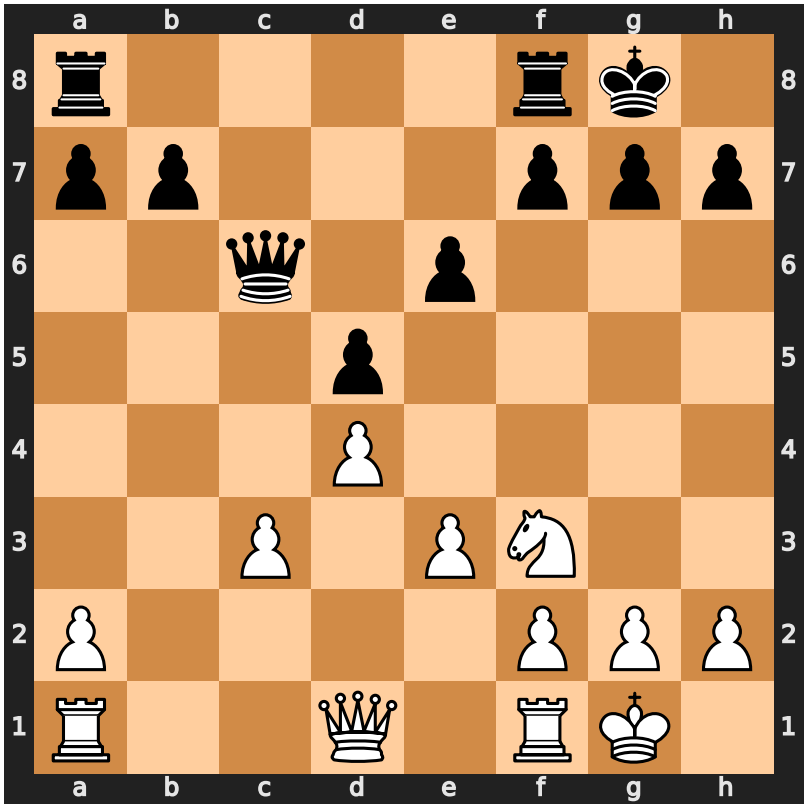

Figure 41.64: Chess Position

White to move. Black's pawn on d5 is isolated. Find a concrete plan to win it.

Hint 1: The d5 pawn is isolated. What square should White occupy? *Hint 2:* A knight on d4 would attack d5 from a stable outpost. *Hint 3:* After Nf3-d4, the d5 pawn is under direct pressure. Add rooks on the d-file.

Solution: White's plan: (1) Play **Nd2-b3** or **Nf3-d4** (Nd4 is the ideal square for the knight, blockading d5 and attacking it simultaneously). (2) Play **Rd1** to put a rook on the d-file. (3) Play

Qd3 or **Qd2** to add queen pressure to d5. (4) If possible, double rooks on the d-file. (5) The combined pressure on d5 will force Black to tie all pieces to its defense. White can then switch the attack to the kingside or queenside, exploiting Black's passivity. The isolated d5 pawn is a target that does not go away.

Exercise 13.45

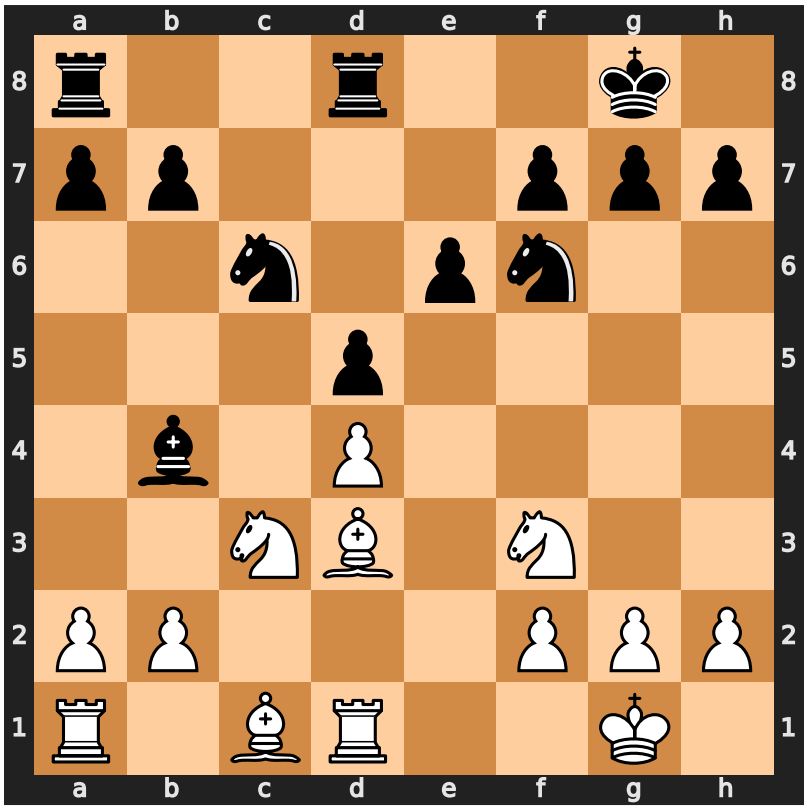

Figure 41.65: Chess Position

White to move. Black has an IQP on d5 but active piece placement. How does White navigate this position?

Hint 1: Black's pieces are active, which compensates for the IQP. White should seek to trade pieces. *Hint 2:* Every piece trade makes the IQP weaker. *Hint 3:* After trading down, the d5 pawn becomes a target in the endgame.

Solution: White's strategy is **simplification.** (1) Play **a3** to force the bishop to commit (…Ba5 or …Be7). (2) After the bishop retreats, play **b2-b4** to gain queenside space and chase the bishop further. (3) Trade minor pieces when possible. The fewer pieces on the board, the weaker the IQP becomes. (4) Aim for a rook endgame where the d5 pawn is a clear target. (5) In the endgame, use the d4 square as a blockade point for the king or a rook, and attack d5 with the remaining rook. Black's active piece play is the IQP's best defense. Remove the pieces, and the defense collapses.

Exercise 13.46

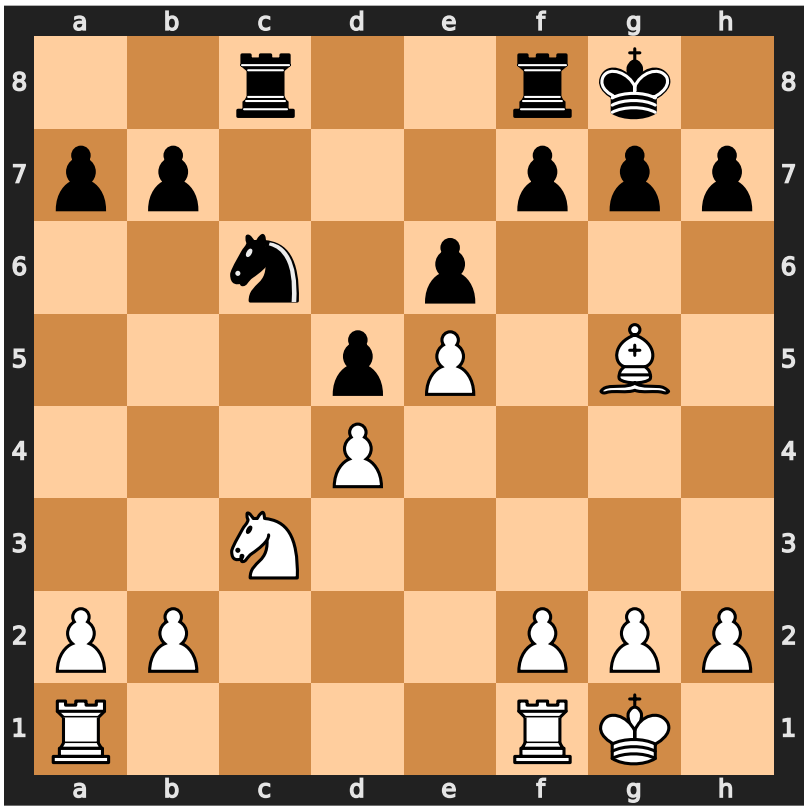

Figure 41.66: Chess Position

White to move. White has a pawn chain d4-e5 and a bishop on g5. How does White convert the space advantage?

Hint 1: The e5 pawn cramps Black's position. Can White add pressure? *Hint 2:* Consider f2-f4-f5 to attack the base of Black's chain at e6. *Hint 3:* After f5 exf5, the e5 pawn becomes a powerful passed pawn.

Solution: White's plan: (1) Play **f2-f4** to reinforce the e5 pawn and prepare f5. (2) Centralize the rooks: **Rae1** and **Rf3** (or Rf2). (3) When ready, play **f4-f5!** This attacks e6, the base of Black's chain. After f5 exf5, White has a passed pawn on e5 that is extremely dangerous. (4) The bishop on g5 supports the attack by controlling the dark squares. (5) If Black does not capture on f5, White can play fxe6 fxe6, and the e6 pawn becomes a target on the open f-file. The space advantage and the pawn chain give White a clear path to victory.

Exercise 13.47

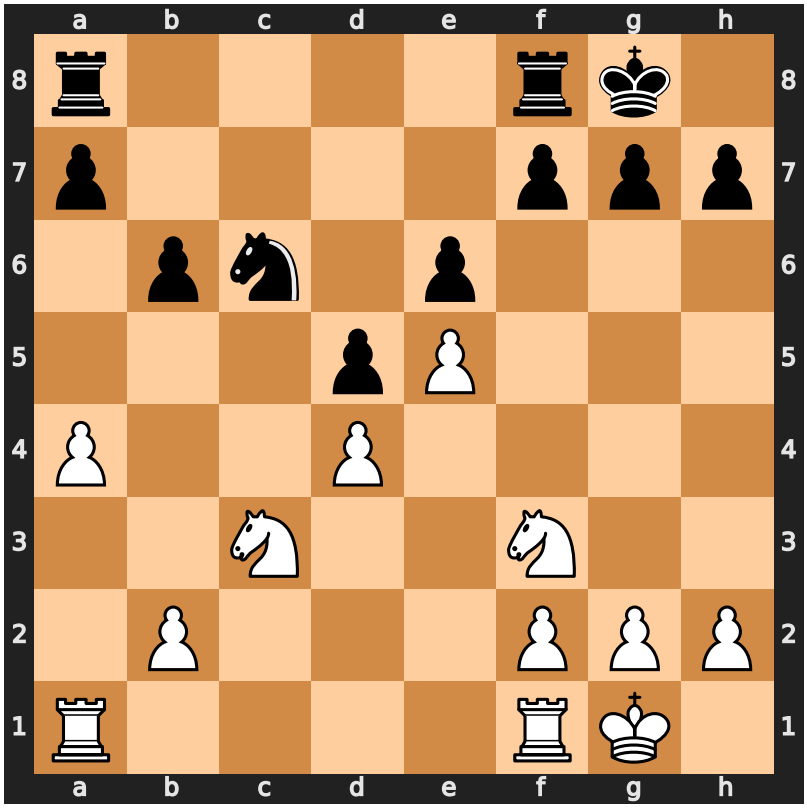

Figure 41.67: Chess Position

White to move. Black has a backward pawn on b6 and a cramped position. How does White exploit this?

Hint 1: The b6 pawn is on a half-open file (White has no pawn on the b-file). How can White target it? *Hint 2:* Play Rb1 to target b6 directly. *Hint 3:* After Rb1, combine with Na4 (aiming at b6 and c5) for maximum pressure.

Solution: White's plan: (1) Play **Rb1** to target the backward b6 pawn. (2) Play **Na4** to attack

b6 and aim for the c5 outpost. A knight on c5 is beautifully placed, attacking a7, b7, d7, and e6 simultaneously. (3) If Black plays …Na5 to prevent Nc5, play **b4** to chase the knight and gain more queenside space. (4) The combined pressure on b6 and the potential infiltration via c5 give White a significant advantage. Black's position is cramped by the e5 pawn, and the backward b6 pawn adds a concrete target.

Exercise 13.48

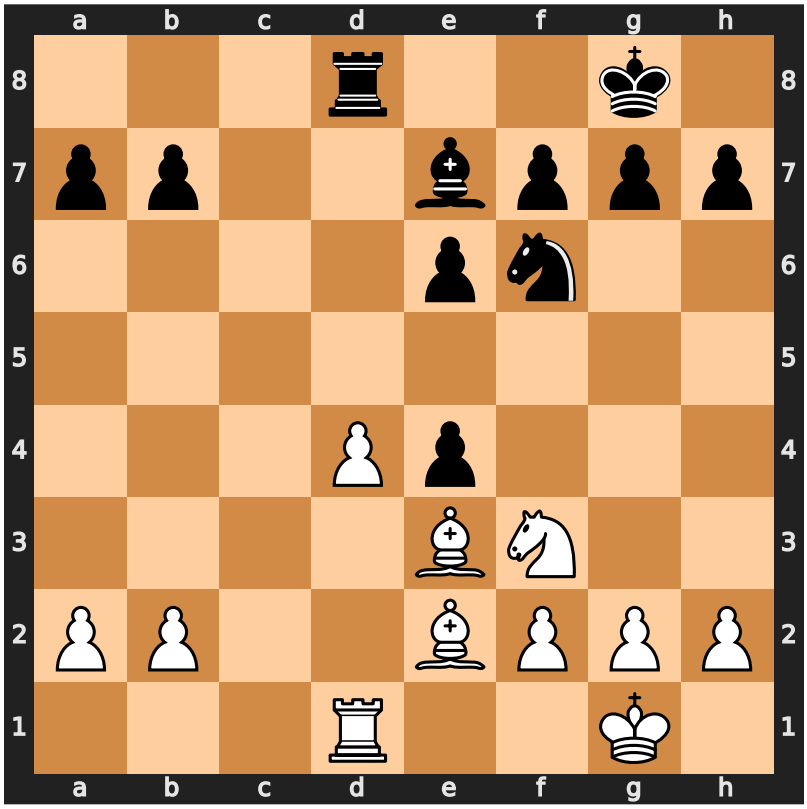

Figure 41.68: Chess Position

White to move. Black has just captured on e4 (dxe4 or …pxe4). White has an isolated d4 pawn. Is White better or worse, and what is the plan?

Hint 1: White's d4 pawn is now isolated, but Black's e4 pawn is also advanced and potentially weak. *Hint 2:* Can White blockade e4 and target it? *Hint 3:* Consider Nd2 to attack e4, then Nc4 to pressure both e4 and d6.

Solution: The position is **dynamically balanced with chances for both sides.** White's d4 pawn is isolated, but Black's e4 pawn is also weak and overextended. White's plan: (1) Play **Nd2** to attack the e4 pawn. (2) After …f5 (defending e4), play **f3!** to undermine e4 further. (3) If the e4 pawn falls, White's d4 pawn is no longer isolated (it could advance to d5). (4) Alternatively, play **Nc4** to reach a powerful outpost that attacks b6 and d6 squares. The lesson: not all isolated pawns are weaknesses. Sometimes the opponent's pawn structure is equally compromised.

Exercise 13.49

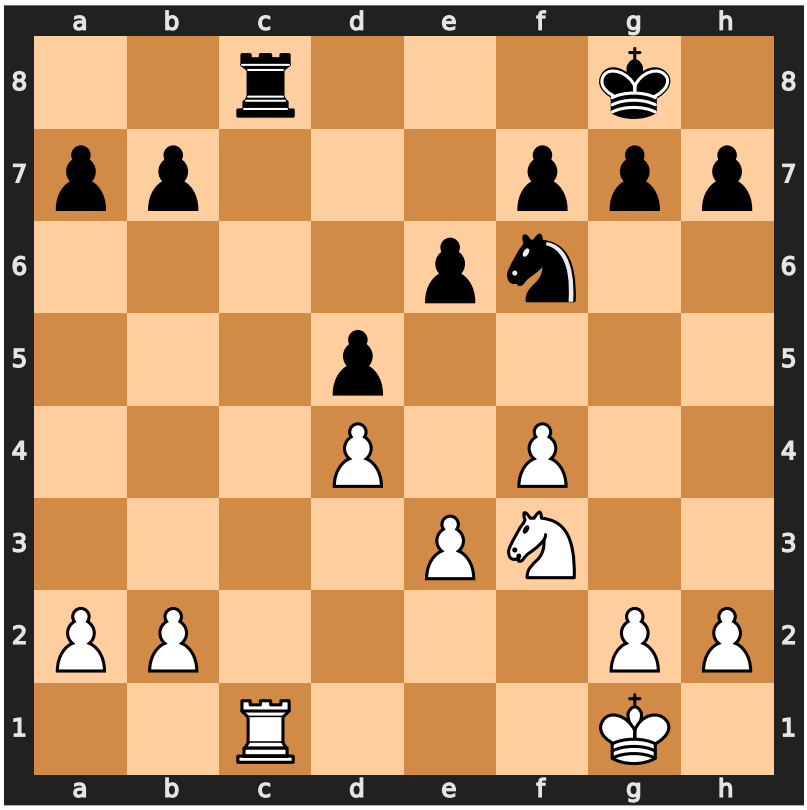

Figure 41.69: Chess Position

White to move. A simplified Carlsbad endgame. White has f4 and d4 against Black's d5 and e6. How does White win?

Hint 1: White should use the king actively. King to f2-e3-d3. *Hint 2:* The rook should aim for the c-file or seventh rank. *Hint 3:* Consider the possibility of e3-e4 as a pawn break after proper preparation.

Solution: White's winning plan: (1) **Kf2-e2-d3** to centralize the king. (2) Play **Rc7** to seize the seventh rank, attacking b7 and a7. (3) From the seventh rank, the rook creates unbearable pressure on Black's queenside pawns. (4) Once the rook is active, consider **e3-e4** to open lines. After e4 dxe4+ Kxe4, White's centralized king and active rook should be decisive. (5) The f4 pawn supports e4 and controls e5, preventing Black's knight from reaching a good square. In rook endgames, an active rook on the seventh rank is often worth a pawn.

Exercise 13.50

White to move. Black has an isolated d5 pawn. It is White's turn. Find the most precise plan to exploit the IQP.

Hint 1: White should blockade d5 with a piece. Which piece is the ideal blockader? *Hint 2:* A knight on d4 blockades d5 and controls key central squares. *Hint 3:* After Nd4, White can add pressure with Rac1, Qb3, and eventually target the d5 pawn with all pieces.

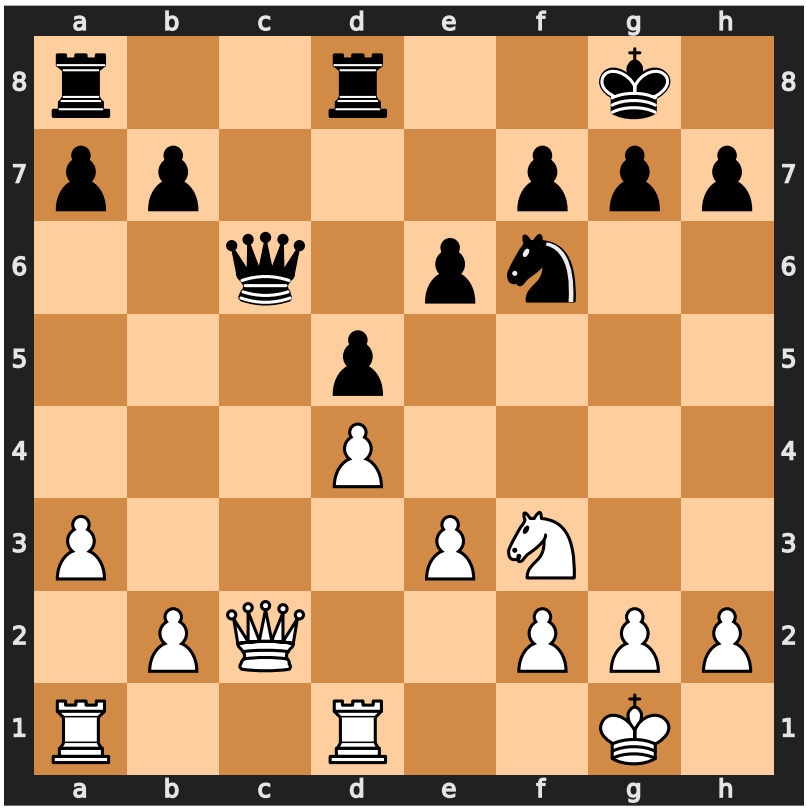

Figure 41.70: Chess Position

Solution: White's precise plan: (1) Play **Nf3-d4**, establishing the knight on the ideal blockading square. From d4, the knight controls b5, c6, e6, f5, f3, and b3. It is the best possible piece for blockading an IQP. (2) Play **Rac1** to target the c-file and potentially invade on c7. (3) Play **Qb3** to add queen pressure to d5 (and b7). (4) If possible, play **Rdc1** to double rooks on the c-file. (5) The combined pressure from the blockading knight, the rooks on the c-file, and the queen aiming at d5 will force Black into passive defense. White can then look for tactical opportunities or simply win the d5 pawn by accumulating pressure. This is the textbook method of exploiting an IQP, and it works at every level of chess.

41.8 Key Takeaways

1. **Pawns are the skeleton of your position.** They define the character of the game, determine piece placement, and create lasting strengths and weaknesses. Every pawn move is permanent.

2. **Learn the eight structure types.** Isolated pawn, doubled pawns, backward pawn, passed pawn, connected pawns, hanging pawns, pawn chain, and pawn islands. Each has its own strengths, weaknesses, and plans.

3. **Recognize structures from openings.** The Carlsbad, French, Sicilian, King's Indian, and London structures each have characteristic plans. When you recognize the skeleton, you know what to do.

4. **Use the five-step planning process.** Identify the structure, evaluate the pieces, find the open files, identify the pawn breaks, and form a plan. This method works at every level.

5. **Structural advantages are patient advantages.** Unlike tactics, which reward speed, pawn structure advantages reward patience and precision. The weakness is not going anywhere. Take your time.

41.9 Practice Assignment

This week, do the following:

1. **Play three games** (online or over the board) and after each game, identify the pawn structure that arose. Write down which of the eight types it most resembles.

2. **Find two master games** in any database (Lichess, Chess.com, or chessgames.com) that feature the Carlsbad structure. Play through them and identify the minority attack if White uses it.

3. **Set up the following position on your board and study it for 10 minutes:**

Answer these questions: - What structure type is this? - Which pieces are good and which are bad? - What is White's best plan? - What is Black's best counter-plan? - Where should the rooks go?

Write down your answers before checking them against this chapter.

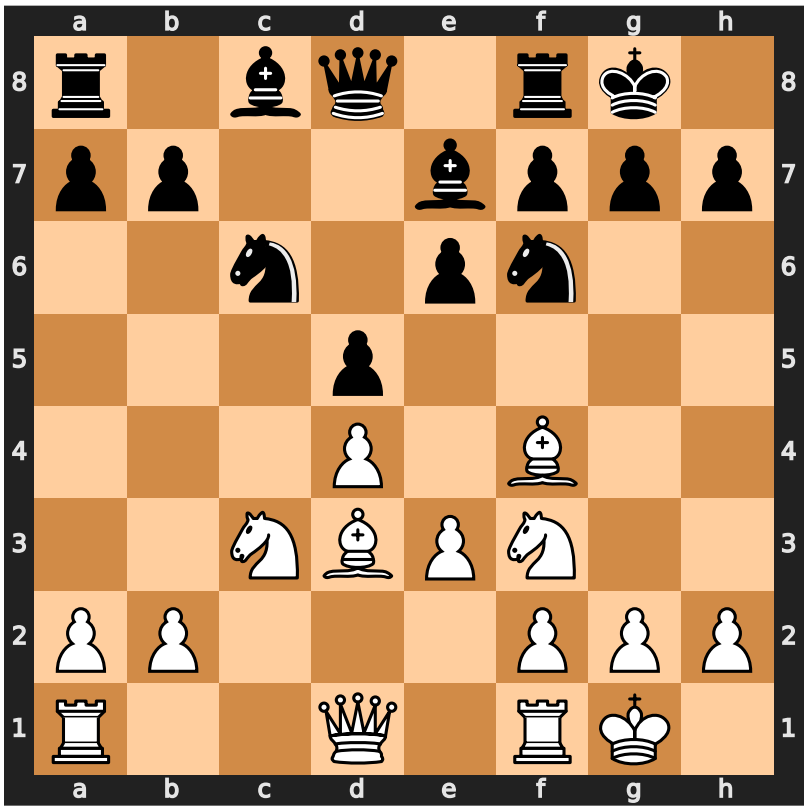

Figure 41.71: Chess Position

4. **Review your last 5 games** and count the pawn islands for each side at move 20. Which side had fewer islands? Did that side win?

41.10 Progress Check

Answer these five questions to test your understanding. If you get at least four correct, you have mastered this chapter's core concepts.

Question 1: What is an isolated pawn? > A pawn with no friendly pawns on either adjacent file.

Question 2: According to Nimzowitsch, where should you attack a pawn chain? > At the base (the rearmost pawn in the chain).

Question 3: In the Carlsbad structure, what is the name of White's primary strategic plan? > The minority attack.

Question 4: Why is a passed pawn dangerous? > It can promote to a queen, and the opponent must devote pieces to stopping it.

Question 5: What is the "trading principle" for minor pieces? > Trade your bad pieces for your opponent's good pieces.

Scoring: - 5/5: Outstanding. You have a strong grasp of pawn structure concepts. - 4/5: Very good. Review the section you missed and move on. - 3/5: Good foundation. Reread the relevant structure types before proceeding. - 0-2/5: No shame in this. Reread the chapter with a board in front of you. These concepts take repetition to internalize.

Rest here. Chapter 13 is complete. You have learned one of the most important topics in chess. The concepts in this chapter will inform every game you play from here forward. Take a day off. You have earned it.

When you are ready, Chapter 14 awaits: *Piece Activity and Coordination.*

Chapter 14: Piece Activity and Coordination

Volume II: The Club Player | Rating Range: 1000 - 1600 Pages: 40 | Exercises: 40 | Annotated Games: 8

> *"The beauty of a move lies not in its appearance but in the thought behind it."* – Aaron Nimzowitsch

---

42.1 What You'll Learn

- What makes a piece "active" versus "passive," and why this distinction wins games
- How pieces work together as a team, and why coordination beats raw material
- When two bishops dominate and when they do not
- How to judge whether a knight or a bishop is stronger in a given position
- How to activate rooks on open files and the seventh rank
- Where to place your queen and how to avoid early queen adventures
- When to trade pieces and when to keep them
- How to use outposts to plant pieces on squares your opponent cannot challenge

---

42.2 Part 1: What Is Piece Activity?

42.2.1 Active Pieces vs Passive Pieces

Here is a simple truth that separates improving players from stagnant ones:

An active piece is worth more than a passive piece.

This is not a metaphor. A knight stuck on a1 defending nothing, attacking nothing, and going nowhere is barely worth two pawns in practical terms. A knight on e5, controlling eight squares and threatening the opponent's position, is worth almost as much as a rook.

The same piece. The same material value on paper. But one is alive and the other is dead weight.

An active piece has the following qualities:

1. **It controls important squares.** Central squares, squares near the enemy king, or key outpost squares.
2. **It has mobility.** It can move to multiple good squares on the next turn.
3. **It coordinates with other pieces.** It supports teammates and participates in threats.
4. **It creates problems for the opponent.** Active pieces force the opponent to react rather than execute their own plans.

A passive piece has the opposite qualities:

1. **It sits on the edge or back rank.** It controls few squares and influences nothing.
2. **It is stuck.** It has one or zero good moves available.
3. **It works alone.** It does not connect with other pieces or support any plan.
4. **It is merely defending.** It babysits a weakness rather than creating threats.

42.2.2 Why Activity Wins Games

Every World Champion understood this. Alekhine built attacks by activating every piece before striking. Fischer would systematically improve his worst piece until all five pieces were working together. Kasparov's pieces swarmed like a pack, each one reinforcing the others.

The reason is mathematical. You start the game with eight pieces (not counting pawns). If all eight are active, you are fighting with your full army. If two pieces are passive, you are effectively fighting with six pieces against your opponent's eight. That is a losing battle, no matter how good your position looks on paper.

Here is the key insight for club players:

Before looking for tactics, ask yourself: "Is my worst piece active?"

If the answer is no, your first job is to fix that. Find a better square for your worst piece. Once all your pieces are active and coordinated, tactics tend to appear on their own.

42.2.3 How to Evaluate Activity

When you look at a position, run through this quick checklist for each of your pieces:

1. **Knights:** Are they on central squares (d4, e4, d5, e5) or outposts? Or are they stuck on the rim?
2. **Bishops:** Do they have open diagonals? Or are they blocked by their own pawns?
3. **Rooks:** Are they on open or half-open files? Or are they hiding behind their own pawns?
4. **Queen:** Is she on a useful square, supporting the team? Or is she exposed and vulnerable to harassment?

If you find a piece that fails this test, improving it is almost certainly your best move.

42.3 Part 2: Piece Coordination

42.3.1 The Whole Is Greater Than the Sum

Individual piece activity matters. But the real magic happens when pieces work *together*.

Two knights side by side on e5 and d5 are strong. But a knight on e5 supported by a bishop on b2, with rooks on the e-file and d-file, and the queen ready to join on f3? That is not four active pieces. That is a machine.

Coordination means your pieces reinforce each other's strengths and cover each other's weaknesses. A bishop alone cannot checkmate. A rook alone cannot control both an open file and a diagonal. But together, pieces cover every angle.

Signs of good coordination:

- Your pieces point in the same direction (toward the enemy king, toward a weakness, toward a promotion square).
- Multiple pieces can reach the same key square within one or two moves.
- Your pieces do not obstruct each other. They leave room for teammates to function.
- Removing one piece from the board would weaken two or three others, because they all depend on each other.

Signs of poor coordination:

- Your pieces point in different directions. One attacks the kingside while another drifts toward the queenside with no purpose.
- Your pieces are bunched up on the same squares, getting in each other's way.
- Your pieces work alone. Each one has its own project, and none of them amount to anything.

42.3.2 How to Improve Coordination

When your pieces feel disconnected, try this three-step process:

1. **Pick a target.** It might be the enemy king, a weak pawn, or a key square. Every piece should know where it is headed.
2. **Reroute the straggler.** Find the piece that is furthest from the action and bring it toward the target. This often means a knight maneuver (Na3-c2-e3-d5) or a rook lift (Ra1-a3-g3).
3. **Create a battery.** Stack pieces on the same file, rank, or diagonal. Queen and bishop on the same diagonal. Two rooks on the same file. Queen behind a rook pointing at the enemy king.

The result of good coordination is that your opponent feels squeezed. Every move you make adds pressure. Every move they make is a defensive reaction. This is how positional advantages turn into winning attacks.

Rest here if you need to. The foundation is set. Come back fresh for the specific piece types.

42.4 Part 3: The Bishop Pair

42.4.1 When Two Bishops Dominate

The bishop pair is one of the most reliable advantages in chess. Two bishops working together control squares of both colors, and in open positions they can dominate knights.

Why the bishop pair is strong:

1. **Complementary coverage.** One bishop covers light squares, the other covers dark squares. Together, they leave no gaps.
2. **Long-range power.** In open positions, bishops can influence the game from one side of the board to the other. Knights need several moves to cross the board; bishops do it instantly.
3. **Endgame dominance.** In endgames with pawns on both sides of the board, the bishop pair is particularly powerful because of their ability to operate on both flanks simultaneously.

Set up your board:

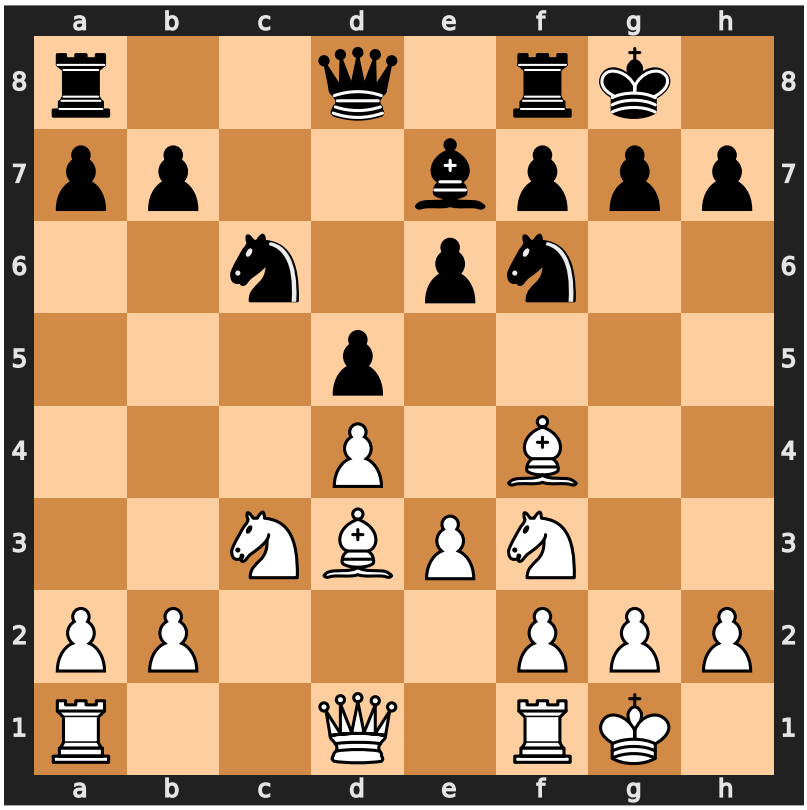

Figure 42.1: Chess Position

White has two bishops (d3 and f4). Black has two knights (c6 and f6). If the position opens up, White's bishops will dominate. If the position stays closed, Black's knights may be just as good or better.

When the bishop pair does NOT work:

- **Closed positions.** When pawn chains block the diagonals, bishops become "tall pawns." Knights thrive in closed positions because they can hop over obstacles.

- **When bishops have no targets.** Two bishops with nothing to aim at are not better than two knights with strong outposts.
- **When one bishop is bad.** If one of your bishops is blocked by its own pawns, you effectively have a bishop and a tall pawn, not a real pair.

How to play WITH the bishop pair:

- Open the position. Trade pawns, create open lines, and give your bishops room to breathe.
- Avoid placing pawns on the same color as either bishop.
- Keep the position fluid. Bishops love positions where things are changing.

How to play AGAINST the bishop pair:

- Keep the position closed. Do not open lines for the bishops.
- Plant knights on strong outpost squares where they cannot be chased by pawns.
- Trade one of the bishops. Once one bishop is gone, the "pair" advantage disappears.
- Use your knights' ability to control squares of both colors.

42.5 Part 4: Good Knight vs Bad Bishop

42.5.1 The Eternal Debate

"Is a knight or a bishop better?" This is one of the oldest questions in chess, and the answer is always the same: **it depends on the position.**

When knights are better:

1. **Closed positions** with locked pawn chains. Knights jump over pawns; bishops cannot.
2. **When strong outposts exist.** A knight on d5 that cannot be driven away by a pawn is a monster.
3. **When the opponent's bishop is "bad."** A bishop blocked by its own pawns on the same color is a liability.
4. **In positions with fixed pawns on one side of the board.** Knights do not need open lines to be effective.

When bishops are better:

1. **Open positions** with few pawns blocking diagonals. Bishops control long lines and can switch from one side of the board to the other.
2. **Endgames with pawns on both sides.** A bishop can influence both flanks; a knight can only be on one side at a time.
3. **When there are no outposts for the knight.** Without a stable square, a knight wanders aimlessly.
4. **Against pawn majorities.** A bishop can help escort passed pawns more effectively than a knight in many cases.

42.5.2 The "Bad Bishop"

A "bad bishop" is a bishop blocked by its own pawns. Specifically, it is a bishop on the same color as most of your pawns. Those pawns block the bishop's diagonals and reduce it to a mere spectator.

Set up your board:

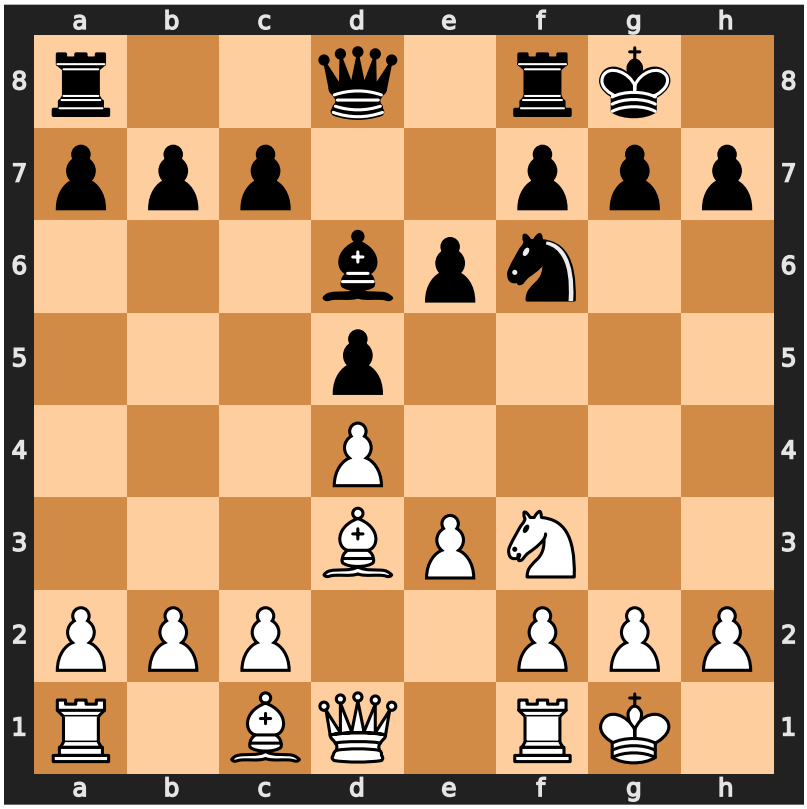

Figure 42.2: Chess Position

Look at Black's bishop on d6. Black's pawns on d5, e6, and likely c7 all sit on dark squares, which is the same color as the bishop's diagonals. The bishop is blocked by its own army. This is a "bad" bishop.

Now look at White's bishop on d3. White's pawns on d4 and e3 are also on dark squares, BUT the bishop sits on a light square (d3). It has an open diagonal (d3-h7). It is a "good" bishop.

How to deal with a bad bishop:

1. **Trade it.** If your bishop is bad, look for a way to exchange it for your opponent's good bishop or for a knight.
2. **Put it outside the pawn chain.** Before locking your pawns, develop the bishop to an active square. In the French Defense, Black often plays …b6 and …Ba6 to get the bad bishop outside the pawn chain.
3. **Change the pawn structure.** If you can advance or trade the pawns that block the bishop, it stops being bad.
4. **Use it as a defender.** A bad bishop is still useful if it defends key squares or pawns. It is not worthless, just limited.

A common mistake: Beginners assume that a "bad bishop" is always weak. This is not true. A bad bishop that defends critical squares is doing important work. The term "bad" refers to its attacking potential, not its overall value in every situation.

42.6 Part 5: Rook Activity

42.6.1 The Power of Open Files

Rooks are the pieces that benefit most from activation. A rook on a closed file does almost nothing. A rook on an open file can dominate the entire game.

Three rules for rook activity:

Rule 1: Put rooks on open files.

An open file is a file with no pawns of either color. A half-open file has no pawns of your color but has an enemy pawn on it (which becomes a target).

Set up your board:

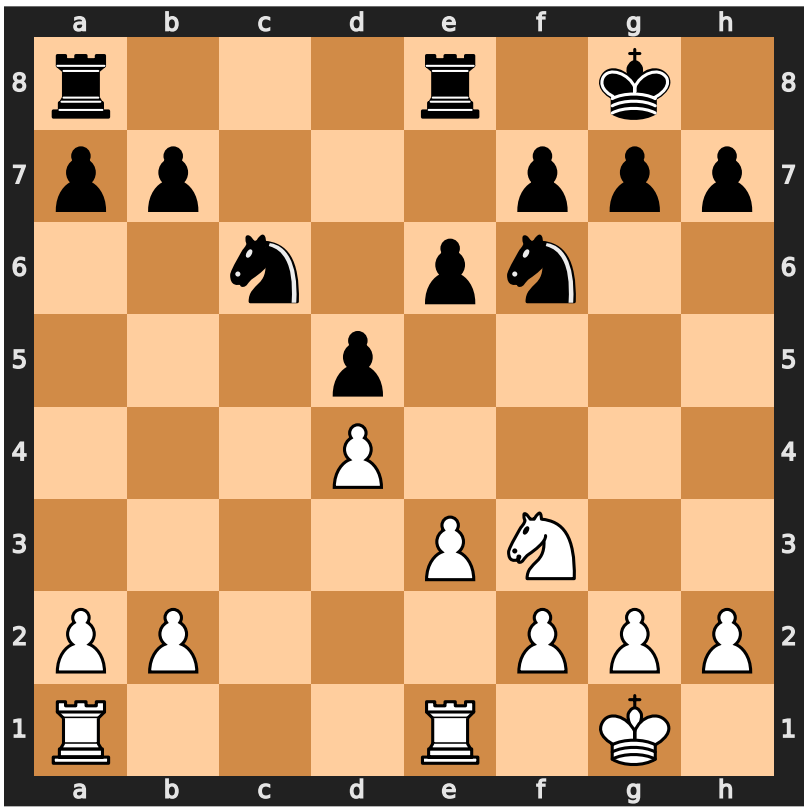

Figure 42.3: Chess Position

Both sides have rooks on the e-file. The e-file is open (no pawns on it). Whoever controls this file controls a highway into the opponent's position.

Rule 2: Rooks belong on the seventh rank.

A rook on the seventh rank (the second rank for Black) is one of the most powerful pieces in chess. It attacks pawns from behind (where they cannot defend each other), cuts off the enemy king, and threatens to create havoc.

Set up your board:

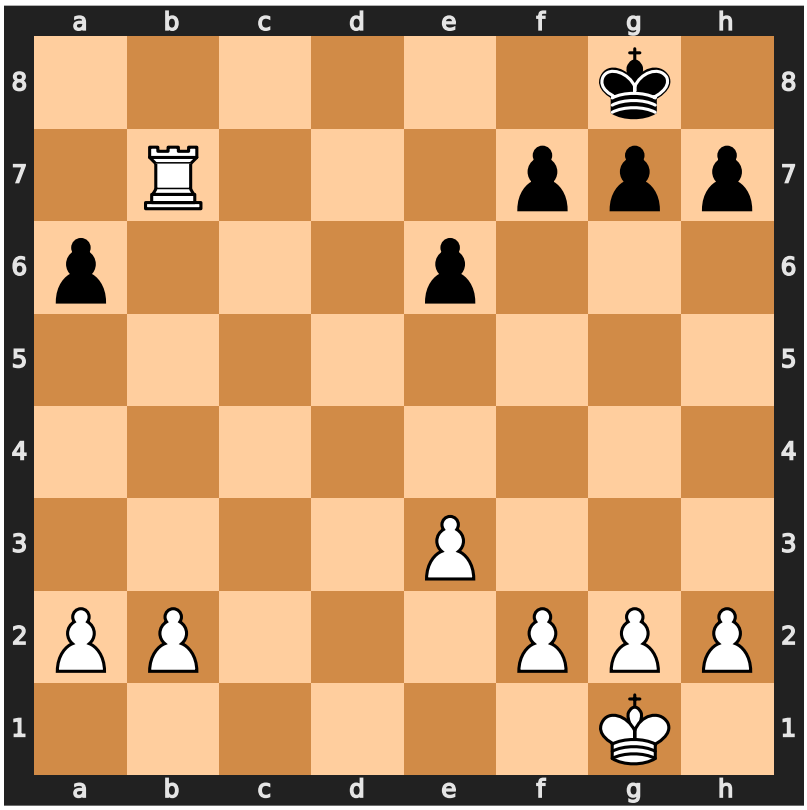

Figure 42.4: Chess Position

White's rook on b7 is on the seventh rank. It attacks the f7 and a7 pawns from behind. Black's king is confined to the back rank. This single rook placement gives White a huge advantage.

Tarrasch said it best: *"A rook on the seventh rank is sufficient compensation for a pawn."* He was not exaggerating.

Rule 3: Doubled rooks are stronger than the sum of their parts.

Two rooks on the same open file create irresistible pressure. The front rook advances; the rear rook supports. If the front rook is captured, the rear rook takes its place.

Two rooks on the seventh rank is almost always a decisive advantage. They attack everything, and the opponent cannot organize a defense.

42.7 Part 6: The Queen

42.7.1 Placement and Patience

The queen is your strongest piece. She combines the power of a rook and a bishop. But that power comes with a vulnerability: she is a high-value target.

Three queen principles for club players:

Principle 1: Do not develop the queen too early.

In the opening, every time your opponent attacks your queen with a minor piece or pawn, you lose a tempo retreating. Your opponent develops while you run.

Set up your board:

Black has brought the queen to h4 on move 2. This looks aggressive, but it is actually a mistake. After 3.Nc3 (or 3.Nf3), the queen will be harassed and will have to retreat. Meanwhile, White develops normally. The queen adventure has wasted Black's time.

Exception: If the queen move creates a concrete threat that cannot be easily met, it may be justified. But in 95% of cases, early queen sorties are punished by development.

Principle 2: The queen works best behind other pieces.

Place the queen where it supports your other pieces without being exposed. Behind a rook on an open file. Behind a bishop on a diagonal. Supporting a knight's advance.

The queen is too valuable to be the first piece into battle. Let your minor pieces and rooks lead the charge. The queen follows and delivers the finishing blow.

Principle 3: In the endgame, the queen becomes an attacker.

Once most pieces are off the board, the queen's vulnerability decreases. In queen endgames, centralize the queen, use it to attack weak pawns, and combine it with your king's advance.

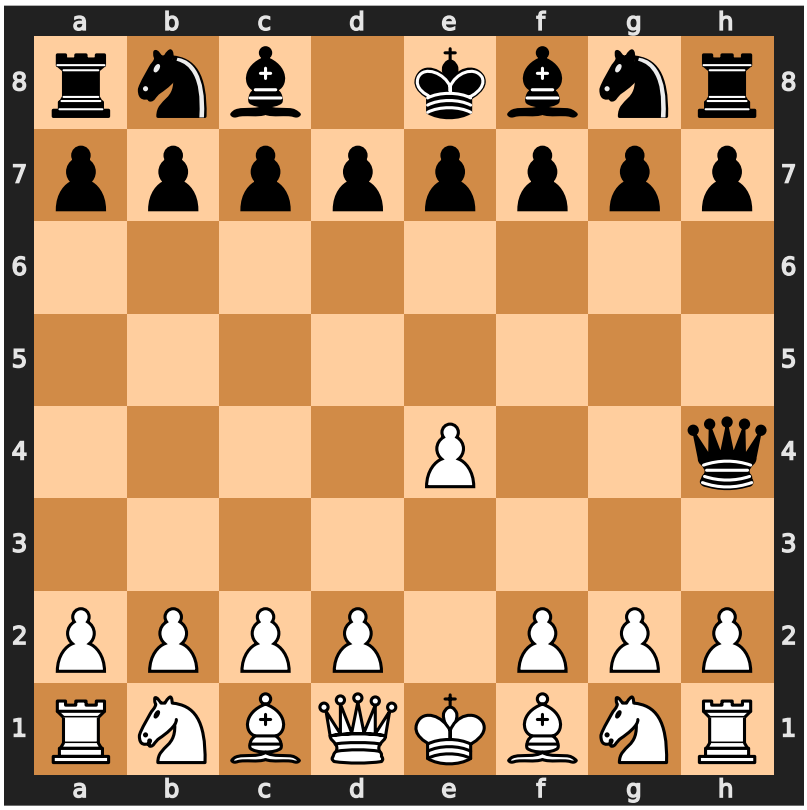

Figure 42.5: Chess Position

42.8 Part 7: Piece Exchanges

42.8.1 When to Trade and When to Keep

Every trade changes the character of the position. Understanding *when* to trade is one of the most important skills in chess.

Trade pieces when:

1. **You are ahead in material.** Every trade brings you closer to a winning endgame. If you are up a pawn, trade pieces (but keep at least one pair of rooks to push your advantage).
2. **Your opponent has active pieces.** If your opponent's knight is beautifully placed on e4, trade it off. Remove the problem.
3. **You have a structural advantage.** Weak pawns are harder to defend with fewer pieces. If your opponent has an isolated pawn, trade down and target it in the endgame.
4. **You are cramped.** If your position is tight, trades create breathing room. Each piece that leaves the board gives your remaining pieces more space.

Keep pieces when:

1. **You are behind in material.** Your best chance is a middlegame attack with many pieces. Trading into an endgame a pawn down is usually losing.
2. **You have the initiative.** If your pieces are active and coordinated and your opponent is on the defensive, keep the pressure on. Do not simplify and let them escape.
3. **You have the bishop pair.** The more pieces on the board, the more open lines will eventually appear for your bishops.
4. **Your opponent is cramped.** If your opponent's pieces are tripping over each other, every piece on the board makes their life harder. Do not relieve their suffering.

42.8.2 Silman's Imbalances: A Preview

Jeremy Silman introduced the concept of "imbalances" to help players evaluate positions. An imbalance is any difference between the two sides. These include:

- **Material:** One side has more pieces or pawns.
- **Piece activity:** One side's pieces are better placed.
- **Pawn structure:** One side has healthier pawns.
- **Space:** One side controls more territory.
- **Development:** One side has more pieces in play.
- **King safety:** One side's king is more exposed.
- **Control of key files or squares:** One side dominates open lines or outposts.

The player who best understands and exploits the imbalances in the position will win the game.

This is a concept we will explore in much greater depth in Volume III. For now, be aware that trading pieces is not a neutral act. Every trade shifts the imbalances. Before you trade, ask: "Does this trade make my imbalances better or worse?"

42.9 Part 8: Outposts

42.9.1 Planting Pieces on Strong Squares

An outpost is a square in enemy territory that is protected by one of your pawns and cannot be attacked by any enemy pawn. A piece placed on an outpost is like a fortress: stable, hard to remove, and projecting power deep into the opponent's position.

Set up your board:

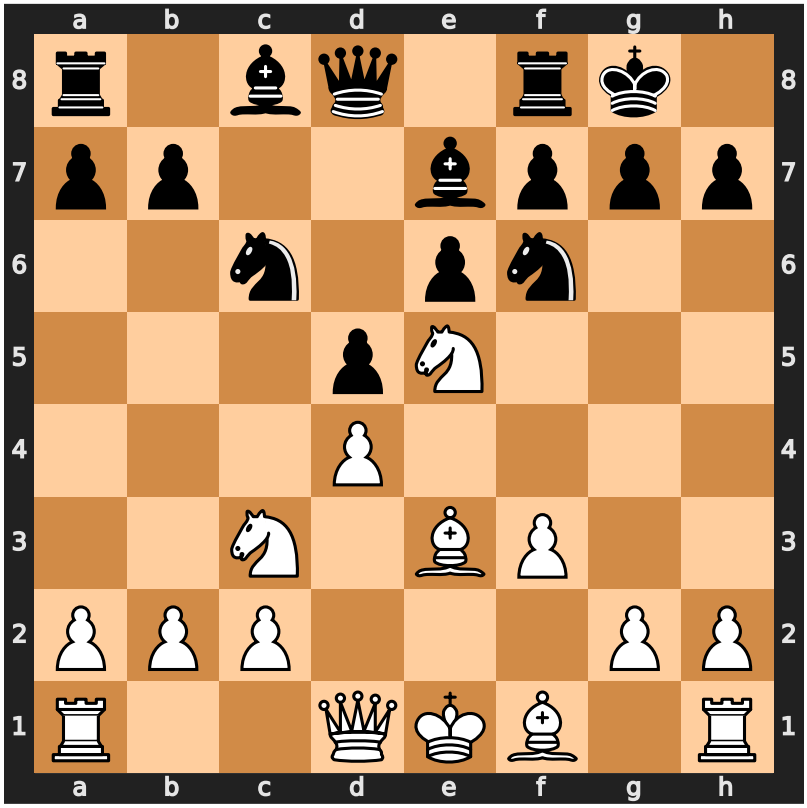

Figure 42.6: Chess Position

White has a knight on e5. This is an outpost. Black has no pawn on the d-file or f-file that could play …d6 or …f6 to chase it away. The knight on e5 controls d3, d7, c4, c6, f3, f7, g4, and g6. It is a monster.

What makes a good outpost:

1. **No enemy pawn can attack it.** This is the most important criterion. If a pawn can come and kick your piece off the square, it is not a true outpost.
2. **A friendly pawn supports it.** A pawn on d4 supports a knight on e5. A pawn on e4 supports a knight on d5. The pawn guarantees the piece can stay.
3. **The square is in or near the center.** Outposts on the edge of the board are less useful because they control fewer important squares.
4. **The piece on the outpost is hard to trade.** If the opponent can simply trade your outpost piece for their own minor piece, the advantage disappears.

Knights love outposts more than bishops do.

A knight on an outpost is at its maximum power. It controls up to eight squares and cannot be challenged by a pawn. A bishop on an outpost is less impactful because bishops need long diagonals to thrive; being "stuck" on one great square is not what bishops do best.

How to create outposts:

1. **Advance pawns to force the opponent's pawns to move.** If you play e4-e5 and your opponent responds …d6, exd6, then the e5 square may become an outpost (if Black has no pawn on f7 to play …f6).
2. **Trade the pawn that guards the square.** If Black has a pawn on f6 guarding e5, trade it off. After the f6 pawn disappears, e5 becomes an outpost.
3. **Provoke pawn advances.** Every time your opponent pushes a pawn, the square that pawn left behind can become an outpost. The move …h6 weakens g5. The move …g6 weakens f5 and h5.

How to fight against outposts:

1. **Do not advance pawns unless you must.** Every pawn move creates a potential outpost for your opponent.
2. **Trade the piece on the outpost.** If a knight lands on e5, trade it with your own knight or bishop.
3. **Challenge the supporting pawn.** If a pawn on d4 supports the outpost on e5, attack d4. Remove the support, and the outpost may fall.

Good stopping point. The theory is complete. When you return, eight masterpiece games await.

42.10 Part 9: Annotated Games

42.10.1 Game 26: Botvinnik vs Capablanca, AVRO Tournament 1938

Theme: Piece Activity Through Deep Preparation

This is one of the most celebrated games in chess history. Botvinnik prepared this game at home for months, and the result is a textbook example of how piece activity and coordination can overwhelm even the greatest natural talent. Capablanca was the third World Champion, famous for his effortless technique. Botvinnik beat him by out-preparing and out-coordinating him.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nc3 Bb4 4.e3 d5 5.a3 Bxc3+ 6.bxc3 c5

The Nimzo-Indian Defense. Black gives up the bishop pair but doubles White's c-pawns and gains time. This is a classic trade-off: structural damage for the bishop pair. Botvinnik understood that the bishop pair would be his primary weapon.

7.cxd5 exd5 8.Bd3 O-O 9.Ne2 b6

Capablanca develops naturally. The fianchetto of the bishop to b7 is logical but passive. Black's pieces will work from a distance.

10.O-O Ba6 11.Bxa6 Nxa6

An instructive exchange. Botvinnik trades his light-squared bishop for Black's. Why give up a bishop when you have the pair? Because the bishop on a6 was Black's most active minor piece. Without it, Black's remaining pieces lack targets and coordination. The knight on a6 is offside.

12.Bb2 Qd7 13.a4 Rfe8 14.Qd3 c4

Capablanca pushes …c4, closing the queenside. This is a strategic decision that favors White in the long run. Now the position is semi-closed, and White can focus on the kingside where the bishop on b2 and the pieces can coordinate.

15.Qc2 Nb8 16.Rae1 Nc6 17.Ng3 Na5 18.f3 Nb3

The knight reaches b3, but it is a dead end. It attacks the c1 square (which is empty) and the a1 rook (which has already moved). Meanwhile, Botvinnik's pieces are pointing toward the kingside.

19.e4 Qxa4 20.e5 Nd7 21.Qf2 g6

This is the critical moment. White has pushed e5, gaining space and activating the bishop on b2 (which now has a clear diagonal toward g7/h8). Black's kingside is beginning to weaken.

22.f4 f5 23.exf6 Nxf6 24.f5 Rxe1 25.Rxe1 Re8

Botvinnik sacrifices a pawn structure for piece activity. After f5, the e-file opens, the bishop on b2 roars, and the knight on g3 springs to life.

26.Re6!

A magnificent rook move. The rook enters on the sixth rank, tying Black down. Notice the coordination: the rook on e6, the bishop on b2 aiming at the long diagonal, and the knight ready to jump to h5 or f5. Every white piece has a job. Every white piece points at Black's king.

26...Rxe6 27.fxe6 Kg7 28.Qf4 Qe8 29.Qe5

White's queen joins the attack. The pawn on e6 is a thorn, supported by nothing but projecting power. Black is paralyzed.

29...Qe7 30.Ba3 Qxa3 31.Nh5+!

The decisive blow. The knight sacrifice opens the king's position. After 31…gxh5 32.Qg5+ Kf8 33.Qxf6+ Kg8 34.e7, the pawn queens. Every white piece contributed to this finish.

31...gxh5 32.Qg5+ Kf8 33.Qxf6+ Kg8 34.e7 Qc1+ 35.Kf2 Qc2+ 36.Kg3 Qd3+ 37.Kh4 Qe4+ 38.Kxh5 Qe2+ 39.Kh4 Qe4+ 40.g4 Qe1+ 41.Kh5 1-0

Capablanca resigned. The pawn on e7 will promote, and Black cannot prevent it without losing the queen.

What this game teaches about piece activity:

- Preparation can create activity before the game even starts
- The bishop pair combined with open lines creates devastating coordination
- A single piece sacrifice can unlock the full power of a coordinated army
- Every piece must have a role in the plan

42.10.2 Game 29: Fischer vs Petrosian, Candidates Match Buenos Aires 1971, Game 7

Theme: Breaking Through with Active Pieces

Tigran Petrosian was the most difficult player in history to beat. His defensive skills were legendary, and his prophylactic thinking made opponents feel like they were playing against a wall. Fischer broke through that wall in this match, and this game shows how relentless piece activity can crack even the tightest defensive setup.

Set up your board.

1.e4 c5 2.Nf3 e6 3.d4 cxd4 4.Nxd4 a6 5.Bd3 Nc6 6.Nxc6 bxc6

The Sicilian. Fischer plays White and immediately trades the knight, giving Black doubled c-pawns. But this is not about pawn structure. Fischer wants open lines for his pieces.

7.O-O d5 8.c4 Nf6 9.cxd5 cxd5 10.exd5 exd5

The center is open. Both sides have isolated d-pawns, but the key difference is piece activity. Fischer's pieces are going to find active squares faster.

11.Nc3 Be7 12.Qa4+ Qd7 13.Re1 Qxa4 14.Nxa4

Queens are off the board, but Fischer does not care. He is not looking for a mating attack. He is looking for piece domination. The knight heads to c5, and the rooks will seize the open files.

14...Be6 15.Be3 O-O 16.Bc5 Rfe8 17.Bxe7 Rxe7

Fischer trades the dark-squared bishops to simplify the position. Now the battle is about rooks, minor pieces, and pawns. And Fischer's pieces are better coordinated.

18.b4 Kf8 19.Nc5 Bc8 20.f3 Reb7 21.Re5

Look at the coordination. The knight on c5 is a monster: it controls a4, a6, b3, b7, d3, d7, e4, and e6. The rook on e5 centralizes and supports the knight. Fischer's pieces work as one.

21...g6 22.Rae1 Ng8

Petrosian is forced into pure passivity. His knight retreats to g8, his rook is stuck on a8, and his bishop is buried on c8. Three pieces doing almost nothing. Fischer has effectively neutralized half of Petrosian's army.

23.Nd7+!

The knight strikes. It forks the king on f8 and connects with the rooks for a decisive combination.

23...Kg7 24.Ne5 Rd8 25.Nc6 Rd6 26.Nxa7 Bd7 27.Re7 1-0

Petrosian resigned. The rook on the seventh rank combined with the dominant knight is too much. Notice: Fischer never launched a flashy attack. He simply made every piece active, coordinated them toward the center and seventh rank, and the position collapsed.

What this game teaches about piece activity:

- Active pieces beat passive pieces, even without a mating attack
- You do not need the queen to dominate with piece activity
- Centralizing pieces and seizing open files creates slow but unstoppable pressure

- Even the greatest defender cannot survive when all the opponent's pieces are working

---

42.10.3 Game 31: Alekhine vs Reti, Baden-Baden 1925

Theme: Piece Coordination as Art

Alexander Alekhine is remembered as the most dynamic World Champion. His pieces seemed to move with a shared intelligence, each one supporting the others in a web of threats. This game against the hypermodern pioneer Richard Reti is a perfect illustration.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nf3 d5 4.Nc3 Be7 5.Bg5 Nbd7 6.e3 O-O 7.Rc1 c6

A solid Queen's Gambit Declined setup from Reti. Black is well-organized but passive. Alekhine will demonstrate how to build a coordinated attack against this type of position.

8.Bd3 dxc4 9.Bxc4 Nd5 10.Bxe7 Qxe7 11.O-O Nxc3 12.Rxc3 e5

Black tries to free the position with …e5. This is the right idea in principle, but the timing allows Alekhine to seize the initiative.

13.dxe5 Nxe5 14.Nxe5 Qxe5 15.f4!

A strong pawn push. The queen is driven from its central perch, and White gains space on the kingside. Notice that White has already created a plan: the f-pawn advance supports a rook lift to the third rank, the bishop on c4 eyes f7, and the queen will swing to the kingside.

15...Qe7 16.f5 Rd8 17.Qh5 g6

Black weakens the kingside to block the f-pawn. But now the dark squares around Black's king (f6, g7, h6) are compromised.

18.fxg6 hxg6 19.Qg5 Qxg5

Black trades queens to relieve pressure. But Alekhine does not need the queen to show coordination.

20.Rxf7!

A rook sacrifice that demonstrates the power of piece coordination. The rook lands on f7, attacking the seventh rank. Combined with the bishop on c4 and the rook on c3, White's pieces form a net around Black's position.

20...Rxd2 21.Rxf8+ Kg7 22.Rf4

White has won the exchange and maintains an active rook. The bishop on c4 and rook on c3 continue to work together. Alekhine converted the advantage smoothly.

What this game teaches about coordination:

- Pieces coordinating toward the same target (the kingside) create unstoppable threats
- Rook lifts (swinging a rook from a file to a rank) are a key coordination technique
- Even after queens come off the board, piece coordination wins games
- A bishop, two rooks, and a plan can defeat any position

42.10.4 Game 38: Karpov vs Unzicker, Nice Olympiad 1974

Theme: The Positional Squeeze

Anatoly Karpov was the master of the squeeze. He would restrict his opponent's pieces one by one until they had no useful moves. Then, with the opponent paralyzed, Karpov would strike. This game is the textbook example. Every piece Karpov moves improves its activity. Every move Unzicker makes reduces his.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nf3 b6 4.e3 Bb7 5.Bd3 Be7 6.O-O O-O 7.Nc3 d5 8.cxd5 exd5

A Queen's Indian structure. The position is symmetrical and balanced. But Karpov understands that in symmetrical positions, the player who achieves greater piece activity wins.

9.b3 Nbd7 10.Bb2 c5 11.Qe2 Re8 12.Rac1 Rc8 13.Rfd1 Qb8

Both sides develop logically. But notice how Karpov's pieces have slightly better coordination: rooks on c1 and d1 control the central files, the bishop pair (d3 and b2) cover both colors, and the queen supports everything from e2.

14.dxc5 bxc5 15.Qf5!

A brilliant queen move. The queen jumps to f5 where it targets d7, d5, and the kingside. Black's queen on b8 is far from the action, defending nothing important.

15...g6 16.Qf4 Qxf4 17.exf4

Karpov trades queens but emerges with a superior pawn structure and better piece activity. The f4 pawn controls e5, and White's rooks own the central files.

17...Nh5 18.g3 Nhf6 19.Ne5 Nxe5 20.fxe5 Nd7

White's pawn on e5 cramps Black's entire position. The knight on d7 is passive, the bishop on b7 bites on the d5 pawn (its own pawn!), and the rooks have no open files.

21.f4 f6 22.Bc3

Karpov redirects the bishop. Every move improves his position by a fraction. Black has no counterplay.

22...fxe5 23.fxe5 Nf8 24.Bg2 Bc6 25.Nb5!

The knight leaps to b5, threatening Nd6. The coordination is complete: the knight aims at d6, the bishops control the long diagonals, and the rooks dominate the center.

25...Bxb5 26.Bxd5+ Kh8 27.Rd2 Rcd8 28.Be4 Rxd2 29.Bxd2 a5 30.Bc3 Rd8 31.Bxg6 1-0

The final blow. The bishop captures on g6, exploiting the weakened kingside. Black's position collapses. Karpov never played a loud move. He simply improved, improved, improved, and then struck when the opponent had nothing left.

What this game teaches about piece activity:

- In symmetrical positions, the player with better coordination wins
- Improving your worst piece is more important than launching an attack

- A positional squeeze means reducing the opponent's activity while increasing your own
- When your opponent's pieces have no good moves, tactics will appear

---

42.10.5 Game 44: Alekhine vs Marshall, New York 1924

Theme: Active Pieces Create Their Own Tactics

Frank Marshall was one of the most dangerous attackers of his era. Alekhine met fire with coordinated precision, demonstrating that organized piece activity beats uncoordinated aggression.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nf3 d5 4.Nc3 Nbd7 5.Bg5 Be7 6.e3 O-O 7.Rc1 c6

A standard Queen's Gambit Declined. Both sides develop normally.

8.Bd3 dxc4 9.Bxc4 Nd5 10.Bxe7 Qxe7 11.O-O Nxc3 12.Rxc3 b6

Black plays solidly. The position is balanced on the surface. But Alekhine has a plan: he will coordinate his pieces around the half-open c-file and the central squares.

13.Qc2 Bb7 14.Rfc1 Rac8 15.Bd3 c5 16.Be4 Bxe4 17.Qxe4 cxd4 18.Nxd4

White stands slightly better. The knight on d4 is centralized, the rooks double on the c-file, and the queen on e4 coordinates with everything. Black's pieces are functional but passive.

18...Qb7 19.Qf3 Nc5 20.Rc4 Na6 21.b4

White gains space on the queenside while maintaining central control. Each move adds a small improvement. The rook on c4 is active on both the c-file and the fourth rank.

21...Rxc4 22.Rxc4 Rc8 23.Rxc8+ Qxc8 24.h3 Nb8 25.Qd3

Even with rooks traded, White's advantage persists. The knight on d4 dominates, the queen is centralized, and the pawns are flexible. Alekhine converted smoothly in the endgame.

What this game teaches:

- Coordinated piece placement creates advantages that survive simplification
- Centralizing the knight and doubling rooks on an open file is a universal plan
- Small improvements compound into large advantages

42.10.6 Game 56: Karpov vs Spassky, Montreal 1979

Theme: Rooks on the Seventh Rank

This game shows the terrifying power of a rook that reaches the seventh rank. Karpov's rook penetrated to the seventh, and Spassky's position disintegrated.

Set up your board.

1.e4 e5 2.Nf3 Nc6 3.Bb5 a6 4.Ba4 Nf6 5.O-O Be7 6.Re1 b5 7.Bb3 O-O 8.c3 d6

The Ruy Lopez, Closed variation. A classical opening battle.

9.h3 Nb8 10.d4 Nbd7 11.Nbd2 Bb7 12.Bc2 Re8 13.Nf1 Bf8 14.Ng3 g6 15.Bg5 Bg7 16.Qd2 h6 17.Bh4 Nh5

Black fights for space and activity, but Karpov's position is coiled and ready to spring.

18.Nxh5 gxh5 19.Bxe7 Rxe7 20.dxe5 dxe5 21.b4 Qf6 22.a4

Karpov opens lines on the queenside. The a-file and b-file will serve as highways for his rooks.

22...Rd8 23.Qe3 bxa4 24.Rxa4 a5 25.Rea1 Bc6 26.R4a3 Nb6 27.Nd2

White repositions, aiming for c4 with the knight and control of the open a-file.

27...axb4 28.cxb4 Re8 29.Nc4 Nxc4 30.Qxc4 Rd2 31.Bb3 Bd7 32.Qc7!

The queen reaches the seventh rank, mirroring what the rooks will do. The pressure is unbearable.

32...Re7 33.Qc3 Red7 34.Ra7 Qd6 35.Rxd7! Rxd7 36.Ra8+ Kh7 37.Qe1

White's rook on a8 dominates the back rank. The queen repositions to join the attack. Karpov won cleanly.

What this game teaches:

- Open files lead to the seventh rank
- A rook or queen on the seventh rank attacks everything from behind
- Opening queenside files with pawn advances is a standard technique

---

42.10.7 Game 61: Hou Yifan vs Navara, Wijk aan Zee 2017

Theme: Modern Piece Activity

Hou Yifan, the strongest female player of her era and a four-time Women's World Champion, plays with a style that combines classical piece coordination with modern dynamism. This game demonstrates how active pieces create their own advantages.

Set up your board.

1.e4 c5 2.Nf3 d6 3.d4 cxd4 4.Nxd4 Nf6 5.Nc3 a6 6.Be2 e5 7.Nb3 Be7 8.O-O O-O 9.Be3 Be6

A Najdorf Sicilian. Both sides develop to standard squares. The battle will be about whose pieces find more active posts.

10.Qd2 Nbd7 11.a4 Qc7 12.a5 Rfc8 13.Rfd1 Rab8 14.Bf3 Nc5

Black centralizes the knight. White must decide how to generate activity.

15.Nxc5 dxc5 16.Nd5 Bxd5 17.exd5 Nd7 18.c4

Hou Yifan fixes the pawn structure and secures the d5 pawn as a support point. Her bishop on f3 and rooks can now coordinate along the central files.

18...f5 19.Bg5 Bxg5 20.Qxg5 Nf6 21.b3 Qe7 22.Qd2 e4 23.Be2

White retreats the bishop but maintains a solid grip. The passed d5 pawn ties down Black's pieces, and White's rooks will use the d-file.

23...Rd8 24.Qc3 Nxd5 25.cxd5 Rxd5 26.Rxd5 Qe5 27.Qxe5 1-0

Hou Yifan simplified into a winning endgame. The piece coordination that built pressure on d5 eventually won the pawn and the game.

What this game teaches:

- Passed pawns supported by active pieces create enduring pressure
- Piece activity is gender-neutral and era-neutral: the principles are the same
- Simplification from an active position leads to winning endgames

---

42.10.8 Game 63: Koneru Humpy vs Harika, Kolkata 2015

Theme: Outpost Domination

Koneru Humpy, one of the strongest players in chess history, demonstrates how planting a piece on an outpost can dominate an entire position.

Set up your board.

1.d4 Nf6 2.c4 e6 3.Nf3 d5 4.Nc3 Be7 5.Bf4 O-O 6.e3 c5 7.dxc5 Bxc5 8.Qc2 Nc6 9.a3 Qa5 10.Rd1 Be7

A Queen's Gambit structure. Koneru Humpy builds a position aimed at the d5 square.

11.Be2 dxc4 12.Bxc4 Nh5 13.Bg3 Nxg3 14.hxg3 Bd7 15.O-O

White has a clean position with a powerful bishop on c4 and the d-file under control. The d5 square beckons as a potential outpost.

15...Rad8 16.e4 Be8 17.e5 f5

Black pushes ...f5 to control e4, but this creates a hole on e6 and weakens the d5 square permanently. Now no black pawn can ever contest d5.

18.Nd5!

The knight lands on the outpost. From d5, it controls b4, b6, c3, c7, e3, e7, f4, and f6. It cannot be removed by any pawn. This knight is worth nearly as much as a rook.

18...exd5 19.Bxd5+ Kh8 20.Bxc6 Bxc6 21.Rxd8 Rxd8 22.Qxc6 Qxa3

White has exchanged the outpost knight for structural gains: Black's pawn structure is ruined, and White's queen and pieces dominate.

23.Qxb7 Qxb2 24.Qxa7 Qc2 25.Rd1 Rxd1+ 26.Qxd1

White is a pawn up with an active queen. The conversion was straightforward.

What this game teaches:

- An outpost knight on d5 can dominate an entire position
- Forcing the opponent to capture your outpost piece often creates other advantages
- Women's chess at the highest level demonstrates the same principles as all great chess

---

All eight games complete. You have seen piece activity and coordination through the eyes of seven different champions spanning a century of chess. When you are ready, the exercises await.

42.11 Part 10: Exercises

How to use these exercises: Attempt each exercise on your physical board before reading the hints. If you get stuck, read Hint 1. Still stuck? Read Hint 2. Only after trying all three hints should you read the solution. There is no shame in using hints. That is what they are for.

Pacing: Do five exercises per session. That is eight sessions to complete all 40. A sustainable pace.

42.11.1 Section A: Identify Active and Passive Pieces (Exercises 14.1 - 14.10)

For each position, identify the most active piece and the most passive piece on the board.

Exercise 14.1

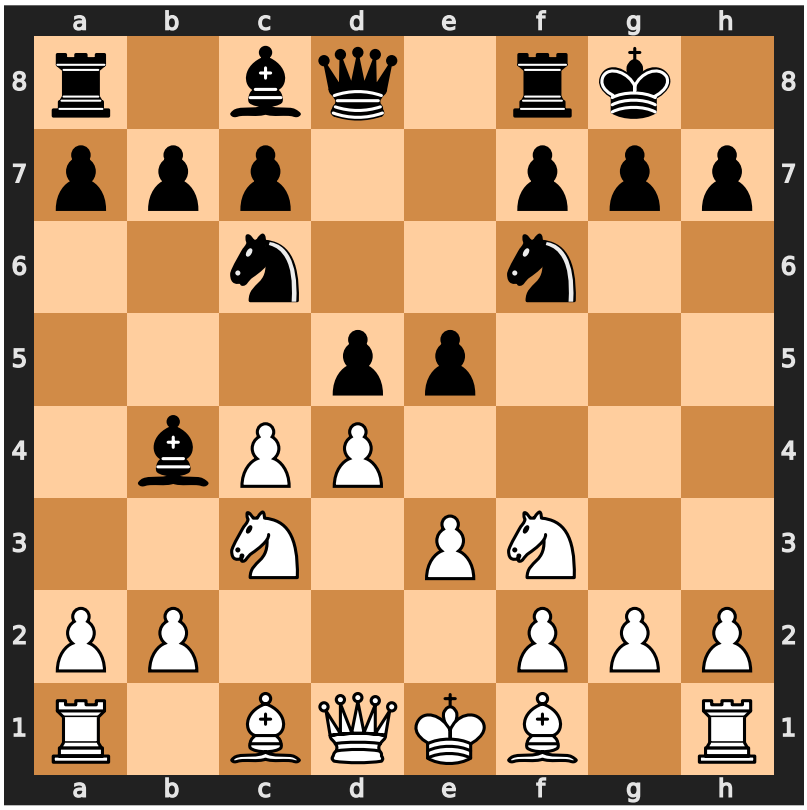

Figure 42.7: Chess Position

White to move. Identify White's most passive piece.

Hint 1: Look at each white piece. Which one has the fewest available squares? *Hint 2:* The bishop

on c1 is blocked by the pawn on e3. *Hint 3:* Compare the c1 bishop to the knight on f3, which controls central squares.

Solution: White's most passive piece is the **bishop on c1**. It is blocked by the pawn on e3 and has no good diagonal available. White should prioritize developing this bishop, perhaps to b2 (after a3 and b3) or to d2 and then to e1-h4. The knight on c3 and knight on f3 are both active on central squares. Improving the worst piece (Bc1) is White's most important task.

Exercise 14.2

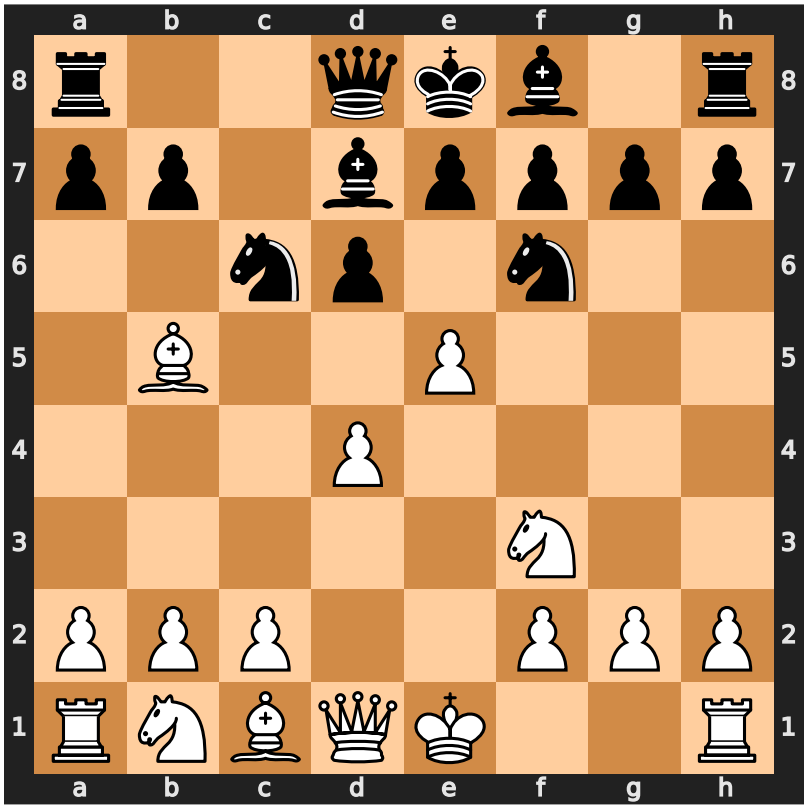

Figure 42.8: Chess Position

White to move. Identify Black's most passive piece.

Hint 1: Check each black piece's mobility and purpose. *Hint 2:* The bishop on d7 is developed but has limited scope. *Hint 3:* Compare it to the knight on f6, which controls central squares.

Solution: Black's most passive piece is the **bishop on f8**. It is still undeveloped and blocked by its own pawns. The bishop on d7 is at least on a useful diagonal, and the knights are on active squares. Black needs to find a way to develop the dark-squared bishop, perhaps with …Be7 or …g6 and …Bg7.

Exercise 14.3

White to move. Identify White's most active piece.

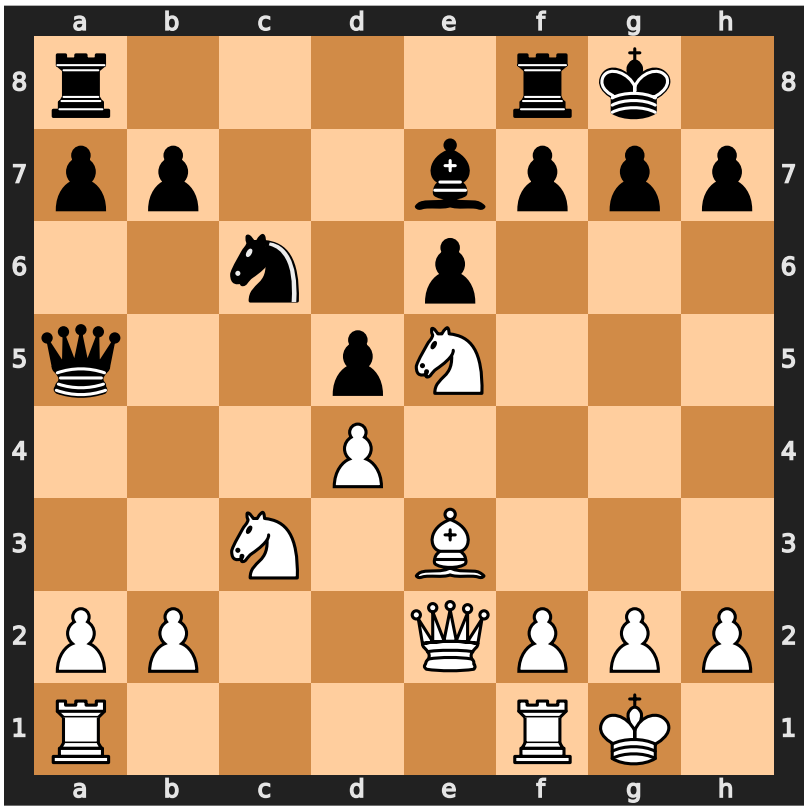

Figure 42.9: Chess Position

Hint 1: Which piece controls the most important squares? *Hint 2:* The knight on e5 sits in the center. Count the squares it controls. *Hint 3:* Compare the e5 knight to the other pieces.

Solution: White's most active piece is the **knight on e5**. It controls c4, c6, d3, d7, f3, f7, g4, and g6. It sits on a central outpost and cannot be challenged by a pawn. It attacks Black's position from the heart of the board. The bishop on e3 and queen on e2 are supportive but less dominant.

Exercise 14.4

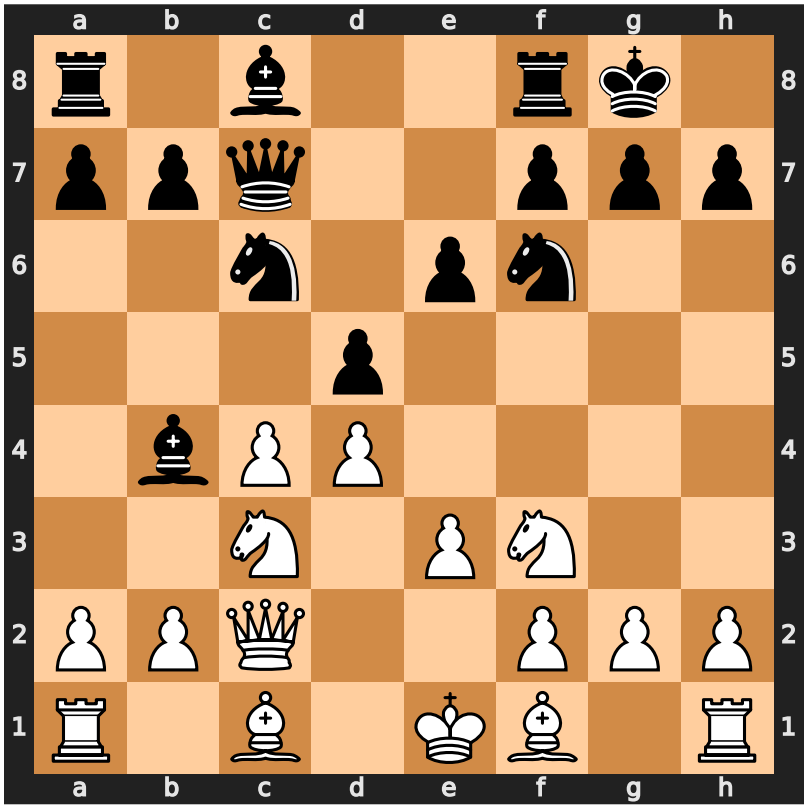

Figure 42.10: Chess Position

White to move. Which side has better piece coordination and why?

Hint 1: Count how many pieces are developed for each side. *Hint 2:* Look at Black's pieces: knight on c6, knight on f6, bishop on b4, queen on c7. All active and pointing at White's center. *Hint 3:* Look at White's pieces: Bc1 is undeveloped, Bf1 is undeveloped, the king has not castled.

Solution: Black has better piece coordination. Black has four pieces developed (two knights, a bishop, and the queen), all aimed at White's center. White has two knights out but both bishops are still on their starting squares, and the king has not castled. White's most urgent task is to develop (Bd3, O-O) before Black's coordination translates into a concrete advantage.

Exercise 14.5

White to move. Evaluate the activity of all four bishops.

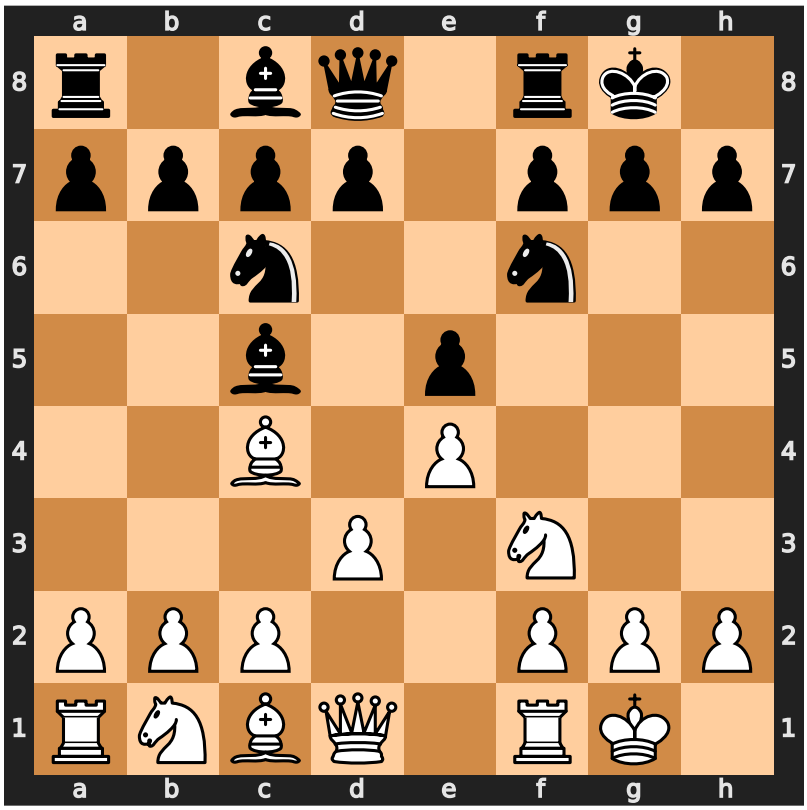

Figure 42.11: Chess Position

Hint 1: Start with White's bishops. Where do they point? *Hint 2:* The c4 bishop eyes f7 (a sensitive square near Black's king). The c1 bishop is still at home. *Hint 3:* Black's c5 bishop has an active diagonal. Black's c8 bishop is undeveloped.

Solution: **Bc4** is very active, aiming at f7 and controlling the center. **Bc1** is passive, still undeveloped and blocked by the d3 pawn. **Bc5** is active, placed on a strong diagonal putting pressure on f2 and d4. **Bc8** is passive, still at home with no open diagonal. Both sides have one "good" and one "bad" bishop. The first player to activate their passive bishop will gain an edge.

Exercise 14.6

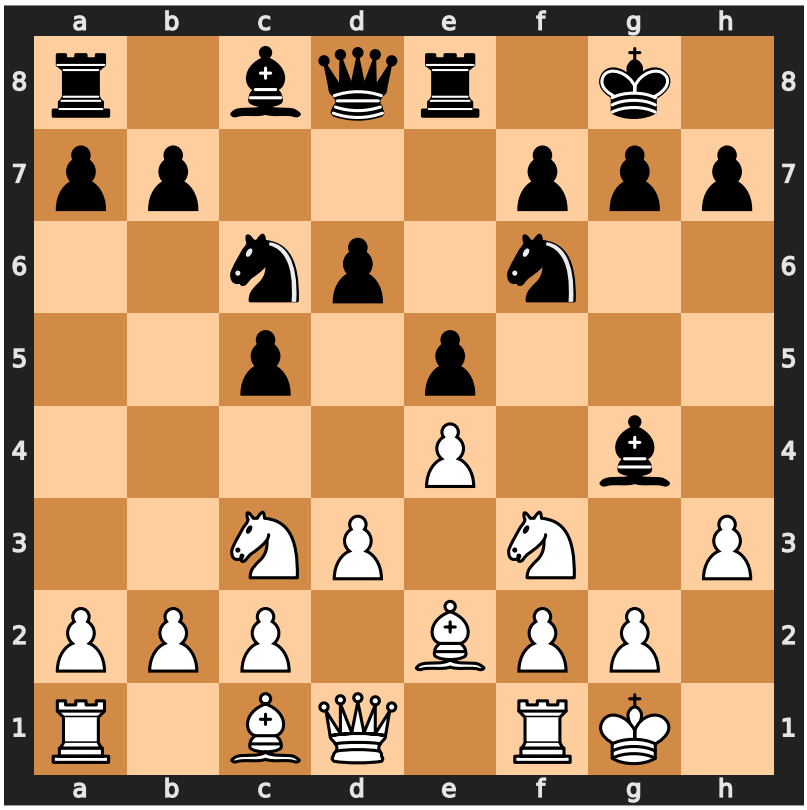

Figure 42.12: Chess Position

White to move. Is Black's bishop on g4 active or passive?

Hint 1: The bishop on g4 pins the knight on f3 against the queen on d1. *Hint 2:* A pin is a form of activity. The bishop is creating a concrete threat. *Hint 3:* But what happens after h3 and Black must decide where to put the bishop?

Solution: The bishop on g4 is **currently active** because it pins the f3 knight, creating a real problem for White. White has played h3 to challenge it. Now Black must decide: retreat with …Bh5 (keeping the pin but allowing g4), trade with …Bxf3 (giving up the bishop pair), or retreat to …Be6 (losing the pin). Active does not mean permanent. The bishop is active NOW, but White's h3 forces a decision.

Exercise 14.7

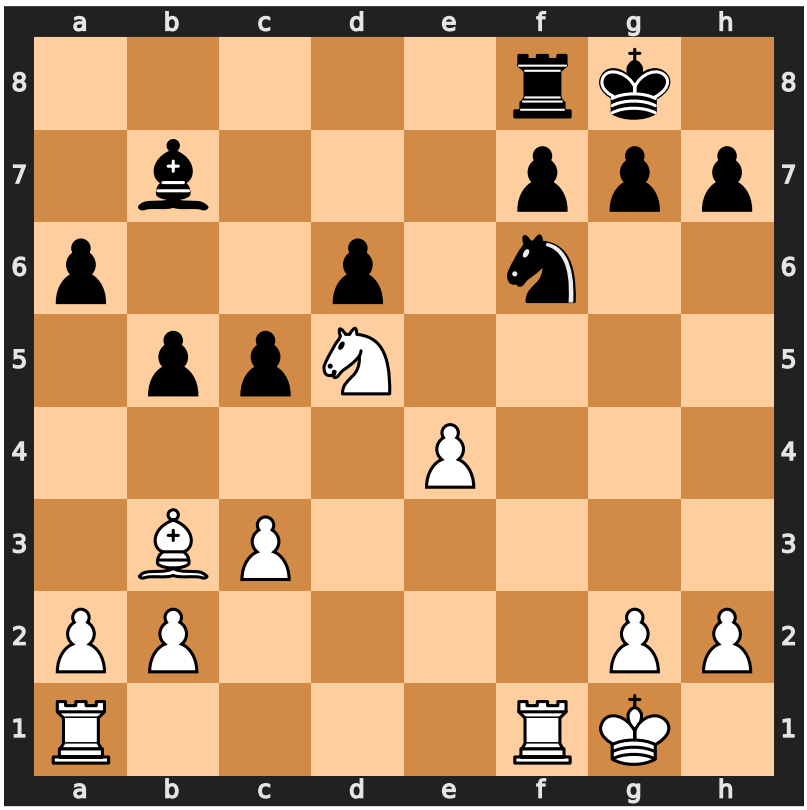

Figure 42.13: Chess Position

White to move. How active is White's knight on d5?

Hint 1: Can any pawn drive the knight from d5? *Hint 2:* Count the squares the knight controls. *Hint 3:* What targets does it threaten?

Solution: The knight on d5 is **supremely active.** It occupies a perfect outpost: no black pawn can challenge it (the c-pawn is on c5, and the e-pawn is gone). It controls b4, b6, c3, c7, e3, e7, f4, and f6. It threatens to jump into c7 (forking rook and king ideas) or e7+ (a check). Meanwhile, Black's knight on f6 is solid but cannot match the d5 knight's dominance. This is a textbook outpost.

Exercise 14.8

White to move. How do White's minor pieces compare to Black's?

Hint 1: Compare centralization. White has pieces on c4, e3, e4, f3. Black has pieces on c6, e7, f6. *Hint 2:* Which pieces control more space? *Hint 3:* Do White's pieces coordinate better?

Solution: White's minor pieces are **significantly more active**. The knight on e4 dominates the center, the bishop on c4 aims at f7, the bishop on e3 supports d4 and eyes the kingside, and the knight on f3 can jump to g5 or d2. Black's minor pieces are developed but defensive: the knight on c6 is blocked by the d4 pawn, the bishop on e7 is passive, and the knight on f6 is the only active defender. White's pieces all point at Black's kingside. This is coordination.

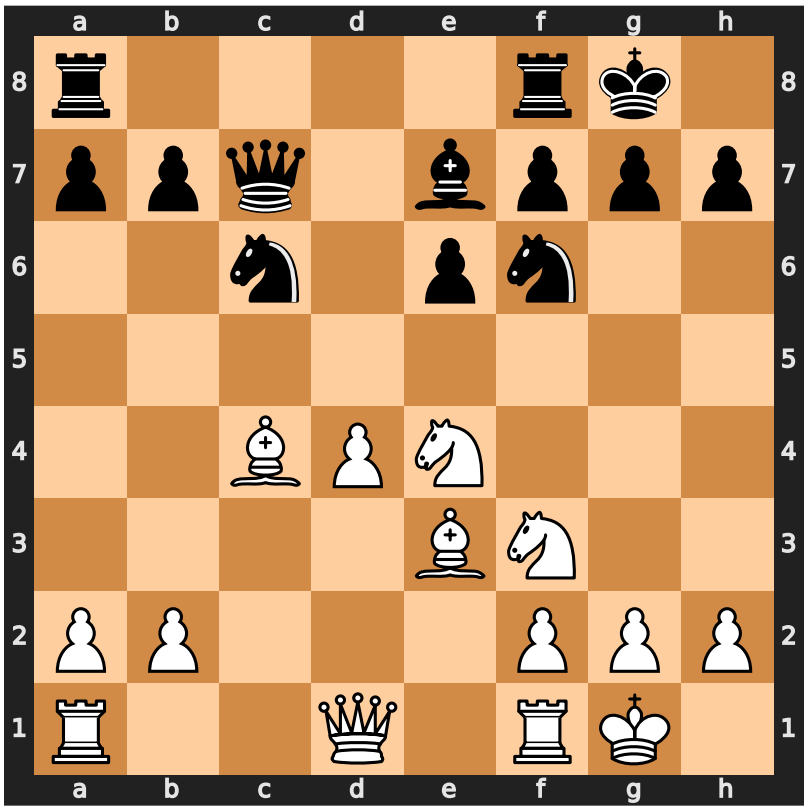

Figure 42.14: Chess Position

Exercise 14.9

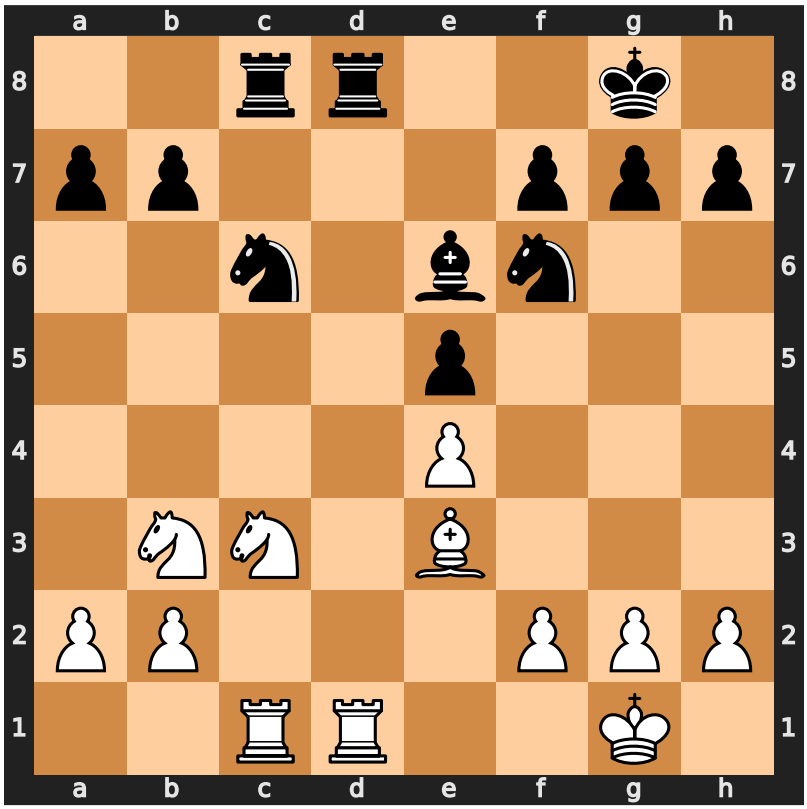

Figure 42.15: Chess Position

White to move. All pieces are developed. Which side's pieces are more active?

Hint 1: Both sides have identical material. Look at piece placement. *Hint 2:* White's knight on b3 is less active than Black's knight on c6. *Hint 3:* Evaluate the bishops: e3 (White) vs e6 (Black).

Solution: The position is roughly **equal in activity.** White has knights on b3 and c3, and a bishop on e3. Black has knights on c6 and f6, and a bishop on e6. Both sides have doubled rooks on the c/d-files. White's c3 knight is slightly better placed than the b3 knight, but Black's pieces are also well-coordinated. The side that improves their least active piece first (White should reroute the b3 knight to d2-f1-e3 or d2-c4) will gain the advantage.

Exercise 14.10

White to move. Evaluate Black's knight on d7. Is it active or passive?

Hint 1: Where can the d7 knight go? *Hint 2:* It can go to b6, c5, e5, or f8. Are any of these squares strong? *Hint 3:* Compare it to Black's knight on f6, which is already on a useful square.

Solution: The knight on d7 is **moderately passive.** It blocks the bishop on c8 and has no immediate strong square. The best destination is c5 or e5, but both require preparation. The f6 knight is more active because it controls d5 and e4. Black's priority should be to move the d7

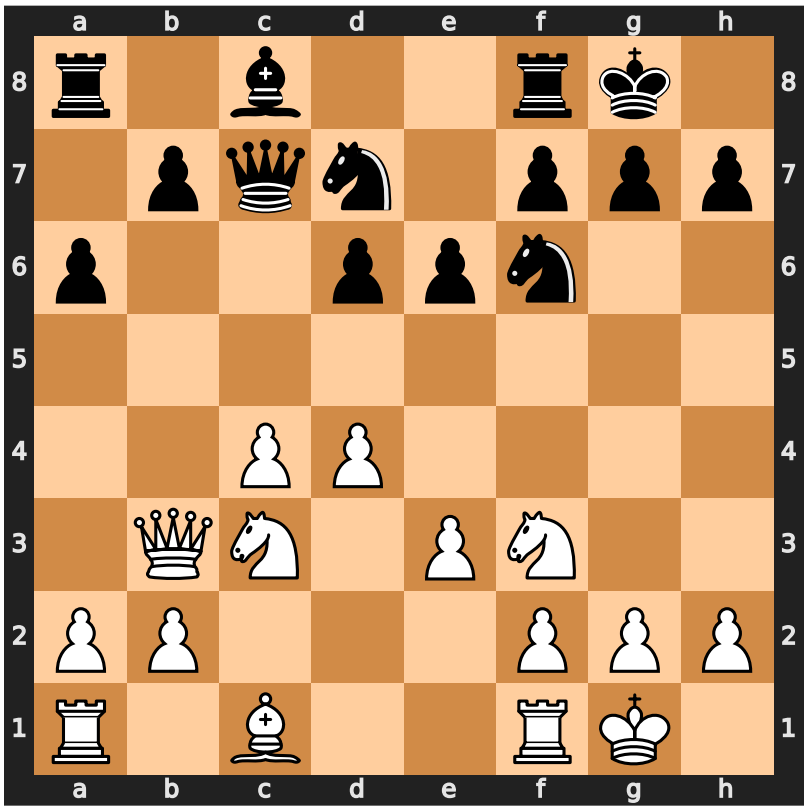

Figure 42.16: Chess Position

knight to c5 (where it attacks d3 and eyes e4) or to b6 (where it pressures c4). The d7 knight is not terrible, but it is clearly Black's worst piece.

Rest here. You have completed the first 10 exercises. Good work.

42.11.2 Section B: Bishop Pair and Knight vs Bishop (Exercises 14.11 - 14.20)

For each position, evaluate the minor piece battle and recommend a plan.

Exercise 14.11

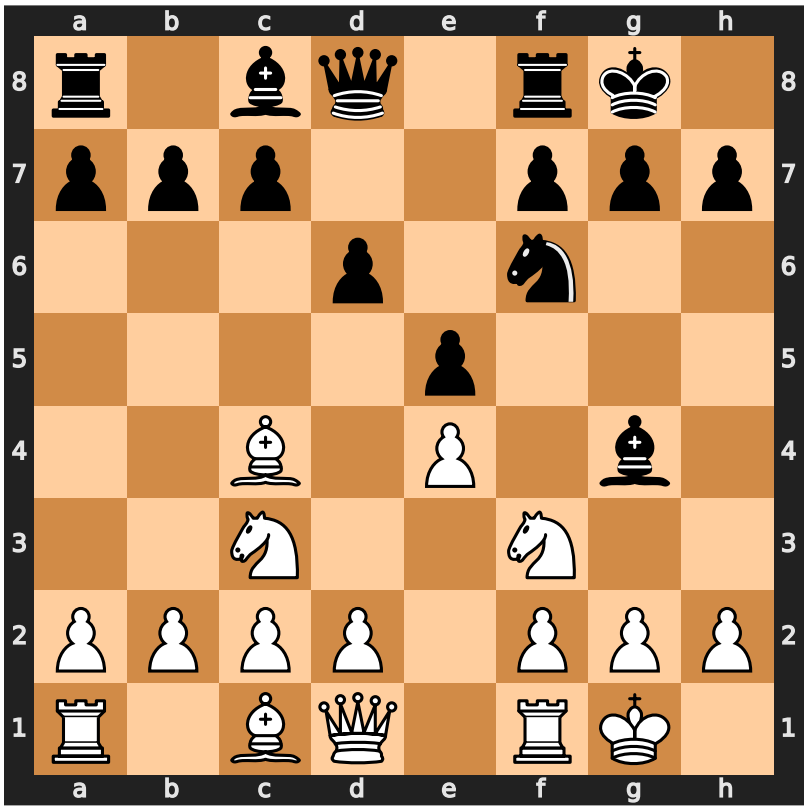

Figure 42.17: Chess Position

White to move. White has the bishop pair. How should White exploit it?

Hint 1: White has bishops on c4 and c1. Black has a bishop on g4 and a knight on f6. *Hint 2:* To make the bishop pair strong, White needs open lines. *Hint 3:* Consider d3-d4 to open the center.

Solution: White should play **d2-d4** (or prepare it with d3 first) to open the center. In open positions, the bishop pair dominates. After d4, lines open for both bishops: Bc4 controls the a2-g8 diagonal, and Bc1 can develop to g5 or e3 to target the kingside. Black should try to keep the position closed with …d5 or trade one of the bishops quickly. White's plan: open the position, activate both bishops, and use their long-range power.

Exercise 14.12

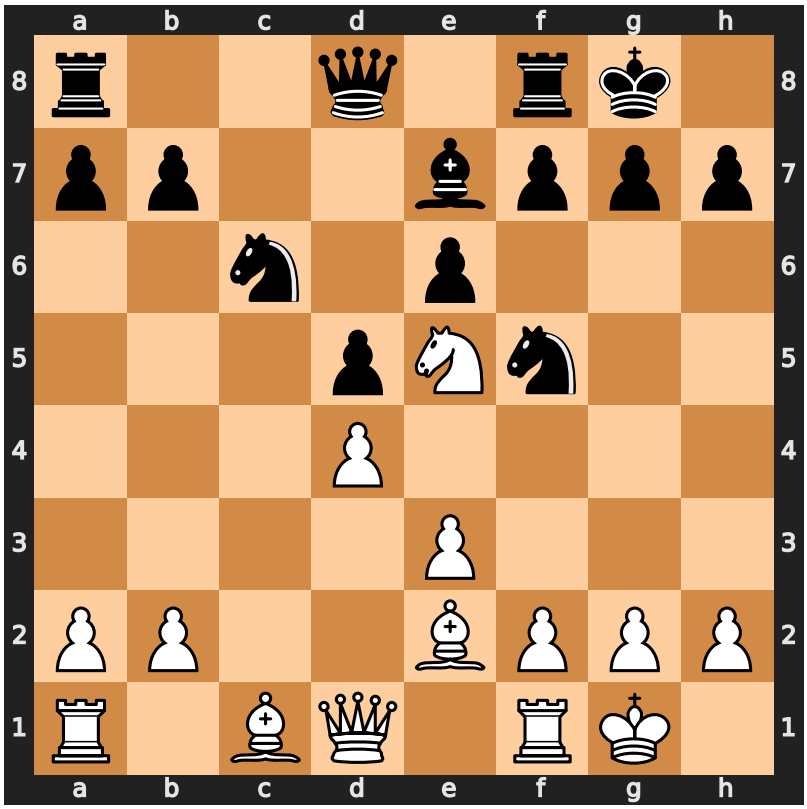

Figure 42.18: Chess Position

White to move. Black has two knights vs White's two bishops. Who stands better?

Hint 1: Look at the pawn structure. Is the position open or closed? *Hint 2:* Black's pawns on d5 and e6 create a semi-closed center. *Hint 3:* The knights on c6 and f5 are both well-placed. Do they have outposts?

Solution: The position is **roughly equal.** The center is semi-closed, which favors the knights. The knight on f5 has a beautiful outpost (guarded by nothing, attacking d4, e3, g3, h4). The knight on c6 pressures d4 and e5. White's bishops are on e2 (passive, not yet aimed at a target) and c1 (undeveloped). If White can open the position with e4 or f3+e4, the bishops will come alive. If Black can maintain the closed structure, the knights dominate. This is a dynamic balance where both sides must fight for the position type they prefer.

Exercise 14.13

White to move. Is Black's bishop on d6 good or bad?

Hint 1: What color squares are Black's pawns on? *Hint 2:* Black has pawns on d5 and e6 (light squares). The bishop on d6 is on a dark square. *Hint 3:* Does the d6 bishop have an open diagonal?

Solution: Black's bishop on d6 is **good.** It sits on a dark square while Black's central pawns (d5,

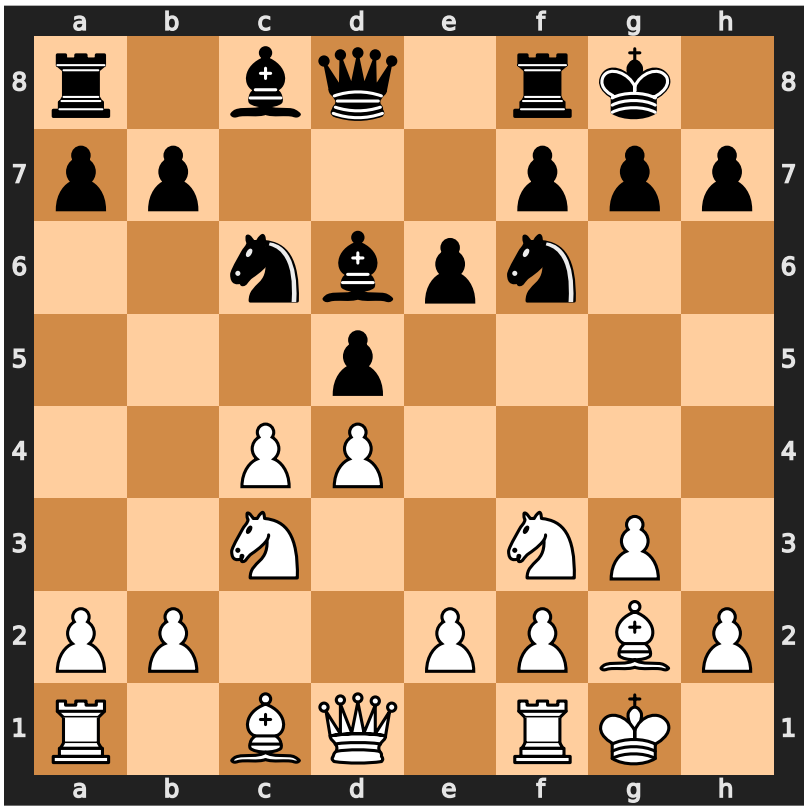

Figure 42.19: Chess Position

e6) are on light squares, meaning they do not block the bishop. The bishop has potential on the b8-h2 diagonal (pointing at White's kingside) and can support …e5 or retreat to e7/c7. The real "bad" bishop in Black's position would be a light-squared bishop stuck behind the d5 and e6 pawns. The d6 bishop is flexible and active.

Exercise 14.14

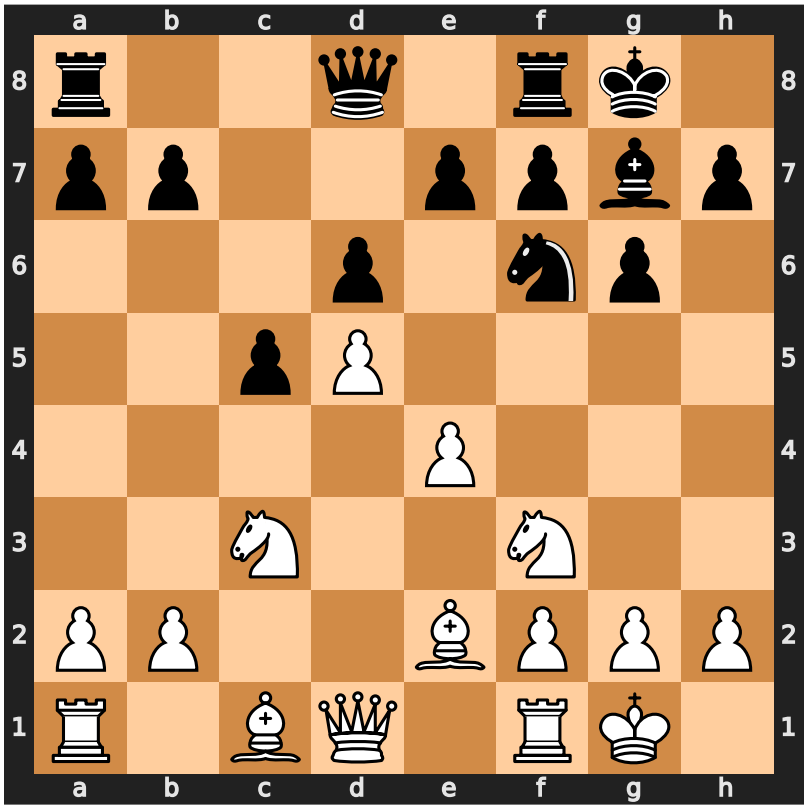

Figure 42.20: Chess Position

White to move. Is White's bishop on e2 good or bad? How can White improve it?

Hint 1: White's pawns on d5 and e4 are on dark and light squares respectively. *Hint 2:* The bishop on e2 is blocked by the e4 pawn. *Hint 3:* Can the bishop reroute to a better diagonal?

Solution: White's bishop on e2 is **passive.** The e4 pawn blocks its best diagonal, and it does not have an immediate target. White should improve it by playing **Bf1-d3** (aiming at the kingside via the b1-h7 diagonal) or **Bc4** (if the e4 pawn advances). Another plan is **Be2-f1-h3**, targeting the e6 square. The key insight: do not accept a passive bishop. Find a way to reroute it, even if it takes two or three moves.

Exercise 14.15

White to move. Black has a "bad" light-squared bishop stuck behind the pawn chain. What is White's strategic plan?

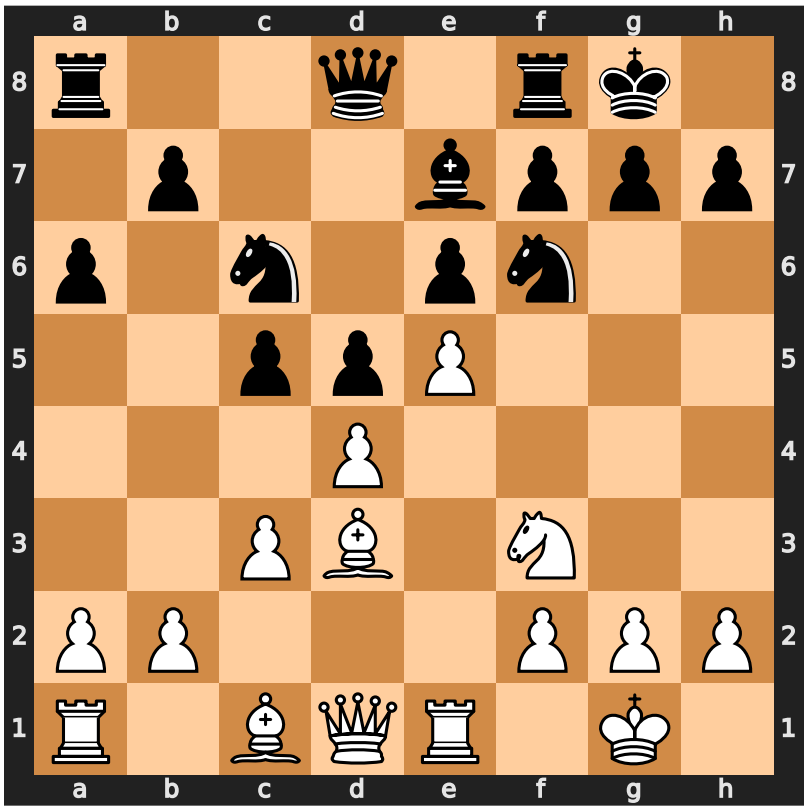

Figure 42.21: Chess Position

Hint 1: Black's pawns are on c5, d5, e6 (light squares). The light-squared bishop is on c8 (behind the chain). *Hint 2:* White's bishop on d3 has a great diagonal (d3-h7). *Hint 3:* White should maintain the pawn chain to keep Black's bishop passive.

Solution: White's plan is to **maintain the e5 pawn and exploit the bad bishop.** As long as the pawn chain (e5, d4, c3) stays intact, Black's light-squared bishop on c8 is stuck behind the e6 and d5 pawns. White should build a kingside attack using the bishop on d3 (aimed at h7), maneuver a knight to f4 or g5, and use the space advantage. Black will try to free the bishop with …b6 and …Ba6, or play …f6 to break the chain. White should prevent both.

Exercise 14.16

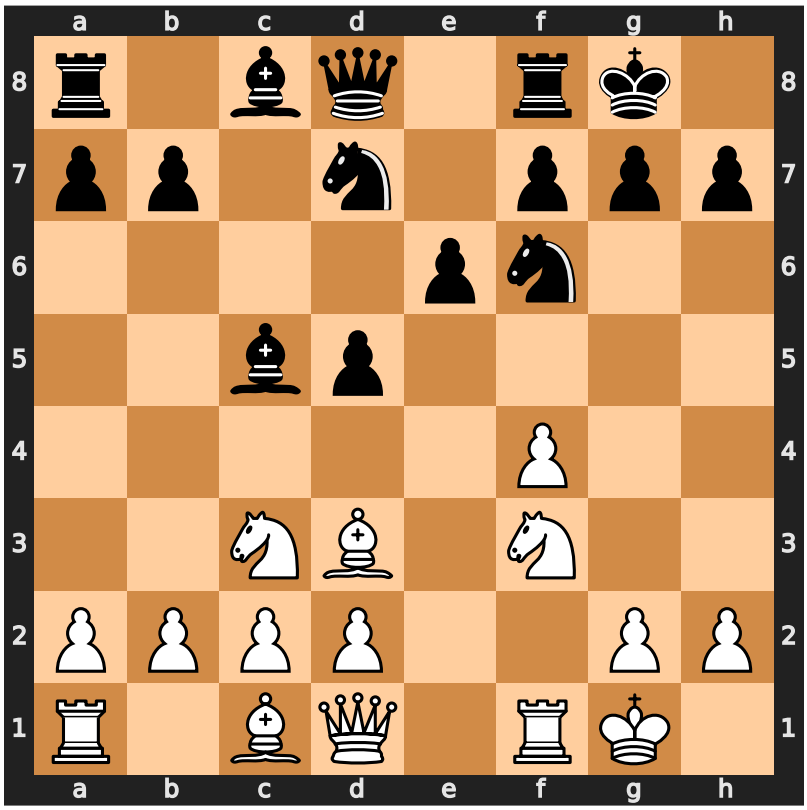

Figure 42.22: Chess Position

White to move. Both sides have a bishop and a knight. Evaluate the minor pieces.

Hint 1: White has a bishop on d3 and knight on c3. Black has a bishop on c5 and knight on d7. *Hint 2:* Which bishop has a better diagonal? *Hint 3:* Which knight has a better outpost available?

Solution: White's bishop on d3 is slightly better because it aims at the kingside (h7 diagonal) and supports the f4 pawn. Black's bishop on c5 is active, targeting f2, but is also exposed to attack (d4 push could challenge it). White's knight on c3 can jump to e4 or e2-g3. Black's knight on d7 is passive and needs to find a better square (e.g., …Nc5 or …Nf6). The minor piece battle is close, but White has a small edge in activity.

Exercise 14.17

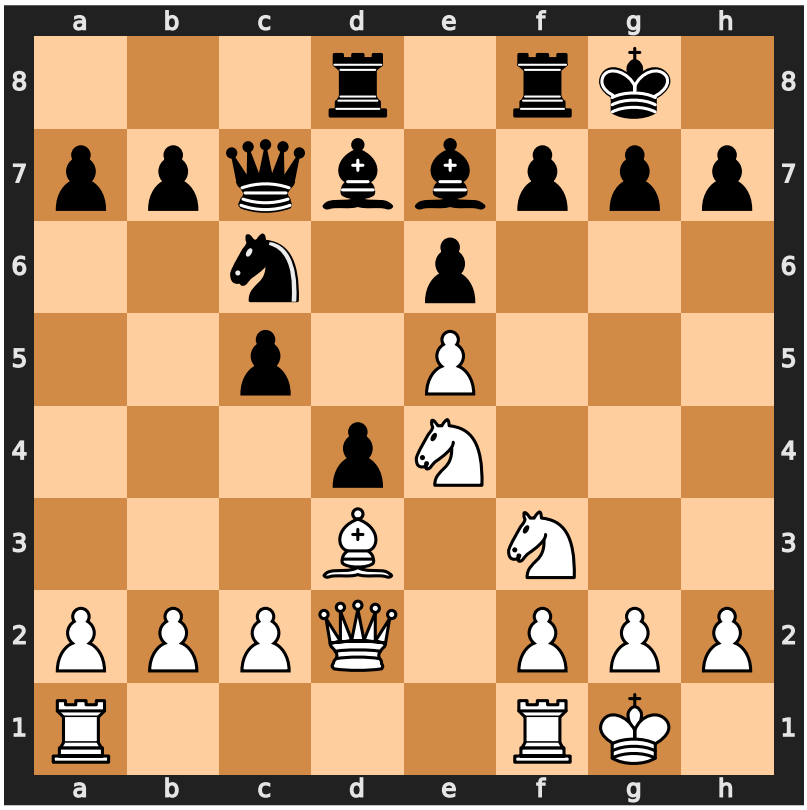

Figure 42.23: Chess Position

White to move. White has a knight on e4 and a bishop on d3. Where should the knight go?

Hint 1: The knight on e4 is well-placed but could be even better. *Hint 2:* Can it reach d6? What would it control from there? *Hint 3:* Nd6 would be an outpost (if no black pawn on e7 can advance past the e5 pawn to challenge it).

Solution: The knight should go to **d6.** After Nd6, the knight sits on an ideal outpost: the e5 pawn prevents …e5 to challenge it, and no c-pawn can reach d6 either. From d6, it controls b5, b7, c4, c8, e4, e8, f5, and f7. It attacks Black's queen on c7 and the bishop on b7 simultaneously. Combined with the bishop on d3, this creates powerful coordination. The knight on d6 would be the dominant piece on the board.

Exercise 14.18

White to move. Black has a centralized knight on d5. How should White respond?

Hint 1: The d5 knight is powerful. Should White trade it or challenge it? *Hint 2:* Nxd5 removes the strong knight. But what does Black get in return? *Hint 3:* After Nxd5 Bxd5 (or …exd5), evaluate the resulting position.

Solution: White should trade: **Nxd5 Bxd5 (or ...exd5).** After Nxd5 Bxd5 Bxd5, White has traded the powerful knight and now has the bishop pair in a position that can open up. After

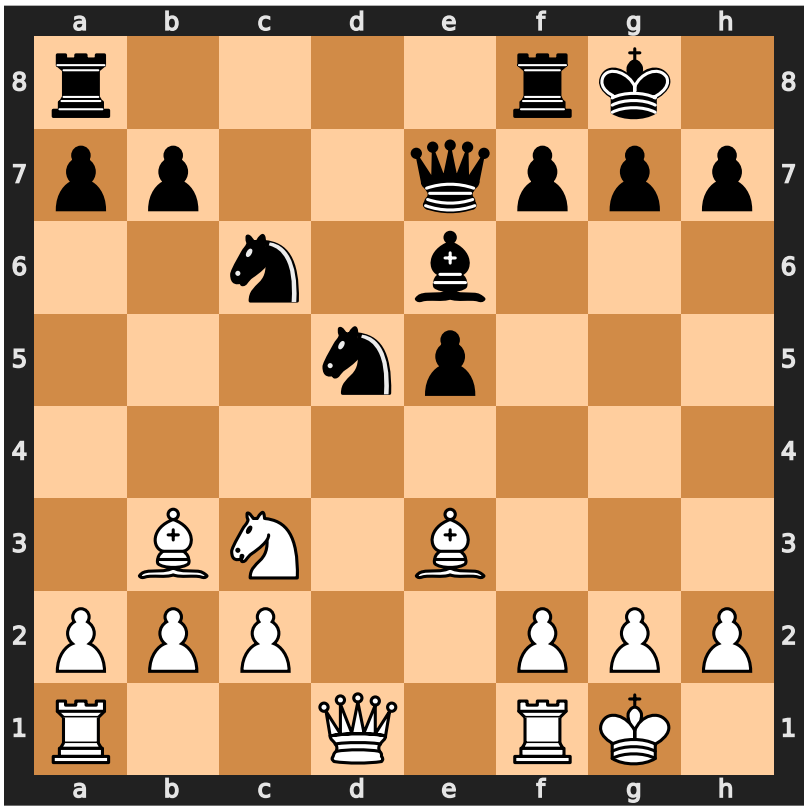

Figure 42.24: Chess Position

Nxd5 exd5, Black gets an isolated pawn on d5, which White can target. In both cases, removing the dominant knight improves White's position. The lesson: when your opponent has a powerful piece on an outpost, trading it is often the simplest and best solution.

Exercise 14.19

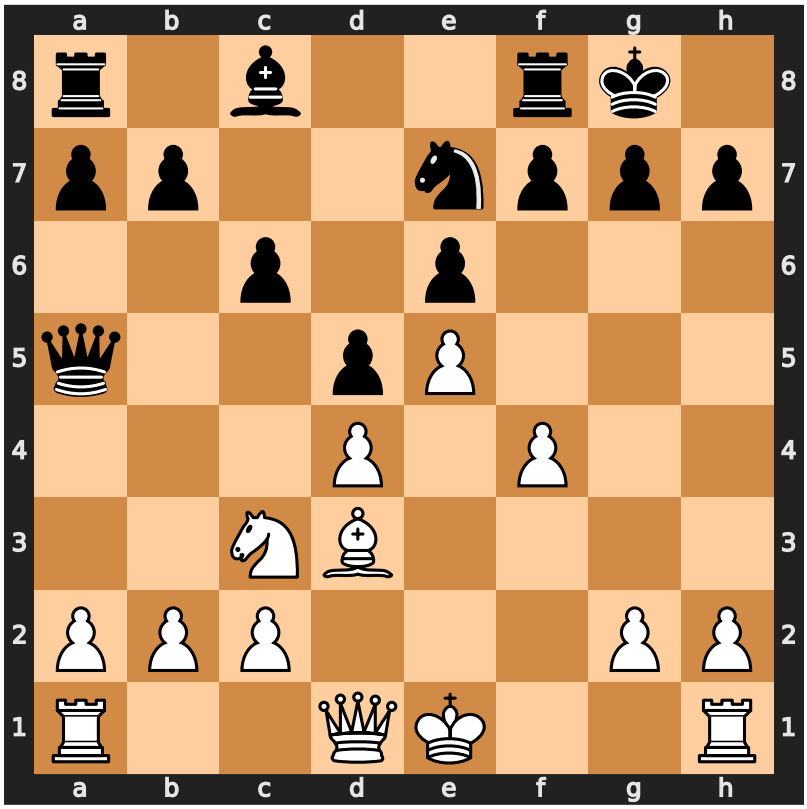

Figure 42.25: Chess Position

White to move. Black has a "bad" bishop on c8 and a knight on e7 that wants to reach f5. What should White do?

Hint 1: Black's knight aims for f5. Should White prevent it or allow it? *Hint 2:* If the knight reaches f5, it will attack d4 and e3. This is dangerous. *Hint 3:* Consider g2-g4 to prevent …Nf5.

Solution: White should play **g2-g4!** to prevent …Nf5. This is a pawn move that weakens the kingside slightly but eliminates Black's best piece improvement plan. Without access to f5, the knight on e7 remains passive. Meanwhile, Black's bishop on c8 stays locked behind the e6/d5 pawn chain. White can continue building with Qf3, O-O (or keep the king in the center in some lines), and prepare a kingside expansion with f5. Preventing the opponent's best piece from reaching its ideal square is a key strategic skill.

Exercise 14.20

White to move. Evaluate the position and recommend whether White should trade dark-squared bishops.

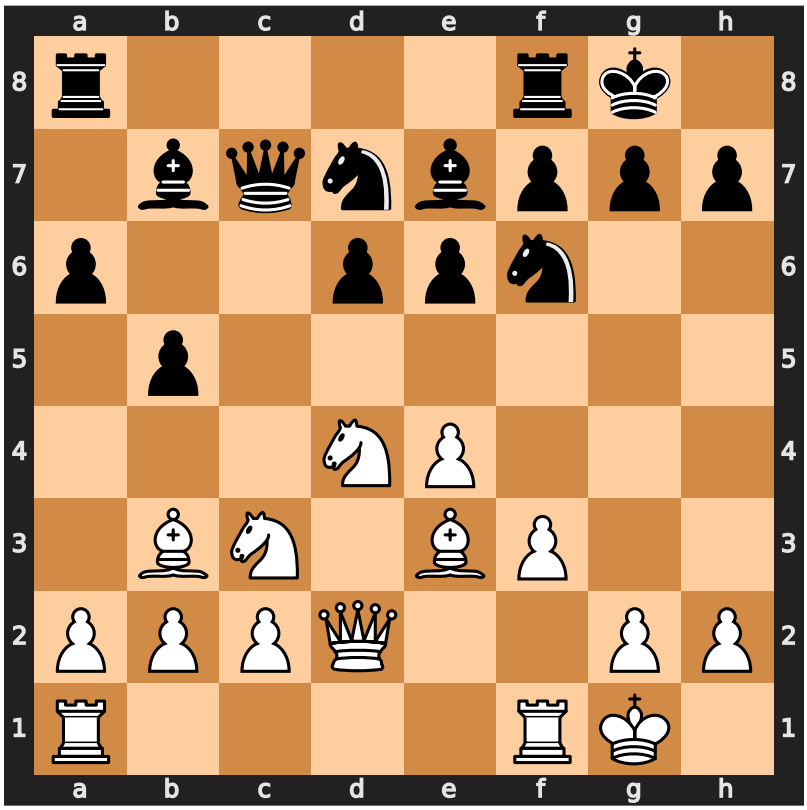

Figure 42.26: Chess Position

Hint 1: White's bishop on e3 and Black's bishop on e7 are the dark-squared pair. *Hint 2:* If White trades them (Bg5, Bxf6 or Be3-d4), what changes? *Hint 3:* Who benefits from the trade?

Solution: White should **not trade dark-squared bishops** here. White's bishop on e3 supports the d4 knight and the kingside. Black's bishop on e7 is passive, doing little from its current square. Trading White's active bishop for Black's passive one is a bad deal. Instead, White should keep Be3 and use it as part of a kingside buildup with f4 and Qf2. If Black's bishop becomes more active later, then the trade might become desirable. The rule: trade your BAD pieces for their GOOD pieces, not the other way around.

Rest here. Twenty exercises done. You are halfway through.

42.11.3 Section C: Rook Activity and Queen Play (Exercises 14.21 - 14.30)

For each position, find the best way to activate the rooks or the queen.

Exercise 14.21

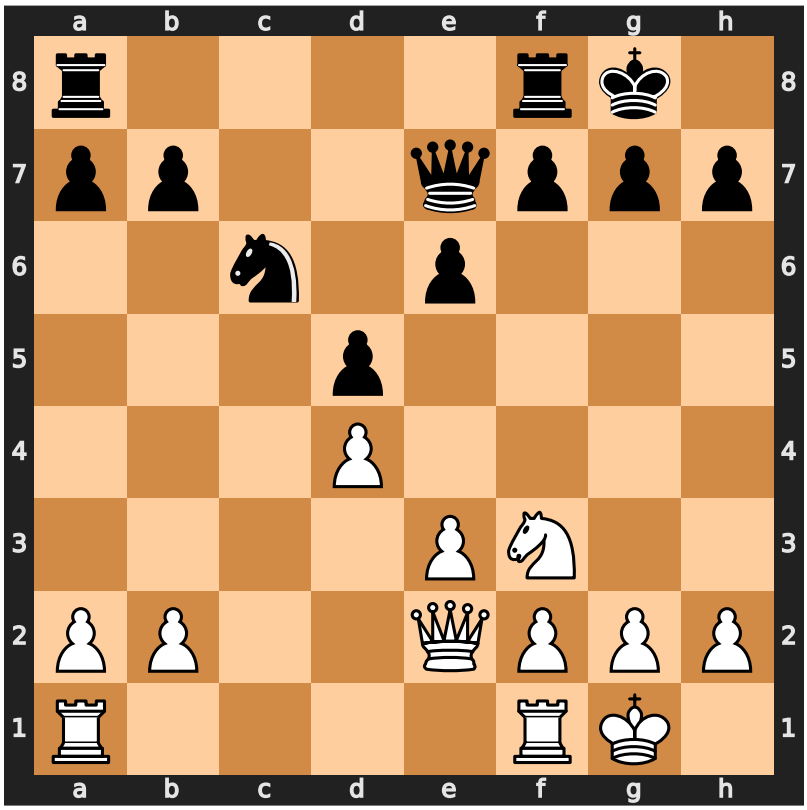

Figure 42.27: Chess Position

White to move. Both sides have undeveloped rooks. Find the best rook placement.

Hint 1: Which files are open or half-open? *Hint 2:* The c-file is open and the e-file has tension. Where should the rooks go? *Hint 3:* Rac1 and Rfe1 are natural. But which one first?

Solution: White should play **Rac1** first, targeting the open c-file. The c-file is fully open and offers immediate pressure on c6 (where Black's knight sits) and potential infiltration to c7. After Rac1, White follows with **Rfe1** or keeps the f-rook for potential kingside play. The e-file is half-open and less immediately useful. Always prioritize the most open file for your rooks. The rook on c1 is immediately active; a rook on e1 would need more preparation to become useful.

Exercise 14.22

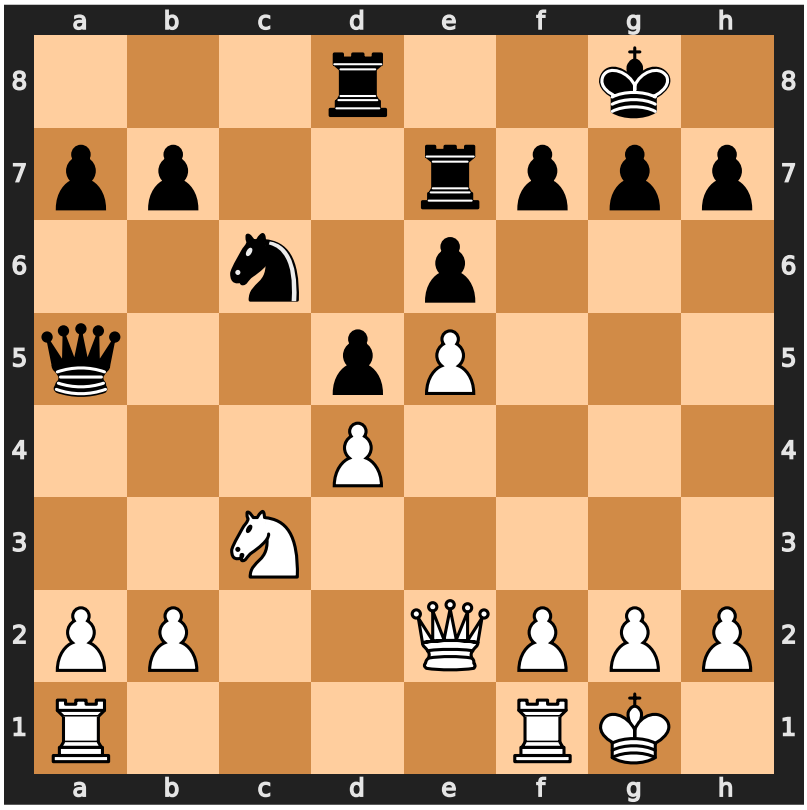

Figure 42.28: Chess Position

White to move. Black's rooks control the d-file and e-file. How does White contest?

Hint 1: White needs to fight for the open files. *Hint 2:* Rac1 fights for the c-file (which is not controlled by Black). *Hint 3:* Can White use a rook on f1 for a kingside plan?

Solution: White should play **Rac1**, opening a new front on the c-file rather than contesting files where Black is already established. Trying to fight for the d-file with Rad1 allows Black to double rooks and maintain control. By seizing the c-file, White creates counter-pressure against c6 and b7. The f1 rook can stay for now, potentially supporting f2-f4 later. The principle: when the opponent controls one file, take a different file rather than fighting over the same one.

Exercise 14.23

White to move. Your rook is on the seventh rank. How do you exploit it?

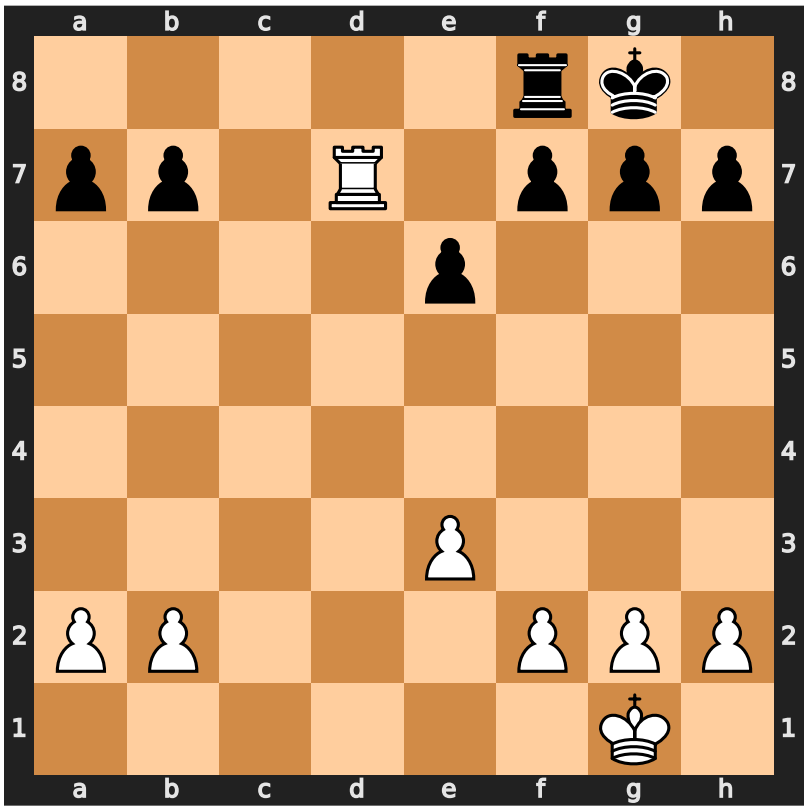

Figure 42.29: Chess Position

Hint 1: The rook on d7 attacks b7 and f7 from behind. *Hint 2:* Can White attack both pawns at once? *Hint 3:* Combine the rook with king activity.

Solution: White should keep the rook on the seventh rank and advance the king: **Kf2-e2-d3-c4.** The rook on d7 ties Black's rook to the defense of b7 or f7. While Black is busy defending, White's king marches forward. Once the king reaches c5 or d5, White can target the weak pawns with both king and rook. The rook on the seventh rank is a "pig" (an old chess term) that gobbles pawns. Do not move it off the seventh unless you have an even better square.

Exercise 14.24

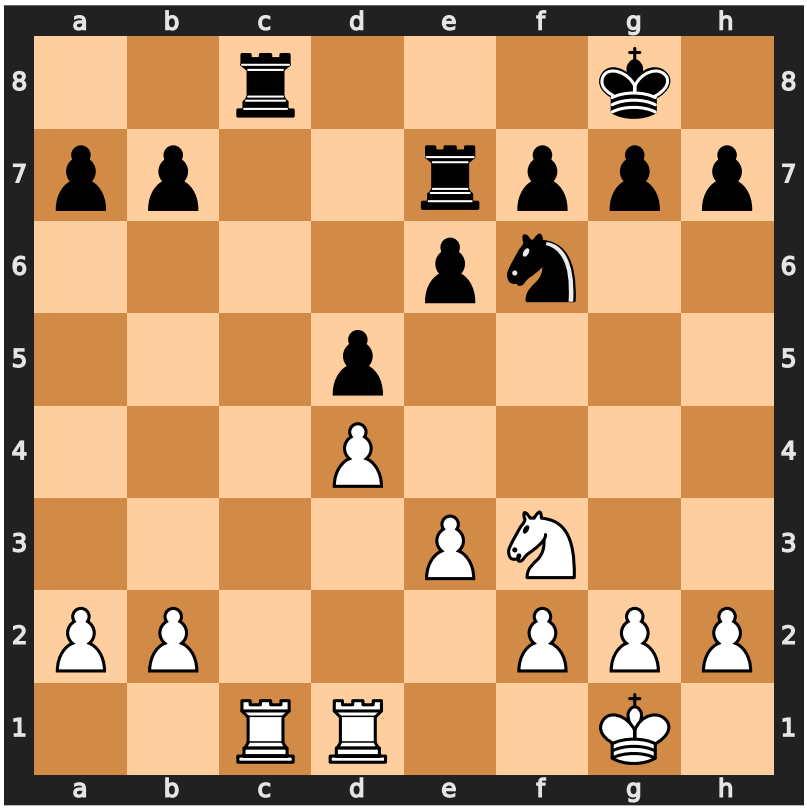

Figure 42.30: Chess Position

White to move. Demonstrate the power of doubled rooks on an open file.

Hint 1: The c-file is open. White has a rook on c1. How to double? *Hint 2:* Rdc1 would double rooks. But is that the best file? *Hint 3:* Consider which file gives White the most penetration points.

Solution: White should play **Rc2 followed by Rdc1**, doubling on the c-file. The doubled rooks aim to invade on c7 (the seventh rank). After Rc7, White's rook attacks b7 and a7 and ties Black to passive defense. Even better: after Rc7, if Black trades rooks (Rxc7 Rxc7), White has a single rook on the seventh rank, which is already a large advantage. Doubling rooks is not just about having two rooks on a file. It is about preparing infiltration.

Exercise 14.25

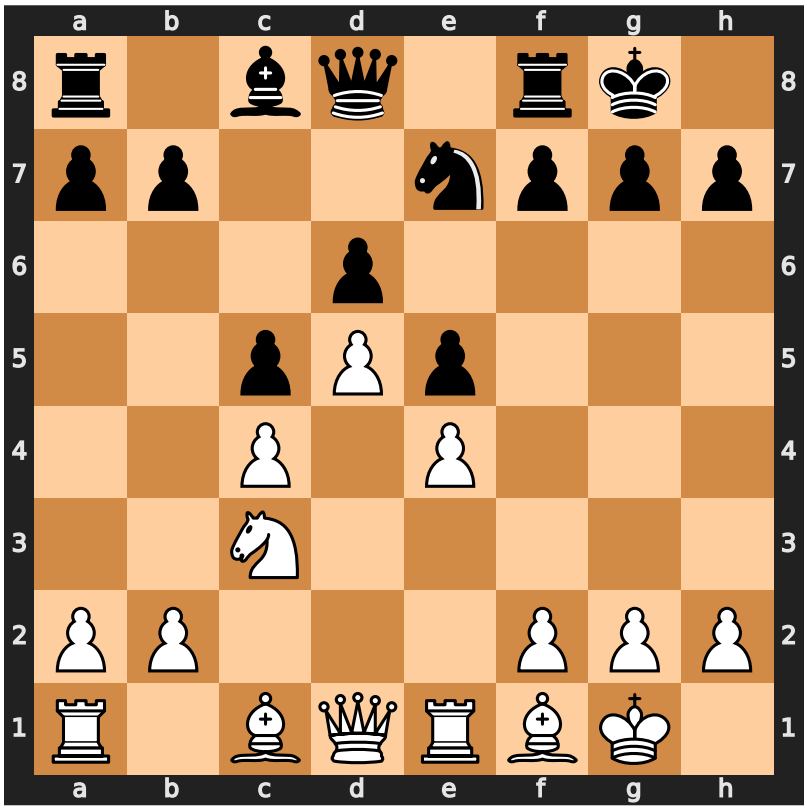

Figure 42.31: Chess Position

White to move. The queen has not moved from d1. Is this a problem?

Hint 1: The queen on d1 is behind the rooks. Is that bad? *Hint 2:* The queen supports the d5 pawn and connects the rooks. *Hint 3:* Would moving the queen to a more active square help right now?

Solution: The queen on d1 is **fine for now.** It connects the rooks, supports the d5 pawn, and is not blocking anything. Moving the queen prematurely (e.g., Qd3 or Qa4) might expose it to tactics. White should complete development first (perhaps Be3 or Bg5) and let the position dictate where the queen belongs. The lesson: the queen does not always need to be "active" in the middlegame. Sometimes the best queen move is no queen move at all.

Exercise 14.26

White to move. Plan a rook lift to bring a rook to the kingside.

Hint 1: A rook lift means moving a rook along a rank to an attacking file. *Hint 2:* Can White play Ra3 and then Rg3 or Rh3? *Hint 3:* After Ra1-a3-g3, the rook joins a kingside attack.

Solution: White should play **Ra3** followed by **Rg3** (or **Rh3**), executing a rook lift. The rook swings from the a-file (where it does nothing) to the g-file or h-file (where it attacks the kingside). Combined with the queen on c2 (which can shift to d3 or f5), the bishop on b2 (eyeing g7), and

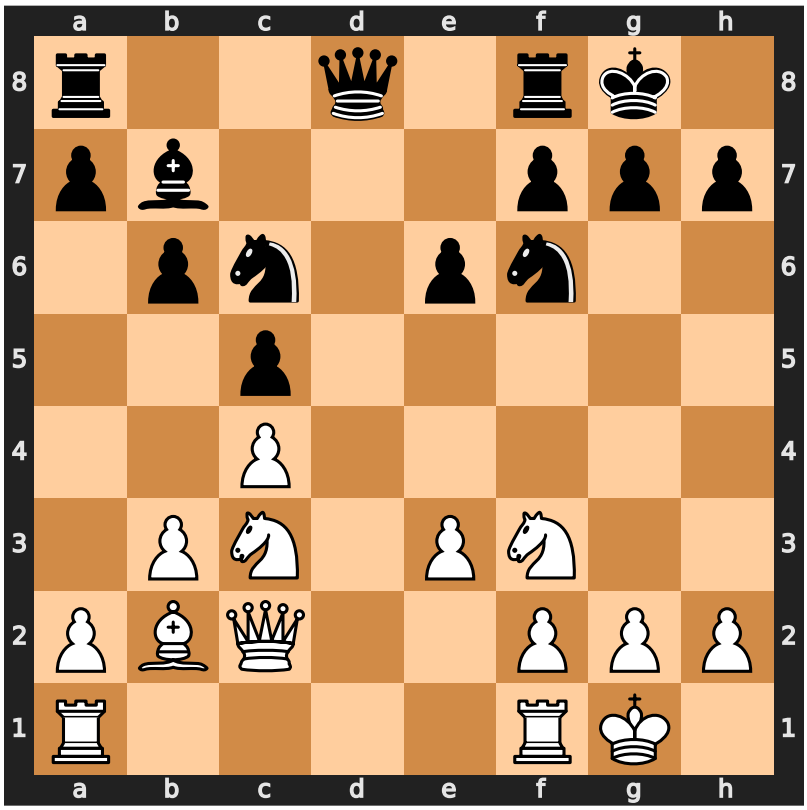

Figure 42.32: Chess Position

the knight on f3 (which can go to g5 or h4), this creates a coordinated attack. Rook lifts are one of the most powerful ways to activate a rook when no open file is available.

Exercise 14.27

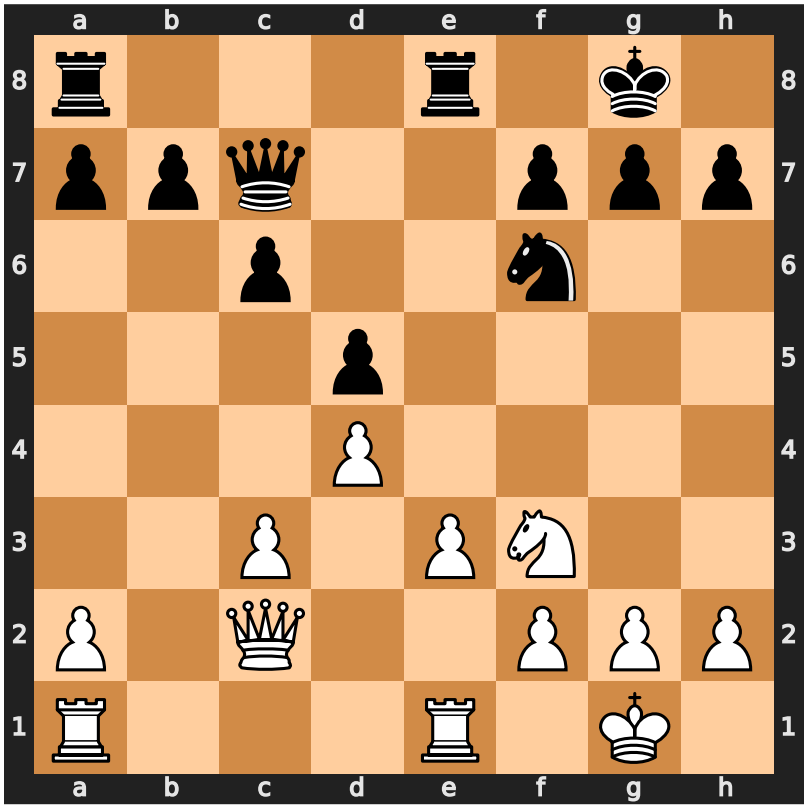

Figure 42.33: Chess Position

White to move. The e-file is half-open. Plan the rook placement.

Hint 1: White can seize the e-file with Re1 (already done) and Rae1 to double. *Hint 2:* Is doubling on the e-file the best use of both rooks? *Hint 3:* Consider: one rook on the e-file, one rook on the a-file (or b-file) for queenside pressure.

Solution: White should play **Rae1** to add control of the e-file, but then consider whether doubling is the best plan. A more flexible approach: keep one rook on e1 and use the other for **Ra1-a4** or **Rb1** to create queenside pressure alongside the c3 pawn's potential advance. The best plan often uses rooks on different files to create threats on two fronts. The opponent cannot defend everywhere. One rook on the e-file, one on the a-file, creates maximum headaches.

Exercise 14.28

White to move. White's queen is on d2. Find a better square.

Hint 1: The queen on d2 is functional but not actively threatening anything. *Hint 2:* Consider Qd2-f2 (supporting f4), or Qd2-h6 (threatening the kingside). *Hint 3:* Where does the queen coordinate

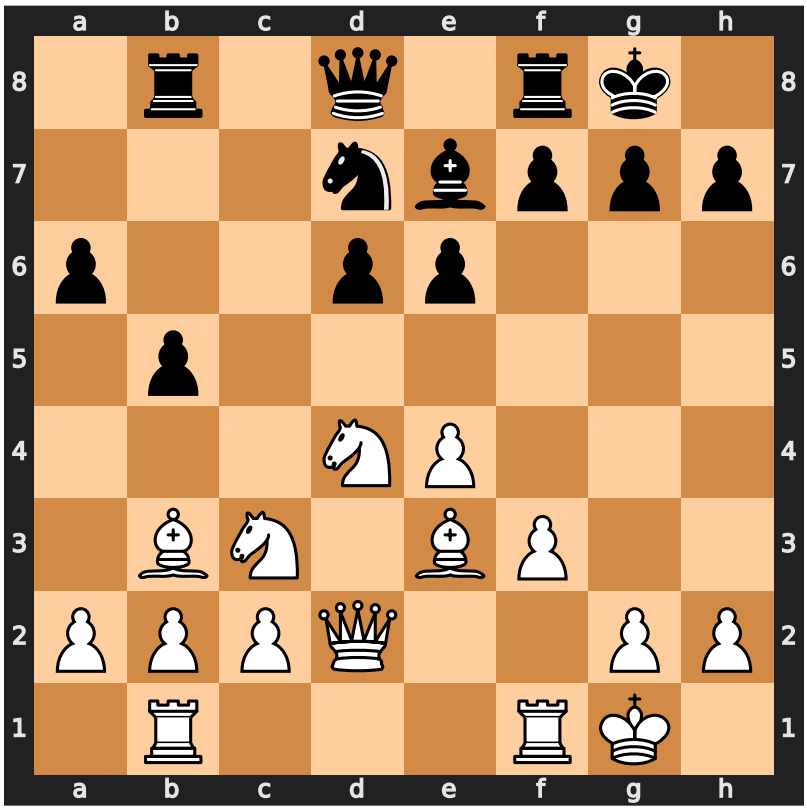

Figure 42.34: Chess Position

best with the other pieces?

Solution: White should consider **Qf2** (preparing f4 and supporting a kingside advance) or **Qd3** (supporting e4 and eyeing the kingside via h7). The best choice depends on the plan: if White wants to push f4, then Qf2 is ideal. If White wants to maintain flexibility, Qd3 centralizes the queen and targets both flanks. The queen should support the plan, not create its own. Avoid moving the queen to a square where it can be harassed (e.g., Qh6 might be met by …Bf6 or …g6 with tempo).

Exercise 14.29

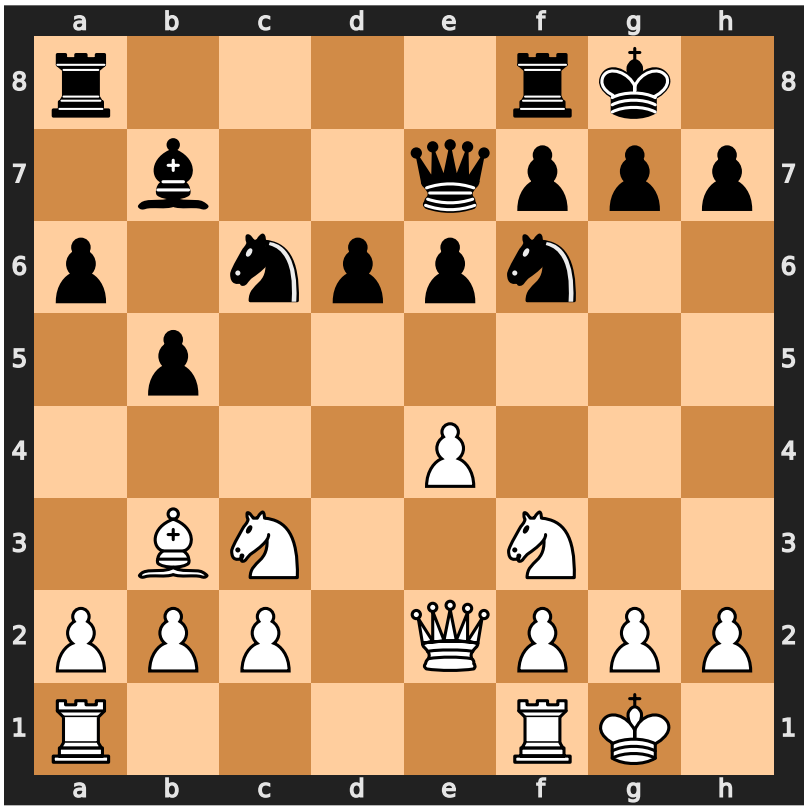

Figure 42.35: Chess Position

White to move. Should White trade queens with Qe2-d2-d8?

Hint 1: What is the material balance? Are there any structural advantages? *Hint 2:* Who benefits from queens coming off? *Hint 3:* If White has more active pieces, keeping the queen keeps the pressure.

Solution: White should **not trade queens.** White's pieces are more active (the bishop on b3 is stronger than the bishop on b7, and the queen on e2 supports a kingside advance). With queens on the board, White can generate kingside threats (e4-e5, Ng5, Qh5). If queens come off, the position becomes a quiet endgame where Black's solid structure makes winning difficult. The rule: keep queens on when you have more active pieces and attacking chances. Trade queens when you want a quiet endgame.

Exercise 14.30

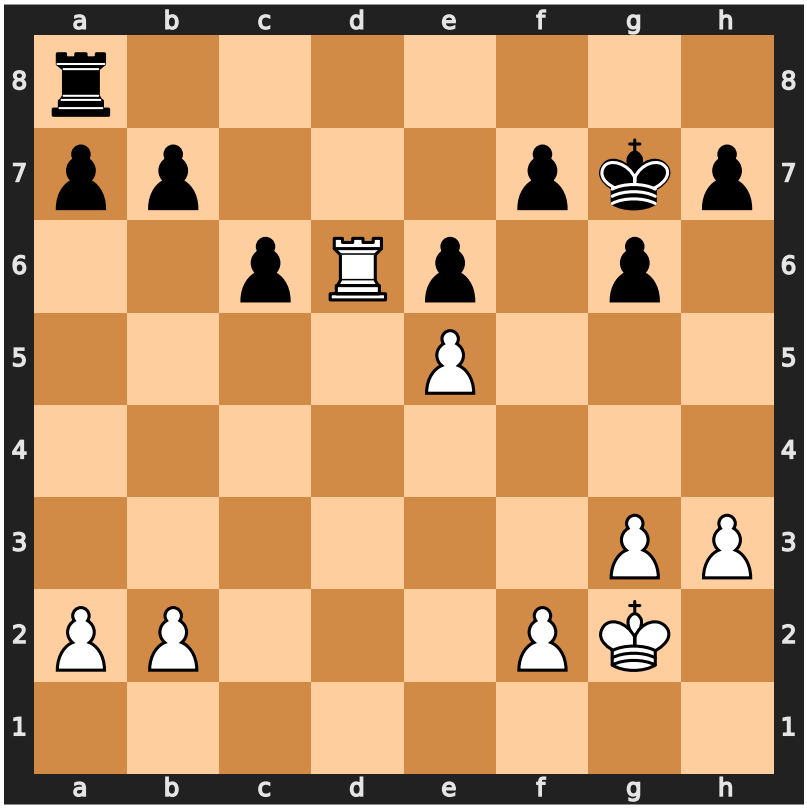

Figure 42.36: Chess Position

White to move. Your rook is on the sixth rank. Is this as good as the seventh?

Hint 1: The rook on d6 attacks c6 and e6 from the side. Is this active? *Hint 2:* Would Rd7 (seventh rank) be better? It would attack a7, b7, and f7. *Hint 3:* Compare the number of targets on rank 6 vs rank 7.

Solution: Rd7 is better. On d6, the rook attacks c6 (a pawn) and e6 (a pawn), but Black can defend both. On d7 (the seventh rank), the rook attacks a7, b7, and f7, which are harder to defend simultaneously. The rook also cuts off the black king from the d-file. Move the rook to the seventh: **Rd7.** The seventh rank is almost always superior to the sixth for a rook, because it attacks pawns from behind and restricts the king.

Rest here. Thirty exercises complete. One more set to go.

42.11.4 Section D: Outposts and Piece Exchanges (Exercises 14.31 - 14.40)

For each position, find the best outpost, exchange, or coordination plan.

Exercise 14.31

White to move. Find the best outpost for a knight.

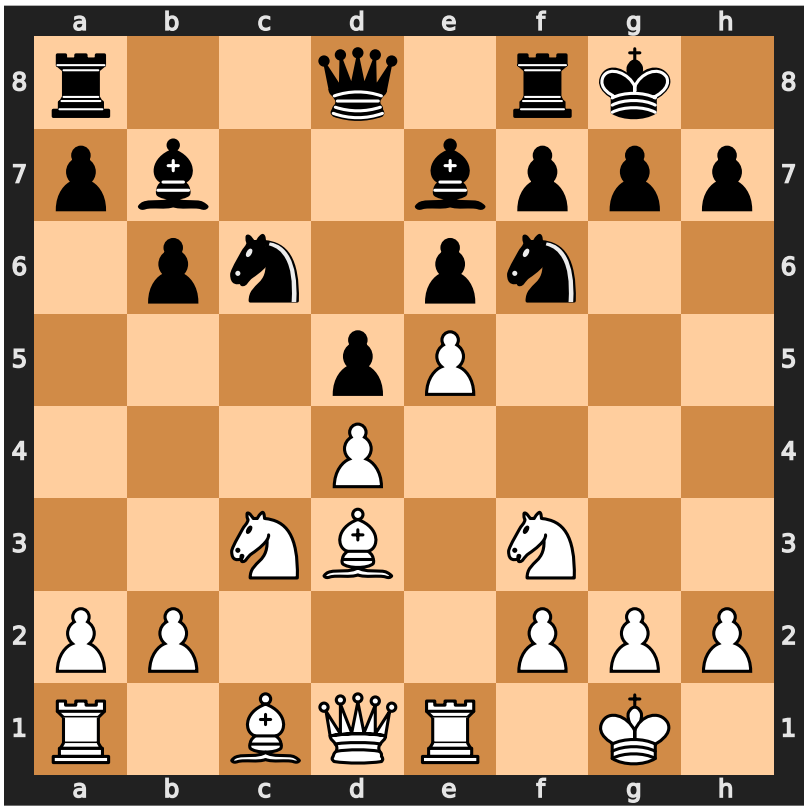

Figure 42.37: Chess Position

Hint 1: The e5 pawn takes away Black's use of e5. But White can use other squares. *Hint 2:* Can a knight reach f5 or d6? *Hint 3:* After Nf3-h4-f5, the knight reaches f5 with no pawn able to challenge it.

Solution: White should maneuver a knight to **f5.** The route is Nf3-h4-f5 (or Nf3-g5-f3-h4-f5 in some variations). The f5 square is a perfect outpost: Black's g-pawn is on g7 and the e-pawn is on e6, so no pawn can drive the knight from f5. From f5, the knight attacks d6, e7, g7, h6, d4, e3, g3, and h4. It radiates power across the board. The knight on f5 combined with the bishop on d3 creates a fearsome battery aimed at the kingside.

Exercise 14.32

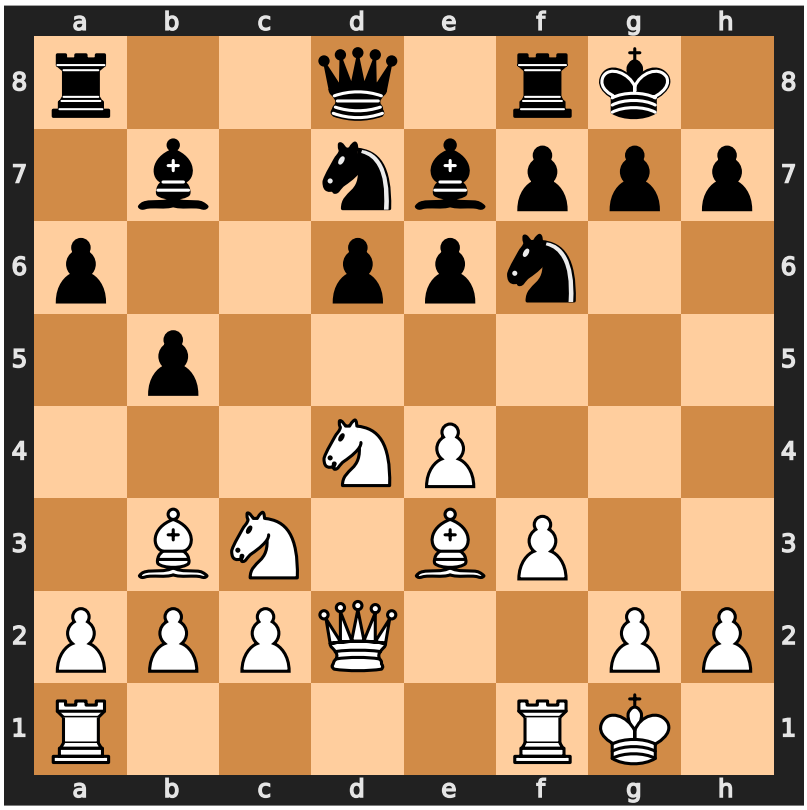

Figure 42.38: Chess Position

White to move. Black has played …b5. This creates a weakness. Where?

Hint 1: When a pawn advances, the squares it leaves behind can become weak. *Hint 2:* The move …b5 weakened the c5 square. Can a pawn recapture it? *Hint 3:* Is c5 an outpost for White?

Solution: The move …b5 weakened the **c5 square.** No black pawn can now guard c5 (the b-pawn has passed it, and the d-pawn is on d6). White should aim to plant a piece on c5. The ideal maneuver: **Nd4-b3-c5** or **Nc3-a4-c5.** A knight on c5 attacks a6, b3, b7, d3, d7, e4, and e6. It would be a permanent outpost that dominates the queenside and pressures the center. This is a classic example of provoking a pawn move to create an outpost.

Exercise 14.33

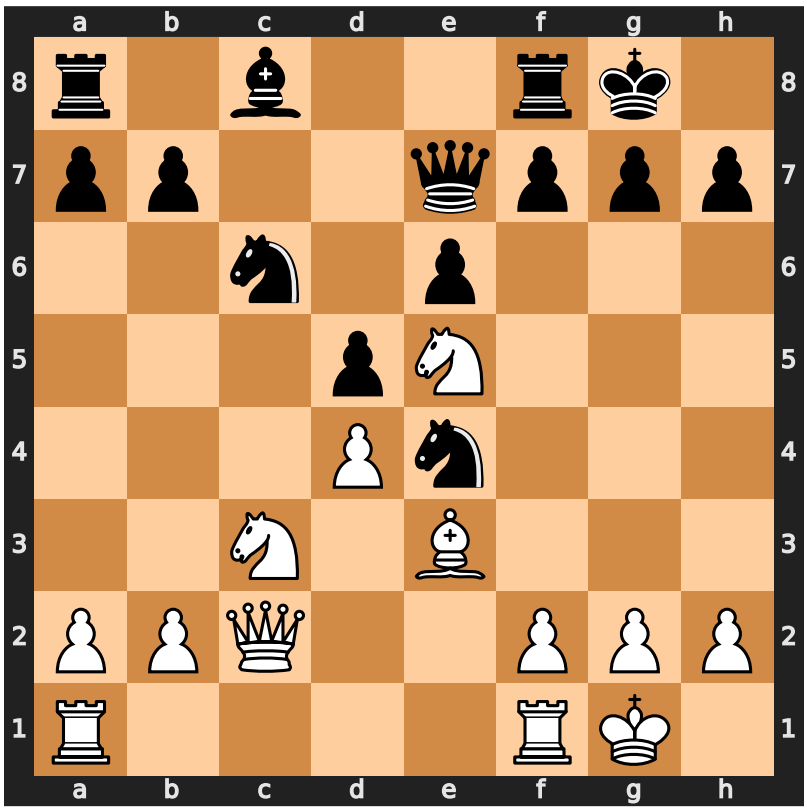

Figure 42.39: Chess Position

White to move. Both sides have centralized knights. Who has the better one?

Hint 1: White's knight is on e5. Black's knight is on e4. Compare their stability. *Hint 2:* Can Black's knight be challenged? Can White's? *Hint 3:* A pawn on d4 supports e5. What supports Black's knight on e4?

Solution: White's knight on e5 is better. It is supported by the d4 pawn and cannot be challenged by any pawn (Black has no f-pawn available to play …f6 without weakening the kingside). Black's knight on e4 is powerful but less stable: White can play f3 to kick it, or Nxe4 to trade it off. The key difference is **pawn support.** White's outpost knight has a pawn behind it; Black's does not. White should maintain the e5 knight and challenge the e4 knight with f2-f3 or Nxe4 dxe4, creating an isolated pawn target.

Exercise 14.34

White to move. Should White exchange pawns on c5 or maintain the tension?

Hint 1: If dxc5, White opens the d-file but gives Black a pawn majority in the center. *Hint 2:* If White maintains the tension, the e5 pawn cramps Black. *Hint 3:* Consider that the tension keeps Black's pieces tied to defense.

Solution: White should **maintain the tension.** The e5 pawn cramps Black's position, restricts the f6 knight, and keeps Black's pieces passive. If White plays dxc5, Black gets a free d5 pawn with

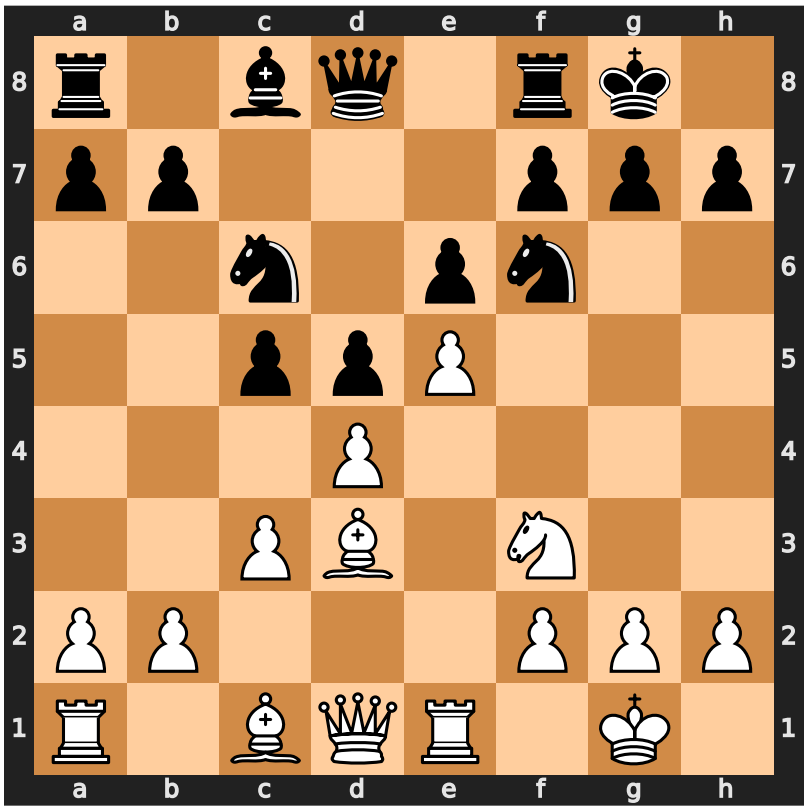

Figure 42.40: Chess Position

no cramp, and the position equalizes. By keeping the tension, White preserves the space advantage and can choose the right moment to break. Plans include Bf4 (supporting e5), Nbd2-f1-g3 (building kingside pressure), and Qe2 (connecting rooks). The principle: do not relieve tension unless you gain something concrete.

Exercise 14.35

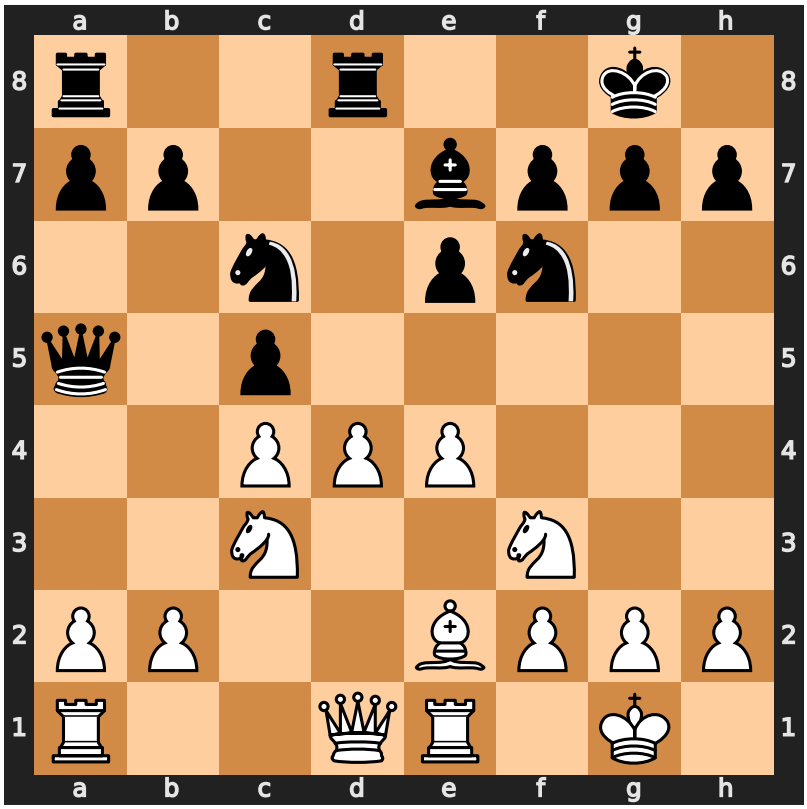

Figure 42.41: Chess Position

White to move. Which piece exchange would most benefit White?

Hint 1: Look at Black's most active piece. Which one causes White the most problems? *Hint 2:* The queen on a5 pressures a2, c3, and d2. *Hint 3:* Can White force a minor piece trade that improves the position?

Solution: White should trade the **c6 knight.** After Nd5 (threatening Nxe7+ and Nc7), Black must respond. If …Nxd5 cxd5 (or exd5), White opens lines and gains a strong center. The c6 knight is Black's best-coordinated piece, supporting the c5 pawn and controlling d4 and e5. Removing it weakens Black's entire queenside structure. The lesson: when deciding which piece to trade, trade the opponent's piece that coordinates best with their other pieces.

Exercise 14.36

White to move. White has a knight on e5 and bishops on b2 and e3. Find the strongest coordination plan.

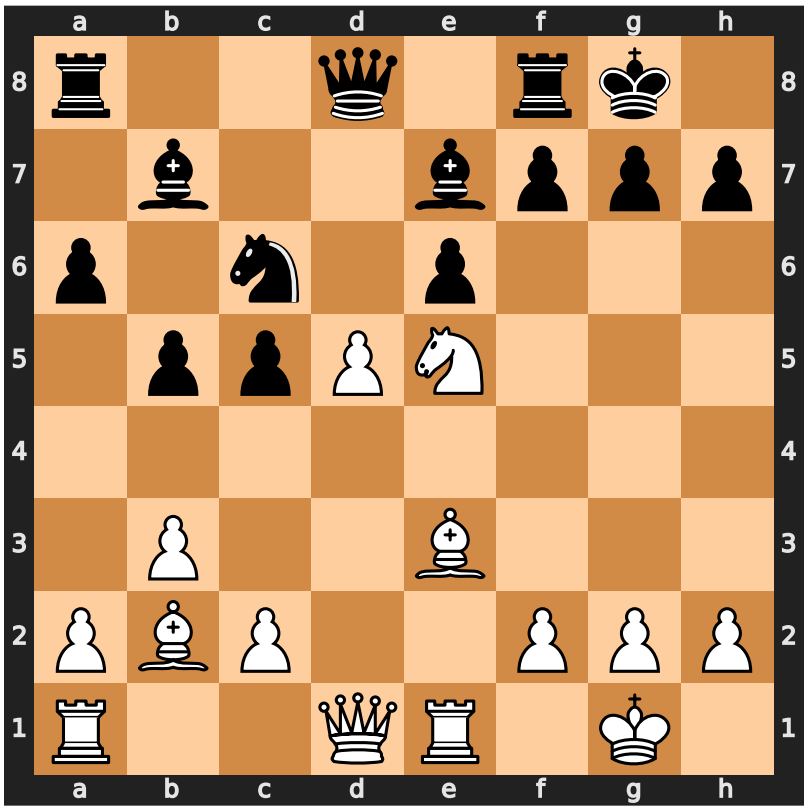

Figure 42.42: Chess Position

Hint 1: The knight on e5 is already dominant. What can the bishops add? *Hint 2:* The bishop on b2 aims at the long diagonal toward g7. *Hint 3:* Can White combine the knight on e5 with Qh5 and threats on the h-file?

Solution: White should play **Qh5**, threatening Qxh7 mate. The coordination is stunning: the knight on e5 controls f7 and g6 (covering escape squares), the bishop on b2 pins the g7 pawn (after …f6, Nxg6 wins), and the queen delivers the blow from h5. If Black plays …g6, then Nxg6 hxg6 Qxg6+ is devastating. If Black plays …f6, the e5 knight moves with a discovered attack. Every piece works together. This is the power of coordination: three pieces create a mating threat.

Exercise 14.37

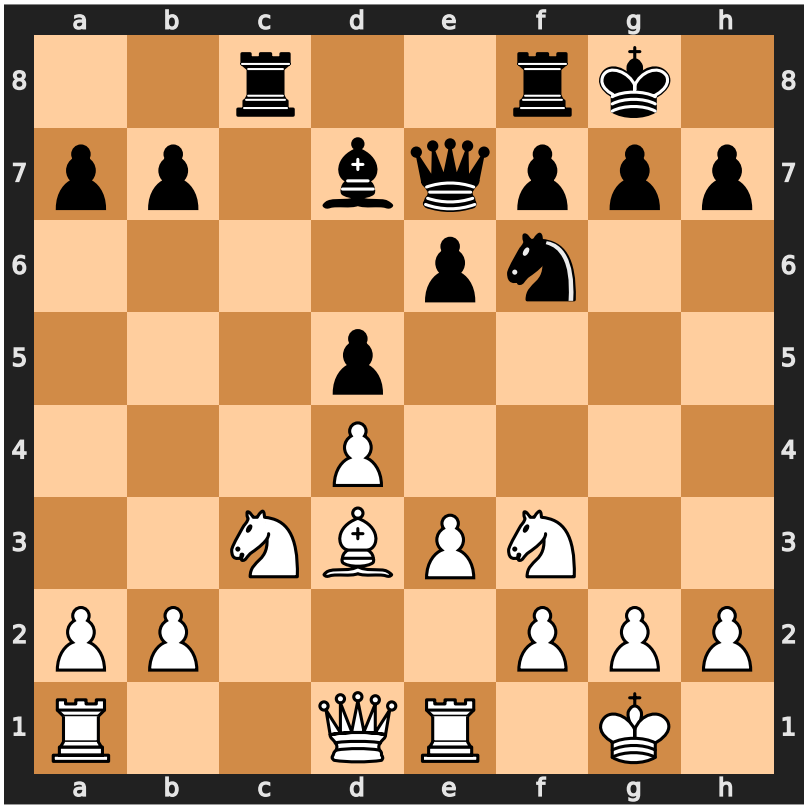

Figure 42.43: Chess Position

White to move. Plan a strategy to exploit better piece activity.

Hint 1: White's pieces are slightly better placed. How to increase the difference? *Hint 2:* Can White target a specific weakness? *Hint 3:* Ne5 centralizes the knight and puts pressure on d7.

Solution: White should play **Ne5**, centralizing the knight on its best possible square. From e5, it attacks d7 (the bishop), c6, f7, and g4. It also supports a potential advance of the c-pawn or a kingside buildup. After Ne5, White can follow with Qf3 (targeting f7 and d5), f2-f4 (supporting the knight and gaining space), or Rc1 (seizing the c-file). The plan is incremental: centralize, coordinate, then strike. Each move improves a piece by a small amount, and the cumulative effect is overwhelming.

Exercise 14.38

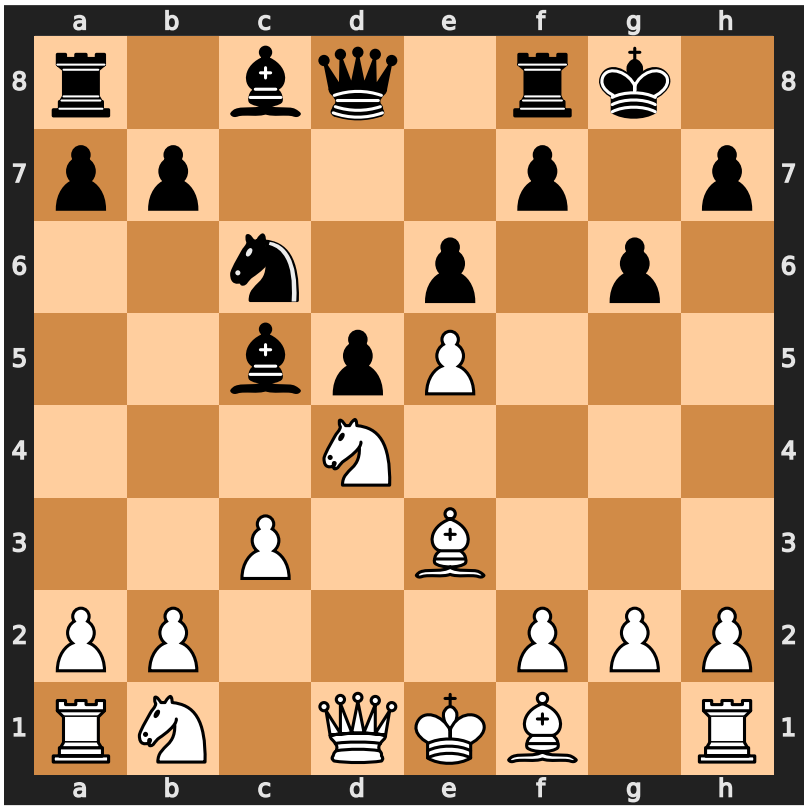

Figure 42.44: Chess Position

White to move. Black has a strong bishop on c5. How should White neutralize it?

Hint 1: The c5 bishop is Black's most active piece. It targets e3 and f2. *Hint 2:* Can White trade it off? *Hint 3:* Consider Bd4 or Na3-c2 to challenge it.

Solution: White should play **Bd4!** offering to trade dark-squared bishops. After …Bxd4 cxd4, White's pawn structure changes, but the dark-squared bishop problem is solved. If Black retreats (…Bb6), White's bishop on d4 is even stronger than Black's on b6, controlling the long diagonal and central squares. The principle: when the opponent has one very active piece, challenge it directly. Either trade it (removing the advantage) or force it to a worse square. Do not let it sit unchallenged on a dominant post.

Exercise 14.39

White to move. Design a three-move plan that maximizes piece coordination.

Hint 1: White has the e5 pawn cramping Black. What pieces should aim at the kingside? *Hint 2:* f2-f4 supports e5 and prepares f5. *Hint 3:* Qf3 aims at f7 and d5 (dual purpose). Rf1 prepares f4.

Solution: White's three-move plan: **(1) f2-f4** (supporting e5 and preparing f5), **(2) Qf3** (centralizing the queen with dual threats on f7 and d5), **(3) Rf1-f3** (preparing a rook lift to g3 or h3 for a

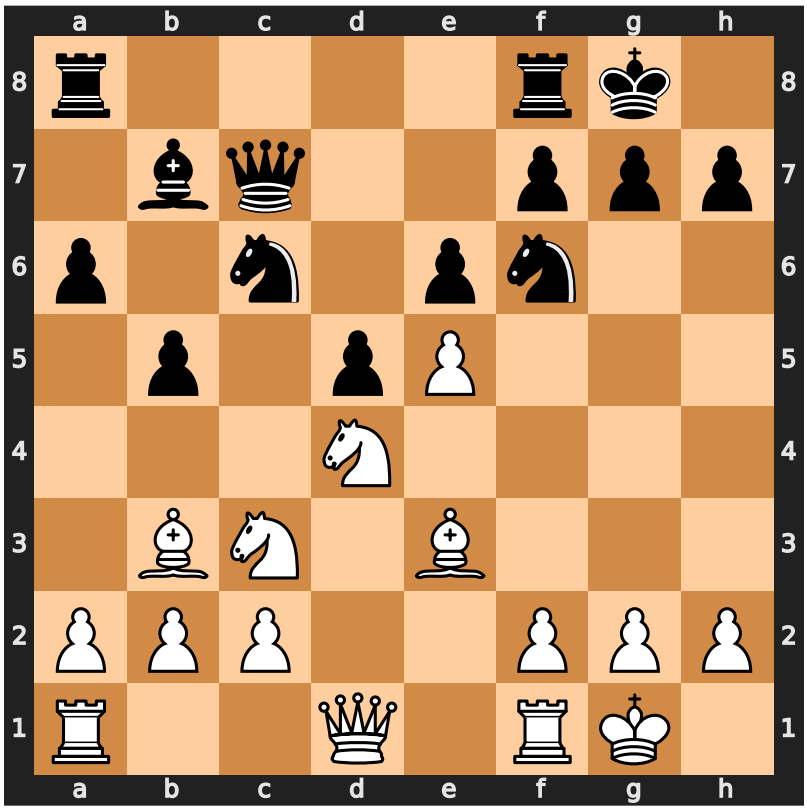

Figure 42.45: Chess Position

kingside attack). After these three moves, White's pieces all point at the kingside: the bishop on b3 eyes f7, the queen on f3 targets the same square plus d5, the rook on f3 can swing to g3 or h3, and the knight on d4 supports f5 and controls key squares. This is total coordination. Every piece has a role, and every role supports the others.

Exercise 14.40

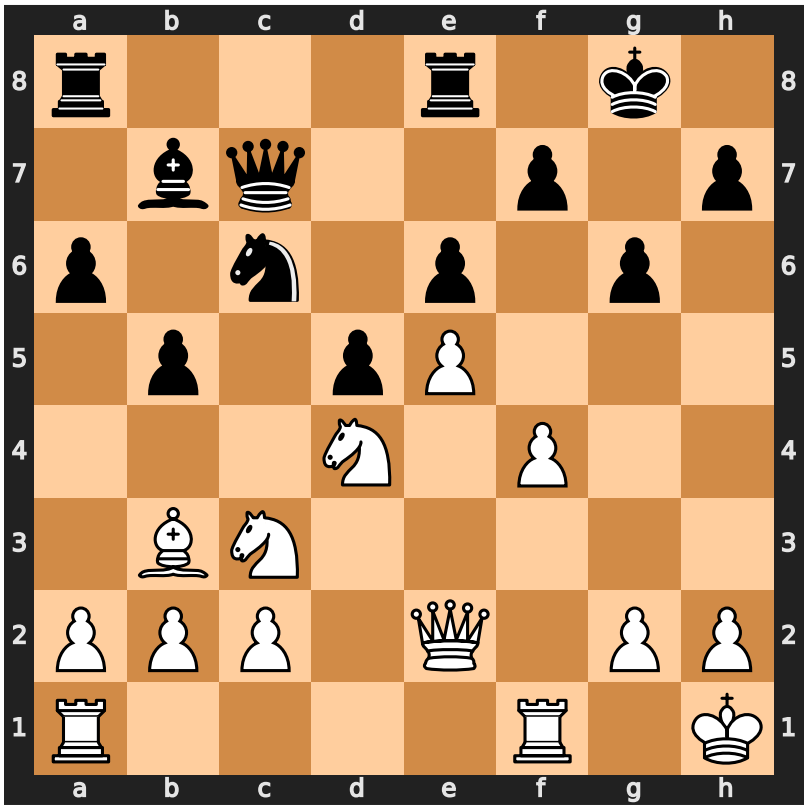

Figure 42.46: Chess Position

White to move. This position combines everything you have learned. Find the best move and explain why.

Hint 1: Look for the most forcing move that improves coordination. *Hint 2:* Can a piece sacrifice open lines to the black king? *Hint 3:* Consider Ndxb5! What happens after …axb5 Nxb5?

Solution: White should play **Ndxb5!** After …axb5 Nxb5, the knight arrives on b5 with devastating effect: it attacks c7 (where Black's queen sits) and d6 (an outpost). If the queen moves, Nd6 forks everything. But the deeper point is coordination: after Nxb5, the bishop on b3 is unblocked on the a2-g8 diagonal (aiming at f7), the queen on e2 can swing to h5 or g4 for a kingside attack, and the rooks can pour down the open a-file. The sacrifice works because it does not just win material. It activates EVERY remaining white piece simultaneously. That is the ultimate lesson of this chapter: piece activity and coordination are not separate concepts. They are one concept. Active pieces coordinate. Coordinated pieces become active. Build both, and your opponent's position will collapse under its own weight.

42.12 Key Takeaways

1. **Active pieces are worth more than passive pieces.** A piece on a strong square does more than a piece hiding on the back rank, regardless of what the material count says.

2. **Improve your worst piece before looking for tactics.** If one of your pieces is doing nothing, making it active is almost always your best move. Tactics flow from good positions.

3. **Coordination multiplies power.** Two pieces aimed at the same target are stronger than two pieces working independently. Three pieces aimed at the same target can be unstoppable.

4. **The bishop pair favors open positions.** When you have two bishops, open the position. When you face two bishops, keep it closed.

5. **Knights love outposts. Bishops love open diagonals.** Place each piece where it thrives. A knight on an outpost is a fortress. A bishop on an open diagonal is a laser.

6. **Rooks need open files and the seventh rank.** An inactive rook is the saddest piece on the board. Give your rooks highways, and they will reward you.

7. **Trade when it helps your imbalances, keep when it hurts them.** Every exchange changes the position. Make sure the change favors you.

8. **Outposts are permanent advantages.** A piece on a square that cannot be challenged by a pawn is a long-term investment that pays dividends for the entire game.

42.13 Practice Assignment

This week, do the following:

1. **Play three games** (online or over the board) and after each game, identify your most passive piece at move 15. Write down what you could have done to activate it sooner.

2. **Find one master game** in any database that features a knight planted on an outpost for at least 10 moves. Study how the outpost influenced the rest of the game.

3. **Set up the following position on your board and study it for 10 minutes:**

Answer these questions: - Which side has more active pieces? Why? - What is White's best outpost? What piece should go there? - If you were Black, how would you improve your worst piece? - Should White trade knights or keep them? - Where should White's rooks go?

Write down your answers before checking them against this chapter.

4. **Review your last five games** and count how many moves it took to put both rooks on open or half-open files. If it took more than 15 moves, you are wasting your rooks. Practice getting them active earlier.

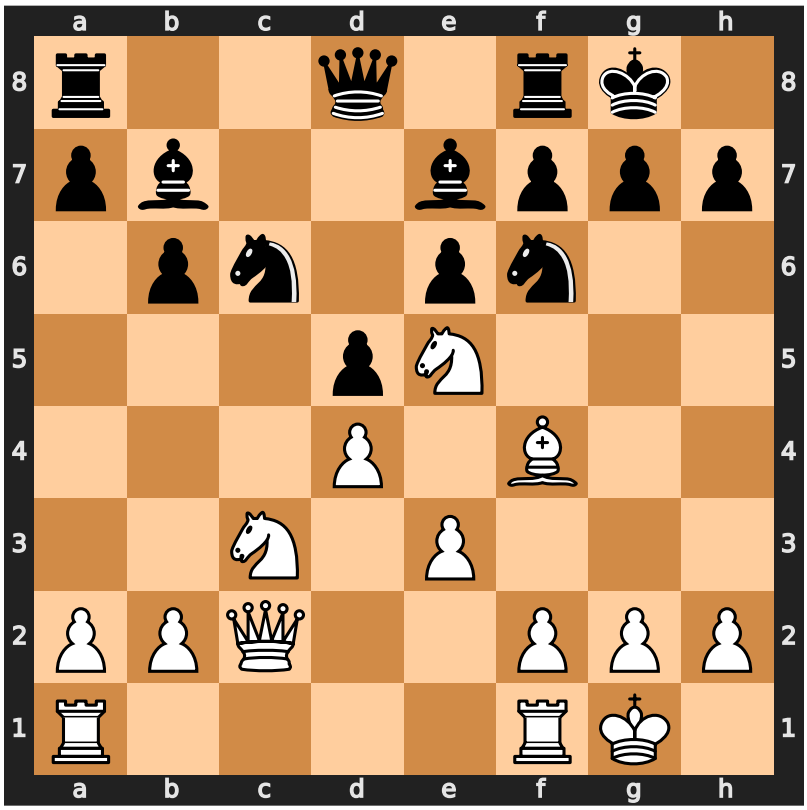

Figure 42.47: Chess Position

42.14 Progress Check

Answer these five questions to test your understanding. If you get at least four correct, you have mastered this chapter's core concepts.

Question 1: What is the first thing you should do before looking for tactics? > Ask if your worst piece is active. If not, improve it.

Question 2: What makes the bishop pair strong? > Two bishops cover squares of both colors and dominate in open positions with their long-range power.

Question 3: Where do rooks belong? > On open files and, when possible, on the seventh rank.

Question 4: What is an outpost? > A square in enemy territory protected by your pawn that cannot be attacked by any enemy pawn. A piece on an outpost is stable and powerful.

Question 5: When should you trade pieces? > When you are ahead in material, when your opponent has active pieces you want to remove, when you have a structural advantage, or when you are cramped and need space.

Scoring: - 5/5: Outstanding. You understand piece activity deeply. - 4/5: Very good. Review the section you missed and move on. - 3/5: Good foundation. Reread the relevant sections before proceeding. - 0-2/5: No worries. Reread the chapter with a board in front of you. These ideas take practice to internalize.

Rest here. Chapter 14 is complete. You now understand one of the most important concepts in chess: that pieces are not just material values on a page. They are living, breathing participants in a battle, and their activity and coordination determine who wins. Take a day off. You have earned it.

When you are ready, Chapter 15 awaits: *Basic Endgames.*

Chapter 43

Chapter 15: The Center: Static vs Dynamic

Volume II: The Club Player | Rating Range: 1000 - 1600 Pages: 35 | Exercises: 30 | Annotated Games: 4

"Whoever has the advantage in the center has the advantage everywhere." — Siegbert Tarrasch (1862–1934)

43.1 What You'll Learn

- Why the center matters beyond the basic principle of "control the center"
- The difference between a static center and a dynamic center, and how each changes your plans
- How to handle central pawn tension: when to capture, when to advance, and when to wait
- How a space advantage works and how to fight against one
- The hypermodern revolution: controlling the center without occupying it
- The most important pawn breaks in the center, and when to use them
- The iron rule: no flank attack without a stable center

43.2 Before We Begin

In Volume I, you learned the most basic principle in chess: control the center. Put your pawns on e4 and d4 (or e5 and d5). Develop your pieces toward the middle of the board. This is correct. It is also incomplete.

Now that you are a club player, you need a deeper understanding. "Control the center" is the first sentence of a long conversation. This chapter is the rest of that conversation.

The center is not just a place to put your pawns. It is the engine that drives your entire game. A strong center supports attacks on either wing. A weak center invites counterplay from your

opponent. A locked center demands patience and maneuvering. A fluid center demands precision and timing.

By the end of this chapter, you will look at the center of any position and understand what it is telling you. That understanding will change how you play every single game.

Set up your board. We have a lot of ground to cover.

43.3 Part 1: The Center Revisited

43.3.1 Why the Center Matters (The Real Reason)

You already know that the center is important. But why?

Here is the answer: **the center controls piece mobility.** A piece placed in the center reaches more squares than a piece placed on the edge. A knight on e4 reaches eight squares. A knight on a1 reaches two. This is geometry, not opinion.

But there is a deeper reason. The center is the crossroads of the board. Every piece that moves from one side to the other passes through the center. If you control the center, you control the traffic. Your pieces can move freely. Your opponent's pieces are stuck in traffic.

Consider this position:

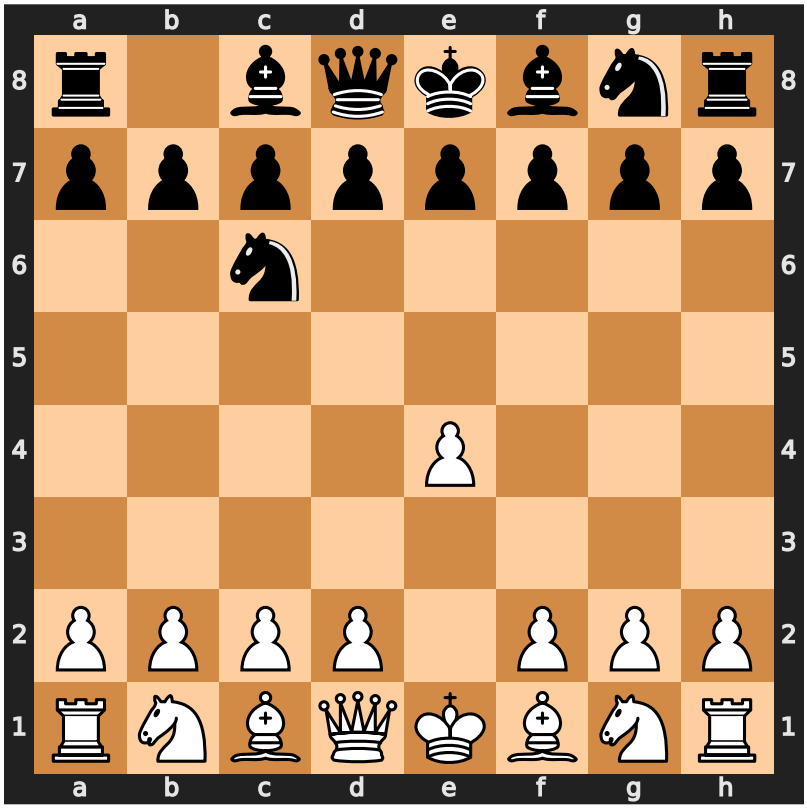

Figure 43.1: Chess Position

White has a pawn on e4. That pawn controls d5 and f5. This means Black's knight on c6 cannot easily reach d5 or f5: two of the best squares on the board for a knight. One pawn, one move, and already the center is shaping Black's options.

Now imagine White adds a pawn on d4:

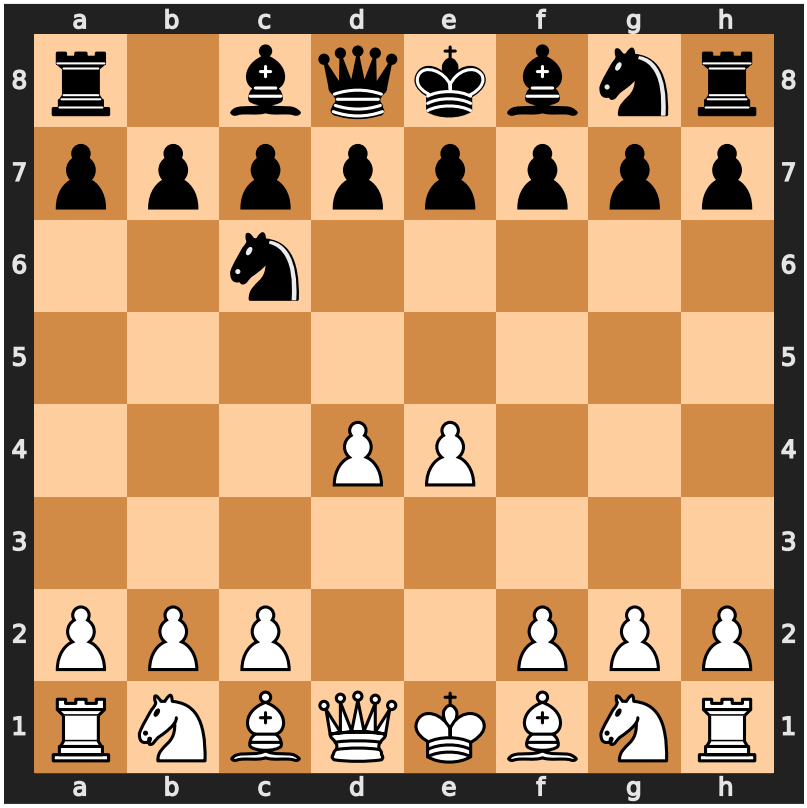

Figure 43.2: Chess Position

White's two center pawns now control c5, d5, e5, and f5. That is the entire fifth rank. Black's pieces have very limited access to these squares. White has a "classical center" and the advantage that comes with it.

The principle: Central pawns control squares. Those squares determine where pieces can and cannot go. This is why the center matters, not as an abstract idea, but as a practical reality that affects every piece on the board.

43.3.2 Three Types of Center

Not every center is the same. Understanding which type of center you have tells you what to do next. There are three types:

1. **Static Center**: The pawns are locked (e.g., White e4 vs Black e5 with d4 and d5 blocked). Neither side can easily push. The game is about maneuvering pieces and attacking on the wings.

2. **Dynamic Center**: The pawns are fluid. Captures, advances, and tensions are still possible. The game is about timing your central break correctly.

3. **Open Center**: The central pawns have been exchanged. Piece activity is everything. Development speed and coordination matter enormously.

Most club games feature a mixture of these, or transition from one type to another. Learning to recognize which center you have, and which center your opponent wants, is a skill that separates improving players from stagnating ones.

This is a good stopping point. The ideas above are foundational. Let them settle before moving on.

43.4 Part 2: The Static Center

43.4.1 What a Static Center Looks Like

A static center occurs when the central pawns are locked. They face each other directly and cannot advance without being captured. The most classic example is the Ruy Lopez main lines where White has e4 and Black has e5, and neither pawn can move without significant consequences.

Set up your board:

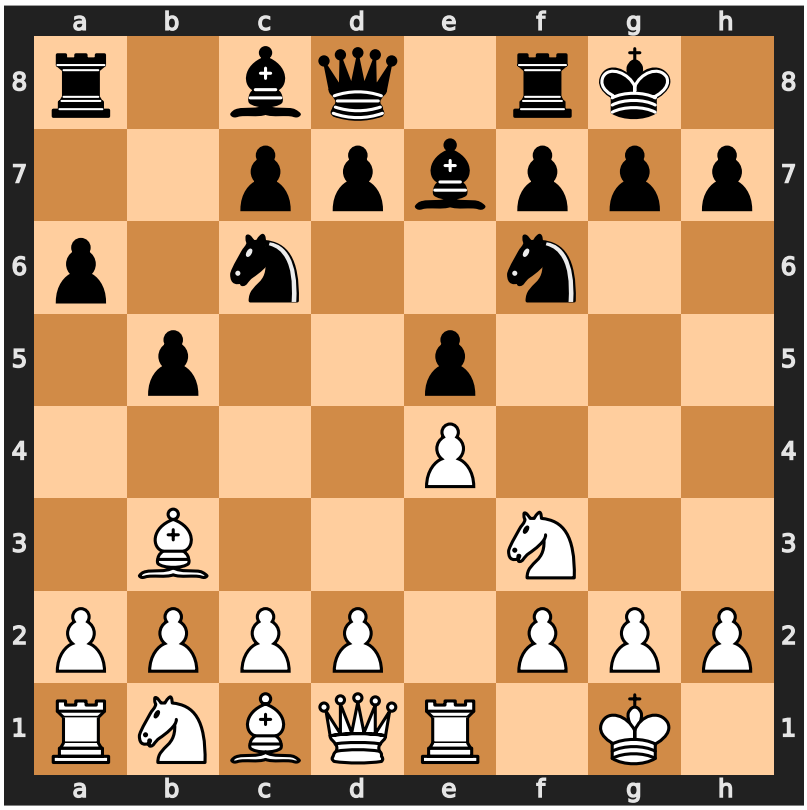

Figure 43.3: Chess Position

Look at the center. White has a pawn on e4. Black has a pawn on e5. Neither pawn can easily advance. The d-file is open, but neither side has pushed d4 or d5 yet. This center is relatively

static. It is not going anywhere soon.

When the center is static, you know something critical: **the middle of the board is settled.** The battle will be fought elsewhere.

43.4.2 The Rules of a Static Center

When the center is locked, four principles govern your play:

1. Attack on the wing where you have more space.

If your pawn chain points toward the kingside, attack on the kingside. If it points toward the queenside, attack there. The chain itself tells you where to go. This is Nimzowitsch's principle, and it is one of the most reliable rules in all of chess.

2. Maneuver your pieces to the best squares.

With the center locked, you have time. Use it. Transfer knights to outpost squares. Reroute bishops to better diagonals. Stack rooks on the file where the action will be. The center is not going to collapse while you reposition.

3. Do not weaken your center.

This is the trap. Your center is stable, and you are tempted to push a pawn for "activity." But if you weaken your center, your opponent will strike there while your pieces are on the wing. The static center is your foundation. Do not crack it.

4. Watch for your opponent's pawn breaks.

Your opponent follows the same rules. If you are attacking on the kingside, your opponent may be preparing a central or queenside break. Stay alert. A well-timed central break can demolish a flank attack.

43.4.3 The Art of Piece Maneuvering

When the center is locked, piece placement becomes everything. There is no point in having a great pawn structure if your pieces are on the wrong squares.

Consider this position:

White has a pawn chain on d4-e5. The center is static. White's plan involves a kingside attack, but first the pieces must reach the right squares.

The knight on f3 is decently placed, but it could be better on g3 or even h4 to support a kingside push. The bishop on e2 is passive. It could redeploy to d3 where it eyes the kingside and supports a potential f4-f5 push. The queen might belong on d2 or even g4 to join the attack.

This kind of slow, purposeful piece improvement is the hallmark of strong play in static center positions. There is no rush. There is no tactic to find. There is only the steady process of putting every piece on its best square.

A useful question to ask yourself: "Which of my pieces is least active, and where does it want to be?" Answer this question, move that piece, and ask again. This is how masters navigate static centers.

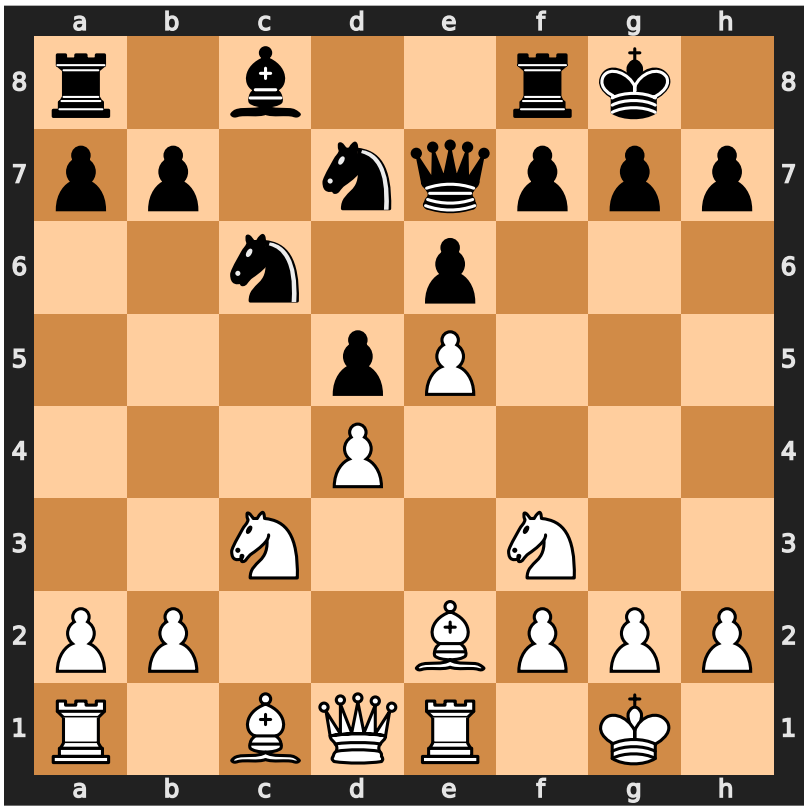

Figure 43.4: Chess Position

43.4.4 Flank Attacks with a Stable Center

When your center is secure, you are free to attack on the wing. The most common kingside attacking plan in positions with a locked center involves:

1. **f2-f4** (or …f7-f5 for Black) to advance the f-pawn toward the enemy king.
2. **g2-g4** to support f5 and open the g-file.
3. **Piece redeployment**: knight to f3-h4 (or g3), bishop to the attacking diagonal, rooks to f1 and g1.

The key insight is that this attack only works because the center is stable. If the center were fluid, your opponent could strike in the middle while your pieces were committed to the wing. With a locked center, that counter-blow is not available.

This leads us to one of the most important rules in this chapter.

> **The Iron Rule:** Never attack on the flank until you are sure your center is stable. If your center is weak or under pressure, fix it first. Flank attacks without a stable center are strategic suicide.

This rule applies at every level of chess, from club games to World Championship matches. Violate it at your peril.

Rest here if you need to. The static center is a deep topic. Let it absorb before continuing.

43.5 Part 3: The Dynamic Center

43.5.1 What a Dynamic Center Looks Like

A dynamic center is one where the central pawns are not yet locked. They face each other with tension: one or both sides can capture, advance, or add reinforcement. The position is alive with possibilities, and every move in the center carries risk and reward.

Set up your board:

Look at the center. White has pawns on d4 and e5. Black has pawns on c5, d5, and e6. There is enormous tension. Black can play …cxd4 or …c4. White can play dxc5 or maintain. The e5 pawn is advanced and influential but potentially vulnerable.

This is a dynamic center. Nothing is settled. Every pawn move changes the character of the position.

43.5.2 When to Push, When to Maintain

In a dynamic center, the critical question is: **should I resolve the tension, or should I maintain it?**

Here is the guiding principle:

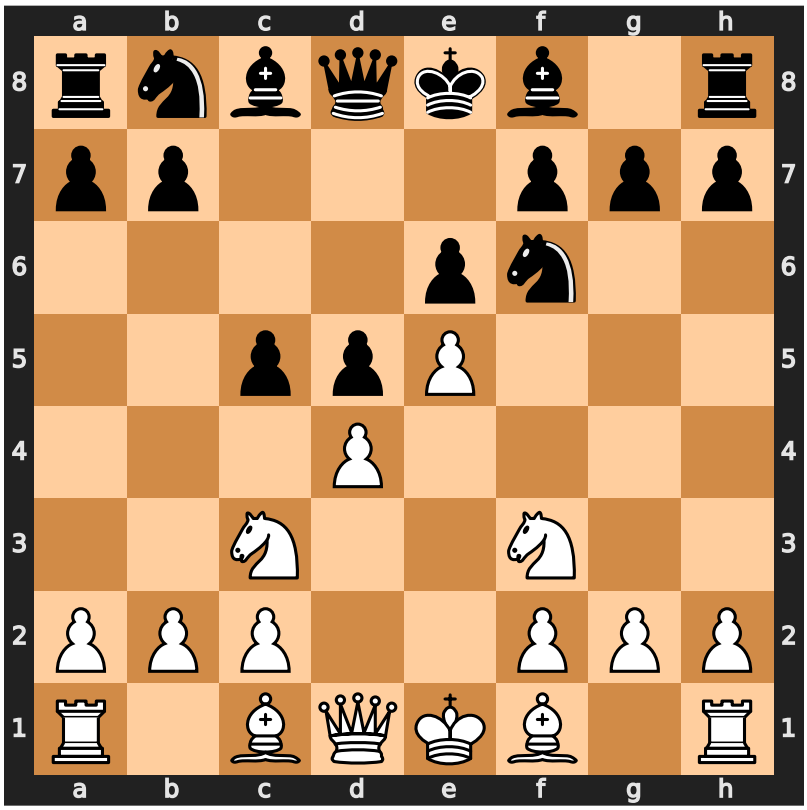

Figure 43.5: Chess Position

Maintain tension when it benefits you.

Every unresolved pawn tension forces your opponent to consider multiple responses. They must ask: "Will my opponent capture? Will they advance? Should I capture first?" This uncertainty is an advantage. As long as the tension benefits you, meaning you are the one who can resolve it favorably, keep it alive.

Resolve tension when you gain something concrete.

Capture when the resulting structure favors you. Advance when the advance opens lines for your pieces or creates a passed pawn. Never resolve tension just because you are uncomfortable with the complexity. Discomfort is not a reason to make a structural commitment.

Here is a practical example:

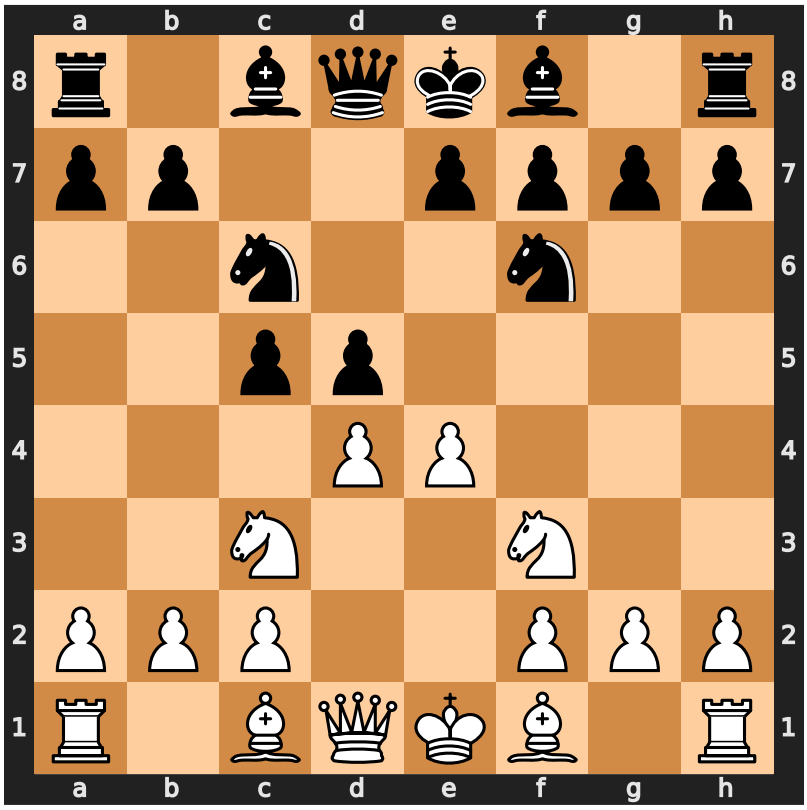

Figure 43.6: Chess Position

White has d4 and e4. Black has c5 and d5. White can play:

- **exd5**: Resolves the tension. After …Nxd5, the center simplifies. This is fine but gives Black a central knight.
- **e5**: Advances. The pawn gains space but blocks the f1-bishop's natural diagonal and makes d5 a strong square for Black.
- **Developing move (Bb5, Be2, or Bg5)**: Maintains the tension. This is often the strongest choice. White develops a piece and keeps all options open.

The concept: **the player who maintains tension has more flexibility.** This does not mean you should never capture or advance. It means you should have a reason when you do.

43.5.3 The Timing of Central Breaks

A central break is a pawn advance in the center that changes the pawn structure. The most common breaks are d4, d5, e4, e5, c4, c5, and f4/f5.

The timing of a break can be the difference between a brilliancy and a blunder. Too early, and your pieces are not ready to exploit the open lines. Too late, and your opponent has had time to prepare a defense.

Three questions to ask before executing a central break:

1. **Are my pieces developed and coordinated?** If your rooks are not connected or a key piece is still on its starting square, wait.
2. **Can my opponent punish the break immediately?** Calculate the consequences. If the break opens a line to your king, reconsider.
3. **Does the resulting structure favor me?** After the dust settles, will I have better piece placement, an outpost, or a passed pawn?

If you answer "yes" to all three, the break is likely correct.

43.6 Part 4: Central Pawn Tension

43.6.1 The Three Options

When your pawn faces an enemy pawn diagonally across the center (e.g., White d4 vs Black c5, or White e4 vs Black d5), you have three choices:

1. **Capture**: Take the enemy pawn.
2. **Advance**: Push past the enemy pawn.
3. **Maintain**: Leave the tension and play a different move.

Each option changes the position in a fundamentally different way. Understanding what each option does is one of the most important skills at the club level.

43.6.2 Option 1: Capture

When you capture a central pawn, you change the pawn structure. You may gain a pawn, open a file, or create an imbalance. But you also relieve tension, and relieving tension usually helps your opponent by removing a decision from their plate.

Capture when: - The resulting structure gives you a clear advantage (e.g., you create a passed pawn or saddle your opponent with an isolated pawn). - You win material or gain a significant tactical advantage. - Your opponent's recapture creates a weakness you can exploit.

Do not capture when: - The tension is working in your favor and your opponent is uncomfortable. - The recapture improves your opponent's piece placement (e.g., their knight recaptures on a central square). - You have no clear plan for the resulting structure.

43.6.3 Option 2: Advance

Advancing a pawn past its rival gains space and can be aggressive, but it is also a commitment. The advanced pawn cannot go back, and the square it left behind may become weak.

Advance when: - You gain a significant space advantage. - The advance opens lines for your pieces. - You can support the advanced pawn and it will not become a target.

Do not advance when: - The advanced pawn will be easily blockaded. - You create weak squares behind the pawn that your opponent's pieces can use. - You do not have enough pieces supporting the advance.

43.6.4 Option 3: Maintain

Maintaining tension is the option most club players overlook, and it is often the strongest. By playing a move elsewhere, developing a piece, improving a piece's position, or creating a threat on another part of the board. You preserve all your options.

Maintain when: - Your opponent is the one who must worry about the tension (they are the ones who need to respond). - You can usefully improve your position while the tension exists. - Neither capture nor advance gives you a concrete advantage right now.

The great masters maintain tension as a weapon. It is not laziness. It is not indecision. It is strategic discipline. The player who maintains tension is often the player who gets the better deal when the tension finally resolves.

> **A rule of thumb:** When in doubt, maintain the tension and improve a piece. You can always capture or advance later. You cannot un-capture or un-advance.

Take a break here if you like. Parts 1 through 4 are the core theory. The rest of the chapter builds on these ideas.

43.7 Part 5: Space Advantage

43.7.1 What Space Means

A space advantage means your pawns are more advanced than your opponent's, giving your pieces more room to maneuver behind them. Your opponent's pieces, by contrast, are cramped. They have fewer squares to choose from and less room to coordinate.

Set up your board:

White has a pawn on e5. This pawn is further advanced than Black's pawns and controls the squares d6 and f6. Behind the e5 pawn, White has room for pieces: a knight on f3 or d4, a bishop on e3 or d3, rooks on central files. Black's pieces, meanwhile, are cramped. The knight on d7 has few good squares. The bishop on e7 is passive. Black needs to challenge the center to equalize.

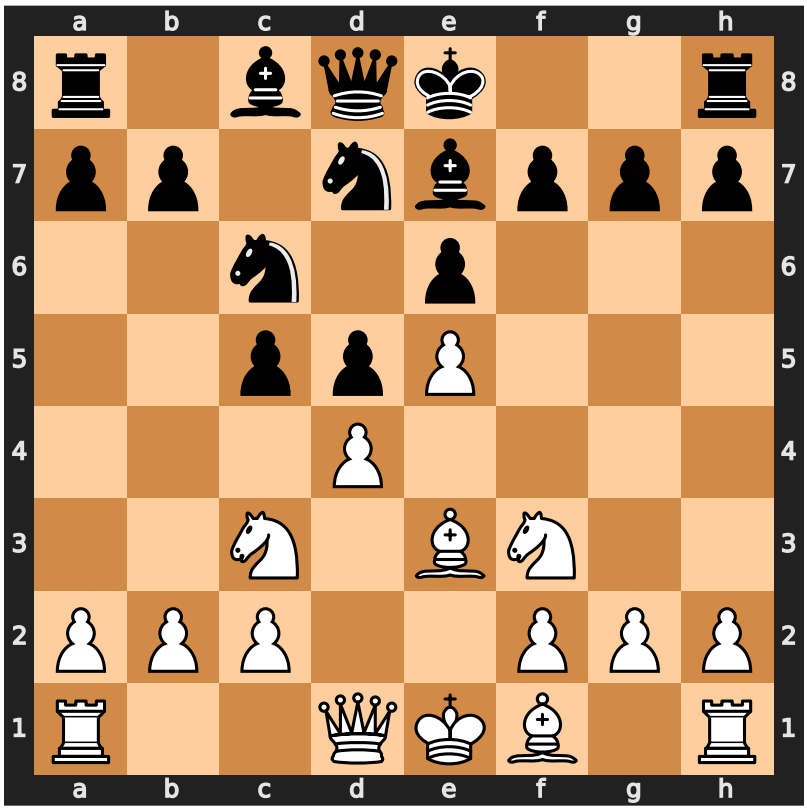

Figure 43.7: Chess Position

43.7.2 How to Use a Space Advantage

Having more space is only an advantage if you use it well. Here are the principles:

1. Keep pieces on the board. A space advantage matters most when there are many pieces competing for limited squares. If you trade everything, the cramping effect disappears. Avoid unnecessary exchanges when you have more space.

2. Restrict your opponent. Use your advanced pawns and well-placed pieces to control your opponent's best squares. Make it hard for them to reposition.

3. Open lines at the right moment. Eventually, you need to break through. A space advantage that never leads to action is just a pretty formation. Look for the right pawn break to open lines while your opponent's pieces are still tangled.

4. Be patient. This is perhaps the hardest lesson. A space advantage is a slow weapon. It does not deliver checkmate on its own. It creates the conditions for checkmate by making your opponent's defense increasingly difficult.

43.7.3 How to Fight Against a Space Advantage

If your opponent has more space, do not panic. Cramped positions are uncomfortable, but they are not lost. Here is how to fight back:

1. Exchange pieces. Every piece you trade gives your remaining pieces more room. If you are cramped, actively seek favorable trades.

2. Challenge the center. Your opponent's space advantage is built on advanced pawns. If you can undermine those pawns with a pawn break, the advantage may evaporate.

3. Do not make weaknesses. When you are cramped, the temptation is to push pawns for "breathing room." This often creates holes that your opponent will exploit. Instead, keep your pawn structure solid and wait for the right moment to strike.

4. Look for counterplay. Even in a cramped position, there may be tactical opportunities. A sacrifice, a pin, a discovered attack. Any of these can turn the tables. Stay alert.

43.8 Part 6: Hypermodern Ideas

43.8.1 Controlling the Center Without Occupying It

In the early twentieth century, a group of chess thinkers led by Richard Reti, Aron Nimzowitsch, and Gyula Breyer challenged the classical dogma that you must occupy the center with pawns. Their argument: sometimes it is better to let your opponent place pawns in the center and then attack those pawns with pieces and flank pawns.

This was the hypermodern revolution, and its ideas are now a permanent part of chess theory.

43.8.2 The Fianchetto

The most common hypermodern technique is the fianchetto, placing a bishop on g2 or b2 (for White) or g7 or b7 (for Black). A fianchettoed bishop does not sit in the center, but it controls

the center from a distance. A bishop on g2 stares down the long a8-h1 diagonal, exerting powerful influence on the central squares d5 and e4.

Set up your board:

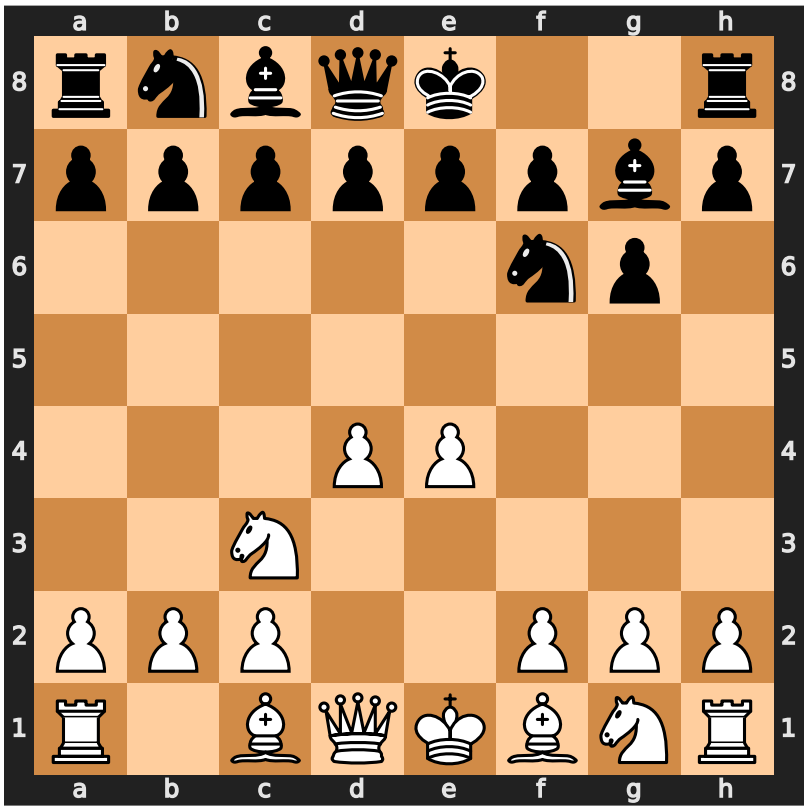

Figure 43.8: Chess Position

Black has fianchettoed the bishop to g7. The bishop does not occupy a central square, but it pressures d4 and the entire a1-h8 diagonal. If White plays carelessly, this bishop can become devastatingly powerful.

The hypermodern idea: let White build a big center with d4 and e4, and then attack it. Black's plan might include …c5 to hit d4, or …d6 and …e5 to challenge the center directly. The fianchettoed bishop supports this counterattack from a safe distance.

43.8.3 Piece Pressure Without Pawns

Another hypermodern concept is controlling central squares with pieces rather than pawns. A knight on e5 controls the center just as effectively as a pawn on e4, in some ways more effectively, because the knight is more flexible.

Consider:

White has a pawn on e4 and d3, not the aggressive d4. But the knight on f3 can reach e5 or d4, the bishop on c4 targets f7, and the c3 knight can swing to d5. White is controlling the center with a combination of one pawn and three pieces. This is the Italian Game approach, and it is highly effective.

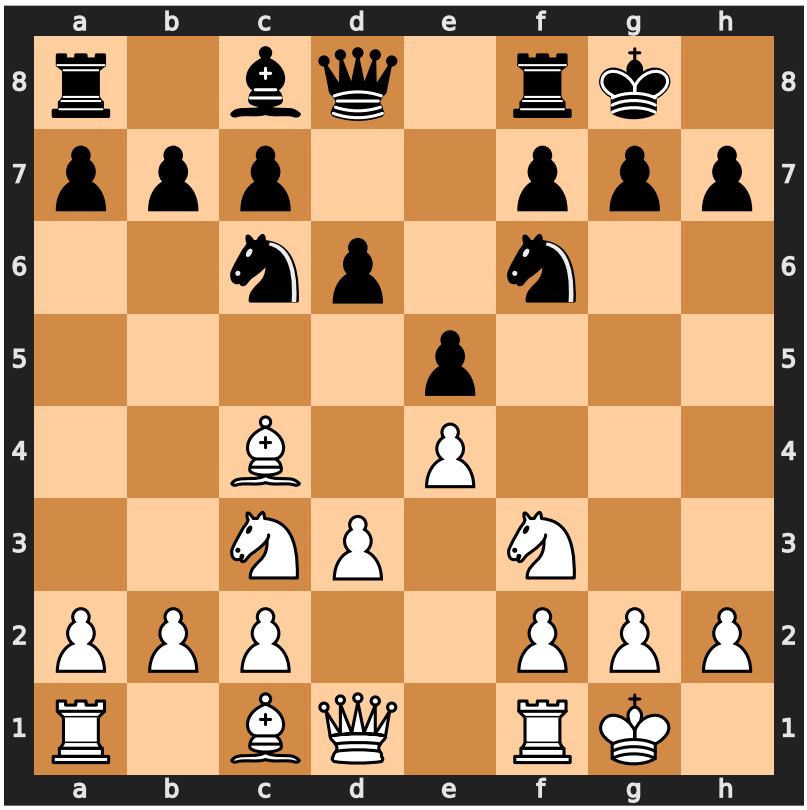

Figure 43.9: Chess Position

The lesson: You do not need two pawns in the center to control it. Sometimes one pawn (or even none) combined with active piece placement is stronger than a classical pawn center. The hypermodern masters proved this, and modern chess confirms it daily.

43.8.4 When Classical Beats Hypermodern (and Vice Versa)

Neither approach is "better." They are tools. Use the right one for the position.

Classical (pawns in the center) works best when: - You can maintain the center without it becoming a target. - Your pieces coordinate well behind the pawn front. - Your opponent lacks the pieces or structure to attack your center.

Hypermodern (controlling from a distance) works best when: - Your opponent's center is overextended and can be attacked. - A fianchettoed bishop controls a critical long diagonal. - Piece activity matters more than pawn territory.

The best players blend both approaches. They are not dogmatic about either.

43.9 Part 7: Pawn Breaks in the Center

43.9.1 The Most Important Breaks

A pawn break is a pawn advance that opens lines, creates new structures, or challenges your opponent's formation. In the center, the most important breaks are:

The d4 break (for White, or …d5 for Black)

This is the classic central break. It challenges a pawn on e5 (or c5) and opens the d-file. In many openings (the Italian, the Ruy Lopez, the Pirc), preparing and executing d4 (or …d5) is White's (or Black's) primary strategic goal.

Example structure:

White's plan centers on playing d2-d4 at the right moment. The preparation might include c3 (to support d4), castling (king safety first), and Re1 (adding support to e4). When d4 comes, it will open the position for White's bishops and challenge Black's center.

The e4 break (or …e5)

This break advances a pawn into the center, often challenging d5 or gaining space. In the French Defense, Black often struggles to achieve …e5, and when it comes, it equalizes.

The c4 break (or …c5)

This break challenges d5 (or d4) from the flank. It is a staple of Queen's Gambit and Sicilian structures. A well-timed c4 can crack open the center and create a powerful passed d-pawn.

The f4 break (or …f5)

This is the most aggressive central break. It advances toward the enemy king and often accompanies a kingside attack. In the King's Indian Defense, Black's …f5 is the signal that the kingside battle has begun. In the French Defense, White's f4-f5 attacks the base of Black's pawn chain.

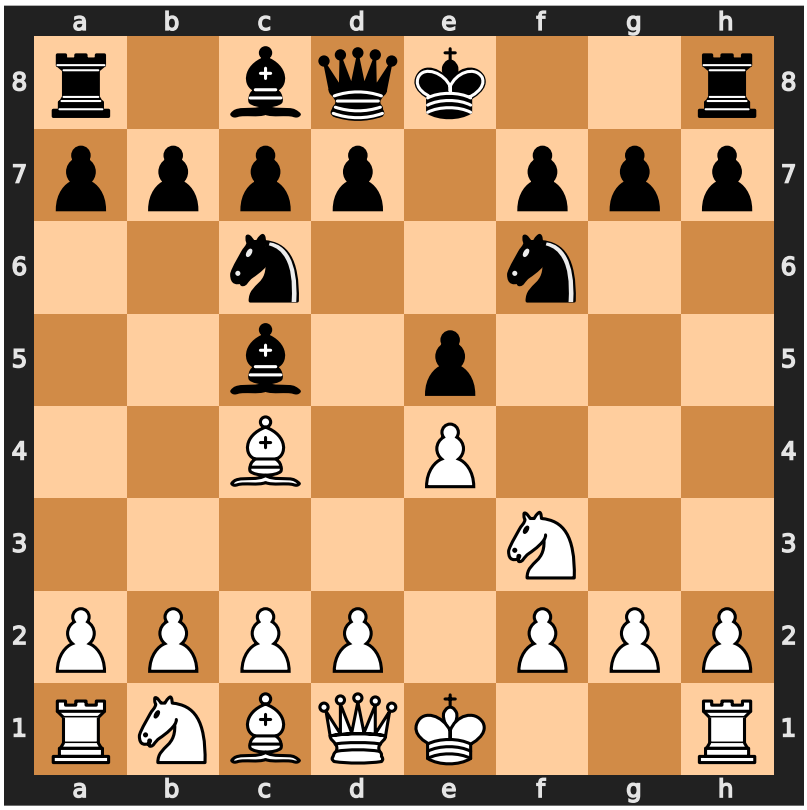

Figure 43.10: Chess Position

Warning: f4 (or …f5) weakens the king's shelter. Use this break only when the benefits outweigh the risks.

43.9.2 How to Prepare a Pawn Break

A pawn break rarely works on its own. It needs preparation:

1. **Support the break with pawns.** If you want to play d4, make sure c3 or e3 supports it. An unsupported break can be refuted.
2. **Develop pieces to exploit the resulting open lines.** Before playing d4, ask: "If d4 works, are my rooks ready for the d-file? Is my bishop ready for the opened diagonal?"
3. **Calculate the consequences.** What happens after you advance? What captures are available? What structure results?
4. **Check your opponent's counter-breaks.** If you play on the wing, can your opponent play in the center? If you play in the center, do they have a prepared tactical response?

43.10 Part 8: Center and the Wings

43.10.1 The Connection

Here is the rule that ties everything together:

The center determines the wings. Not the other way around.

If your center is strong and stable, you can attack on either flank with confidence. Your opponent cannot strike back through the middle while you are occupied on the wing.

If your center is weak or under pressure, a flank attack is dangerous. Your opponent will break through the center while your pieces are committed elsewhere, and your position will collapse.

Example:

White has a powerful center with d4, e5, and c5. The center is strong and stable, Black cannot easily challenge it. White is free to launch a kingside attack with Bd3, Qe2, and eventually g4-g5 or f4-f5, knowing that the center is secure.

Now compare:

White has d4 and e4, but Black can play …dxe4 at any moment. If White launches a kingside attack and Black responds with …dxe4, the center opens and White's king may be exposed. White must either secure the center first (with e5 or by maintaining the tension carefully) or accept the risk.

The practical takeaway: Before starting a wing attack, always ask: "Is my center safe?" If the answer is no, fix the center first. The attack can wait. A collapsing center cannot.

Theory complete. Take a break before the annotated games. You have earned it.

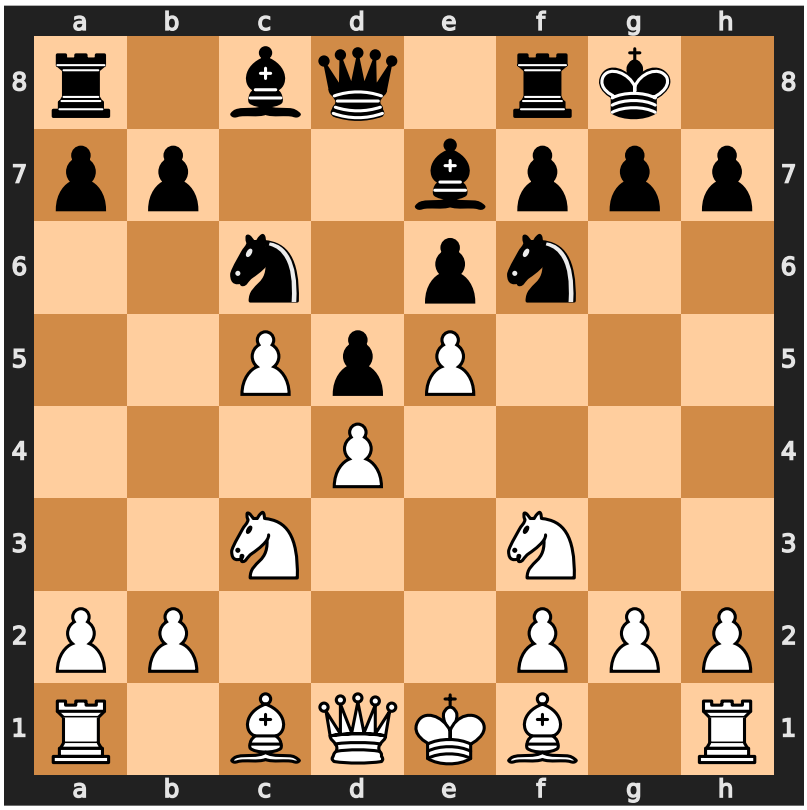

Figure 43.11: Chess Position

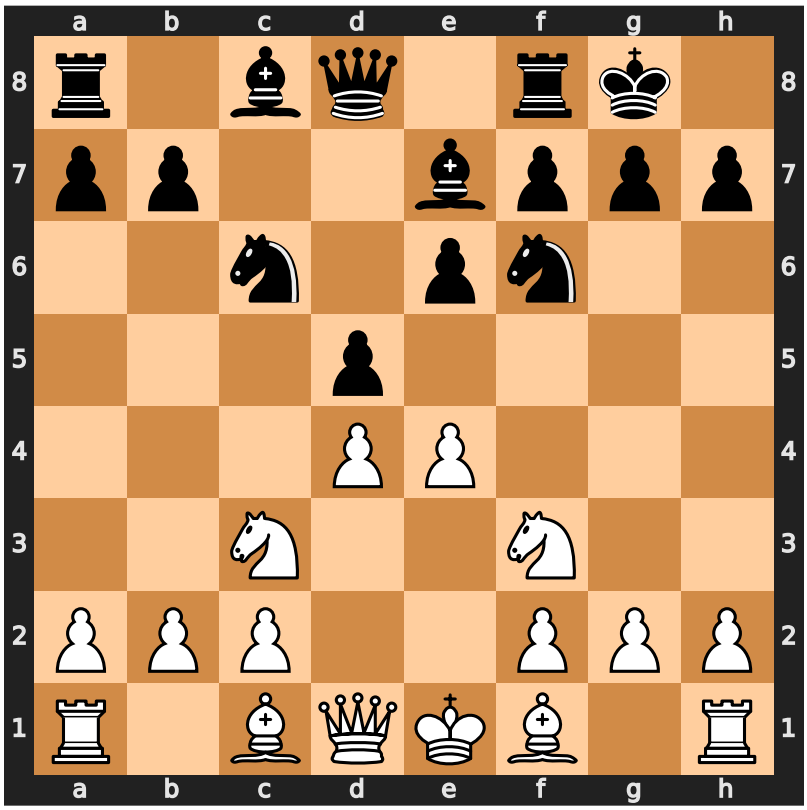

Figure 43.12: Chess Position

43.11 Annotated Master Games

The four games in this chapter all involve the center, how to control it, how to exploit it, and how it determines the outcome of the game.

43.11.1 Game 28: Petrosian vs Spassky

World Championship Match, Game 10, Moscow, 1966 King's Indian Defense (E63) | Result: 1-0

Field	Value
White	Tigran Petrosian
Black	Boris Spassky
Event	World Championship Match, Game 10
Site	Moscow, 1966
Opening	King's Indian Defense (E63)
Result	1-0

Why This Game Is Instructive: Petrosian, the legendary "Iron Tigran," demonstrates the art of prophylaxis combined with central control. He builds a rock-solid center, prevents all of Spassky's counterplay, and then converts his structural advantages with a famous exchange sacrifice. This game teaches you that controlling the center is not always about attacking. Sometimes it is about making sure your opponent cannot do anything.

The Moves:

1.Nf3 Nf6 2.g3 g6 3.c4 Bg7 4.Bg2 O-O 5.d4 d6 6.Nc3 Nbd7 7.O-O e5 8.e4 c6

Both sides have established their central presence. White has the classical d4+e4 center. Black has played …e5 to contest d4, and …c6 to support a potential …d5 break. The center is semi-static: White's pawns are firm on d4 and e4, while Black must decide how to challenge them.

9.h3 Qb6 10.d5!

Key Moment. Petrosian closes the center. By playing d5, he transforms the position from a dynamic center to a static one. The center is now locked: d5 vs c6 and e5. With the center fixed, Petrosian knows exactly where the battle lines are. He will maneuver on the queenside, while Black's kingside counterplay (the usual …f5 break) is made more difficult.

This is the prophylactic mindset in action: close the center to reduce your opponent's options, then improve your position piece by piece.

10…cxd5 11.cxd5 Nc5 12.Ne1 Bd7 13.Nd3 Nxd3 14.Qxd3

White has traded off Black's active knight. Every favorable exchange in a closed center is a small victory. It gives White's remaining pieces more room to operate.

14…Rfc8 15.Rb1 Nh5

Spassky attempts to generate counterplay by relocating the knight, perhaps aiming for f4.

16.Be3 Qa6 17.Qxa6 bxa6

The queens are off the board. This favors White. Without queens, Black's attacking chances on the kingside are greatly reduced, and Petrosian can focus on his structural advantages: the d5 pawn secures space, and Black's doubled a-pawns are a long-term weakness.

18.Nd1 f5 19.f3 Bh6 20.Bf2

Petrosian calmly repositions. No rush. No fireworks. He is improving each piece methodically while Black struggles to create active play.

20...fxe4 21.fxe4 Bg5 22.Rc1 Bd2 23.Rxc8+ Rxc8

Black has traded a pair of rooks, but White's remaining pieces are better coordinated.

24.Ne3 Bxe3 25.Bxe3 Nf6

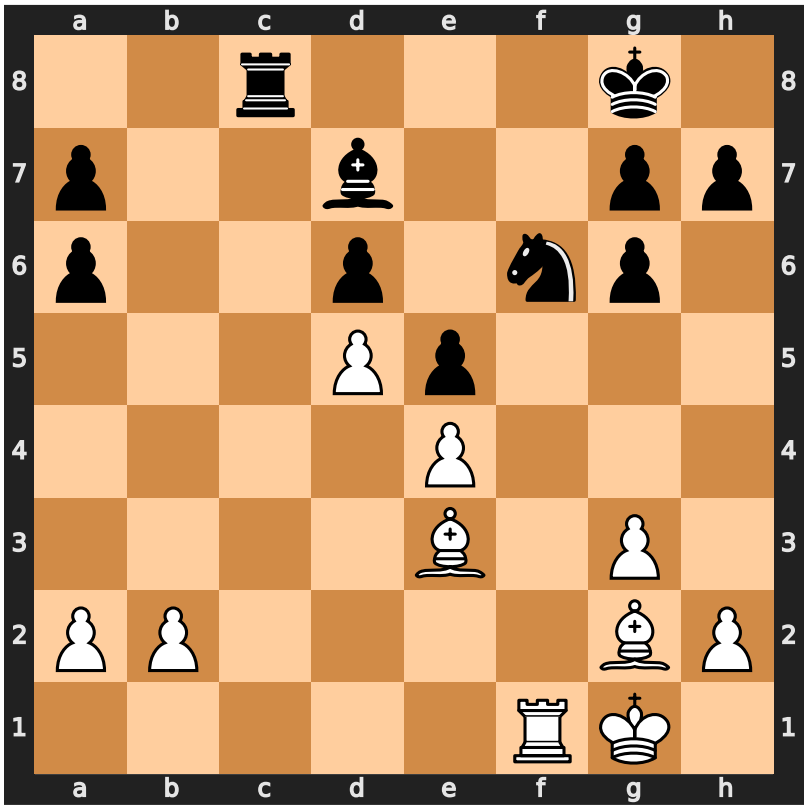

Figure 43.13: Chess Position

Study this position on your board. White's center (d5+e4) is like a wall. Black's pieces are passive. The bishop on d7 has no good diagonal. The knight on f6 is decent but has limited scope. Petrosian's structure does all the work.

26.b4 Rc3 27.Kf2 Ra3 28.Bc1 Rc3 29.Bd2 Ra3 30.a4 Nh5 31.Bc1 Rc3 32.Bd2 Ra3 33.Be1 Nf4 34.Bf1 Nd3+ 35.Bxd3 Rxd3 36.Bf2 a5 37.b5 Rd4 38.a3 Kf7 39.Ra1 Ke7 40.Be3 Rd3 41.Bc1 1-0

Spassky resigned. His position is lost due to the queenside weaknesses and the passivity of his pieces.

Key Lesson: A closed center gives the player with more space the luxury of time. Petrosian used that time to improve every piece, trade what needed trading, and slowly strangle his opponent. If you control the center and close it, you control the game.

43.11.2 Game 36: Korchnoi vs Petrosian

Candidates Match, Moscow, 1974 English Opening (A36) | Result: 1-0

Field	Value
White	Viktor Korchnoi
Black	Tigran Petrosian
Event	Candidates Match
Site	Moscow, 1974
Opening	English Opening (A36)
Result	1-0

Why This Game Is Instructive: Even the greatest defensive player in chess history can be broken when an opponent relentlessly targets the center. Korchnoi demonstrates how persistent central pressure creates opportunities elsewhere. The center determines the wings.

The Moves:

1.c4 g6 2.Nc3 Bg7 3.g3 c5 4.Bg2 Nc6 5.e3 e6

Black is playing a hypermodern setup, fianchettoed bishop, pieces aimed at the center, pawns held back. White chooses a restrained approach with e3 rather than the more ambitious d4.

6.Nge2 Nge7 7.d4 cxd4 8.exd4 d5

Key Moment. The center opens. With d4 and …d5 both played, we have a symmetric pawn structure in the center. But symmetry can be deceptive. It is often the side with the initiative (White, in this case) who benefits more.

9.cxd5 Nxd5 10.O-O O-O 11.Nxd5 exd5

Set up this position. The center now has an isolated d-pawn for each side, White on d4, Black on d5. These symmetrical isolated pawns create a battle for the d4 and d5 squares. The question is: whose isolated pawn is a strength, and whose is a weakness? The answer depends on piece activity.

12.Nf4 Bf5

Petrosian develops the bishop to f5, an active square. But Korchnoi is about to demonstrate the power of centralized pieces.

13.Be3 Qd7 14.Rc1 Rfe8 15.Qb3 Na5 16.Qa4 Qxa4

The queens are exchanged, and now the endgame approaches. In the endgame, the side with the more active pieces and the ability to target the opponent's isolated pawn will prevail.

17.Rxc5 1-0

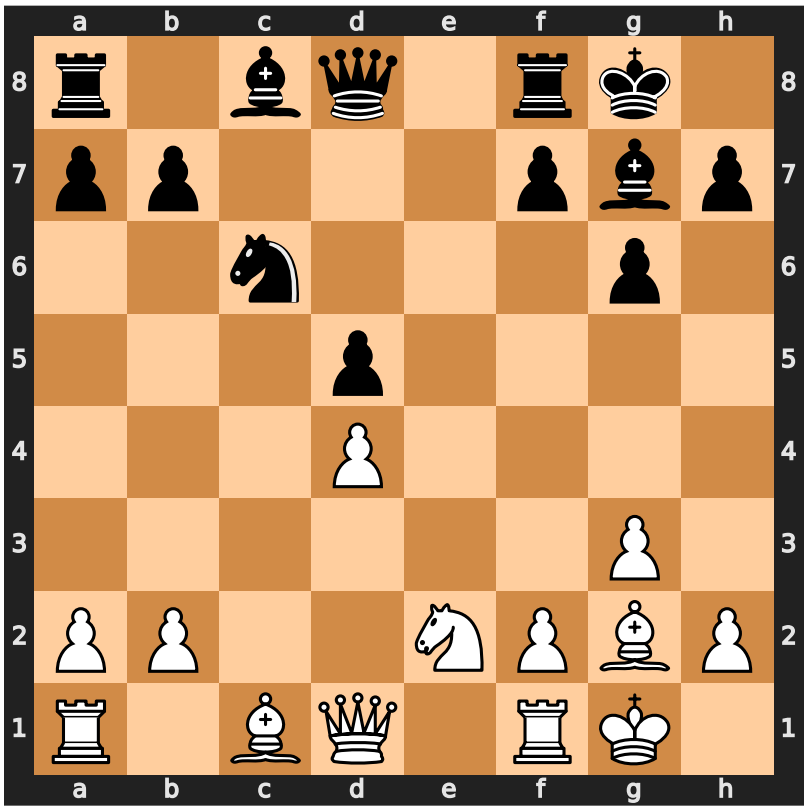

Figure 43.14: Chess Position

Petrosian resigned after Rxc5. White's centralized rook, active knight on f4, and coordinated minor pieces gave Korchnoi a decisive advantage. The d5 pawn was falling, and Black's pieces could not coordinate to defend it.

Key Lesson: Central pawn tension that resolves into symmetric isolated pawns is not truly equal. The side with more active pieces, better-placed knights, bishops on attacking diagonals, rooks on open files, wins the positional battle. Activity matters more than structure in these positions.

43.11.3 Game 53: Petrosian vs Bronstein

Amsterdam Candidates, 1956 Nimzo-Indian Defense (E53) | Result: 1-0

Field	Value
White	Tigran Petrosian
Black	David Bronstein
Event	Amsterdam Candidates
Site	Amsterdam, 1956
Opening	Nimzo-Indian Defense (E53)
Result	1-0

Why This Game Is Instructive: This is Petrosian's prophylactic masterpiece: a perfect demonstration of first restricting the opponent's plans, then improving your own position, and only then attacking. The center remains under White's control throughout, and that control determines everything.

The Moves:

1.d4 Nf6 2.c4 e6 3.Nc3 Bb4 4.e3 c5 5.Bd3 O-O 6.Nf3 d5 7.O-O dxc4 8.Bxc4 Nbd7

The Nimzo-Indian. Black has traded the d5 pawn for White's c4 pawn, clearing the center. The resulting position has a dynamic center: White has d4, Black has …c5 and …e6. The tension on d4 (challenged by …c5) is critical.

9.Qe2 b6 10.d5!

Key Moment. Just as in Game 28, Petrosian plays d5 to close (or semi-close) the center. This pawn advance gains space, opens the a2-g8 diagonal for the bishop on c4, and limits Black's pieces. The center is now decided: White has a mobile d5 pawn that cramps Black's position.

10…exd5 11.Nxd5 Bxd5 12.Bxd5 Qc7

White has a powerful bishop on d5, occupying the center. This bishop controls the long diagonal and restricts Black's knight on d7. Petrosian's center is not defined by pawns here. It is defined by the dominance of a centralized piece.

13.Rd1 Bd6 14.Nd2 Nxd5 15.Qh5 N7f6 16.Qxd5 Rad8 17.Qf3 Be7 18.Nc4

White's pieces are beautifully coordinated. The knight heads to c4, targeting b6 and d6, while the queen controls the a8-h1 diagonal.

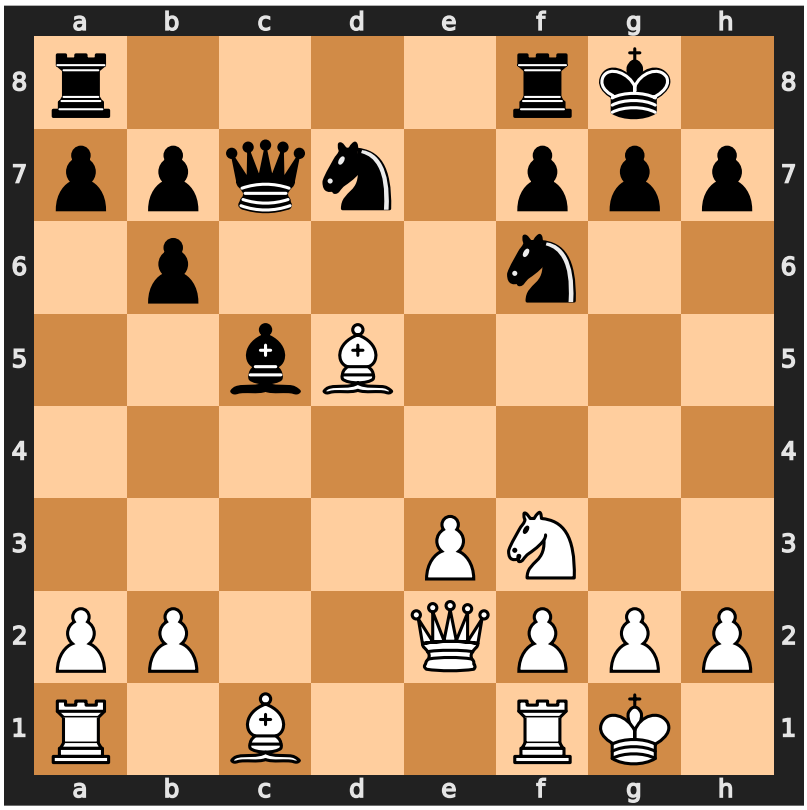

Figure 43.15: Chess Position

18…Nd5 19.b3 Bf6 20.Bb2 Bxb2 21.Nxb2 Rfe8 22.Nc4 Re6 23.Rac1 Qe7 24.a3 Rde8 25.Rd3 h6 26.Rcd1 Nf6 27.b4 cxb4 28.axb4 Ng4 29.Qxg4 1-0

Bronstein resigned. White's queenside pressure, centralized pieces, and superior pawn structure made the position hopeless.

Key Lesson: Prophylactic center control means restricting your opponent first, then improving your own position. Petrosian did not attack until Black had no counterplay. The center was the foundation: once White controlled it, the rest of the board followed.

43.11.4 Game 4 (Supplementary): Nimzowitsch vs Salwe

Karlsbad, 1911 French Defense (C02) | Result: 1-0

Field	Value
White	Aron Nimzowitsch
Black	Georg Salwe
Event	Karlsbad
Site	Karlsbad, 1911
Opening	French Defense (C02)
Result	1-0

Why This Game Is Instructive: This is one of the most famous games in chess history for illustrating the concept of the blockade and the battle for the center. Nimzowitsch, the father of hypermodern chess, shows how a central outpost and a blockading strategy can dominate a game.

The Moves:

1.e4 e6 2.d4 d5 3.e5

White establishes a pawn chain: d4-e5. The center is now semi-closed. White's space advantage on the kingside is balanced by Black's potential to attack the base of the chain with …c5 and eventually …f6.

3…c5 4.c3 Nc6 5.Nf3 Qb6 6.Bd3 Bd7

This is a classic French Defense position. The center is static (d4 vs …d5, e5 fixed). According to our rules, the pawn chain d4-e5 points toward the kingside, so White should attack there. Black's chain …d5-e6 points toward the queenside, so Black should attack there.

7.dxc5 Bxc5 8.O-O f6

Black challenges the e5 pawn, attacking the chain. This is the correct strategic idea, even though it has tactical risks.

9.b4 Be7 10.Bf4 fxe5 11.Nxe5 Nxe5 12.Bxe5 Nf6 13.Nd2

White has traded the e5 pawn but gained a powerful bishop on e5 and excellent development. The d5 pawn is now isolated, and the square d4 is a perfect blockading point.

13…O-O 14.Nf3 Bd6 15.Qe2 Qc7 16.Bd4

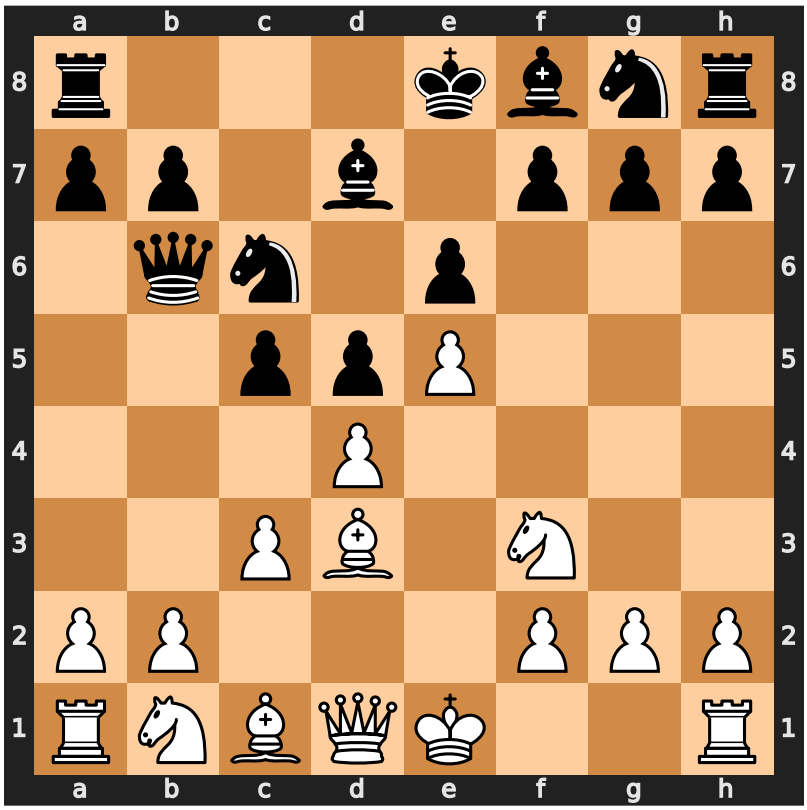

Figure 43.16: Chess Position

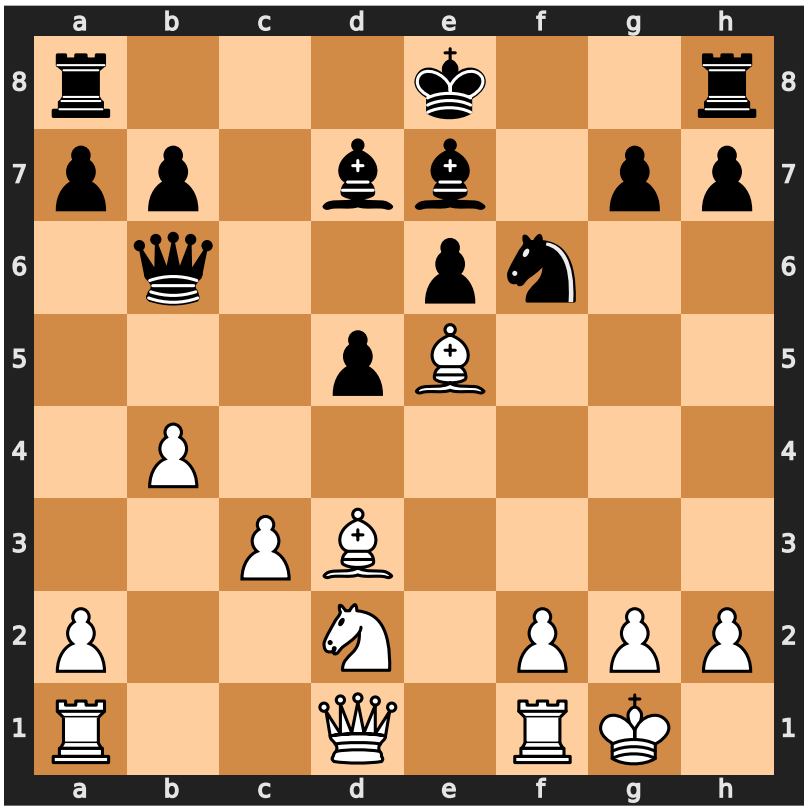

Figure 43.17: Chess Position

Key Moment. The bishop lands on d4. The blockading square. From d4, this bishop controls both central diagonals and prevents Black from ever advancing …d5-d4. The blockade of the isolated pawn is complete.

16…Ne4 17.Ne5! Bxe5 18.Bxe5 Qc5 19.Bxe4 dxe4 20.Qxe4

White has won the d5 pawn and dominates the center. The game continued:

20…Rxf2 21.Qe5 Bc6 22.a4 Raf8 23.Rxf2 Rxf2 24.b5 Bd7 25.Qd6 1-0

Salwe resigned. White's central domination, achieved through the blockade and the powerful bishop, was decisive.

Key Lesson: A central outpost, especially the square in front of an isolated or backward pawn, is one of the most powerful tools in chess. Nimzowitsch built an entire philosophy around this idea. When you occupy the center with a well-placed piece, you control the game.

Rest here if you want. Four master games is a lot of chess. Let the ideas settle before tackling the exercises.

43.12 Exercises

Exercise Section: ~90 minutes for all 30 exercises (or ~25 minutes for the ADHD Quick Start set: Exercises 1, 5, 11, 18, 25)

Each exercise includes a diagram position (set up the FEN on your physical board), a difficulty rating, a time estimate, and three progressive hints. Solutions appear at the end of this volume.

The exercises are grouped into five sections matching the chapter's structure.

43.12.1 Section A: Identify the Center Type (Exercises 15.1 – 15.6) –

For each position, identify whether the center is static, dynamic, or open, and state which side benefits from the current center structure.

Exercise 15.1 ~1 min

White to assess. What type of center is this? Who benefits and why?

Hint 1: Look at the central pawns. Are they locked, in tension, or exchanged? *Hint 2:* Both sides have one pawn in the center. They face each other. *Hint 3:* The e-pawns are symmetrically placed. Is the center settled?

Solution: The center is **dynamic.** White has e4, Black has e5. Neither pawn is locked, White could play d4 to challenge, and Black might play …d5 under certain circumstances. The center is not yet resolved. White benefits slightly because White can prepare d4, the classical central break, while Black must react.

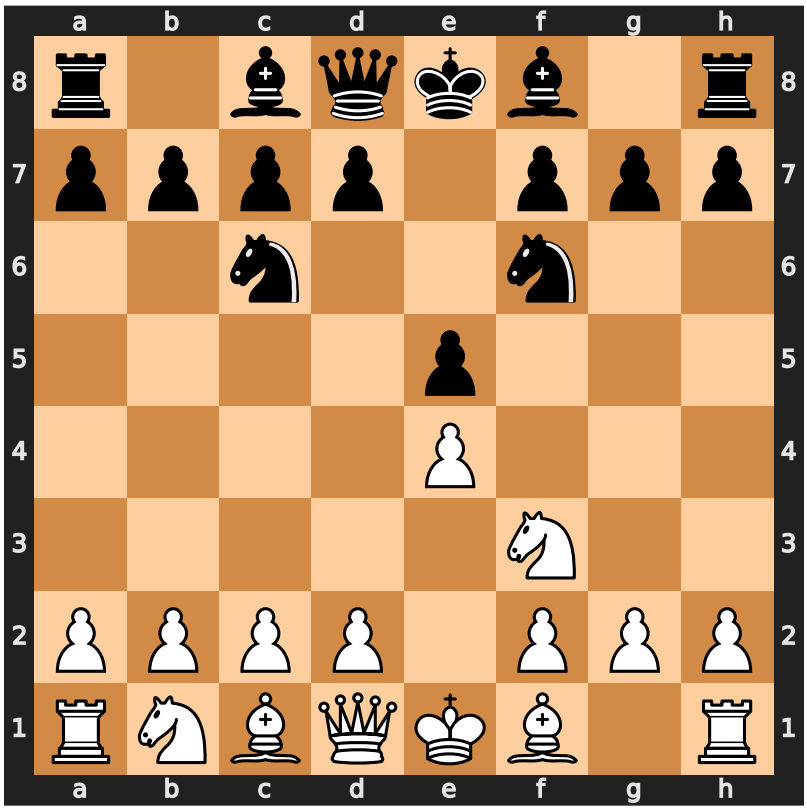

Figure 43.18: Chess Position

Why this works: Recognizing a dynamic center tells you to think about timing. The first player to resolve the tension favorably gains the advantage. In this position, White's initiative (first move) makes it easier to prepare d4.

Exercise 15.2 ~2 min

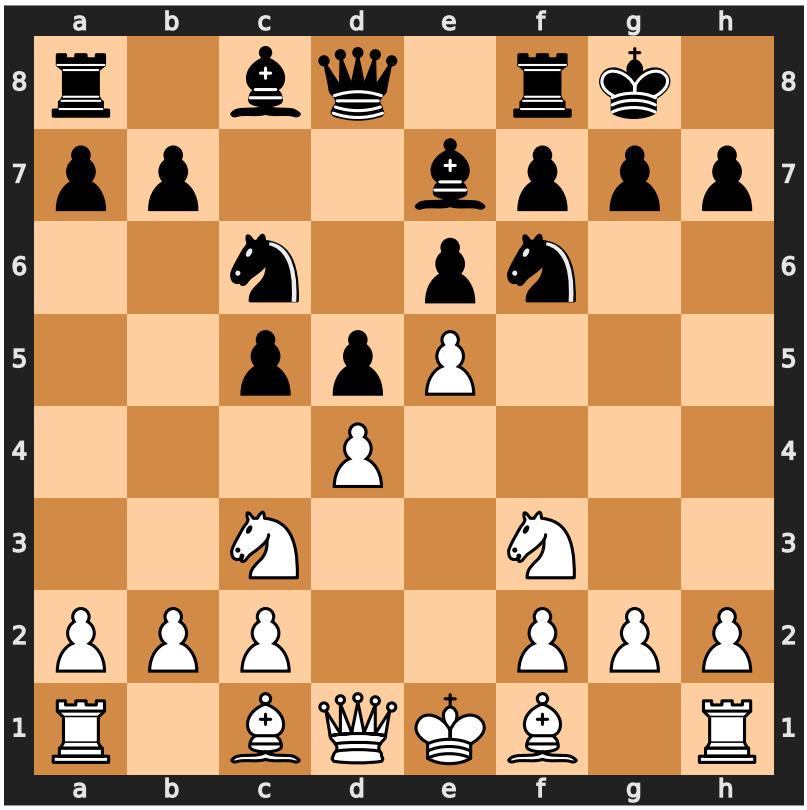

Figure 43.19: Chess Position

White to assess. Static, dynamic, or open? What does the center tell you about the plans for both sides?

Hint 1: White has an advanced e5 pawn. Is it going to move soon? *Hint 2:* Black has …c5 hitting d4. Is there tension? *Hint 3:* The e5 pawn is fixed, but d4 is under pressure. It is partly static, partly dynamic.

Solution: The center is **semi-static with dynamic tension.** The e5 pawn is fixed and will not move. But d4 is under pressure from …c5. If Black captures …cxd4, the center structure changes significantly. White's plan: support d4 (with Be3 or maintain it) and attack the kingside (the chain d4-e5 points that way). Black's plan: challenge d4 with …cxd4 or prepare …f6 to undermine e5.

Why this works: A center that is "partly locked, partly fluid" demands both patience (on the stable side) and alertness (on the fluid side). White must watch d4 while preparing the kingside attack.

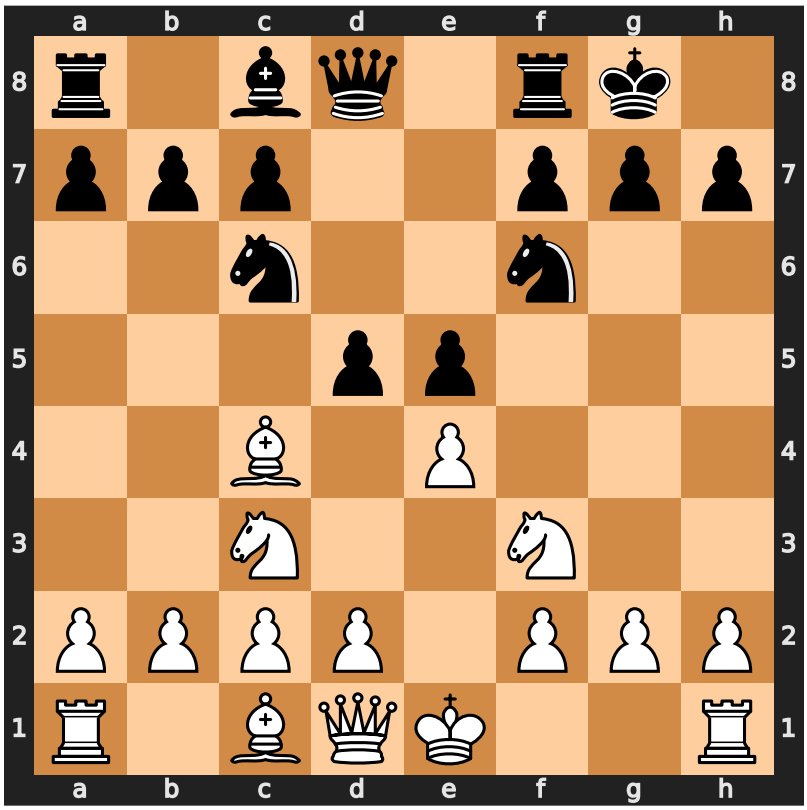

Figure 43.20: Chess Position

Exercise 15.3 ~2 min

White to assess. What type of center? What is the critical decision White faces?

Hint 1: White has e4. Black has d5 and e5. What are White's options? *Hint 2:* Should White capture on d5? Advance e5? Or maintain the tension? *Hint 3:* Consider what happens after exd5, e5, or a developing move like d3.

Solution: The center is **dynamic.** There is maximum tension: White's e4 faces Black's d5, and Black's e5 faces White's potential d4. White's critical decision: exd5 (trading and simplifying), e5 (advancing but potentially losing central control later), or a developing move like d3 or O-O (maintaining tension). The strongest approach is usually to maintain the tension with a developing move, keeping all options open.

Why this works: In a dynamic center, the player who resolves tension prematurely often helps the opponent. By maintaining the tension, White forces Black to keep worrying about multiple scenarios.

Exercise 15.4 ~2 min

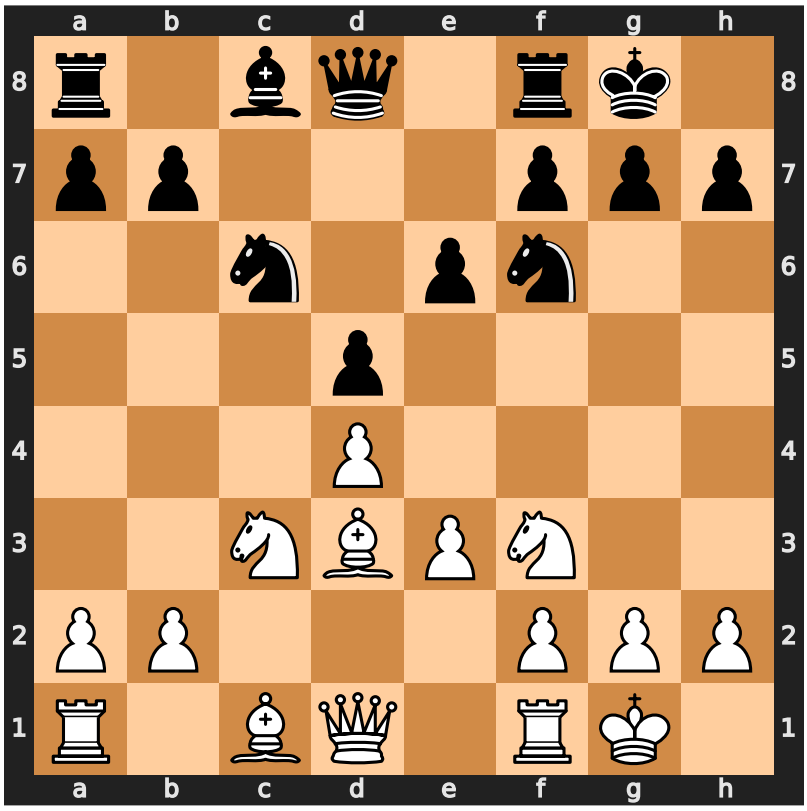

Figure 43.21: Chess Position

White to assess. The d-pawns face each other on d4 and d5. Is this center static, dynamic, or open?

Hint 1: Can either d-pawn advance without being captured? *Hint 2:* What would happen if White plays e3-e4? *Hint 3:* The center is stable for now, but either side can break it open.

Solution: The center is **static with break potential.** The d4 and d5 pawns are locked against each other, neither can advance without immediate capture. However, White can prepare the e3-e4 break to challenge d5, and Black can prepare …e6-e5 or …c5 to challenge d4. The center is stable now, but both sides should be planning their pawn breaks. This is a Carlsbad-type structure where long-term planning (minority attack for White, kingside play for Black) is the correct approach.

Why this works: Recognizing that a stable center can be broken open is critical. It means you should prepare for the break, develop pieces to support it, while keeping your current position solid.

Exercise 15.5 ~3 min

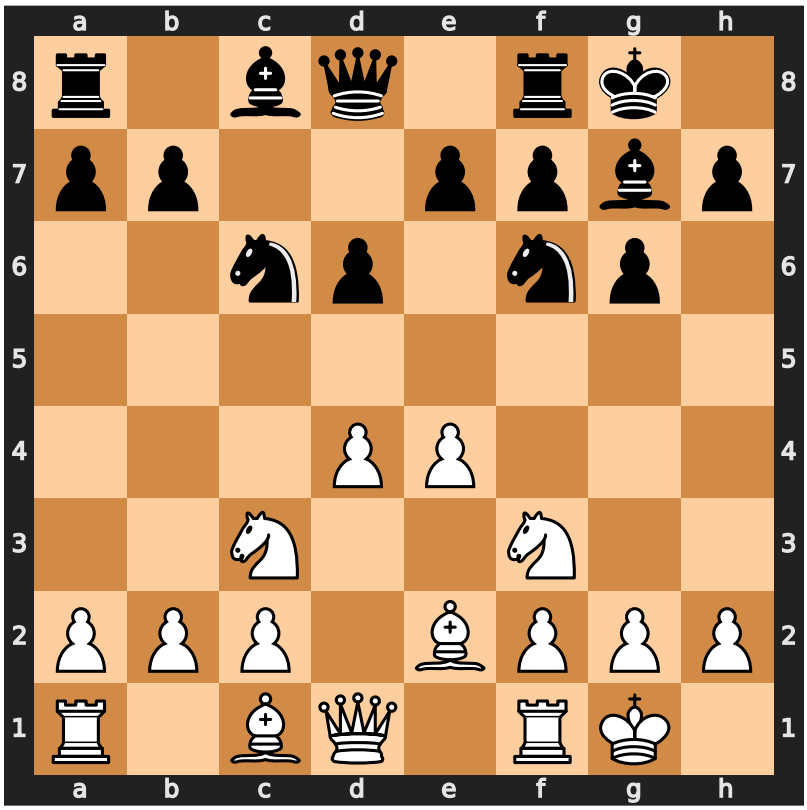

Figure 43.22: Chess Position

White to assess. What type of center does White have? What are White's and Black's plans based on the center?

Hint 1: White has a classical d4+e4 center. Is Black challenging it? *Hint 2:* Black can play …e5 or …c5 to challenge. Which is more likely in this structure? *Hint 3:* This resembles a King's Indian or Pirc structure. What do you know about those plans?

Solution: White has a **classical center** (d4+e4) that is currently stable but can be challenged. This is a Pirc/King's Indian type of structure. Black's main plan is …e5 (challenging the center directly) or …c5 (hitting d4 from the flank). White's plan: maintain the center and prepare an attack (kingside with f4 or queenside with c4-c5 depending on what Black does). The center type is **dynamic**: both sides will fight over whether it stays or transforms.

Why this works: A classical center is strong but also a responsibility. If Black successfully challenges it, White's advantage disappears. White must develop quickly and decide whether to maintain, advance, or trade.

Exercise 15.6 ~2 min

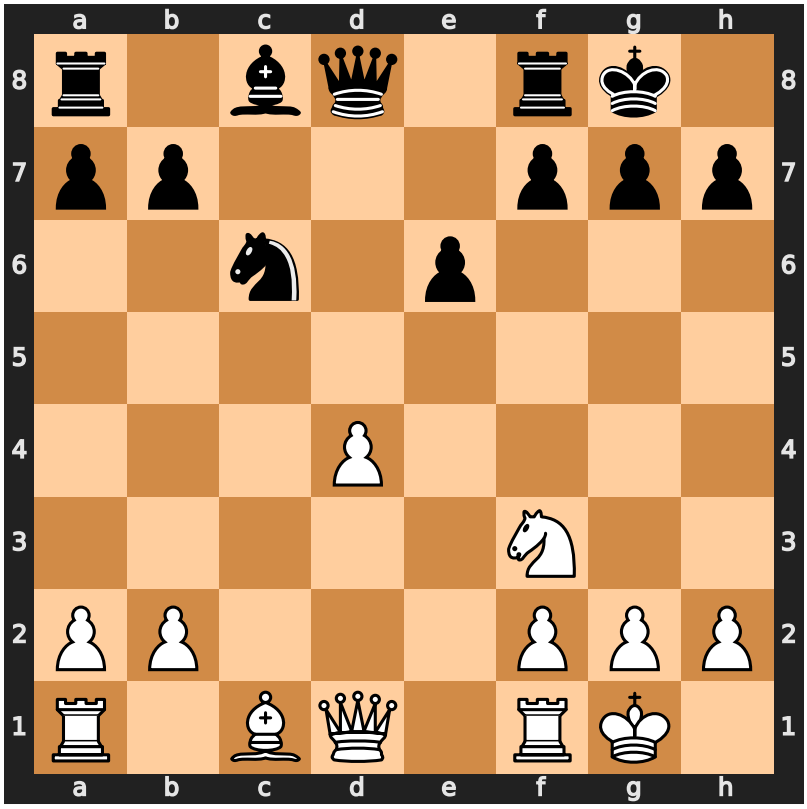

Figure 43.23: Chess Position

White to assess. The center has mostly been clarified. What type is it now, and what does White need?

Hint 1: Only White has a d-pawn. Black has no central pawns except on e6. *Hint 2:* Is the center open, closed, or something else? *Hint 3:* White has a central pawn majority. How should White use it?

Solution: The center is **open with a White pawn advantage.** White's d4 pawn is the only central pawn. The d-file and e-file are open or half-open. White's advantage is the central pawn. It controls c5 and e5. White should use this pawn to restrict Black and look for a d4-d5 advance at the right moment. Piece activity on the open central files (Rd1, Qd2, or Qe2) is critical.

Why this works: An open center with a pawn advantage means piece activity is paramount. The side with the central pawn and more active pieces will dominate.

43.12.2 Section B: Capture, Advance, or Maintain? (Exercises 15.7 – 15.12)

In each position, you face a decision about central pawn tension. Choose the best option and explain why.

Exercise 15.7 ~3 min

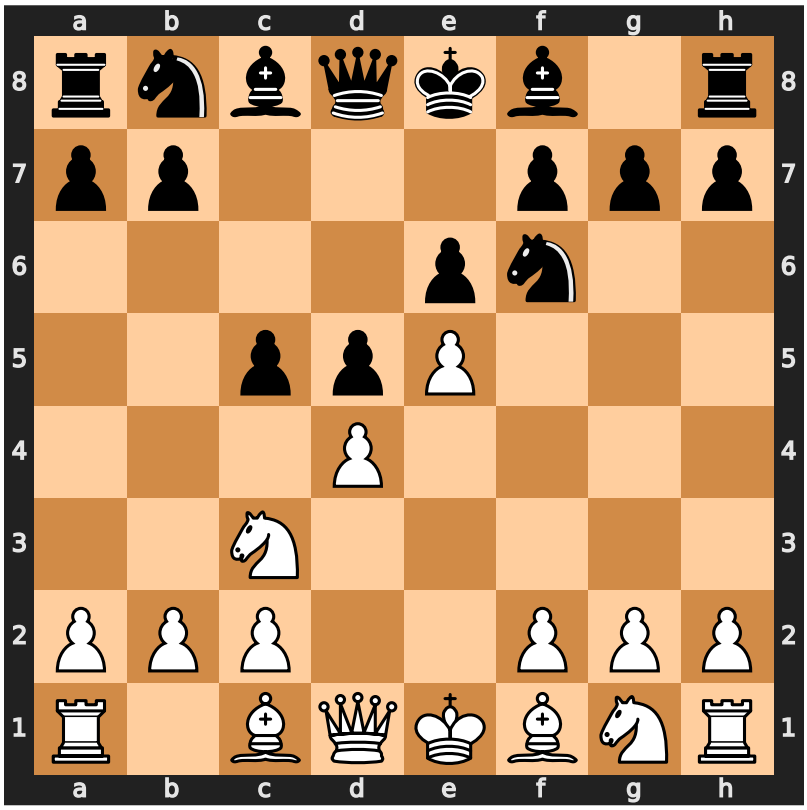

Figure 43.24: Chess Position

White to move. The e5 pawn is advanced and Black is pressuring d4 with …c5. Should White capture (dxc5), advance (d5), or maintain?

Hint 1: What happens after dxc5? Does White want to trade the d4 pawn? *Hint 2:* What happens after d5? Does this help or hinder White? *Hint 3:* Consider a developing move that keeps the tension alive.

Solution: Maintain with a developing move like **f4** (supporting e5) or **Nf3** (developing). Capturing dxc5 gives up the strong d4 pawn for a flank pawn on c5 that Black will recapture anyway. Advancing d5 closes the center but makes e5 harder to support and gives Black the c5 square. Maintaining the tension forces Black to keep worrying about d5 while White develops. The tension is White's friend here.

Why this works: White's d4 pawn supports e5, which is White's biggest asset. Giving up d4 (via capture or advance) undermines the whole structure. Maintaining keeps the pressure on.

Exercise 15.8 ~3 min

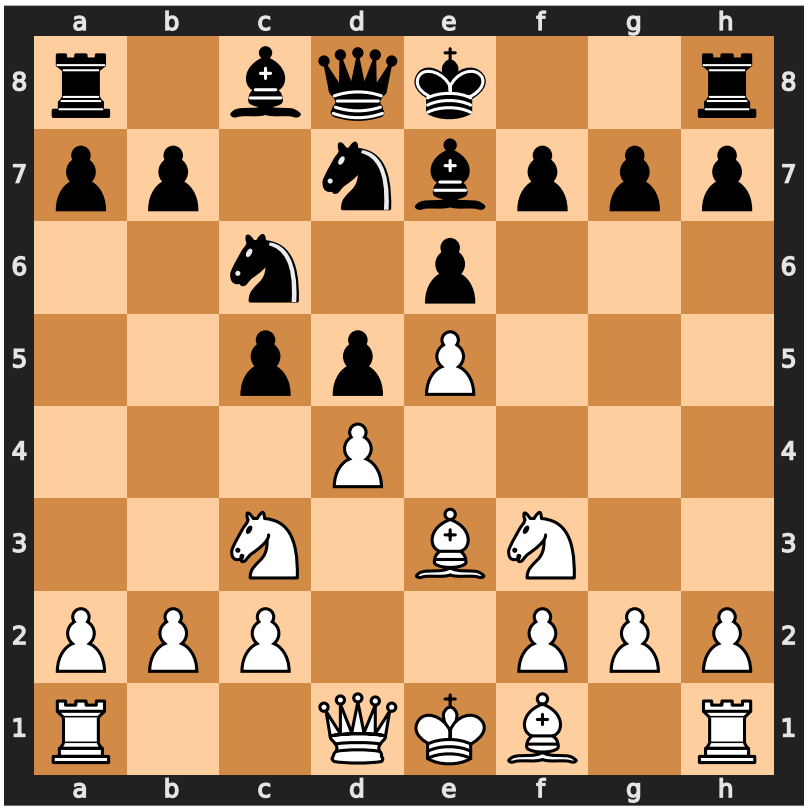

Figure 43.25: Chess Position

White to move. Black has developed pieces and is ready to capture on d4. Should White play dxc5, advance d5, or maintain?

Hint 1: Black is about to play …cxd4. Should you preempt this? *Hint 2:* If White plays dxc5, Black recaptures and the d4 square is gone. Is that good for White? *Hint 3:* Consider whether closing the center with d5 gives White a clear plan.

Solution: Advance with d5. In this position, Black is well-prepared to capture on d4, which would relieve the pressure. By playing d5, White closes the center, fixes the pawn structure, and gains a clear plan: kingside attack. The chain d5-e5 points toward the kingside. White can now play f4, g4, and maneuver pieces toward Black's king. This is the plan Petrosian used repeatedly.

Why this works: When your opponent is about to resolve the tension favorably (by capturing your central pawn), it is often better to resolve it yourself on your own terms. D5 creates a permanent space advantage and a clear attacking direction.

Exercise 15.9 ~3 min

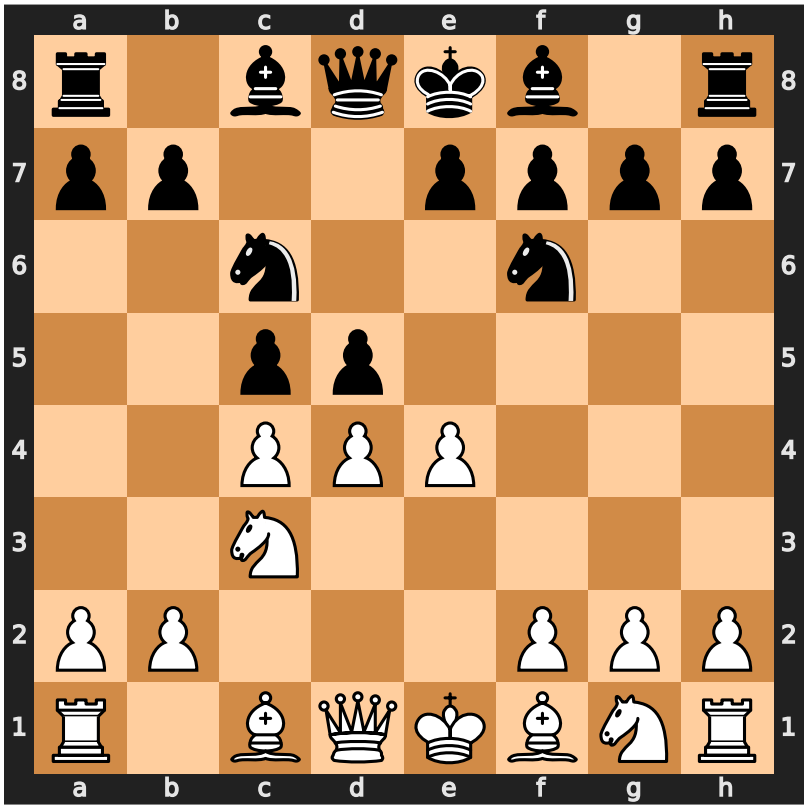

Figure 43.26: Chess Position

White to move. Two central tensions exist: c4 vs d5 and e4 vs d5. What should White do?

Hint 1: If cxd5, what recapture does Black have and how does it change the structure? *Hint 2:* If exd5, the pawn goes to d5, is that strong or is it a target? *Hint 3:* Consider taking with one pawn and leaving the other tension alive.

Solution: Capture with cxd5. After cxd5, if Black plays …Nxd5, White has a strong e4 pawn and an open c-file. If …exd5 (less common here due to the pawn structure), White gets the Carlsbad structure with excellent play. Taking with cxd5 keeps e4 alive as a strong central pawn while opening the c-file for the rook. This is better than exd5 (which creates an isolated d-pawn) or maintaining (which lets Black equalize with …dxe4).

Why this works: When you have two tensions, resolving one while keeping the other is often the strongest approach. It reduces complexity on your terms while preserving your most valuable central asset.

Exercise 15.10 ~3 min

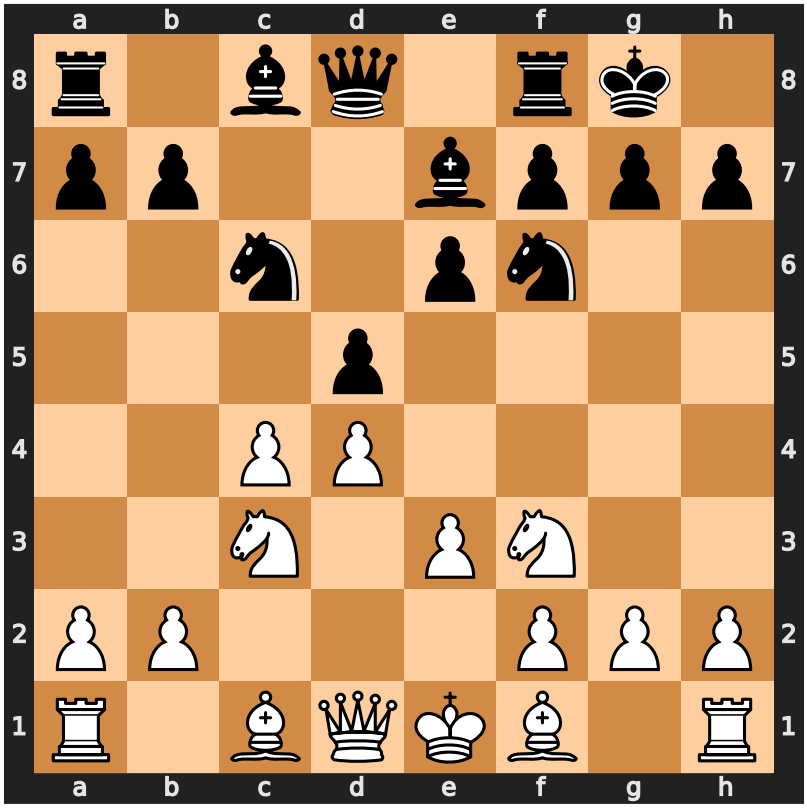

Figure 43.27: Chess Position

White to move. The c4 pawn faces the d5 pawn. Should White capture, advance (c5), or maintain?

Hint 1: If cxd5, how does Black recapture? Nxd5 or exd5? *Hint 2:* If c5, the pawn advances past d5. Does this help White? *Hint 3:* What does a quiet developing move like Bd3 accomplish?

Solution: Maintain with **Bd3**. Capturing cxd5 allows …exd5 (Carlsbad, acceptable but not necessary yet) or …Nxd5 (giving Black a strong central knight). Advancing c5 gains queenside space but surrenders all influence on d5, which becomes a magnificent outpost for Black. Maintaining with Bd3 develops a piece, prepares O-O, and keeps the tension. White can choose to capture or advance later, once development is complete.

Why this works: "Maintain" is often correct when neither capture nor advance gives a clear

advantage, and you still have useful developing moves available. Bd3 does something useful while keeping all central options open.

Exercise 15.11 ~3 min

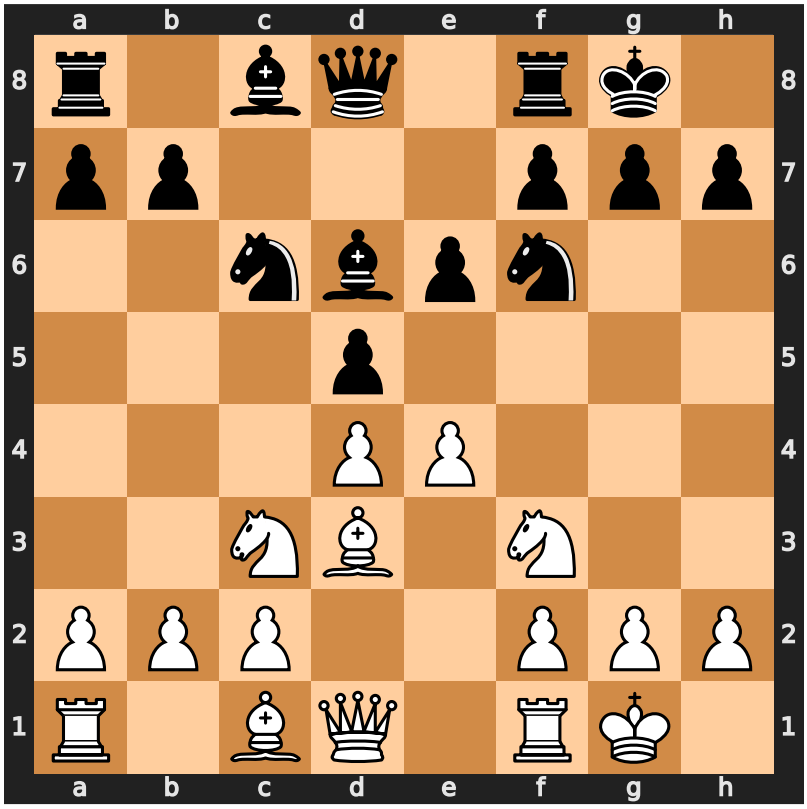

Figure 43.28: Chess Position

White to move. Central tension between e4 and d5. The center will define the whole game. What should White do?

Hint 1: If e5, White gains space but the d5 square becomes very strong for Black. *Hint 2:* If exd5, the structure simplifies. Is the resulting position good for White? *Hint 3:* Consider e5 or exd5, which one creates a position you know how to play?

Solution: Both **e5** and **exd5** are reasonable; the choice depends on your style. **e5** creates a French-type structure where White has kingside space and a clear plan (f4, Qg4, kingside attack), but Black gets the strong d5 square. **exd5 exd5** creates a Carlsbad structure where White plays the minority attack (a4-b4-b5). For club players, **exd5** is often simpler to play because the Carlsbad plan is concrete and well-known. But e5 is equally valid if you are comfortable with the French-type positions from this chapter.

Why this works: This exercise has two correct answers, and that is the lesson. The center is not always about finding one "best" move. It is about understanding the resulting position and choosing the one that suits your abilities.

Exercise 15.12 ~3 min

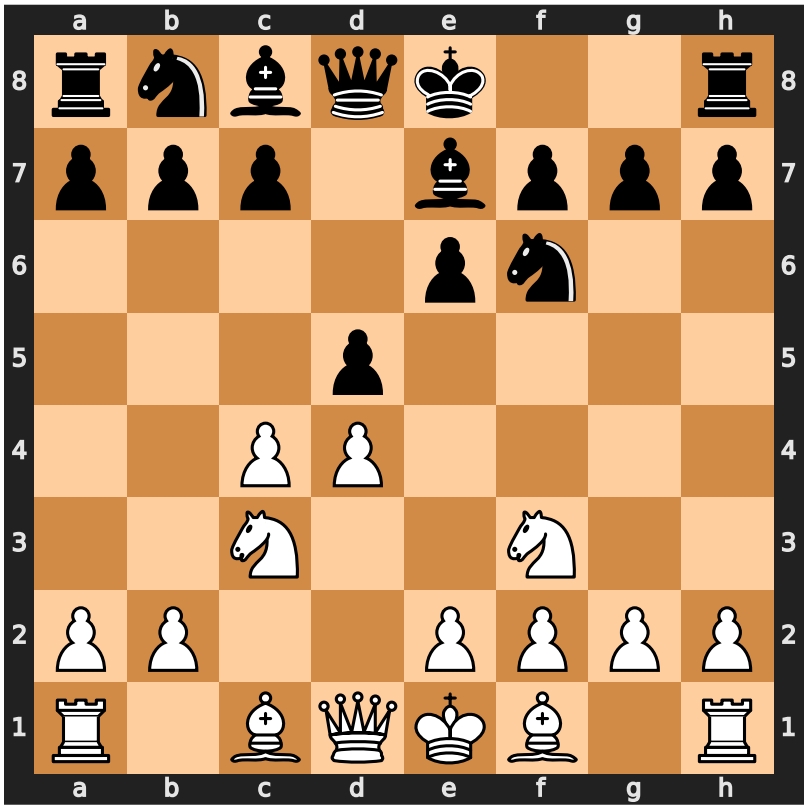

Figure 43.29: Chess Position

White to move. This is a Queen's Gambit position. Should White take on d5 now?

Hint 1: If cxd5 exd5, what is the resulting structure? Is it favorable? *Hint 2:* If cxd5 Nxd5, Black gets a centralized knight. Is that good for White? *Hint 3:* What developing moves does White have instead?

Solution: Maintain with **Bg5** or **e3**. Capturing cxd5 exd5 creates a symmetric Carlsbad structure where White has a slight edge but nothing dramatic. Capturing cxd5 Nxd5 gives Black an excellent knight and frees Black's position. Instead, Bg5 pins the knight and adds pressure to d5, while e3 solidifies the center and prepares Bd3. Maintaining the tension forces Black to worry about cxd5 while White develops freely.

Why this works: In the Queen's Gambit, White's c4 pawn creates tension that Black must constantly respect. Resolving it too early is a strategic concession. You are giving up your best tool for pressure.

You have completed 12 exercises. Take a break. Stretch. Get some water. The next section introduces more challenging positions.

43.12.3 Section C: Space and Hypermodern (Exercises 15.13 – 15.18) –

These exercises test your understanding of space advantage and hypermodern center control.

Exercise 15.13 ~3 min

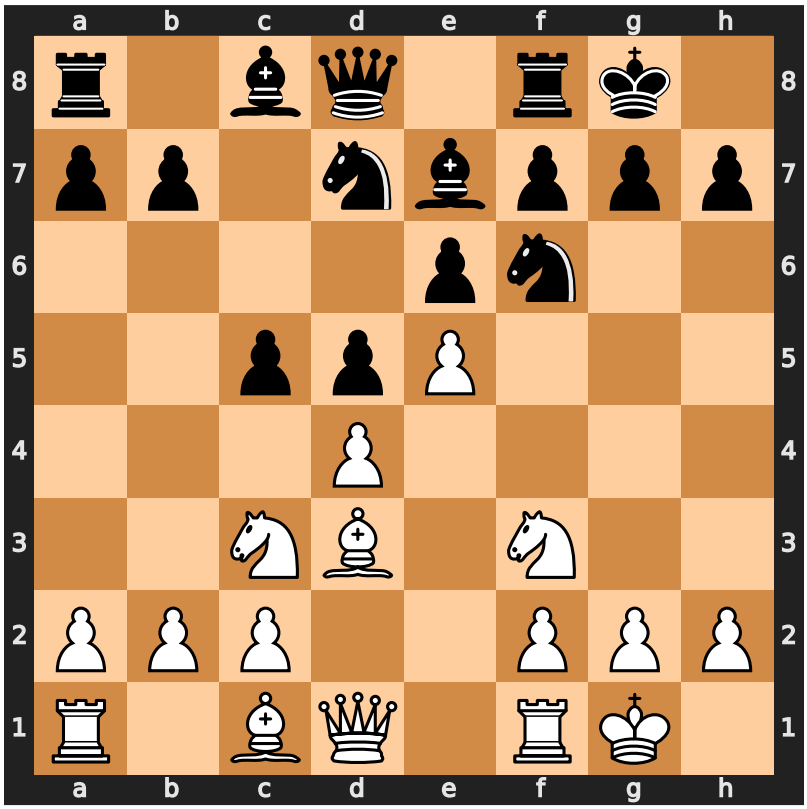

Figure 43.30: Chess Position

White to move. White has a space advantage with e5. How should White use it?

Hint 1: White has more space on the kingside. Where should the attack go? *Hint 2:* Consider f4 to support e5 and prepare f5. *Hint 3:* How can White restrict Black's counterplay on the queenside?

Solution: White should play **f4** to reinforce e5 and prepare a kingside attack with f5. After f4, the e5 pawn is rock-solid, and White can aim for f5 to crack open Black's kingside. White should also watch …c4 (Black's queenside counter). If …c4, White plays Bc2 and the queenside push stalls. The space advantage gives White more room to maneuver and reroute pieces to the kingside: Qe1-h4, Rf3-h3, or Ng5 are common motifs.

Why this works: A space advantage is maximized by keeping pieces on the board and opening lines toward the cramped side. F4 does both. It supports the advanced pawn and prepares to open the f-file.

Exercise 15.14 ~3 min

Black to move. White has a big space advantage with e5 and f4. How should Black fight back?

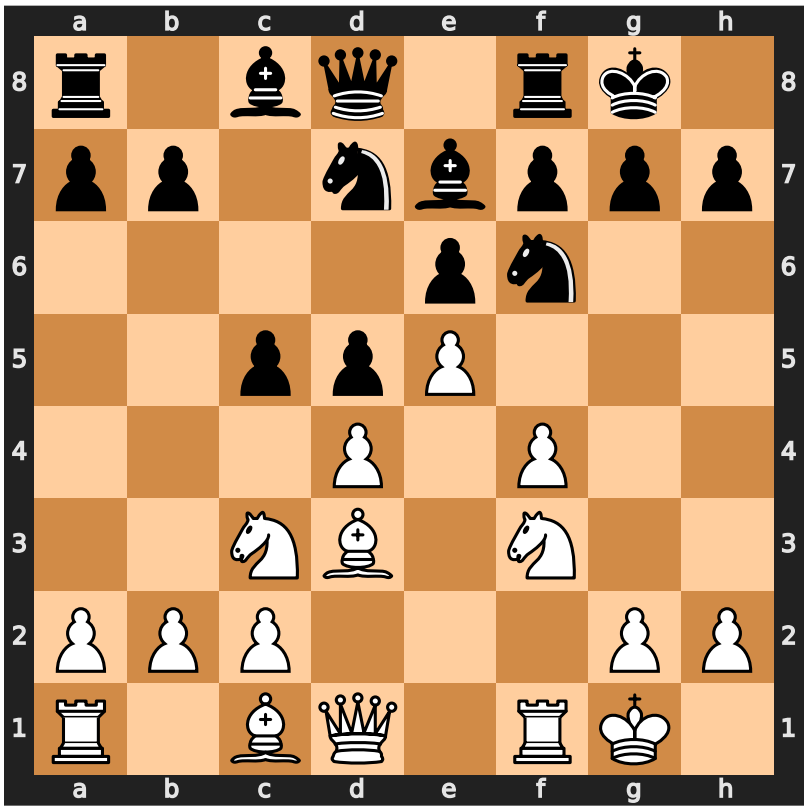

Figure 43.31: Chess Position

Hint 1: Black is cramped. What is the best way to fight a space advantage? *Hint 2:* Exchanges relieve the cramping. Which pieces should Black trade? *Hint 3:* The …c4 push gains queenside space. Is it the right moment?

Solution: Black should prepare exchanges and challenge the center. The immediate priorities: (1) **...cxd4** to open lines and trade a central pawn, or (2) **...f6** to challenge e5 directly. If …f6 exf6 Bxf6, Black opens the f-file and gains breathing room. Black should also seek to trade knights (…Nf8-g6 exchanging a knight on g5 if White plays one there). Every piece trade makes the space advantage less relevant.

Why this works: The antidote to a space advantage is piece exchanges and central challenges. Black must not sit passively. That allows White to build up an overwhelming attack.

Exercise 15.15 ~5 min

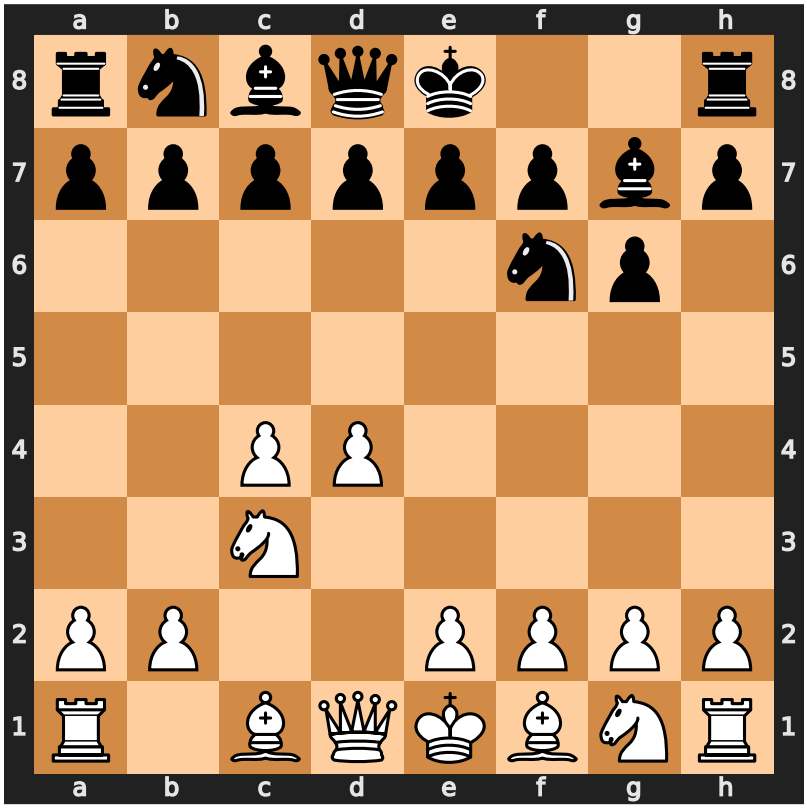

Figure 43.32: Chess Position

White to move. Black has fianchettoed the king's bishop. How should White handle the center? Classical approach or hypermodern? Why?

Hint 1: White has c4 and d4: a classical center. Black has no central pawns yet. *Hint 2:* Black's bishop on g7 will pressure d4 if the center opens. *Hint 3:* Should White play e4 (maximum center) or e3 (modest center)?

Solution: White should play **e4** for the full classical center. Against a fianchetto setup, the strong center (d4+e4) is White's best weapon. The bishop on g7 will indeed pressure d4, but White

can defend it with Be3, Nf3, and f3 if needed. The alternative e3 is too modest. It allows Black to achieve …d5 easily, equalizing. With e4, White controls more space, and if Black ever plays …d6+…e5, White can respond with d5, gaining a permanent space advantage.

Why this works: Against hypermodern setups, the classical response is often strongest: build the big center and dare the opponent to prove it is overextended. If they cannot, you have a lasting advantage.

Exercise 15.16 ~5 min

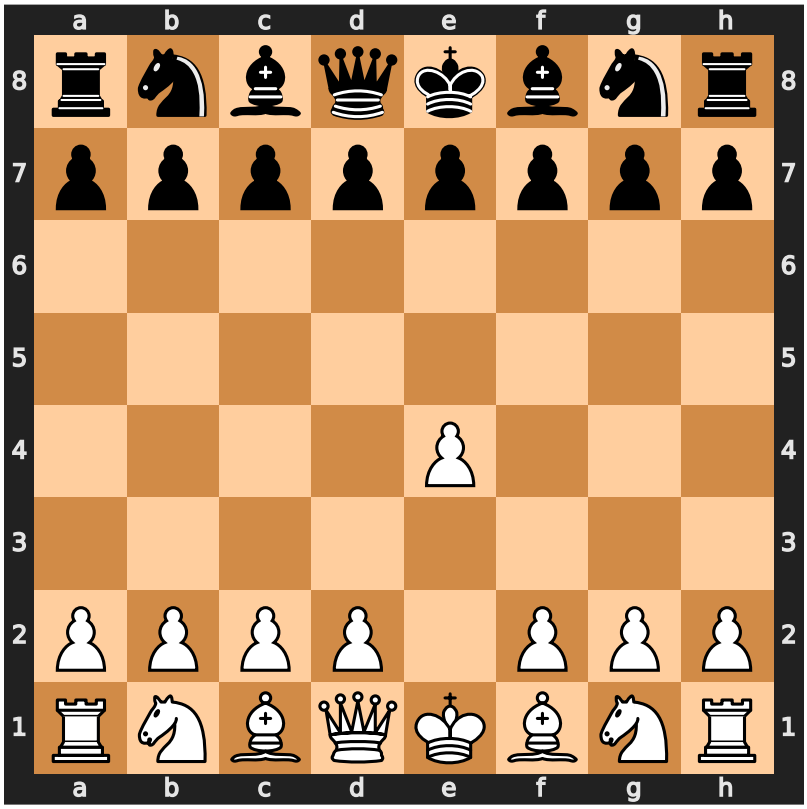

Figure 43.33: Chess Position

Black to move. This is the starting position after 1.e4. Black must decide: classical response (…e5) or hypermodern (…g6, …Nf6, …c5)? What are the trade-offs?

Hint 1: Classical 1…e5 contests the center immediately. What does Black gain? *Hint 2:* Hypermodern 1…g6 delays center occupation. What does Black gain? *Hint 3:* Consider what happens in each case when White plays d4.

Solution: Both approaches are valid. **1...e5** (classical) immediately contests the center and prevents White from building a d4+e4 center easily. The trade-off: Black's pawn is committed early, and some lines lead to open, tactical positions. **1...g6** (hypermodern) prepares the fianchetto, letting White build a center and then challenging it. The trade-off: White gets to choose how big to make the center, and if Black does not challenge it quickly, White can gain a significant space advantage. **1...c5** (Sicilian, somewhat hypermodern) challenges d4 from the flank. The trade-off: asymmetric play, often leading to sharp positions.

Why this works: There is no single "correct" approach to the center. Understanding the trade-offs lets you choose the strategy that matches your style and knowledge.

Exercise 15.17 ~5 min

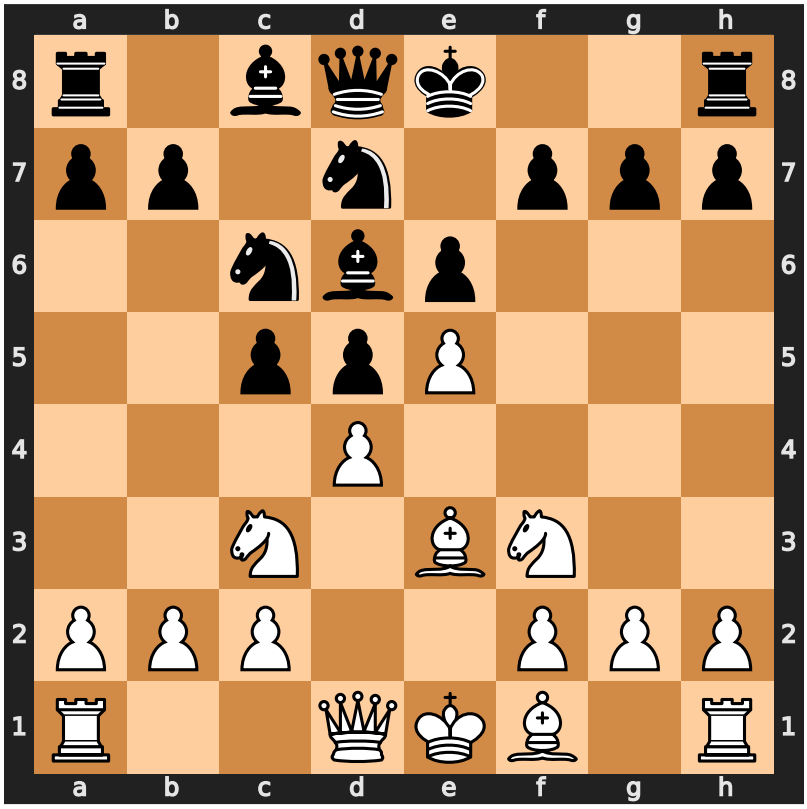

Figure 43.34: Chess Position

White to move. White has e5 and d4. Black has …c5 and …d5. This is a French Defense structure. What is White's kingside attacking plan based on the pawn chain?

Hint 1: The chain d4-e5 points toward the kingside. Follow the chain. *Hint 2:* White wants to play f4-f5 eventually. How should White prepare this? *Hint 3:* What role does the bishop on e3 play in the attack?

Solution: White's plan: (1) **Castle kingside** or queenside depending on the position. In many French structures, queenside castling is aggressive. (2) Play **f2-f4** to support e5 and prepare the f5 break. (3) After castling, reroute the knight: Nf3-d2-f3 (or Ng5 if the king is castled short). (4) Play **f4-f5** to attack the base of Black's chain at e6. After f5, if …exf5, White recaptures and opens the f-file toward Black's king. (5) The bishop on e3 guards d4 and can reroute to g5 or h6 in some lines. This is the classic French attack, follow the chain to the kingside.

Why this works: Nimzowitsch's principle of attacking where the chain points is one of the most reliable guidelines in chess. The chain d4-e5 creates a wall on the kingside and points White's energy toward Black's king.

Exercise 15.18 ~5 min

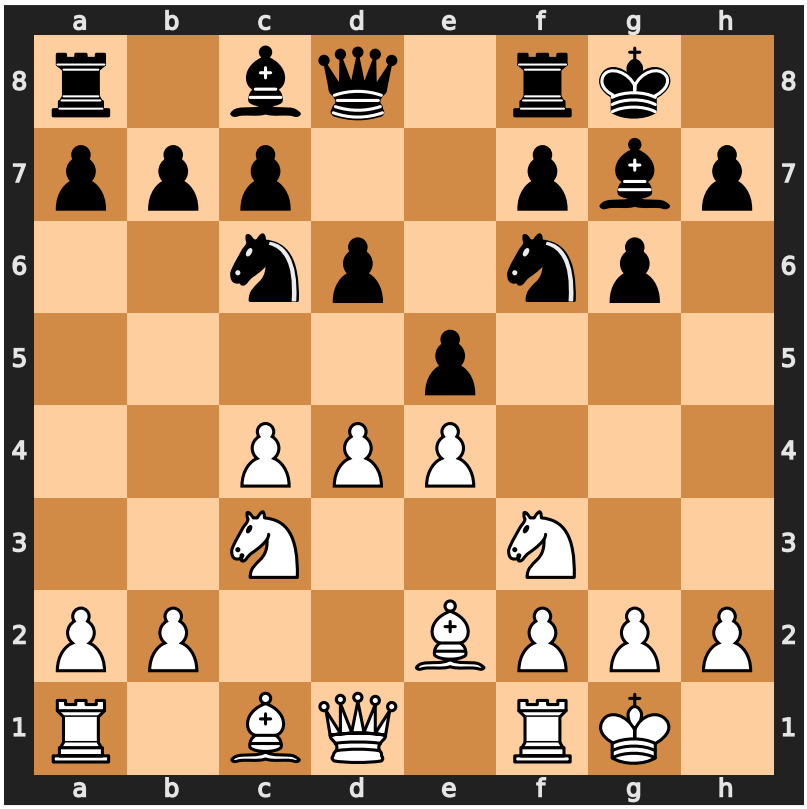

Figure 43.35: Chess Position

White to move. Black has set up a King's Indian formation with …e5. What is the consequence of …e5 for the center, and what should White do?

Hint 1: If White plays d5, the center closes. Who does that favor? *Hint 2:* If White plays dxe5, the center opens. Who does that favor? *Hint 3:* Consider d5, and then plan based on the closed center.

Solution: White should play **d5**, closing the center. After d5, the center is static: d5 vs …e5. The d5 pawn gains space on the queenside, and White's plan is the queenside attack with c5 (prepared by a3, Rb1, b4). Black's plan is the kingside attack with …f5 (prepared by …Nd7, …f5, …Nf6, …f4). This is the fundamental King's Indian battleground. White must execute the c5 break faster than Black executes the f5 break. Alternatively, dxe5 dxe5 opens the position, but the g7 bishop comes alive on the long diagonal, which typically favors Black. For most club players, d5 leads to a more structured, plannable position.

Why this works: When Black plays …e5 in the King's Indian, White almost always responds with d5. The resulting closed center creates a race between queenside and kingside attacks: a race White often wins at the club level because the queenside play is more concrete and easier to execute.

43.12.4 Section D: Pawn Breaks (Exercises 15.19 – 15.24) –

Find the correct pawn break and explain why it works.

Exercise 15.19 ~3 min

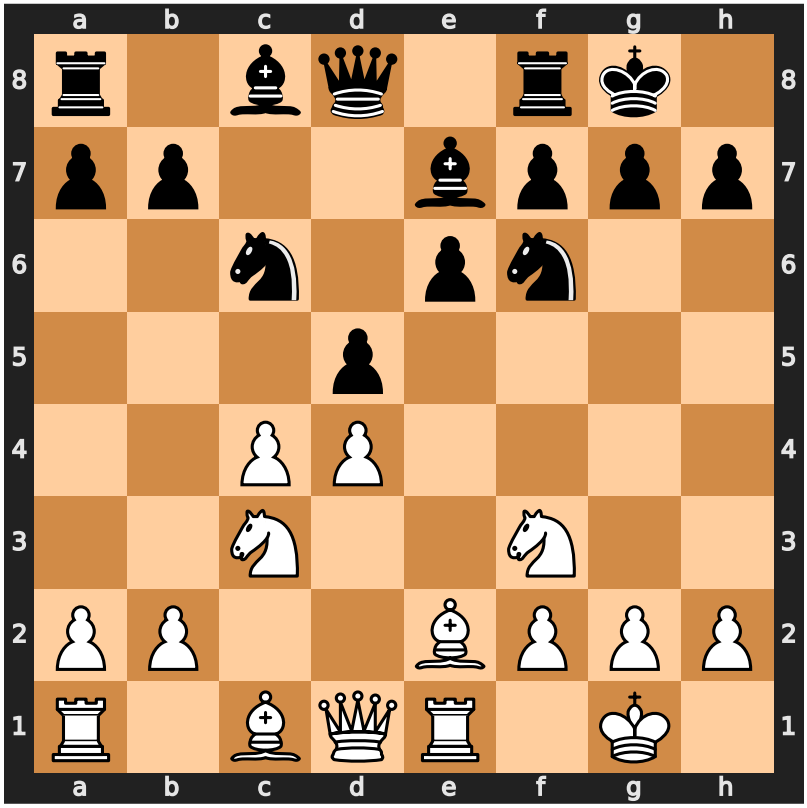

Figure 43.36: Chess Position

White to move. Find the correct central pawn break.

Hint 1: White has c4 and d4. Black has d5 and e6. What breaks are available? *Hint 2:* Consider cxd5 followed by e4. *Hint 3:* The sequence cxd5 exd5, then e4, challenges Black's entire center.

Solution: White plays **cxd5 exd5** (or …Nxd5), followed by **e2-e4**. This is the classic two-step break in Queen's Gambit positions. After cxd5 exd5 e4, White challenges Black's d5 pawn and opens the center. If …dxe4 Nxe4, White has a powerful centralized knight. If Black avoids the exchange, White has more space. The key is that cxd5 first removes a defender of the center before the e4 advance.

Why this works: Pawn breaks often work best in sequences. Removing one central pawn (cxd5) makes the next break (e4) more effective. This two-step approach is a fundamental technique.

Exercise 15.20 ~3 min

Black to move. White has a big center (d4, e5, c5). What break does Black need to equalize?

Hint 1: Black is cramped. The center must be challenged. *Hint 2:* Which pawn can hit the base

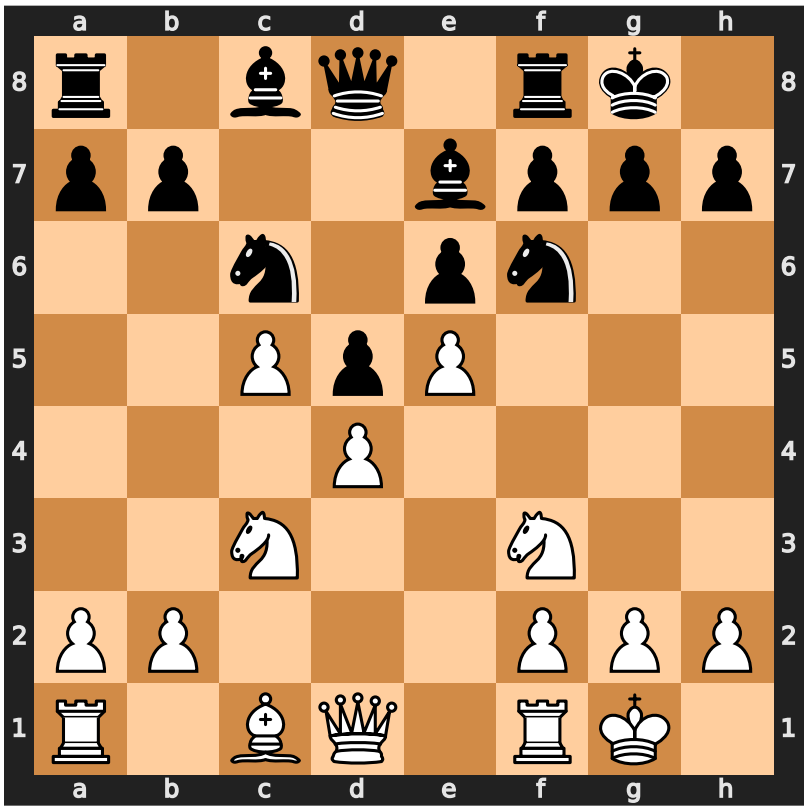

Figure 43.37: Chess Position

of White's chain? *Hint 3:* …f6 attacks e5 directly.

Solution: Black plays **...f6** to challenge e5, the most advanced pawn in White's chain. After …f6 exf6 Bxf6, Black opens the f-file and frees the position. Alternatively, …f6 can be prepared with …Bd7, …Rf7, and …Raf8 to make the break more effective. The point is that e5 is the keystone of White's space advantage, remove it, and Black breathes.

Why this works: When your opponent has a space advantage built on an advanced pawn, attack that pawn. This is Nimzowitsch's principle of attacking the head of the pawn chain. …F6 challenges e5 and, if successful, equalizes the space.

Exercise 15.21 ~5 min

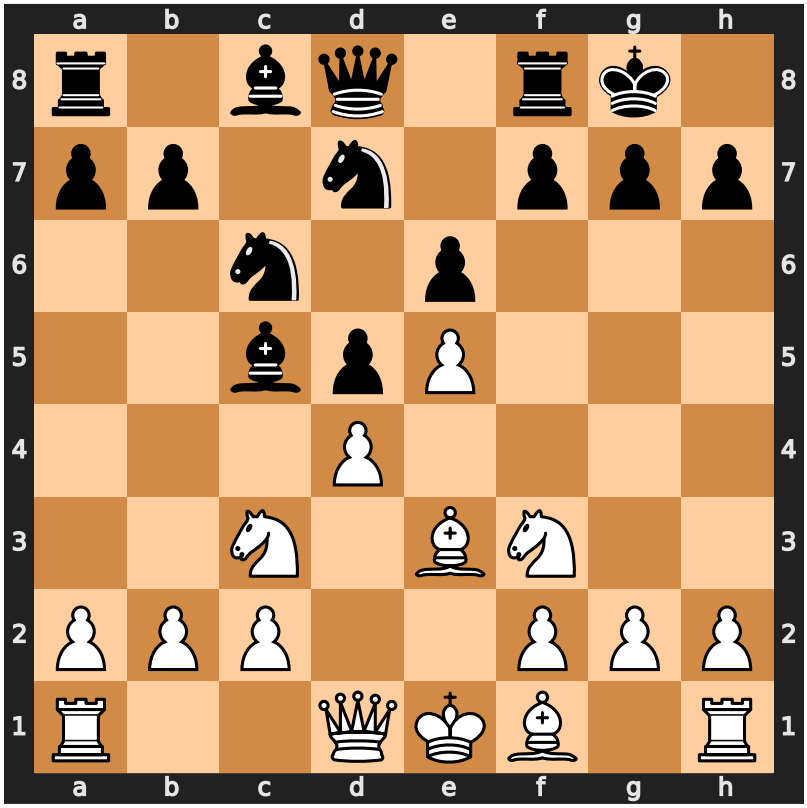

Figure 43.38: Chess Position

White to move. The center is semi-locked (d4 vs c5, e5 fixed). Find White's key break and explain the plan.

Hint 1: The chain d4-e5 points toward the kingside. What break supports a kingside attack? *Hint 2:* Consider f2-f4 to reinforce e5 and prepare f5. *Hint 3:* After f4 and f5, White opens lines toward Black's king.

Solution: White plays **f2-f4**, reinforcing e5 and preparing the f4-f5 break. The plan: (1) f4 immediately, (2) Bd3 (supporting f5 and aiming at the kingside), (3) Qe2 or Qe1-h4 (bringing the queen into the attack), (4) f5 to attack e6. After f5 exf5, the e5 pawn becomes even more powerful, and the f-file opens toward Black's king. This is the classic French Defense kingside attack.

Why this works: The f4-f5 break is White's most powerful weapon in French-type structures. It follows the chain, attacks the base of Black's chain (e6), and opens files toward the king. This is strategy and tactics working together.

Exercise 15.22 ~5 min

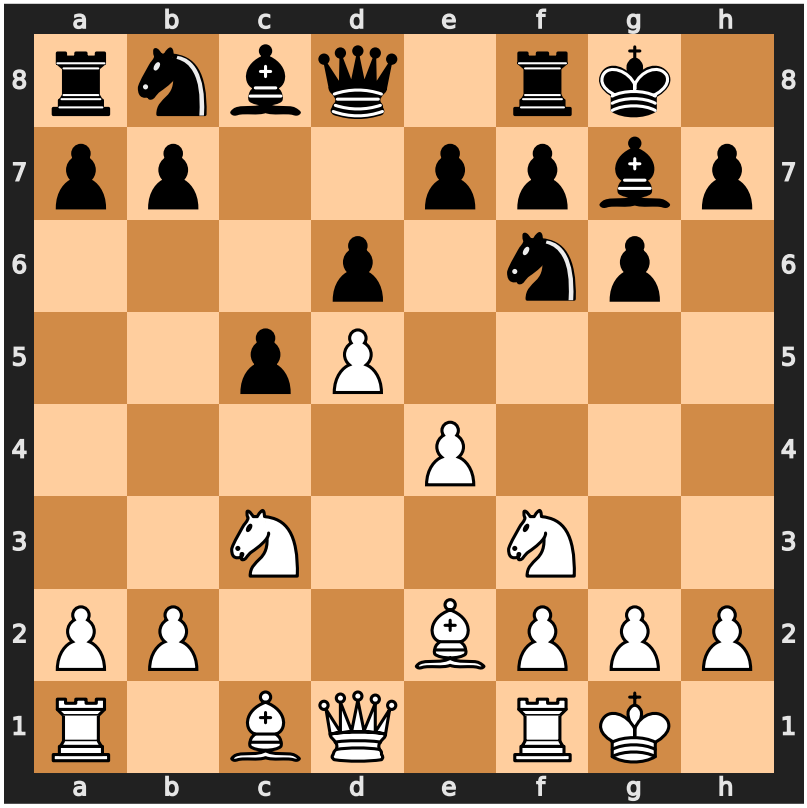

Figure 43.39: Chess Position

White to move. Find the correct central or flank break in this King's Indian/Benoni structure.

Hint 1: White has d5 and e4. The center is closed. Where does the chain point? *Hint 2:* The queenside is where White should attack. What is the key break? *Hint 3:* c2-c4 followed by b4 and c5.

Solution: White plays **c2-c4** (if not already played in the sequence), followed by **a2-a4**, **b2-b4**, and **c4-c5**. This is the classic queenside attack in the Benoni/King's Indian structure. The c5 break undermines Black's d6 pawn and opens the c-file for rook penetration. White should also consider Nd2 (heading for c4) and Rb1 to support the b4 advance. The center is closed (d5 is fixed), so White's attack on the wing is safe.

Why this works: In Benoni structures, the chain d5-e4 points toward the queenside. White follows the chain and executes the c5 break to create targets. This is the same principle as the kingside attack in the French, follow the chain.

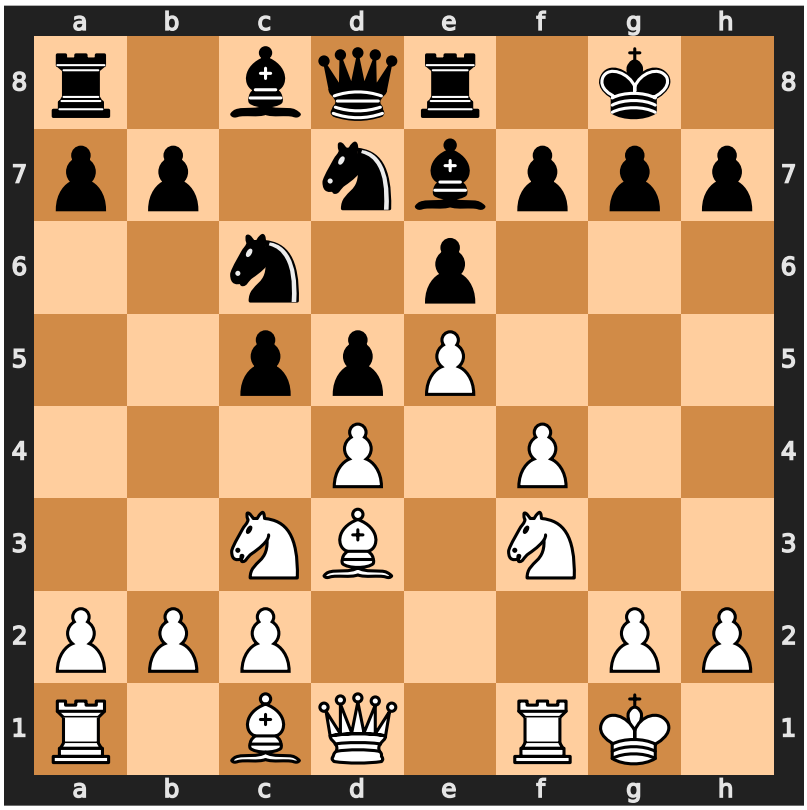

Figure 43.40: Chess Position

Exercise 15.23 ~5 min

White to move. White has e5 and f4. Black is about to play …cxd4 or …f6. What should White do before Black challenges?

Hint 1: White should strike first. What kingside advance increases pressure? *Hint 2:* Consider g2-g4 to prepare g5 or f5. *Hint 3:* Or consider Qe1-h4 to build the attack before breaking with f5.

Solution: White plays **Qe1** (heading to h4 for the kingside attack) or **Kh1** (preparing g4 without allowing tactical tricks on the g1-a7 diagonal). The plan is to build the attack with Qh4, Rf3-h3, and then g4-g5 or f5. White must act before Black plays …f6, which would challenge e5 and neutralize White's space advantage. The key is **urgency**: in positions with a space advantage and a target on the kingside, the attacker must be faster than the defender's counter-break.

Why this works: When your opponent is preparing a counter-break (…f6 against e5), you must either prevent it (by playing f5 first, sealing the kingside) or get your attack rolling before it arrives. Speed matters in dynamic positions.

Exercise 15.24 ~5 min

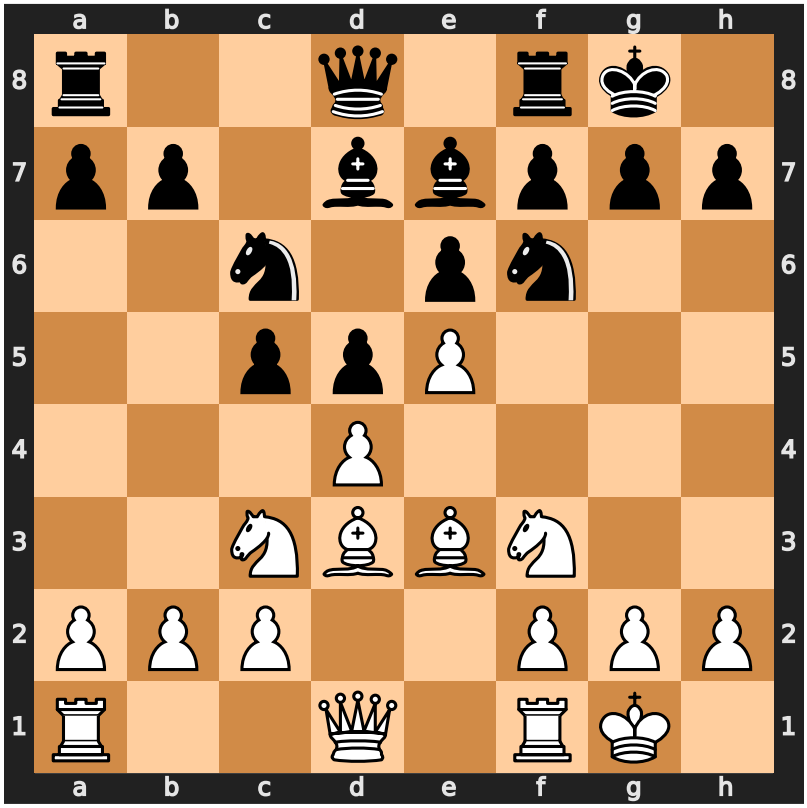

Figure 43.41: Chess Position

White to move. White has a central pawn duo (d4+e5). Black threatens …cxd4 followed by …f6. Find the best continuation.

Hint 1: Should White prevent …cxd4 or allow it? *Hint 2:* Consider closing the center with d5 or

maintaining with a quiet move. *Hint 3:* D5 closes the center and defines the attacking plans for both sides.

Solution: White plays **d5!** closing the center. After d5, the e5 pawn is secure (no more …cxd4 undermining it), and Black's …f6 break becomes harder to achieve (exd5 would leave Black's structure shattered). The closed center means White can proceed with the kingside attack: Qe2 or Qe1, Nd2-c4, f4, g4, and eventually f5. By playing d5 before Black can execute …cxd4 and …f6, White seizes the strategic initiative.

Why this works: Sometimes the best response to an opponent's threatened break is to make your own break first. D5 eliminates Black's counterplay and gives White a clear attacking plan.

43.12.5 Section E: Center and the Wings (Exercises 15.25 – 15.30) –

These are the hardest exercises in this chapter. Each one requires you to evaluate the center and form a complete plan.

Exercise 15.25 ~7 min

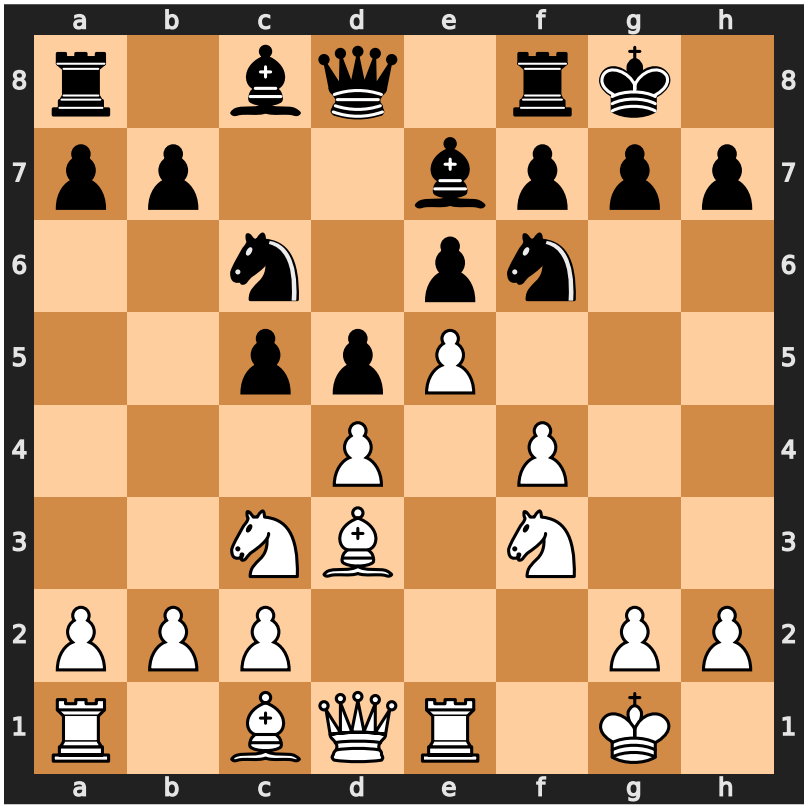

Figure 43.42: Chess Position

White to move. White has a space advantage (e5, f4, d4). Create a complete attacking plan for the next 5-7 moves.

Hint 1: The center is stable (e5 and d4 are well-supported). Where should White attack? *Hint 2:* The chain d4-e5 points toward the kingside. Plan a kingside attack. *Hint 3:* Consider Qe1 (heading

to h4), Kh1, g4, and f5.

Solution: White's plan: (1) **Qe1**: the queen heads to h4 for the kingside attack. (2) **Qh4**: threatening g5 and applying pressure on h7. (3) **Kh1**: removing the king from the g-file before opening it with g4. (4) **Rf3**: swinging the rook to the kingside (Rf3-h3 or Rf3-g3). (5) **g4**: preparing to open the g-file or play g5 to chase the f6 knight. (6) **g5 or f5**: the decisive break. After f5 exf5 gxf5, the kingside opens and White's attack crashes through. This plan works because the center is stable, Black cannot play …dxe4 or …cxd4 to create counterplay in the middle.

Why this works: This is the complete model for a wing attack with a stable center. Every piece has a role. The plan follows the pawn chain. The center supports the attack. This is strategic chess at its best.

Exercise 15.26 ~7 min

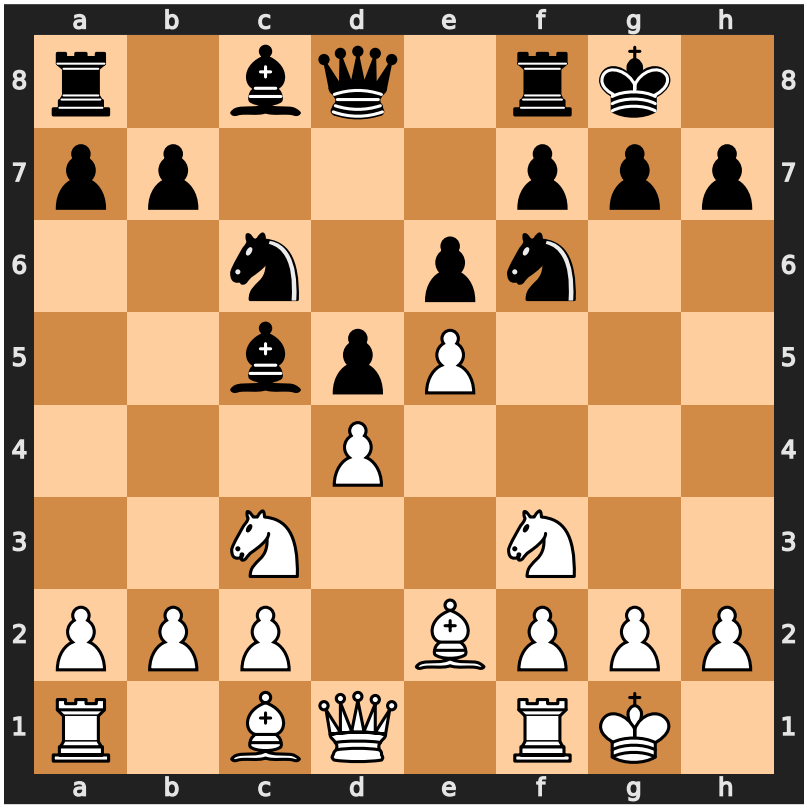

Figure 43.43: Chess Position

White to move. Black has active pieces and is pressuring d4 with …c5 (the bishop is on c5). Should White stabilize the center or counterattack? Give a complete plan.

Hint 1: D4 is under pressure. If White does nothing, …cxd4 follows. *Hint 2:* Consider Na4 to target the bishop, or a3 and b4 to chase it away. *Hint 3:* What does d5 accomplish here?

Solution: White should stabilize with **Be3** (defending d4 and preparing to challenge the c5 bishop). After Be3, White can follow with Qd2, Rad1, and if needed, a3 to prepare b4. The plan: (1) **Be3**: defends d4 and develops. (2) **Qd2**: connects rooks and supports Be3. (3) **Rad1**: rook to the d-file.

(4) If Black plays …cxd4, recapture with Bxd4 and the center is fine. The key is to not panic about …cxd4. After Bxd4 Bxd4 Qxd4, White's queen centralizes and the e5 pawn gives White lasting space.

Why this works: When your center is under pressure, stabilize it, do not abandon it. Be3 solves the immediate problem and keeps White's structure intact. The center is worth defending because it supports everything else.

Exercise 15.27 ~7 min

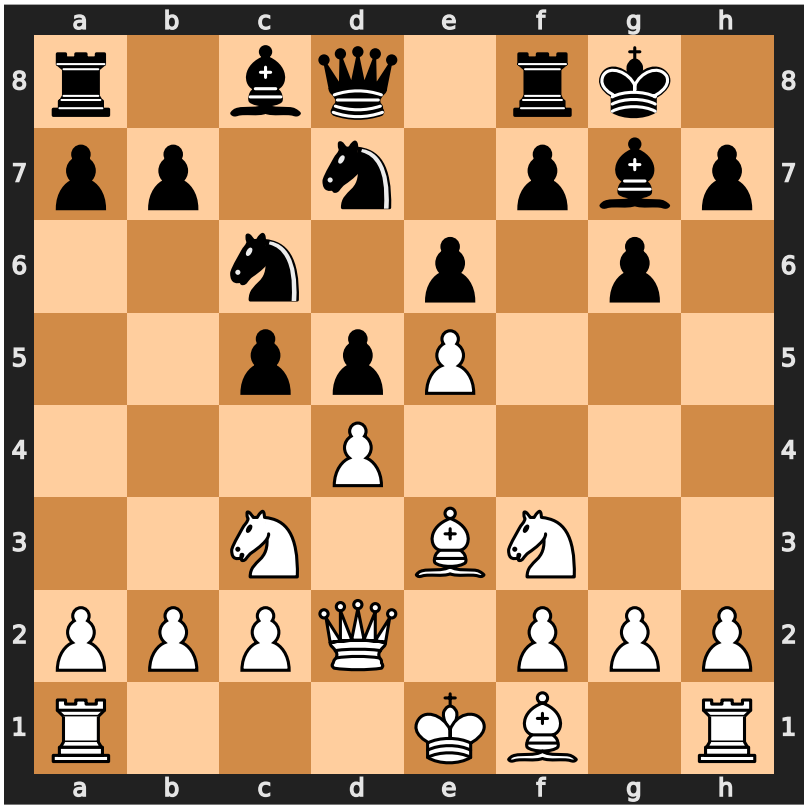

Figure 43.44: Chess Position

White to move. White can castle kingside or queenside. The choice depends on the center. Analyze both options and recommend one.

Hint 1: If White castles kingside, the king is safe but far from the queenside where a minority attack might develop. *Hint 2:* If White castles queenside, the king is closer to the queenside pawns but exposed to a potential …b5 attack. *Hint 3:* Which castling supports a kingside pawn storm better?

Solution: Castle queenside (O-O-O) is the aggressive choice. With the center semi-locked (d4 and e5 are stable), White can castle long and launch a kingside pawn storm: h4, g4, h5. The king on c1/b1 is safe because the center is closed, Black cannot open lines toward it easily. Castling kingside (O-O) is safer but passive; it limits White's attacking options because the g and h pawns cannot advance without exposing the king. In French-type structures with a stable center, queenside castling is the most ambitious plan.

Why this works: The castling choice is directly connected to the center. A stable center makes queenside castling safe because Black cannot open the center to attack the king. This frees White to use the kingside pawns as weapons rather than shelter.

Exercise 15.28 ~10 min

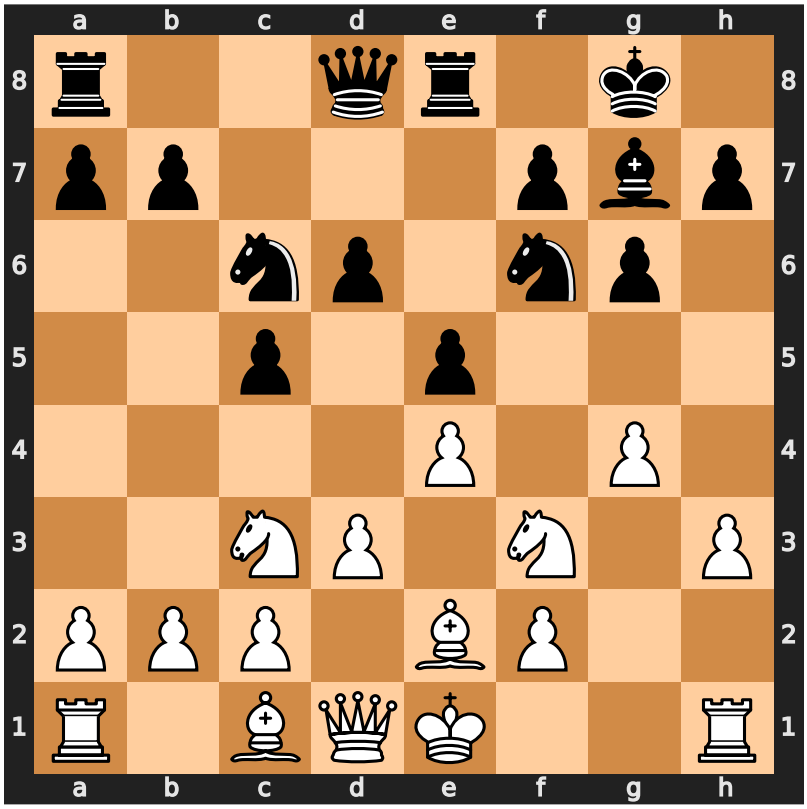

Figure 43.45: Chess Position

White to move. White has launched g4 and h3 on the kingside. Black has a solid center with …e5 and …d6. Is White's wing attack justified, or is the center unstable? Evaluate and give a plan.

Hint 1: White has advanced g4 and h3, committing to a kingside attack. But is the center safe? *Hint 2:* Black can play …d5 at some point, challenging White's e4 pawn. Is that dangerous? *Hint 3:* Consider whether White should play d4 first to stabilize, or continue the attack.

Solution: White's wing attack is **premature.** The center is not stable, Black can play …d5 at any moment, and White's g4 advance has weakened the kingside. White should first stabilize with **d4** (closing the center or creating a more solid structure), then continue the kingside attack. Without d4, if Black plays …d5 exd5 Nxd5, the center opens and White's exposed kingside becomes a liability. The correct order: (1) **d4** to close the center, (2) then **g5, h4, Ng3** to continue the attack. **The Iron Rule applies:** fix the center before attacking the wing.

Why this works: This exercise catches a common club player mistake: launching a wing attack without securing the center. The g4-h3 advance is fine in principle, but only after d4 ensures the center cannot be blown open.

Exercise 15.29 ~10 min

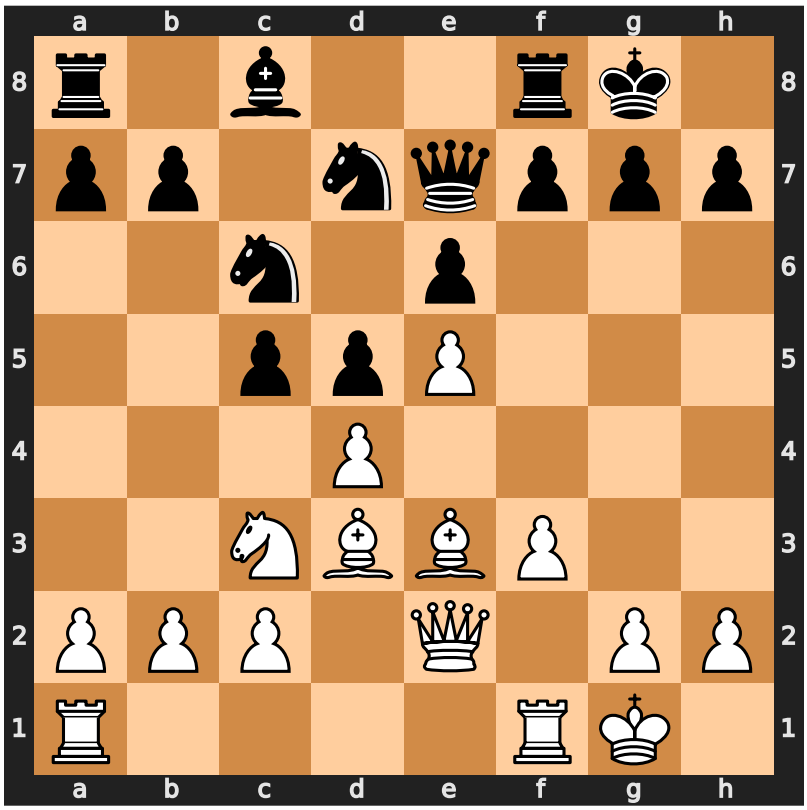

Figure 43.46: Chess Position

White to move. White has e5 and d4 with a strong center. Evaluate the position and provide a concrete 5-move plan.

Hint 1: White's center is powerful (d4+e5) but …cxd4 threatens to undermine it. Deal with that first. *Hint 2:* Consider whether to close with d5 or maintain the tension. *Hint 3:* After closing with d5, what is the long-term plan?

Solution: White plays (1) **d5!**: closing the center and fixing the pawn structure. Now e5 is permanently protected by d5. (2) **f4**: supporting e5 further and preparing the f5 break. (3) **Qg4** or **Qf2**: repositioning the queen for the kingside. (4) **Nd1-f2-g4** or **Ne2-g3**: rerouting a knight to attack the kingside. (5) **f5**: the decisive break, attacking e6 and opening the f-file. This plan is systematic, based entirely on the closed center giving White time to build the attack.

Why this works: Closing with d5 eliminates all of Black's central counterplay (…cxd4 is no longer possible) and gives White a free hand on the kingside. This is the Iron Tigran approach, neutralize first, attack second.

Exercise 15.30 ~10 min

White to move. Black is ready to play …cxd4 followed by …Nd5, challenging White's center. You must decide: let it happen, prevent it, or preempt it. Give a complete plan with reasoning.

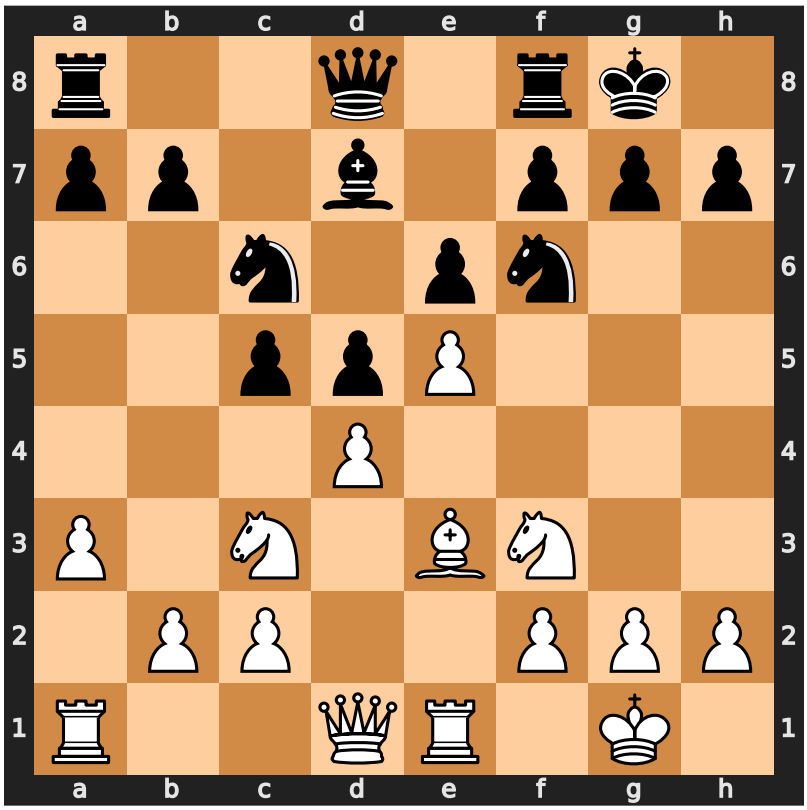

Figure 43.47: Chess Position

Hint 1: If …cxd4 Bxd4, is White's center intact or weakened? *Hint 2:* If White plays dxc5, the center changes character. Is that better? *Hint 3:* If White plays d5 to close, does that solve the problem?

Solution: White should play **dxc5** followed by repositioning. After dxc5, White has e5 and c5: two advanced pawns on different flanks. The d-file opens for White's rook (Rd1). Black must recapture (…bxc5 or …Bxc5), and in either case, White has a strong e5 pawn with piece activity on the open d-file. Alternatively, **d5** is possible but after …exd5 Nxd5 Nxd5 Qxd5, the center simplifies and Black may equalize. The dxc5 approach keeps more tension and gives White concrete targets. The plan: (1) **dxc5**, (2) **Qd6** or **Nd4** centralizing, (3) **Rd1** on the open file, (4) **b4** to support c5, (5) build pressure on the c-file and d-file while Black struggles with the cramped position behind e5.

Why this works: Sometimes "resolve the tension" is the right answer, when the resulting position gives you active play and structural targets. Dxc5 trades one strong pawn (d4) for a different kind of advantage (two advanced flanking pawns and open files). The key is that e5 remains, and Black is still cramped.

43.13 Key Takeaways

1. **The center controls piece mobility.** Central pawns determine where pieces can go and how freely they can maneuver. Every positional decision flows from the center.
2. **Know your center type.** Static centers demand patience and maneuvering. Dynamic centers demand precision and timing. Open centers demand piece activity and rapid development.
3. **Maintain tension when it benefits you.** The player who resolves central tension prematurely often helps the opponent. When in doubt, develop a piece and keep your options open.
4. **Use space advantage wisely.** More space means keeping pieces on the board, restricting your opponent, and opening lines at the right moment. Fight space disadvantage with exchanges and counter-breaks.
5. **Follow the iron rule.** Never attack on the wing until your center is stable. The center determines the wings, not the other way around.

43.14 Practice Assignment

This week, do the following:

1. **Play three games** and after each one, identify the center type at move 10. Was it static, dynamic, or open? Write down your answer and how it affected the rest of the game.
2. **Find one game with a static center and one with a dynamic center** from any database (Lichess, Chess.com, or chessgames.com). Play through both and note how each player's plans were shaped by the center.

3. **Set up the following position on your board and study it for 10 minutes:**

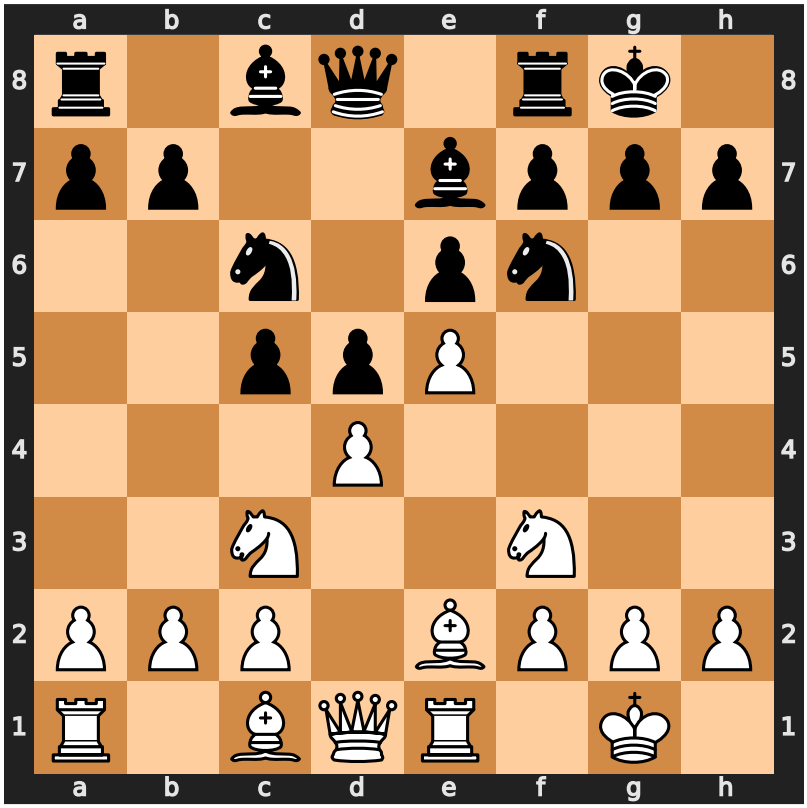

Figure 43.48: Chess Position

Answer these questions: - What type of center is this? - What are White's three options for the central tension? - What happens if White plays d5? Dxc5? A developing move? - Which option do you prefer and why? - What is Black's best plan regardless of White's choice?

Write down your answers before checking them against this chapter.

4. **Play through Petrosian vs Spassky 1966 (Game 28)** on your physical board. Focus on how Petrosian's d5 changed the entire game. Note every move where the closed center allowed White to maneuver freely.

43.15 Progress Check

Answer these five questions to test your understanding. If you get at least four correct, you have mastered this chapter's core concepts.

Question 1: What are the three types of center? > Static, dynamic, and open.

Question 2: In a static center, what should you do? > Maneuver your pieces to the best squares and attack on the wing where you have more space.

Question 3: When facing central pawn tension, what are your three options? > Capture, advance, or maintain.

Question 4: What is the iron rule about flank attacks? > Never attack on the flank until your center is stable. Fix the center first.

Question 5: What is the hypermodern approach to the center? > Controlling the center from a distance with pieces and fianchettoed bishops rather than occupying it with pawns.

Scoring: - 5/5: Outstanding. You understand the center deeply. Move on with confidence. - 4/5: Very good. Review the section you missed and continue. - 3/5: Solid foundation. Reread Parts 1-3 with a board in front of you before proceeding. - 0-2/5: No shame in this. The center is one of the deepest topics in chess. Reread the chapter slowly, one part per day. These concepts take time.

Rest here. Chapter 15 is complete. You now understand the center at a level most club players never reach. The concepts in this chapter, static vs dynamic, tension management, space, the iron rule, will appear in every game you play from here forward. They are the strategic backbone of chess.

Take a day off. You have earned it.

When you are ready, Chapter 16 awaits: *King Safety and the Art of Attack*.

"The purpose of a sacrifice is not necessarily to gain material, but to give your pieces the best possible squares." — Mikhail Tal

---

44.1 What You'll Learn

- How pawn structures around the king create shelter, and how to judge when that shelter is strong or compromised
- When to castle, which side to castle, and the rare situations where staying in the center is correct
- How to launch a pawn storm attack against the opposing king, including the Greek Gift sacrifice
- How to play opposite-side castling positions where both sides race to attack
- The prerequisites for a successful attack and how to build one from scratch
- When to sacrifice material for an attack, and how to tell if the sacrifice is sound
- How to defend against attacks without panicking
- Eight practical attacking patterns every club player should recognize

---

44.2 Before We Begin

This is the chapter you have been waiting for.

Everything you have learned so far (tactics, calculation, pawn structures, piece activity) has been building toward this moment. This chapter is where all of it comes together. The art of attacking the king is the most thrilling, most rewarding, and most beautiful part of chess.

But let us be honest about something. Attacking chess is not just about throwing pieces at the king and hoping for the best. The strongest attackers in history (Tal, Kasparov, Fischer, Alekhine) were not reckless. They were precise. They understood *when* an attack would work, *why* it would work, and *how* to make it work. The fireworks came from preparation, not from chaos.

This chapter will teach you to think like an attacker. Not by memorizing tricks, but by understanding the principles that make attacks succeed or fail. Once you understand these principles, you will start seeing attacking possibilities that were invisible before.

Set up your board. This is going to be fun.

44.3 Part 1: The King's Shield

44.3.1 Why the King Needs Protection

The king is the most important piece on the board. It is also, paradoxically, the weakest. It moves one square at a time. It cannot run away from danger quickly. It cannot fight off multiple attackers. Left exposed in the center, it becomes a target for every piece your opponent owns.

This is why we castle. This is why we build pawn shelters. This is why the first strategic question in any middlegame position is: *Where is the king, and how safe is it?*

A king behind a solid pawn shield, tucked away in the corner of the board, is a king that can be forgotten. Your pieces are free to attack, maneuver, and fight for the initiative. A king stuck in the center or exposed behind shattered pawns is a king that demands constant attention, and attention spent defending the king is attention not spent winning the game.

44.3.2 The Three Pawn Shelters

There are three fundamental pawn structures that protect the king. Each has strengths, weaknesses, and situations where it excels.

1. The Classical Castle (Short Side)

After kingside castling, White's king sits on g1 behind the pawns on f2, g2, and h2. This is the most common and most reliable king shelter in chess.

What makes it strong:

- Three pawns stand on their original squares, forming a wall
- The f2 pawn is protected by the king itself
- The g2 pawn is the anchor. It protects both f3 and h3
- The h2 pawn covers g3

What makes it vulnerable:

- If the h-pawn advances (h2-h3), the g3 square becomes weak
- If the g-pawn advances (g2-g3 or g2-g4), the king's shelter loosens significantly
- If the f-pawn advances (f2-f3 or f2-f4), the e3 and g3 squares become potential entry points

The key principle: Every pawn move in front of your castled king is a permanent weakening. Sometimes it is necessary. But never make it casually.

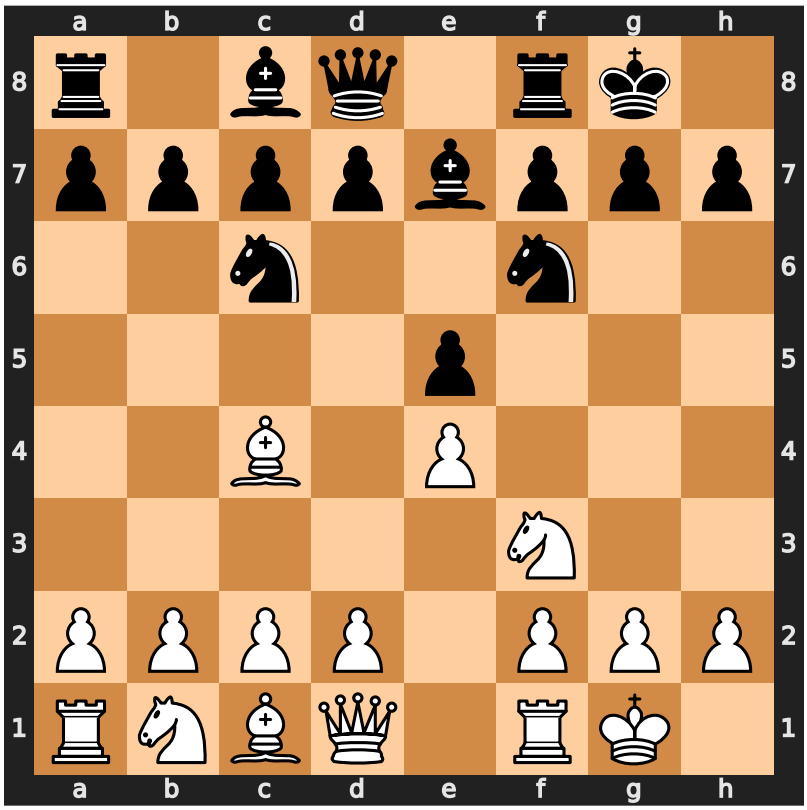

Figure 44.1: Chess Position

---

2. The Fianchetto Shelter

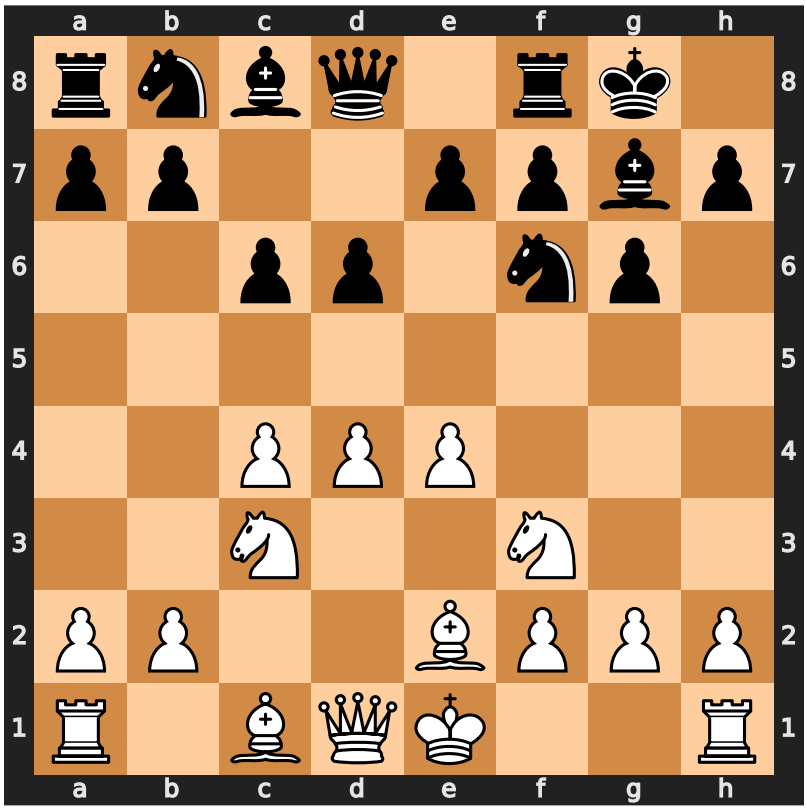

Figure 44.2: Chess Position

Black has fianchettoed the bishop to g7 with the pawns on f7, g6, and h7. The bishop on g7 replaces the pawn that would normally stand on g7, and it does double duty: it guards the king while also being an active attacking piece on the long diagonal.

What makes it strong:

- The bishop on g7 is a powerful defender. It controls the dark squares around the king
- The g6 pawn supports the bishop and covers f5 and h5
- The f7 pawn is protected by the king and supports the g6 pawn
- The structure is resilient, even if one pawn is traded, the bishop still covers the critical squares

What makes it vulnerable:

- If the bishop is traded (especially via Bh6xg7), the dark squares collapse. The g7 square becomes a hole, and h6 and f6 are weakened.
- If the h-pawn is advanced (h7-h6 or h7-h5), the g6 pawn can become a target
- A sacrifice on g6 (Bxg6 or Nxg6) can blow the shelter open

The key principle: In a fianchetto structure, the dark-squared bishop is the foundation of king safety. Protect it. If your opponent tries to trade it, understand that they are attacking your king, not just making an exchange.

---

3. The Queenside Castle

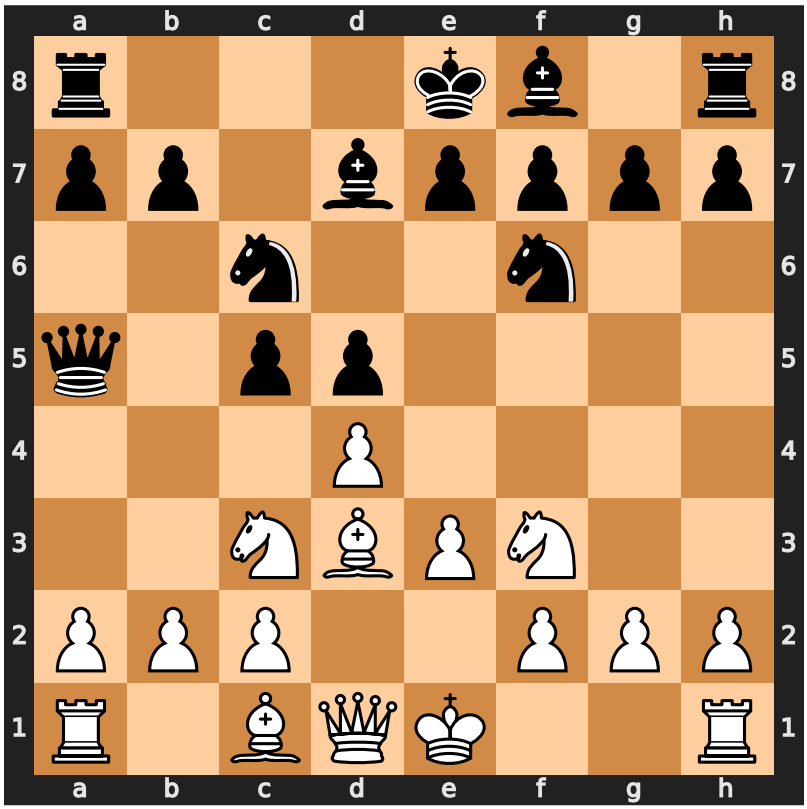

Figure 44.3: Chess Position

Queenside castling places the king on c1 (after O-O-O, then sometimes sliding to b1). The pawns on a2, b2, and c2 (or c3) form the shelter.

What makes it strong:

- The king is far from the kingside, where most of the action typically occurs
- The rook on d1 immediately enters the game on an important central file
- Queenside castling often signals an aggressive intent. You are clearing the way for a kingside pawn storm

What makes it vulnerable:

- The a-pawn and b-pawn are natural targets for a queenside pawn advance (…a5, …b5, …b4)
- The king on c1 or b1 can be exposed if the c-pawn has already moved (creating a hole)
- The king has less room to escape than on the kingside. The corner is closer

The key principle: Queenside castling is a statement of intent. You are trading king safety for attacking potential. If you castle queenside, be prepared to attack fast. Your opponent will be coming for you.

44.3.3 Reading the King's Shelter

Here is a skill that will serve you for the rest of your chess career: learning to *read* a king position at a glance.

When you look at a position, ask these three questions:

1. **Are the pawns in front of the king on their original squares?** If yes, the shelter is intact. If one or more have moved, identify the weaknesses they have created.
2. **Is the king's guardian piece still present?** In a fianchetto, this is the bishop. In a classical shelter, this is usually the knight on f3 (or f6 for Black) that guards the key squares. If the guardian piece has been traded or deflected, the king is more vulnerable.
3. **Are there open or half-open files near the king?** An open file aimed at the king's position is a highway for rooks and queens. If the g-file or h-file is open near a castled king, that king is in danger.

Practice this. Every time you see a position (in a game, in a book, in a puzzle), take two seconds to assess the king safety on both sides. Within a few weeks, it will become automatic.

Rest here if you need to. The king shelter types are the foundation for everything that follows. Make sure you can picture all three before moving on.

44.4 Part 2: When to Castle

44.4.1 The Default: Castle Early

There is a reason every beginner is taught to castle early. It is one of the most reliable pieces of chess advice ever given, and it remains true at every level of play.

Castle early because:

- Your king moves from the center (where files can open and attacks can come from any direction) to the corner (where it is shielded by pawns)
- Your rook enters the game. It moves from the corner to a central or semi-central position
- You complete your development, castling is a developing move for both the king and the rook

A useful guideline: If you can castle and there is no concrete reason not to, castle. The burden of proof is on *not* castling, not on castling.

44.4.2 When to Castle Kingside

Castle kingside (O-O) when:

1. **Your kingside pawns are intact.** The f, g, and h pawns are on their original squares (or nearly so).
2. **The center is not locked.** If the center can open, your king needs to be out of the way.
3. **Your opponent has not already launched a kingside pawn storm.** If your opponent has pushed g4 and h4 before you castle, you may be walking into the attack.

4. **You have no specific reason to castle queenside.** Kingside castling is the default. Queenside castling requires a reason.

44.4.3 When to Castle Queenside

Castle queenside (O-O-O) when:

1. **You intend to attack on the kingside.** Queenside castling clears your kingside pawns for a storm: f4, g4, h4, rolling forward toward the enemy king.
2. **The queenside is safer than the kingside.** If your kingside has already been weakened (say you played h3 and g4 early in a sharp opening), your king may be safer on the other side.
3. **You want opposite-side castling dynamics.** Some openings, particularly the Sicilian Dragon with the Yugoslav Attack, are designed around opposite-side castling. You attack their king while they attack yours. We will study this in detail in Part 4.

44.4.4 The Rare Exception: Staying in the Center

Very rarely, it is correct to delay castling or not castle at all. This happens when:

- **The center is completely locked.** If no pawn breaks are available and the center cannot open, the king may be safe enough in the middle.
- **Castling would walk into an attack.** If your opponent has already set up a devastating attack on the side you would castle to, sometimes the king is safer staying put.
- **You need the rook where it is.** In some endgame transitions, it is better to connect the rooks manually.

But let us be clear: these are exceptions, not rules. If you are below 1600, castle early and castle often. The positions where staying in the center is correct are rare, complex, and usually arise from very specific opening lines. Do not look for reasons not to castle. Look for reasons to castle, and you will almost always find them.

Set up your board: a cautionary tale:

This is the King's Gambit after 1.e4 e5 2.f4. White has voluntarily weakened the king's shelter by moving the f-pawn. This is a calculated risk, White gains central control and attacking chances, but the king is slightly exposed. Black can exploit this with precise play.

The lesson: even a single pawn move in front of the king changes the character of the position. When you play f4, you accept that the e1-h4 diagonal is now open and the g1 king may be more vulnerable. Great players from Spassky to Short have made this trade willingly, but they understood the cost.

44.5 Part 3: Pawn Storm Attacks

44.5.1 The Concept

A pawn storm is exactly what it sounds like: you push your pawns forward like a battering ram against the enemy king's shelter. The goal is to pry open lines, files, diagonals, or both, so your major pieces (rooks and queen) can reach the king.

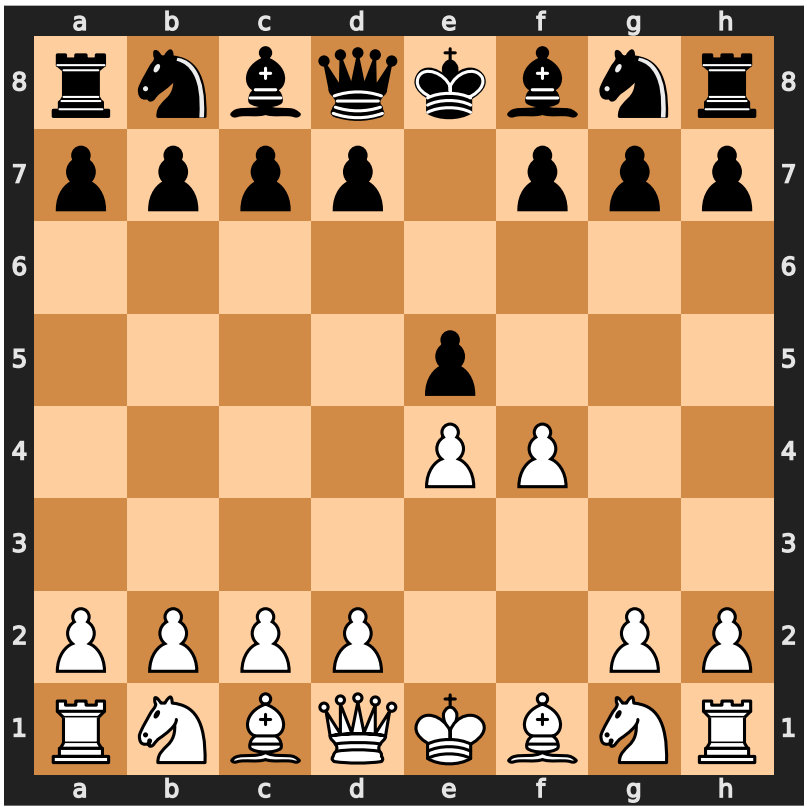

Figure 44.4: Chess Position

Pawn storms are most effective when:

1. **You have castled on the opposite side from your opponent.** Your king is safe on one wing while your pawns crash forward on the other.
2. **Your opponent's king shelter has a target.** A fianchetto with g6 can be attacked with h4-h5. A classical shelter with h7 can be attacked with g4-g5.
3. **You have piece support behind the pawns.** Pawns alone cannot checkmate. They open lines for your pieces.

44.5.2 The Kingside Pawn Storm: h4-h5 Against a Fianchetto

Set up your board:

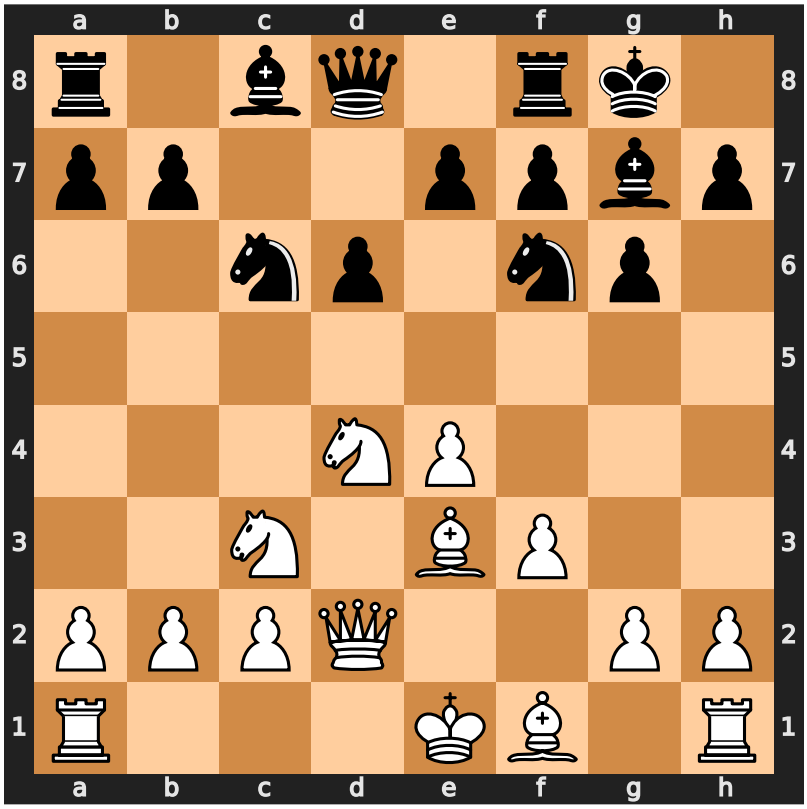

Figure 44.5: Chess Position

This is a typical Sicilian Dragon position. White will castle queenside and storm the kingside. The attack plan:

1. **O-O-O**: Get the king safe on the queenside
2. **Bh6**: Trade Black's powerful dark-squared bishop, weakening the fianchetto
3. **h2-h4**: Begin the pawn storm
4. **h4-h5**: Attack the g6 pawn. If Black takes (…gxh5), the g-file opens for White's rook
5. **g2-g4**: Support the h-pawn and prepare to open more lines

The h4-h5 advance is the signature move against a fianchetto. When the h-pawn reaches h5 and attacks g6, Black faces a choice: take on h5 (opening the g-file), or allow hxg6 (opening the h-file). Either way, lines open and White's pieces pour through.

Critical principle: When storming with pawns, do not advance them one at a time without support. Each pawn advance should be part of a coordinated plan. H4-h5 is strong because g4 supports the h-pawn and the bishop on h6 has already weakened the shelter.

44.5.3 The Greek Gift Sacrifice: Bxh7+

This is one of the most famous attacking patterns in chess. Every club player should know it, recognize it, and understand *why* it works.

Set up your board:

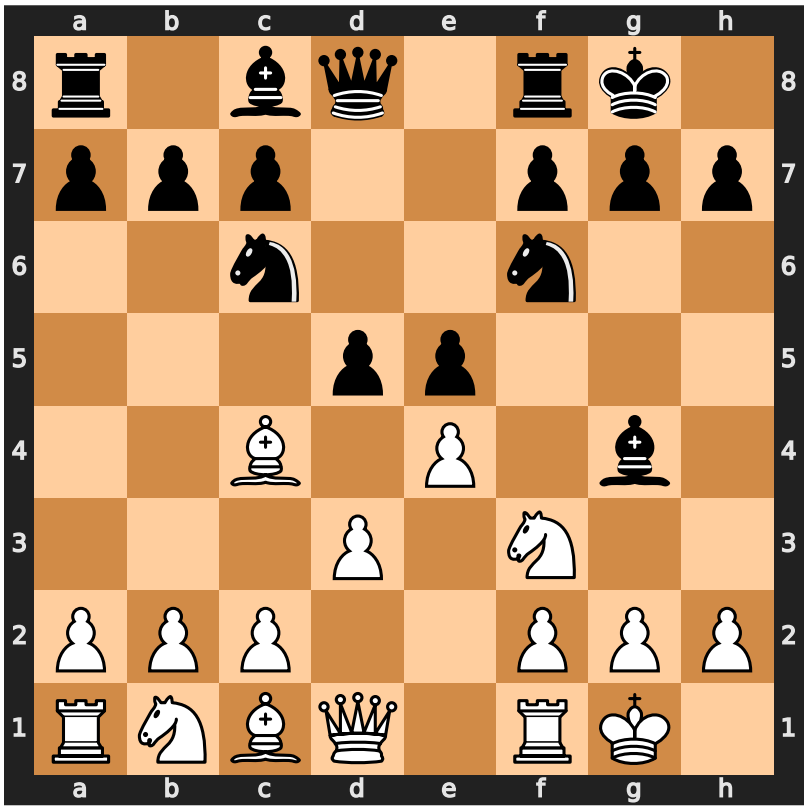

Figure 44.6: Chess Position

Imagine White has a bishop on d3 (not c4), a knight on f3, and a queen that can reach h5. Black has castled kingside with the pawns on f7, g7, h7.

The Greek Gift pattern:

1. **Bxh7+!**: The bishop sacrifices itself on h7. The king must take: **Kxh7**.
2. **Ng5+**: The knight leaps to g5 with check, also threatening Qh5+. The king must choose where to go.
3. If **Kg8**, then **Qh5** threatens Qh7# and Qxf7+. Black is under enormous pressure.
4. If **Kg6**, the king is dangerously exposed. White plays **Qd3+** (or Qg4+ depending on the position), and the king is hunted.

The three conditions for Bxh7+ to work:

This sacrifice is NOT always correct. It requires three conditions:

1. **A bishop that can reach h7 with check.** Usually a light-squared bishop on d3 or c2.
2. **A knight that can reach g5 in one move after Bxh7+.** The knight is usually on f3.
3. **A queen that can reach h5 (or the kingside) quickly.** If the queen is on the other side of the board or blocked, the attack stalls.

If all three conditions are met and Black has no strong defensive resource (like …Bf5 blocking the diagonal or …Ng4 counterattacking), the Greek Gift is devastatingly effective.

When it does NOT work:

- If Black can play …Kg8 followed by …Nf6 covering h7 and blocking the queen
- If Black has a bishop that can return to f5, blocking the diagonal and forcing the queen away
- If White's queen cannot reach the kingside quickly enough

The lesson: The Greek Gift is a *pattern*, not a rule. Always calculate the specific position. But knowing the pattern means you will see the possibility where others miss it.

Rest here if you need to. The Greek Gift is a lot to absorb. Practice recognizing the three conditions in your own games before continuing.

44.6 Part 4: Opposite-Side Castling

44.6.1 The Race

Opposite-side castling creates the most exciting positions in chess. Both sides have castled on different wings. Both sides can storm the opposing king with pawns without weakening their own shelter. The result is a race: whoever gets to the enemy king first, wins.

These positions require courage, precision, and a willingness to burn your bridges. There is no going back once the pawns start rolling forward.

Set up your board:

This is a typical opposite-side castling position from the Sicilian. White's king is on c1 (queenside). Black's king is on g8 (kingside).

White's plan: Storm the kingside with h4-h5, g4, possibly Bh6 to trade the fianchetto bishop.

Black's plan: Storm the queenside with …a5, …b5, …b4, attacking the c3 knight and trying to open lines to the White king.

Who wins? The side whose attack arrives first. This is why TEMPO, speed, is everything in opposite-side castling positions.

44.6.2 The Rules of Opposite-Side Castling

Rule 1: Do not trade pieces. Attacks need pieces. Every trade reduces your attacking force and makes it harder to deliver checkmate. In these positions, avoid unnecessary exchanges.

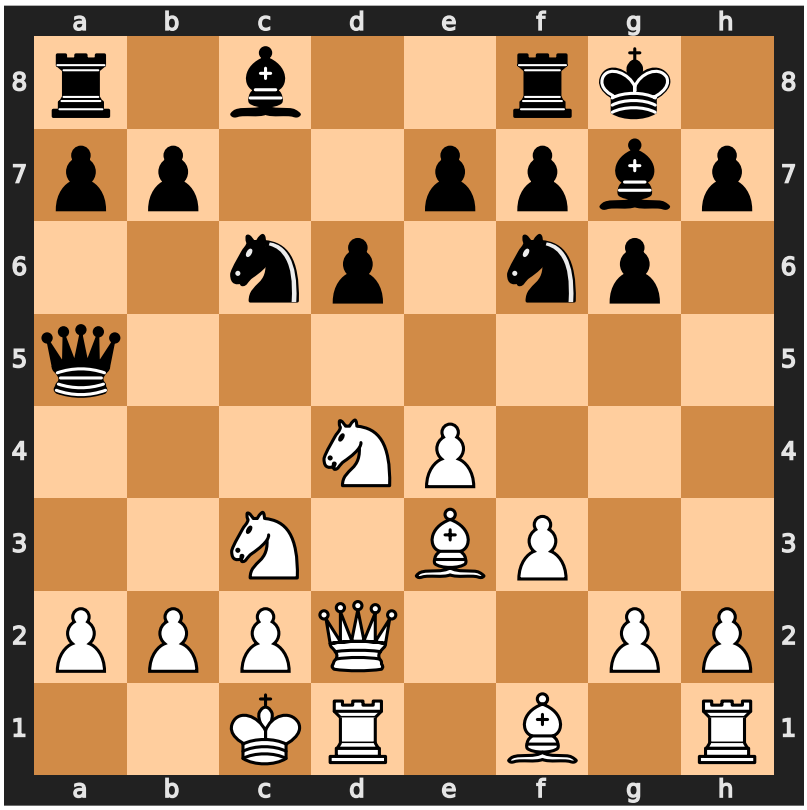

Figure 44.7: Chess Position

Rule 2: Push pawns aggressively. You are not weakening your own king shelter by advancing pawns on the other side of the board. Push them fearlessly. Each pawn advance opens a potential line for your rooks and queen.

Rule 3: Count tempi. Who is further along? If your opponent's pawns are already on the fifth rank and yours are still on the second, you are behind in the race. Adjust: either speed up your attack or find a defensive resource to slow theirs.

Rule 4: The side with the better center usually has the faster attack. Central control allows you to redirect pieces from one wing to another. If you control the center, your pieces can swing to the kingside faster than your opponent's pieces can reach the queenside.

Rule 5: A sacrifice that opens lines is almost always correct in the race. If sacrificing a pawn (or even an exchange) opens a key file or diagonal toward the enemy king, it is usually worth it. You are not playing for an endgame. You are playing for checkmate.

44.6.3 Practical Example: The Yugoslav Attack

The Sicilian Dragon with the Yugoslav Attack is the most famous opposite-side castling battleground in all of chess. Thousands of games have been played in this line, and both sides have refined their attacks over decades.

White's plan: O-O-O, Bh6 (trade the bishop), h4-h5, hxg6 or g4-g5, open the h-file, pile in with Rdg1, Qh6, and deliver mate.

Black's plan: …Rc8, …a5-a4, …b5-b4, open the b-file, sacrifice on c3 if necessary, infiltrate with rooks and the queen.

The beauty of this structure is that both plans are well-known, both are dangerous, and the winner is determined by accuracy and timing. This is chess at its most thrilling.

44.7 Part 5: Attacking the King — Prerequisites

44.7.1 Why Most Attacks Fail

Here is a truth that many attacking players learn the hard way: **most attacks fail because they are launched too early.**

An attack without preparation is like an army charging without supply lines. It might look impressive for a moment, but it collapses when the defender holds firm. The strongest attackers do not rush. They prepare. They build. They wait for the right moment, and then they strike with overwhelming force.

44.7.2 The Four Prerequisites

Before launching an attack on the king, check for these four conditions. If you have at least three of the four, your attack is likely to succeed. If you have fewer than three, it is probably premature.

Prerequisite 1: A Development Lead

If you have more pieces in play than your opponent, you have a temporary advantage. Extra pieces mean extra attackers. The more pieces you can bring to the party, the more overwhelming the attack.

How to recognize this: Count the pieces that are actively participating in the attack (or can join within one or two moves) versus the pieces your opponent has available for defense. If you have a significant edge, say, four active attacking pieces against two defenders. The conditions are ripe.

Prerequisite 2: Open Lines Toward the King

Pieces need highways to reach the king. These highways are:

- **Open files** (for rooks and queens)
- **Open diagonals** (for bishops and queens)
- **Outpost squares** near the king (for knights)

If the position is closed (all pawns locked, no open files, no diagonals), an attack is nearly impossible. You need at least one open line, and ideally two or more.

Prerequisite 3: Piece Coordination

A single piece attacking the king is an annoyance. Two pieces are a threat. Three pieces are dangerous. Four or more pieces are devastating. The key is *coordination*: your pieces working together, each one supporting the others.

Look for positions where your queen, a rook, and a minor piece (bishop or knight) can all converge on the king's position within two or three moves. That kind of coordination is the foundation of a successful attack.

Prerequisite 4: A Weakened Pawn Shield

If the enemy king's pawn shelter is intact (f7, g7, h7 or f2, g2, h2), breaking through is difficult. But if the shelter is compromised: a pawn has advanced, a pawn has been captured, or a key defender has been traded. The king is more vulnerable.

Common weaknesses to look for:

- A missing h-pawn (creates targets on g7/g2 and h-file access)
- A pawn on h6 or h3 (the g6/g3 square is weakened)
- A pawn on g6 without a bishop on g7 (the dark squares are holes)
- The f-pawn has moved (the diagonal toward the king opens)

44.7.3 Putting It Together

When you recognize that you have most of these prerequisites, it is time to attack. When you do not have them, your job is to *create* them: develop your remaining pieces, open files through pawn breaks or exchanges, coordinate your forces, and provoke weaknesses in the enemy king's shelter.

The best attackers do both: they prepare the attack AND they provoke the conditions that make it work. This is what separates a prepared assault from a premature charge.

44.8 Part 6: The Sacrifice

44.8.1 The Heart of Attacking Chess

Sacrificing material (giving up a pawn, a piece, an exchange, or even the queen) for an attack is the most dramatic act in chess. It is also the most misunderstood.

A sacrifice is not a gamble. It is an investment. You give up material now in exchange for something that material cannot buy: time, initiative, open lines, or a direct path to the king.

44.8.2 Sound vs. Speculative Sacrifices

Not all sacrifices are created equal. Understanding the difference between a sound sacrifice and a speculative one will save you many painful losses.

A sound sacrifice is one where you can calculate to a concrete advantage. You give up the material and can see (through calculation) that you will win it back with interest, or force checkmate, or reach a position that is objectively winning.

Example: Sacrificing a bishop on h7 (the Greek Gift) when you can calculate that the king will be forced into the open and you have a forced sequence leading to checkmate or decisive material gain. You do not need to hope. You can *see* the result.

A speculative sacrifice is one where you cannot calculate to a concrete finish. You give up material because the resulting position *looks* dangerous for your opponent, but you cannot prove that the attack works. You are relying on practical chances: your opponent may not find the best defense, the complications may favor you, or the position may be so difficult to navigate that even a computer would struggle.

When to play which:

- If you can see a forced win, play the sound sacrifice. Always.
- If the position is complex and you believe your opponent will struggle to defend, a speculative sacrifice can be a powerful practical weapon, especially in time trouble or against a weaker defender.
- If you are not sure whether a sacrifice is sound or speculative, spend your calculation time on it. If you still cannot prove it works after serious thought, ask yourself: “What happens if the attack fails? Is the resulting position hopeless?” If the answer is yes, proceed with caution.

44.8.3 Initiative as Compensation

There is a concept in chess that sits between “material advantage” and “positional advantage.” It is called **initiative**.

Initiative means you are making the threats. Your opponent is reacting. Every move you play creates a problem that your opponent must solve. As long as you maintain the initiative, your opponent cannot execute their own plans. They are too busy surviving.

Initiative can compensate for material. A player with a knight less but three pieces bearing down on the enemy king, open files, and the constant threat of checkmate has enormous compensation. The extra material on the other side of the board is useless if it cannot get back to defend.

The great Mikhail Tal understood this better than anyone. He would sacrifice a piece, sometimes with no concrete follow-up in mind, simply because the resulting position gave him the initiative. His opponents, even World Champions, would drown in complications.

Here is what Tal taught us: **if your opponent must solve a new problem every move, they will eventually solve one wrong.**

44.9 Part 7: Defending Against Attacks

44.9.1 The Defender's Mindset

Defending is harder than attacking. This is a psychological truth, not just a chess truth. When you are under attack, your brain wants to panic. It wants to find the one magic move that saves everything. It wants to hide the king, run away, do *something*.

Stop. Breathe. Think.

The best defenders in history (Petrosian, Lasker, Carlsen) were calm under fire. They did not look for miracle moves. They looked for the best practical choice on every move. They knew that an attack, even a strong one, will eventually run out of steam if the defender makes no serious mistakes.

44.9.2 The Four Tools of Defense

Tool 1: Trade Attackers

Every piece you trade reduces your opponent's attacking force. If your opponent has a queen, two rooks, and a bishop aimed at your king, and you can trade one of those rooks, the attack loses significant power.

The principle: trade attacking pieces, not defending pieces. If your knight on f6 is guarding your king, do not trade it for an enemy bishop on c4 unless you have a very good reason. But if your opponent's knight on e5 is a key attacker, exchanging it simplifies the defense.

Tool 2: Return Material

Sometimes the best defense is to give back the material your opponent sacrificed. If your opponent gave up a piece for an attack, and you can return that piece to reach a safe position, do it. You might end up with equality instead of a winning material advantage, but equality is infinitely better than getting checkmated.

Example: If your opponent sacrificed a bishop on h7 and you are under pressure, sometimes giving back the bishop (or a different piece) to close lines and neutralize the attack is the correct defensive approach.

Tool 3: Create Counterplay

Passive defense eventually loses. If you just sit and wait, your opponent will build up pressure until something breaks. Instead, look for ways to create your own threats.

Counterplay can take many forms: - A counter-attack against the opponent's king (especially in opposite-side castling positions) - A central pawn break that opens lines and creates threats in the

middle - A tactical shot that forces your opponent to deal with your threats instead of continuing the attack

The best defense is often a well-timed counter-punch.

Tool 4: Do Not Panic

This is the most important tool, and it is not a chess concept. It is a mental skill.

When you are under attack, your instinct is to play quickly and get out of danger. Resist this instinct. Sit on your hands. Look at the position objectively. Ask yourself: "What is my opponent actually threatening?" Often, the threats are fewer and less dangerous than they appear at first glance.

Many attacks are based on the hope that the defender will panic and make a mistake. If you stay calm and find accurate moves, the attack will often fizzle. Your opponent has invested material and time into this attack. If it fails, *they* are the one in trouble.

Rest here if you need to. The theory sections are dense. Take a break before the annotated games.

44.10 Part 8: Practical Attack Patterns

Before we study the annotated games, here are eight attacking setups that every club player should recognize. These are not tricks. They are structural patterns that arise naturally from common positions. Knowing them means you will see the attack when it appears in your own games.

44.10.1 Pattern 1: The Battery on the b1-h7 Diagonal

White places a queen on c2 (or b1) and a bishop on d3, both aimed at h7. If Black's knight leaves f6 or the h7 pawn is undefended, the threat of Bxh7+ (the Greek Gift) becomes real.

Signal to watch for: Queen and bishop aligned on the b1-h7 diagonal with a knight ready to jump to g5.

44.10.2 Pattern 2: The Rook Lift

A rook swings from the first rank to the third rank (for White) or sixth rank (for Black), then slides sideways to join the attack on the kingside. For example: Ra1-a3-g3, placing the rook on the g-file where it attacks the g7 pawn and supports queen checks.

Signal to watch for: A rook that has no obvious file to use, but can reach the third rank with one move.

44.10.3 Pattern 3: The Knight on f5 (or f4)

A knight on f5 is one of the most powerful attacking pieces in chess. It attacks the g7 and h6 pawns, supports queen infiltration on g3 or h4, and cannot easily be driven away (especially if there is no pawn to play …g6 without weakening the king further).

Signal to watch for: The f5 square is uncontested by Black's pawns and pieces.

44.10.4 Pattern 4: Queen and Knight Coordination

The queen and knight are the deadliest attacking duo. Their movement patterns complement each other. The queen covers long diagonals, ranks, and files, while the knight jumps to squares the queen cannot reach. Together, they create forks, double attacks, and checkmate threats that are almost impossible to defend against.

Signal to watch for: A knight within two hops of the enemy king and a queen that can support it.

44.10.5 Pattern 5: The Sacrifice on f7 (or f2)

The f7 pawn (f2 for White) is the weakest point in the starting position. It is defended only by the king. Even after castling, f7 can be a target. A sacrifice on f7 (Bxf7+ or Nxf7) can drag the king out, open the f-file for a rook, and create immediate tactical threats.

Signal to watch for: The f7 pawn is defended only by the king, and you have two or more pieces that can converge on that square.

44.10.6 Pattern 6: The h-file Attack

After the h-pawns are exchanged (hxg6 fxg6 or hxg6 hxg6), the h-file opens. A rook on h1 (or h8 for Black) can slide directly toward the enemy king. Combine with a queen on the h-file and the attack is often decisive.

Signal to watch for: Pawns have been exchanged on the h-file and your rook can reach it.

44.10.7 Pattern 7: The Back Rank Weakness

When all the pawns are on the second rank in front of the king (f2, g2, h2), the king has no escape square. If the back rank is weakly defended (only the king and maybe one piece), a rook or queen infiltration on the first rank leads to checkmate.

Signal to watch for: The king is trapped behind its own pawns with no escape square. Your rook or queen can reach the back rank.

44.10.8 Pattern 8: King Hunt

Rarely, the king can be dragged out of its shelter and hunted across the board. This requires overwhelming piece activity and often involves multiple sacrifices. The king, exposed and unprotected, is chased from square to square while checks and threats rain down.

Signal to watch for: The king's pawn shelter is gone, your pieces are fully developed and active, and there is no safe square for the king to hide.

This last pattern brings us to one of the most extraordinary games ever played: a game where the king did not merely escape the shelter. The king *attacked*.

44.11 Annotated Games

44.11.1 Game 27: Mikhail Tal vs. Bobby Fischer

Candidates Tournament, Bled/Zagreb/Belgrade, 1959 Sicilian Najdorf (B87)

Theme: Sacrificial attack, when the initiative is worth more than material

This game is a masterclass in what happens when the most fearless attacker of all time meets the most precise defender of his era. Tal's play in this game is a demonstration of sacrificial attacking chess at its most inspired.

1.e4 c5 2.Nf3 d6 3.d4 cxd4 4.Nxd4 Nf6 5.Nc3 a6 6.Bc4

Tal chooses the sharp 6.Bc4 against the Najdorf, aiming for quick development and direct pressure on f7. This is an aggressive choice, White develops the bishop actively and signals that tactics will follow.

6...e6 7.Bb3 b5

Fischer responds with characteristic ambition. The pawn advance …b5 grabs queenside space and prepares …Bb7, developing the bishop to an active diagonal.

8.f4

Tal wastes no time. The f4 advance is a declaration of intent: White will attack on the kingside. The pawn supports e5 and prepares to roll forward. Notice how quickly Tal establishes a pawn presence in the center and kingside. This is prerequisite preparation for an attack.

8...b4 9.Na4 Nxe4

Fischer takes the pawn, but this opens the position, exactly what Tal wants. When you take central pawns in sharp positions, you need to be prepared for the consequences. Every capture in an open position creates new lines, and new lines favor the side with better development.

10.O-O

Tal does not recapture the pawn. He castles, completing his development and preparing to bring every piece into the attack. This is a critical decision: Tal prioritizes piece activity and king safety over material. The pawn on e4 is not going anywhere, but Tal's attack might.

Pause and study this position. Tal has an open center, pieces ready to mobilize, and a king safely tucked away. Fischer has an extra pawn but his king is still in the center. The stage is set.

The game continued with fierce tactical complications. Tal sacrificed material to maintain the initiative, keeping Fischer under constant pressure. Every time Fischer tried to consolidate, Tal found a new threat. The attack was not based on a single sacrifice but on a *continuous stream* of aggressive moves, each one creating problems.

What this game teaches us:

1. **Development lead + open center = attacking conditions.** Tal recognized that his piece activity compensated for the missing pawn.
2. **Initiative is a real form of compensation.** Tal's pieces were active, coordinated, and threatening. Fischer's extra pawn could not help defend the king.

3. **Against a great defender, you must be relentless.** Fischer was the best defender alive. Tal knew that one quiet move would allow Fischer to consolidate. So Tal never played a quiet move.

This is the essence of sacrificial attacking chess: not a single brilliant sacrifice, but a sustained offensive where every move poses a new problem.

44.11.2 Game 33: Paul Keres vs. Alexander Kotov

Budapest Candidates Tournament, 1950 Nimzo-Indian Defense (E25)

Theme: Kingside attack with piece coordination

Paul Keres was one of the most dangerous attackers in chess history. In this game, he demonstrates how a kingside attack should be built: patiently, methodically, and with devastating coordination.

1.d4 Nf6 2.c4 e6 3.Nc3 Bb4 4.f3 d5 5.a3 Bxc3+ 6.bxc3

The Nimzo-Indian with f3, known as the Saemisch Variation. White accepts doubled c-pawns in exchange for a powerful center and the bishop pair. The f3 pawn supports e4, preparing a massive central advance.

6...c5 7.cxd5 Nxd5 8.dxc5

White opens the position, which favors the bishop pair. The open center will give White's bishops and rooks room to operate.

The middlegame saw Keres slowly build a kingside attack. He developed every piece toward the kingside, established control of the center with his pawns, and then launched the decisive assault.

What makes this game instructive is the patience. Keres did not rush. He made sure that:

- His pieces were developed to their ideal squares
- The center was under his control
- Black's defenders were stretched thin
- The king's shelter had been weakened

Only when ALL of these conditions were met did Keres strike. The attack, when it came, was swift and decisive, but the preparation took many moves.

What this game teaches us:

1. **Attacks must be prepared.** Keres spent the middlegame building the prerequisites. He did not throw pieces at the king prematurely.
2. **The center controls the flanks.** Keres used his central pawn majority to restrict Black's counterplay while building the kingside offensive.
3. **Piece coordination wins attacks.** Every one of Keres's pieces contributed to the final assault. No piece was idle or misplaced.

44.11.3 Game 35: David Bronstein vs. Miguel Najdorf

Zurich Candidates Tournament, 1953 Nimzo-Indian Defense (E21)

Theme: Creative attack, finding resources others would miss

David Bronstein was one of the most creative minds in chess history. He came within half a point of becoming World Champion in 1951, and his games are filled with ideas that were decades ahead of their time.

In this game against the great Najdorf, Bronstein demonstrates that attacking chess is not just about brute force. Sometimes the most dangerous attacks come from unexpected directions: a quiet move that suddenly changes the character of the position, a piece redeployment that catches the opponent off guard.

1.d4 Nf6 2.c4 e6 3.Nc3 Bb4 4.Nf3 c5

Another Nimzo-Indian, but the game quickly enters unique territory. Bronstein's creative play means that standard responses lead to non-standard positions.

The critical moment in this game came when Bronstein found an attacking idea that was anything but obvious. Where a conventional player would have continued with standard development, Bronstein found a way to redirect his pieces toward the king with startling speed.

What this game teaches us:

1. **Creativity beats routine.** Bronstein's opponents expected standard play. He gave them positions they had never seen before.
2. **Attacking ideas can come from anywhere.** Not every attack begins with an obvious pawn storm or sacrifice. Sometimes the strongest attack starts with a subtle piece redeployment.
3. **Study the positions, not just the moves.** Bronstein's genius was in understanding positions at a deeper level than his contemporaries. This understanding allowed him to find moves that others could not imagine.

44.11.4 Game 40: Nigel Short vs. Jan Timman

Tilburg, 1991 Alekhine Defense (B04)

Theme: The King March, when the king itself becomes an attacking piece

This is one of the most extraordinary games in chess history, and it belongs in this chapter not because it follows the rules of king safety, but because it breaks every single one of them.

Nigel Short, one of the strongest players Britain has ever produced, played a game against Timman that chess players still talk about thirty years later. In this game, Short marched his king from g1 all the way up the board, not to escape danger, but to *participate in the attack*.

1.e4 Nf6 2.e5 Nd5 3.d4 d6 4.Nf3 g6 5.Bc4 Nb6 6.Bb3 Bg7 7.Qe2

A solid setup against the Alekhine Defense. White maintains the e5 pawn and develops naturally.

The middlegame reached a position where Short had a significant advantage. His pieces were active, his center was strong, and Timman's king was awkwardly placed. A normal grandmaster would have converted this advantage through standard technique, perhaps building a decisive attack, or transitioning to a winning endgame.

Short did something no one expected.

Short played Kf1, then Ke2, then Kd3, then Kc4, marching his king up the board. The king was not running from danger. It was walking *toward* the enemy position, sheltered behind its own central pawns and pieces.

Set up your board at the key moment:

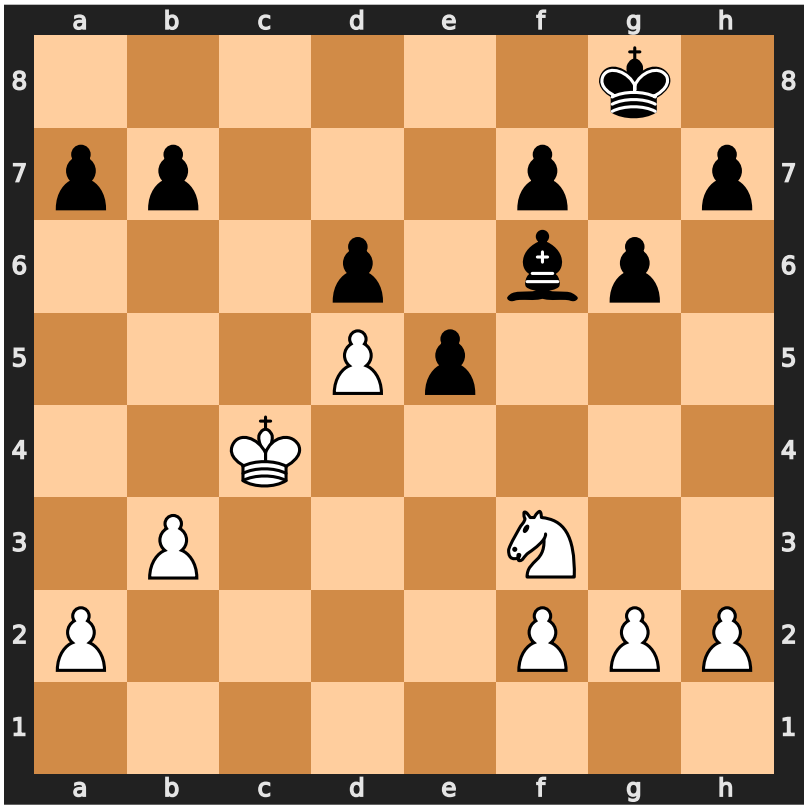

Figure 44.8: Chess Position

Look at this position. White's king is on c4. In the middle of the board. And it is *perfectly safe* because:

1. The position is simplified: few pieces remain
2. White's central pawns on d5 and e5 provide a shield
3. Black's remaining pieces cannot create threats against the exposed king
4. The king is actively supporting White's plans. It controls key squares and frees the other pieces

This is the lesson, and it is profound: King safety is not an absolute rule. It is a *principle* that must be evaluated in context. In a sharp middlegame with queens on the board, the king belongs behind its pawn shelter. But in a simplified position with few pieces, the king can become a powerful attacking piece.

What this game teaches us:

1. **Rules are guidelines, not laws.** The principle "keep your king safe" is excellent advice, but there are positions where the king is safer in the center (or even in enemy territory) than behind its own pawns.

2. **The king is a piece. Use it.** In positions with reduced material, the king's ability to control squares and support pawns makes it a valuable participant, not just a liability.
3. **Courage in chess means seeing what others cannot.** Short saw that his king was safe on c4: a square that looks absurdly dangerous at first glance. His ability to evaluate the position accurately, against all instinct, produced one of the most memorable games in history.

Play through this game on your board. It will change how you think about the king.

44.11.5 Game 46: Garry Kasparov vs. Viswanathan Anand

PCA World Championship, Game 10, New York, 1995 Ruy Lopez Open Defense (C80)

Theme: Overwhelming attack, when every piece joins the assault

This game represents attacking chess at its highest level. Kasparov, widely considered the greatest player of all time, demonstrates what happens when all four attack prerequisites are met simultaneously: development lead, open lines, piece coordination, and a weakened pawn shield.

1.e4 e5 2.Nf3 Nc6 3.Bb5 a6 4.Ba4 Nf6 5.O-O Nxe4

The Open Defense of the Ruy Lopez. Black takes the e4 pawn, leading to sharp, tactical play. This is a bold choice by Anand. He was playing for a win with the Black pieces in a World Championship match.

6.d4 b5 7.Bb3 d5 8.dxe5 Be6

The position opens up dramatically. Pawns are being exchanged, lines are opening, and both sides need to navigate carefully. This is the kind of position where concrete calculation matters more than general principles.

The middlegame saw Kasparov build a devastating attacking position. He developed every piece toward the kingside, opened lines with precise pawn breaks, and coordinated his forces with surgical precision.

What made Kasparov's attack irresistible was the coordination. Every piece (the queen, both rooks, and the remaining minor pieces) contributed to the assault on Anand's king. There was no defensive resource that could handle the combined weight of Kasparov's entire army bearing down on one sector of the board.

The key position:

When all of Kasparov's pieces converged on the kingside, Anand's position collapsed rapidly. The attack was not based on a single sacrifice or a single threat. It was based on the overwhelming force of an entire army focused on one target.

What this game teaches us:

1. **Piece coordination is the ultimate weapon.** Kasparov did not win with a brilliant sacrifice (although there were tactical shots). He won because every piece worked together.
2. **Against the greatest player ever, even World Championship contenders can be overwhelmed.** Anand was one of the strongest players on the planet. Kasparov's preparation and execution were simply on another level.

3. **The attack follows naturally from the prerequisites.** Kasparov did not force the attack. He created the conditions (development, open lines, coordination, king weaknesses) and the attack materialized organically.
4. **Study how Kasparov positioned his pieces before the decisive blow.** The instructive part is not the finish. It is the buildup.

44.11.6 Further Study: Additional Attacking Masterpieces

The following games from the Codex's master collection are directly relevant to this chapter. Each one is worth playing through on your board.

Game 52: Tal vs. Botvinnik, World Championship Match, Game 6, 1960 Tal demonstrates the exchange sacrifice, giving up a rook for a minor piece to shatter the king's pawn shelter. This technique is a foundation of attacking chess and remains one of the most powerful weapons in positions where the pawn structure around the king can be damaged.

Game 60: Judit Polgar vs. Alexei Shirov, Buenos Aires, 1994 Two of the most aggressive players of their generation battle in a Ruy Lopez where the attack develops with ferocious energy. Polgar's play demonstrates that attacking chess requires calculation AND intuition. The ability to sense that the attack is correct even before you can prove it.

Game 65: Judit Polgar vs. Viswanathan Anand, Dos Hermanas, 1999 Polgar defeats the World Champion in a Sicilian Scheveningen with an attacking display that showcases everything this chapter has taught you: pawn storms, piece coordination, sacrificial threats, and precise calculation. This game is proof that attacking chess, done right, can defeat anyone.

44.12 Exercises

44.12.1 Section A: Spot the Weakness in the King Position (Exercises 16.1 - 16.15)

For each position, identify the weakness(es) in the indicated king's shelter and explain how they could be exploited.

Exercise 16.1

Black has castled kingside. Identify the weakness in Black's king position.

Hint 1: Look at the pawn on g6. What square does it weaken? *Hint 2:* The dark squares f6 and h6, are they defended by pawns? *Hint 3:* Where is Black's dark-squared bishop? Is it defending the king?

Solution: The fianchetto with g6 has weakened the dark squares around Black's king. The f6 and h6 squares are no longer defended by pawns. The dark-squared bishop is gone (likely traded or still on c8). Without the bishop on g7, the dark-square complex (f6, g7, h6) becomes porous. White should aim to exploit these weak dark squares with moves like Bh6, Qd2 (targeting h6), or maneuvering a knight to f5 or h5 via g3.

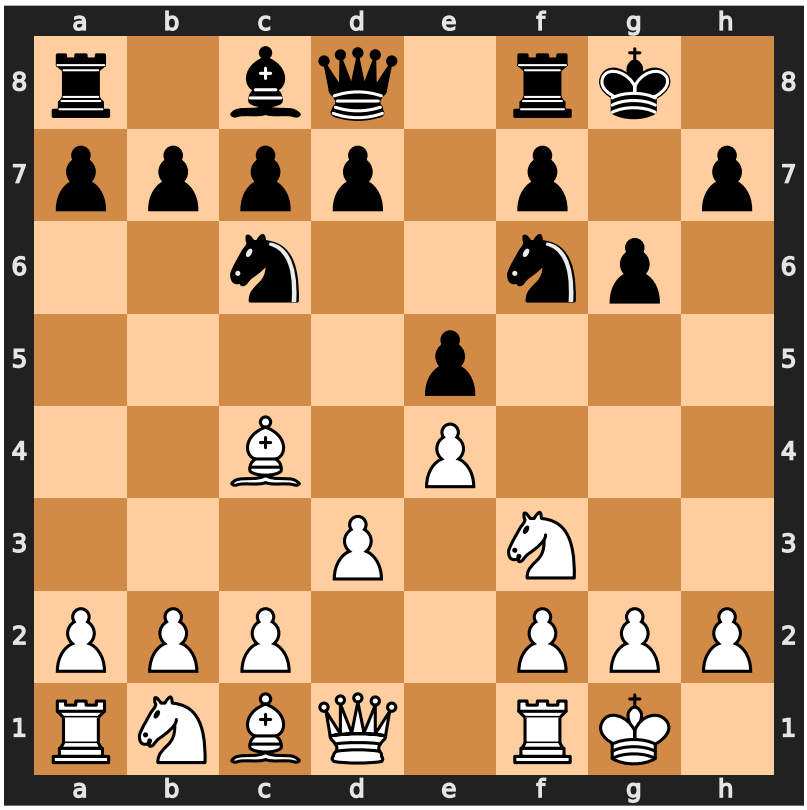

Figure 44.9: Chess Position

Exercise 16.2

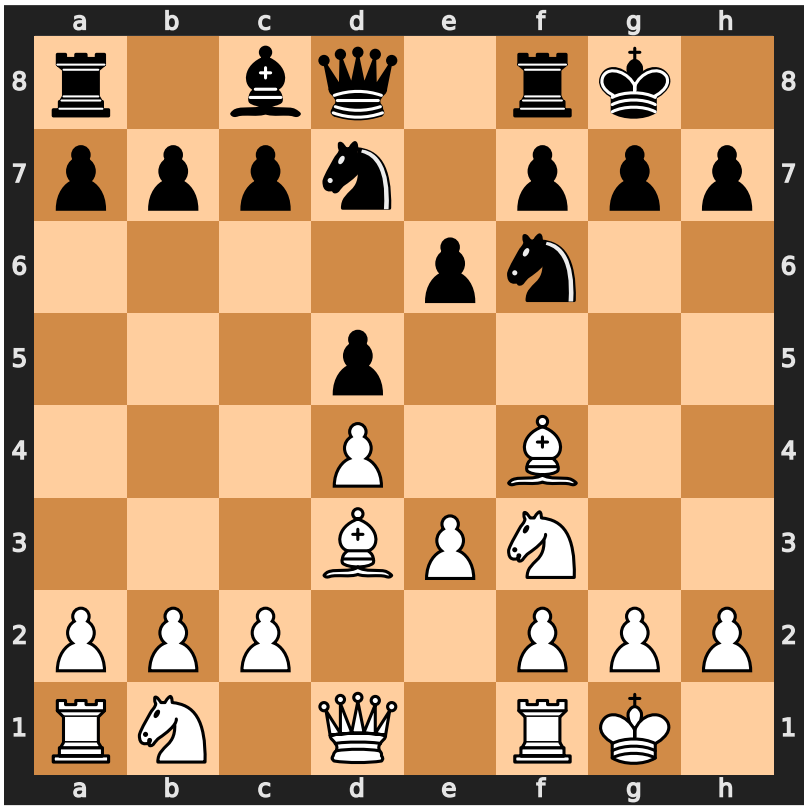

Figure 44.10: Chess Position

Black has castled kingside with a standard shelter (f7, g7, h7). Is Black's king safe?

Hint 1: Are all three shelter pawns on their original squares? *Hint 2:* Look at the pieces. Is there a battery forming on the b1-h7 diagonal? *Hint 3:* Can White play Bxh7+?

Solution: Black's pawn shelter looks intact, f7, g7, h7 are all in place. However, White has a bishop on d3 aimed at h7 and a knight on f3 ready to jump to g5. The Greek Gift conditions are partially met. Black should be aware of the Bxh7+ threat and may need to play …h6 to prevent Ng5, or develop a piece to defend h7 (such as …Re8 preparing …Nf8). The king is *currently* safe but the potential threat must be respected.

Exercise 16.3

Black has played …h6. What weakness has this created?

Hint 1: The h6 pawn no longer covers g7 jointly with g7 pawn, but what square is now weakened? *Hint 2:* Look at the g6 square. Is it defended? *Hint 3:* Can White exploit the weakened g6 square with a piece maneuver?

Solution: The move …h6 weakens the g6 square. While h6 prevents Ng5 and Bg5, it creates a "hook" for a future pawn storm (g4-g5 attacking h6). The g6 square is no longer covered by a pawn

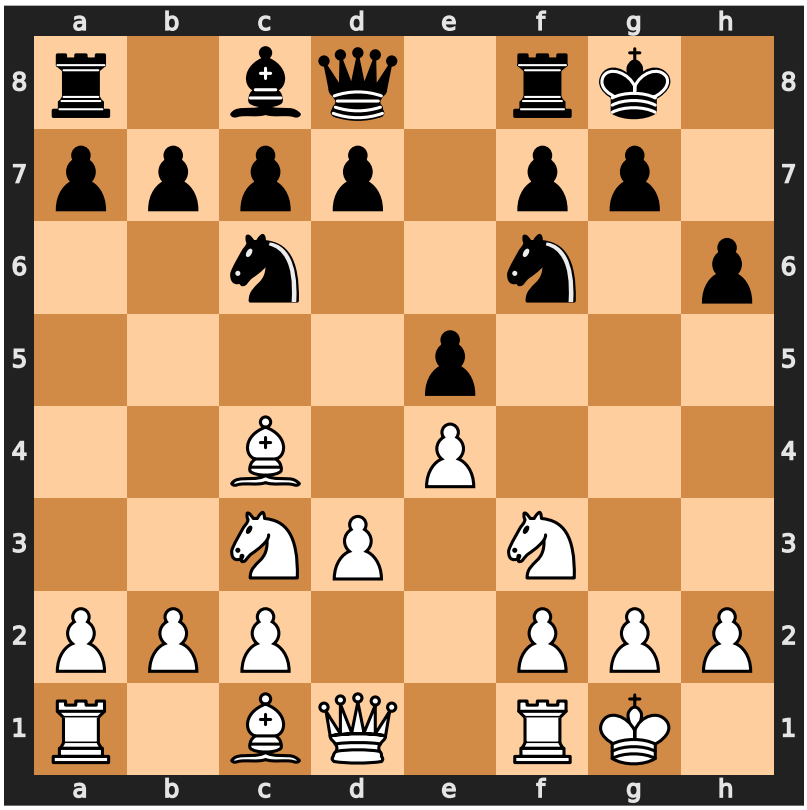

Figure 44.11: Chess Position

on h7. White can aim to maneuver a knight to g6 (via e2-g3 or f3-h4-g6) where it would fork the f8 rook and pressure the king. Additionally, if White can play g4-g5, the h6 pawn becomes a target and the g-file may open. The move …h6 is not necessarily bad, but it is a commitment that creates targets.

Exercise 16.4

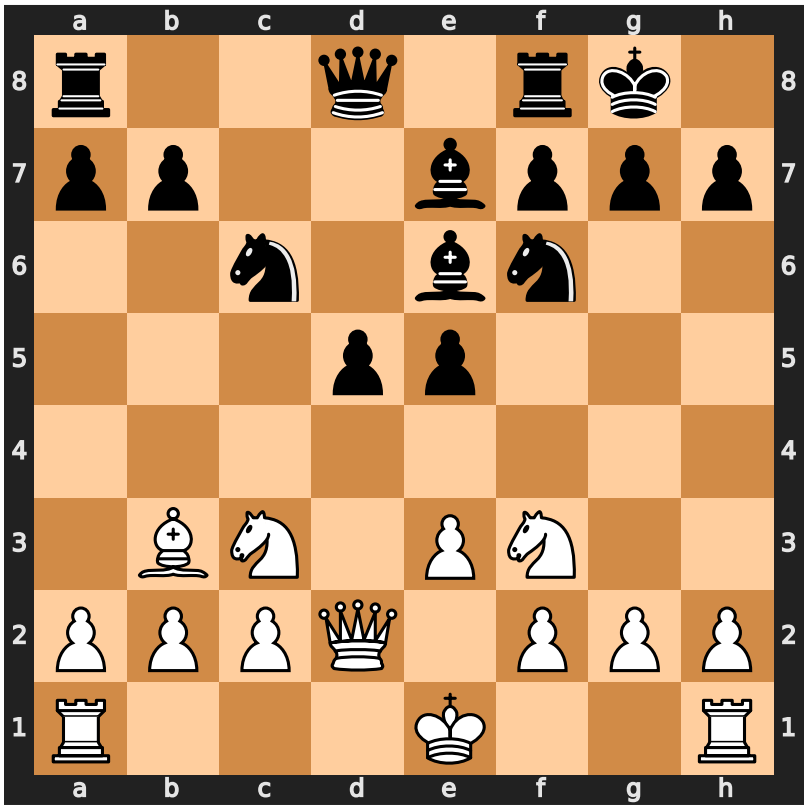

Figure 44.12: Chess Position

White has NOT yet castled. Evaluate both castling options for White.

Hint 1: If White castles kingside, where will the attack come from? *Hint 2:* If White castles queenside, what is the pawn storm plan? *Hint 3:* What does the queen on d2 suggest about White's plans?

Solution: White should castle queenside (O-O-O). The queen on d2 is already positioned for a kingside attack (supporting Bh6 or Qh6 later). After O-O-O, the rook immediately activates on d1, and White can prepare a kingside pawn storm with h4, g4, and h5. Castling kingside would be safer for the king, but it would place the king on the same side as Black's central pawn mass (d5, e5), limiting White's attacking options. The queen placement on d2 is the telling detail. It signals opposite-side castling intentions.

Exercise 16.5

White has castled kingside. Black has a bishop on c5 aimed at f2. Is the f2 pawn a weakness?

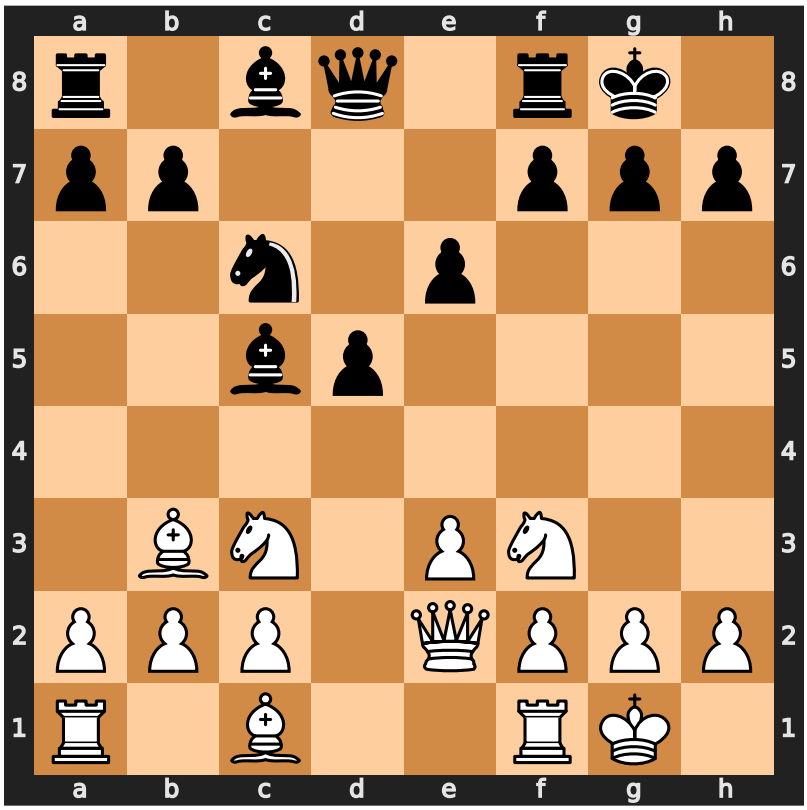

Figure 44.13: Chess Position

Hint 1: The f2 pawn is defended by the king on g1. What happens if it is attacked again? *Hint 2:* Can Black add pressure to f2 with …Qb6 or …Ng4? *Hint 3:* If f2 falls, what happens to the king's shelter?

Solution: The f2 pawn is a latent weakness. It is currently defended by the king, but if Black plays …Qb6 (adding a second attacker) or …Ng4 (attacking f2 and threatening Nxh2), the pressure on f2 could become critical. If f2 falls or is sacrificed, the king's shelter is ripped open. The entire kingside structure (f2, g2, h2) depends on f2 as the foundation. White should play Kh1 to remove the king from the diagonal, or Na4 to challenge the bishop on c5.

Exercise 16.6

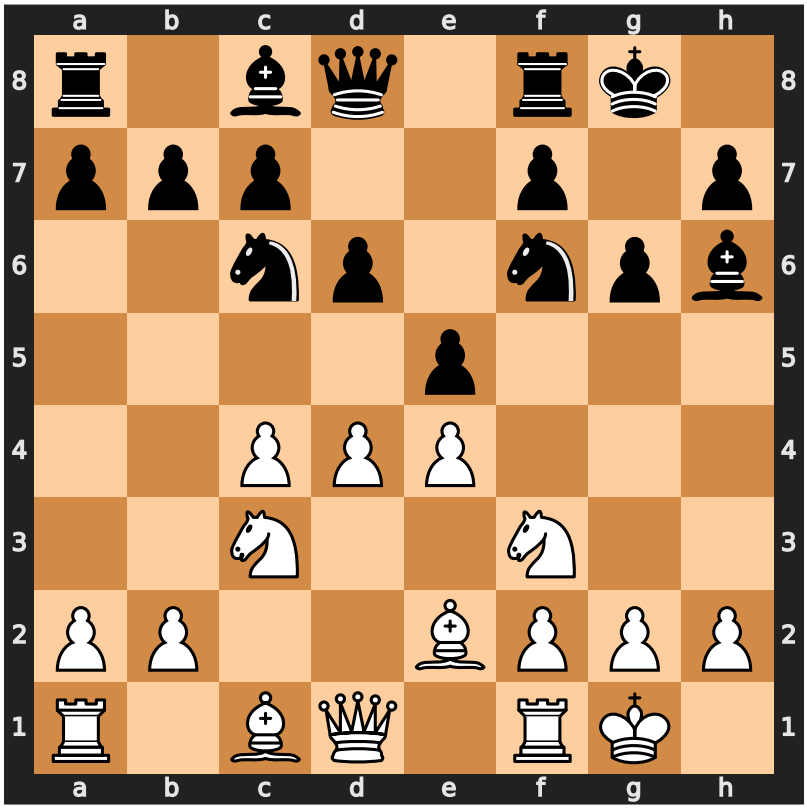

Figure 44.14: Chess Position

Black has played …Bg7-h6. Is this bishop actively defending the king or has it abandoned its post?

Hint 1: The g7 square is now empty. What piece was guarding it? *Hint 2:* Look at the dark squares: f6, g7, h6. How many are now weak? *Hint 3:* Can White exploit the absence of the bishop from g7?

Solution: The bishop on h6 has abandoned its defensive post on g7. The critical dark-square diagonal (a1-h8) around the king is now unguarded. The g7 square is a hole, White can aim to place a piece there (especially after opening the position). White should consider d5 to open lines, followed by Nd4-f5 targeting g7 and h6. The bishop on h6 may look active, but it has left the king vulnerable. This is a common mistake: moving a defensive piece for "activity" without recognizing the cost.

Exercise 16.7

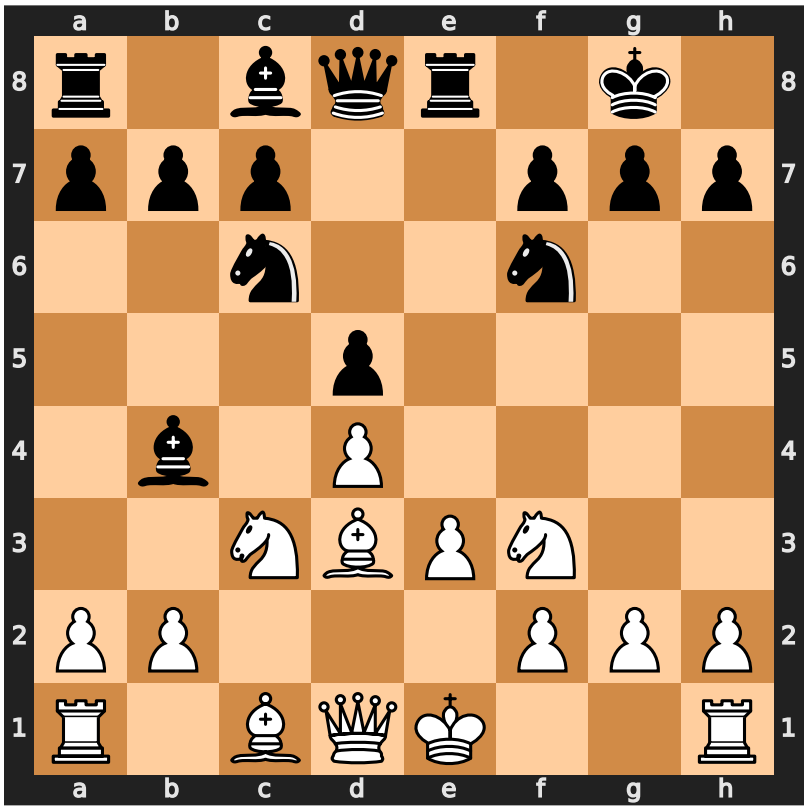

Figure 44.15: Chess Position

White has not castled. Black threatens …Bxc3+ winning a piece. Should White castle now or deal with the threat first?

Hint 1: What happens after …Bxc3+ bxc3? Is White's king safe enough to castle later? *Hint 2:* If White castles immediately (O-O), does the threat on c3 still matter? *Hint 3:* Consider that …Bxc3+ creates doubled pawns but also opens the b-file.

Solution: White should castle immediately with O-O. After castling, the king is safe on g1 behind intact kingside pawns. If Black then plays …Bxc3 bxc3, White has doubled c-pawns but gains the open b-file and a strong center. The king is safe on the kingside regardless of what happens on the queenside. The key lesson: when you can castle and improve your king safety, do it. Do not get distracted by threats that, upon examination, are not actually dangerous.

Exercise 16.8

Black's king is safe but passive. White's pieces are more active. Does White have grounds for a kingside attack?

Hint 1: Count the pieces White can bring to the kingside in two moves. *Hint 2:* Is there a pawn break that would open lines near Black's king? *Hint 3:* Can the bishop on d3 participate in an attack on h7?

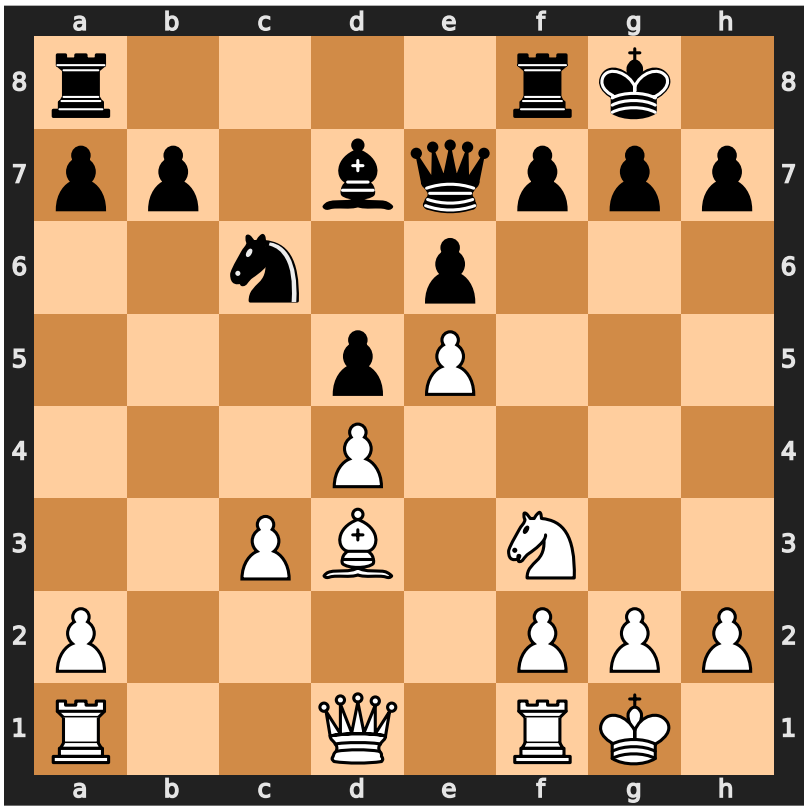

Figure 44.16: Chess Position

Solution: White has grounds for an attack. The bishop on d3 eyes h7. The knight on f3 can reroute to g5 or e5-g4. The queen can swing to h5 or c2 (joining the b1-h7 diagonal with the bishop). White's plan: Qc2 (creating the battery), Re1, Ng5 (if h6 is not played), or h4-h5 if Black plays …g6. Black's position is solid but passive. The bishop on d7 and knight on c6 are not contributing to the defense of the kingside. This is a classic case where the prerequisites are partially met and White should build patiently.

Exercise 16.9

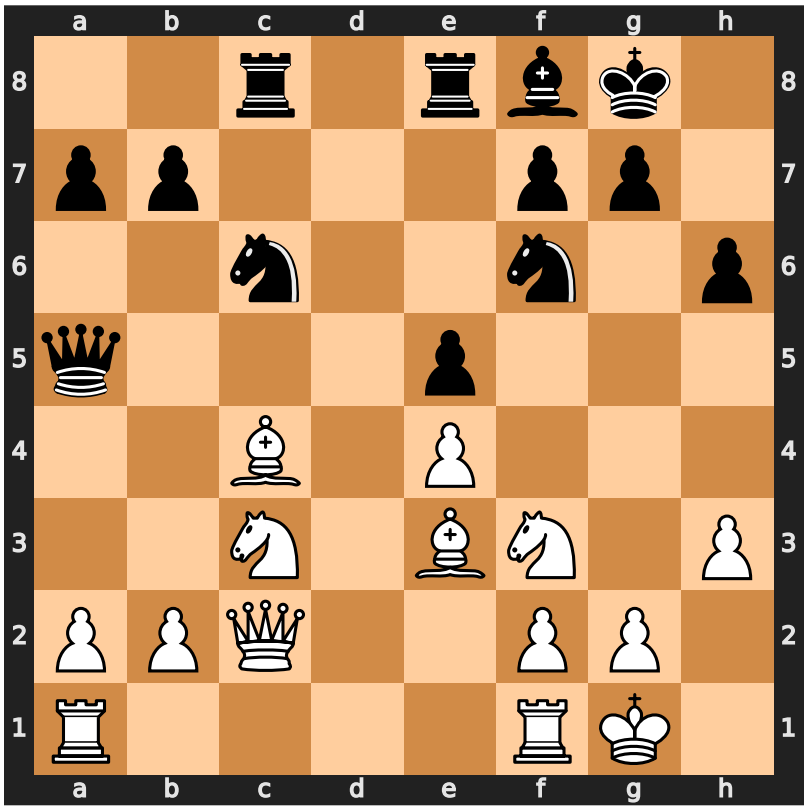

Figure 44.17: Chess Position

White's queen is on c2 and bishop is on c4. Assess the attacking potential.

Hint 1: The queen on c2 and bishop on c4 aim at different diagonals. Where should the bishop go? *Hint 2:* If the bishop moves to d3, what diagonal does it join? *Hint 3:* What is the classic battery along the b1-h7 diagonal?

Solution: White should reposition the bishop from c4 to d3 (via Bd3) to create the deadly b1-h7 diagonal battery with the queen on c2. After Bd3, the battery aims directly at h7. Combined with the knight on f3 (ready for Ng5), this creates the classic Greek Gift setup. White should also consider Re1 and Rad1 to bring the rooks into play. The attack is building. The battery, the knight, and the h3 pawn (which prevents …Ng4) all contribute to a gathering storm on the kingside.

Exercise 16.10

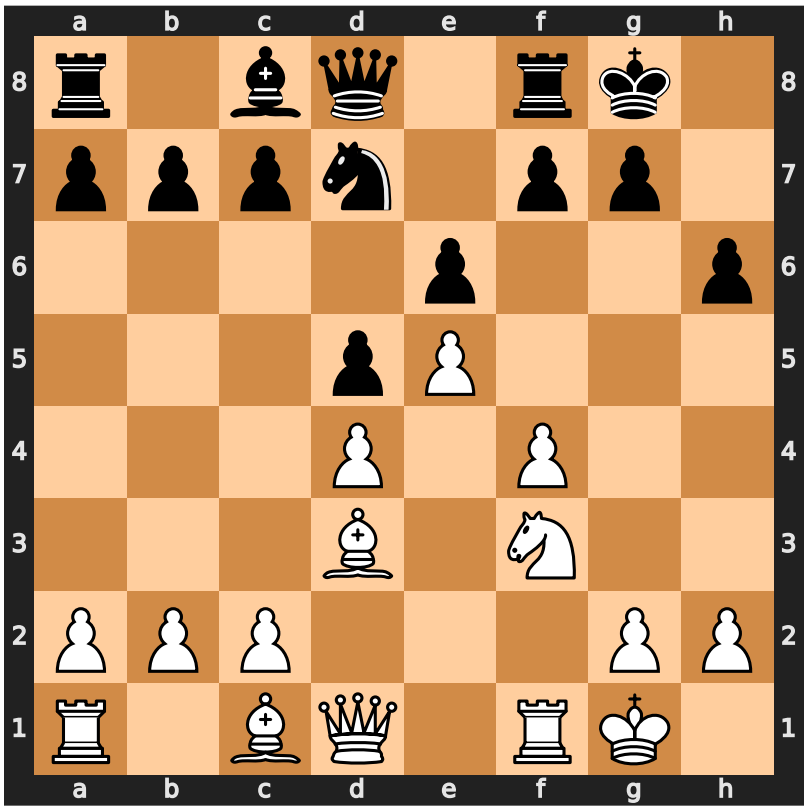

Figure 44.18: Chess Position

Black has played …h6. Evaluate whether this weakens the kingside enough for White to attack.

Hint 1: The h6 pawn creates a "hook": a target for a pawn storm. *Hint 2:* Can White play g4, f5, and eventually g5 to attack h6? *Hint 3:* Where should White's pieces be positioned to support the pawn storm?

Solution: Yes, …h6 creates a target. White can build a pawn storm: g4 (supporting f5), f5 (attacking e6 and preparing to redirect toward the kingside), and eventually g5 (attacking the h6 hook). White's plan: Qe1 (heading to h4 or g3), g4, f5, and then g5. When g5 hits h6, lines open directly toward the king. The bishop on d3 supports the attack by covering h7. The knight can reroute to e5 or g5 (after the h6 pawn is undermined). The key insight: …h6 looks like a preventing move (stopping Ng5) but it creates a long-term target that White can exploit with patient preparation.

Exercise 16.11

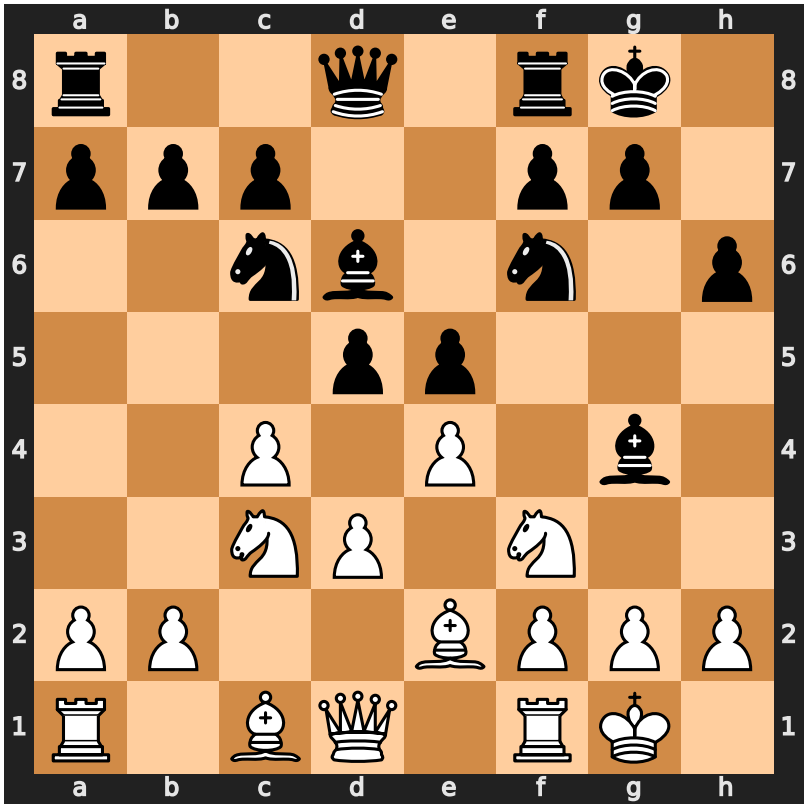

Figure 44.19: Chess Position

Identify ALL the weaknesses in Black's king position.

Hint 1: Start with the pawn structure: are f7, g7, h7 all intact? *Hint 2:* The h6 pawn, what does it weaken? *Hint 3:* Black has played …g7 (not moved) but …h6 is played. What is the impact?

Solution: Black's king weaknesses: (1) The h6 pawn weakens the g6 square, no pawn guards it now. (2) The h6 pawn is a "hook" for a g4-g5 pawn storm. (3) The g5 square could become accessible to a White knight. However, the g7 pawn is still in place and the f7 pawn is intact, so the

shelter is only slightly compromised. Black's dark-squared bishop on d6 is not defending the king (it is on the wrong diagonal). Overall: Black's position is playable but requires vigilance. White should aim for a pawn storm or piece infiltration via g5/g6.

Exercise 16.12

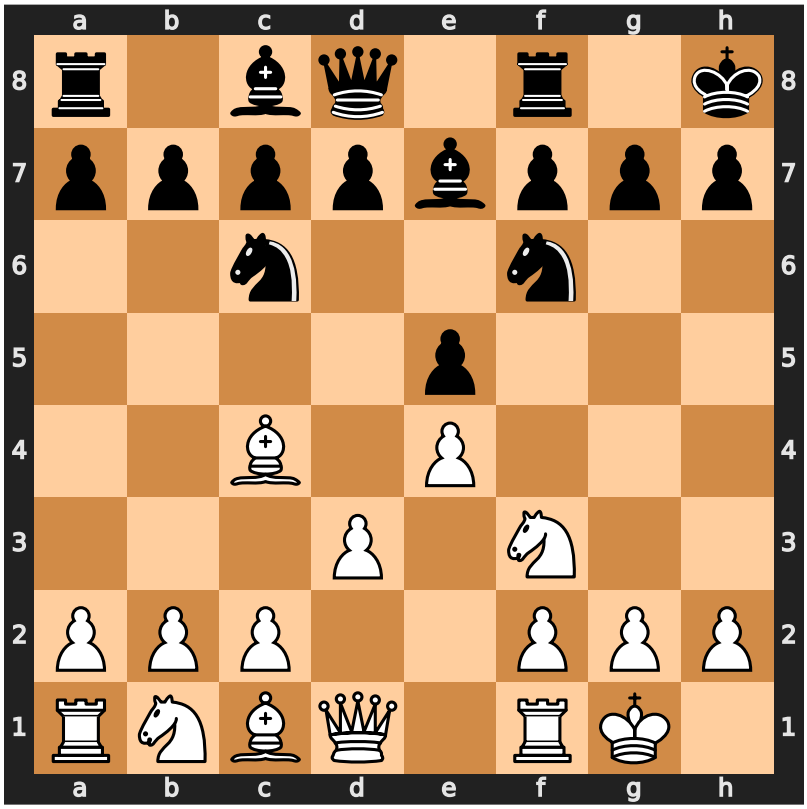

Figure 44.20: Chess Position

Black has castled kingside but the king is on h8 (after …Kg8-h8). Why might Black have done this, and is the king safer or less safe?

Hint 1: On h8, the king is off the g-file. Why does that matter? *Hint 2:* Does the king on h8 have an escape square? *Hint 3:* Is the king more or less vulnerable to the Greek Gift on h8 vs g8?

Solution: Black played …Kh8 to move the king off the g-file and the a2-g8 diagonal. On g8, the king is exposed to potential Bxf7+ sacrifices (the bishop on c4 aims at f7) and back-rank threats along the g-file. On h8, the king avoids these specific threats. However, the king on h8 has drawbacks: it is more vulnerable to h-file attacks (after h4-h5 or a sacrifice on h7), and it has fewer escape squares (only g8). Whether this is correct depends on the position. The key lesson: king moves in the castled position have trade-offs. Moving to h8 solves one problem but may create another.

Exercise 16.13

White has a bishop on d3. If Black plays …e5, does this help or hinder White's kingside attack?

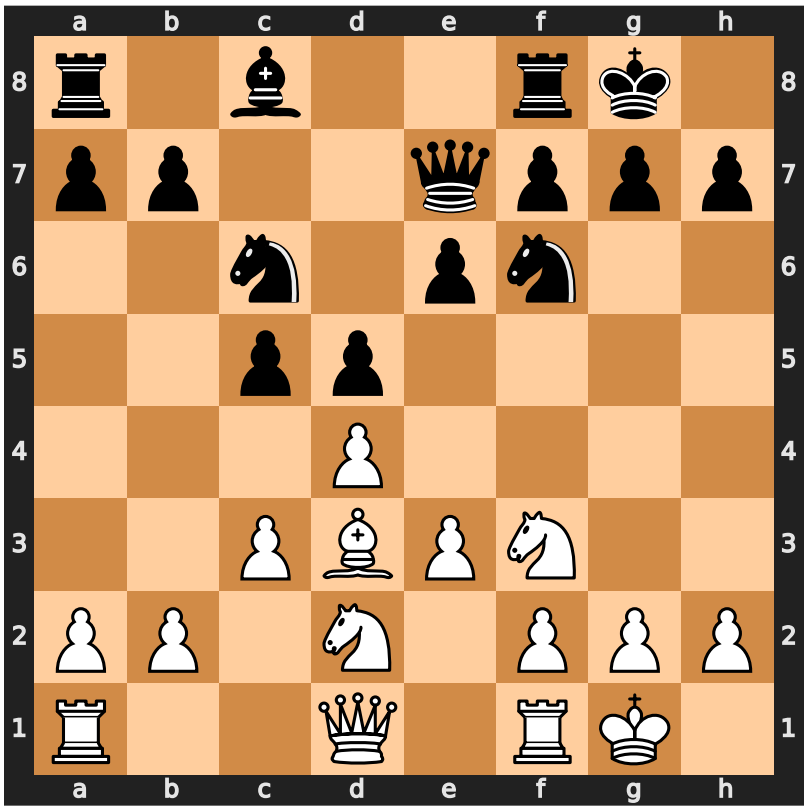

Figure 44.21: Chess Position

Hint 1: After …e5, the e6 square is no longer defended by a pawn. What does this mean for White's pieces? *Hint 2:* Does …e5 open or close lines toward Black's king? *Hint 3:* Think about the bishop on d3, does …e5 improve or worsen its scope?

Solution: After …e5, the e6 square becomes available for White's knight (Ne4-g5 or Nf3-e5-g4). The advance also opens the d3 bishop's diagonal, with no pawn on e6 blocking the way, the bishop's line toward h7 is clearer. However, …e5 does close the center somewhat. On balance, …e5 helps White's attack more than it helps Black's defense. The key weakness: the e6 square becomes an outpost, and the bishop on d3 gains scope toward the kingside. Black should prefer …e5 only if there is a concrete tactical reason.

Exercise 16.14

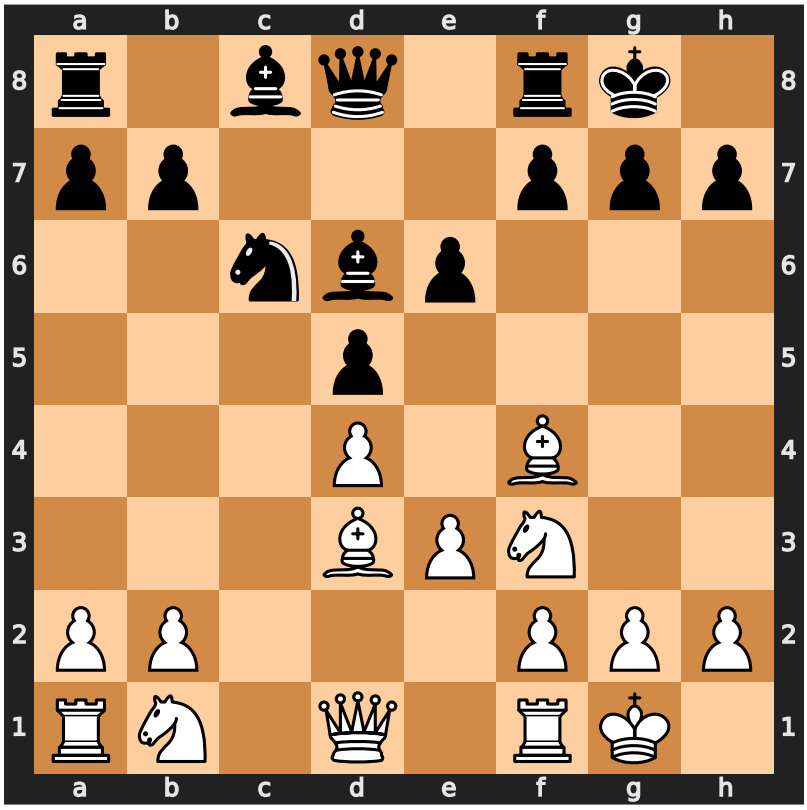

Figure 44.22: Chess Position

White has a bishop on f4 and a bishop on d3. Should White play Qc2, targeting h7, or Qe2, preparing e4?

Hint 1: Qc2 creates the battery on the b1-h7 diagonal. What does this threaten? *Hint 2:* Qe2 prepares e3-e4, opening the center. Which is more forcing? *Hint 3:* Can White do both? Is there a move order that achieves both goals?

Solution: White should play **Qc2** first. The battery along the b1-h7 diagonal creates an immediate threat of Bxh7+ (the Greek Gift). Black must respond to this threat, likely with …h6 (which weakens g6), …g6 (which weakens f6 and h6), or …Re8 (preparing …Nf8). Each of these responses

weakens Black's position in some way. After Black responds, White can THEN prepare e3-e4 with Nbd2 and e4. The attacking threat (Qc2) should come first because it forces a concession; the positional plan (e4) can wait.

Exercise 16.15

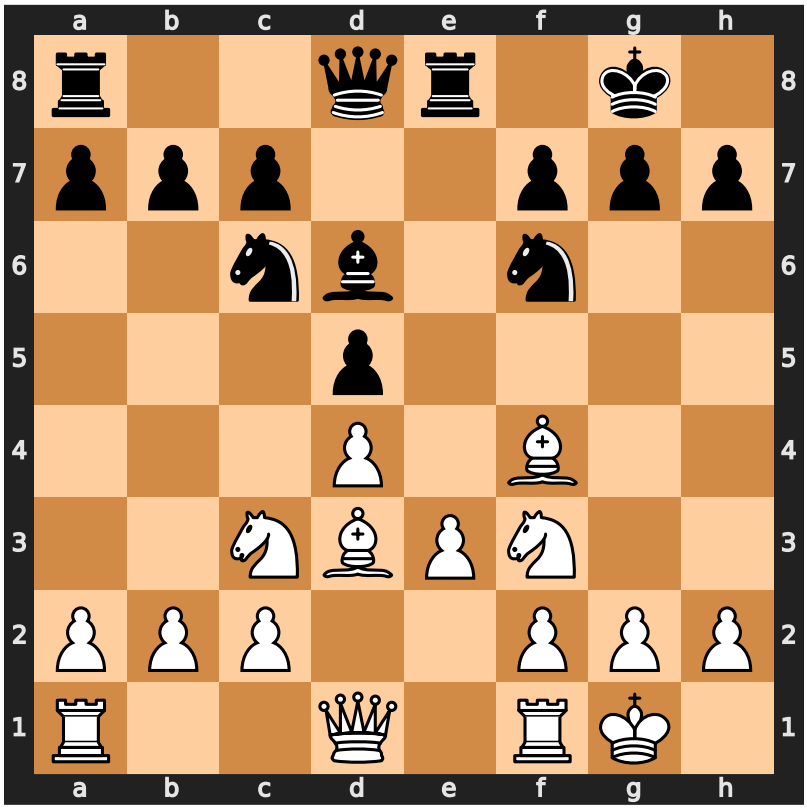

Figure 44.23: Chess Position

White wants to attack Black's king. Outline a three-move attacking plan.

Hint 1: What is the first piece White should reposition to aim at the kingside? *Hint 2:* Where should the queen go to create a battery with the d3 bishop? *Hint 3:* What supporting move prepares the final assault?

Solution: White's three-move plan: (1) **Qc2**: creating the battery on the b1-h7 diagonal, threatening Bxh7+. (2) After Black responds (say …h6 to prevent Ng5), **Re1**: connecting the rooks and preparing to use the e-file. (3) **Ne5**: centralizing the knight on its most powerful square, where it supports Ng4 (if h6 was played) or threatens Bxh7+ followed by Qh7+ and Ng6. This plan follows the prerequisites: develop pieces toward the target, create threats, coordinate the forces. The attack will build from here.

Rest here if you need to. Fifteen exercises done. You have earned a break. Come back fresh for the attacking exercises.

44.12.2 Section B: Find the Attacking Move (Exercises 16.16 - 16.30)

For each position, find the strongest attacking move. All positions are White to move unless stated otherwise.

Exercise 16.16

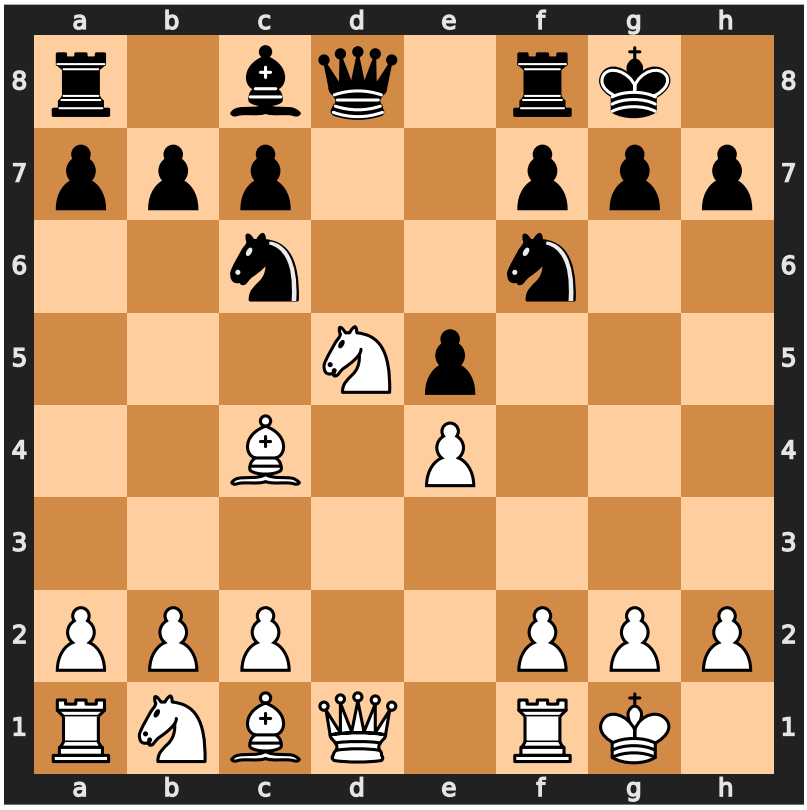

Figure 44.24: Chess Position

White has a knight on d5 and a bishop on c4. Find the strongest move.

Hint 1: The knight on d5 attacks f6. If the f6 knight moves, what is threatened? *Hint 2:* Can White force the f6 knight to move? *Hint 3:* What happens after Nxf6+ gxf6? Look at the open g-file.

Solution: Nxf6+! After …gxf6, Black's kingside is shattered. The g-file is open, and Black's king is exposed behind the ugly f6 and h7 pawns. White can follow up with Qh5, threatening Qh6 and various mating attacks. If Black recaptures with the queen (…Qxf6), the queen is misplaced and White can continue developing with tempo. The key: this is not a material sacrifice. It is an exchange of knight for knight, but the structural damage is permanent and devastating.

Exercise 16.17

White has not castled. Find the most aggressive option.

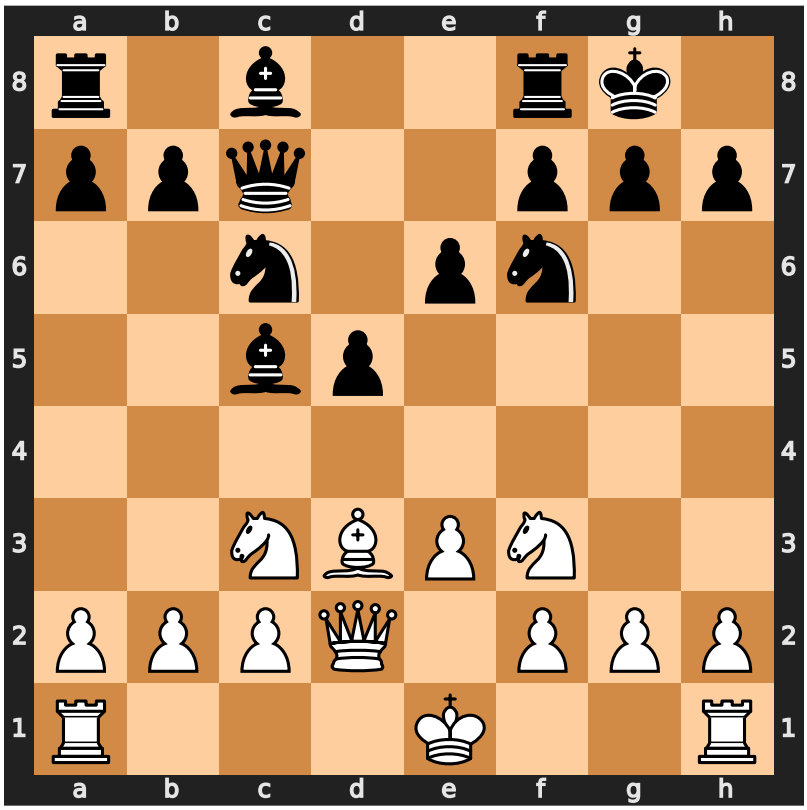

Figure 44.25: Chess Position

Hint 1: White's queen is on d2. Where does it go after O-O-O? *Hint 2:* Queenside castling activates the rook and prepares a pawn storm. *Hint 3:* After O-O-O, what is White's attacking plan?

Solution: O-O-O! Queenside castling is the attacking move. It places the king safely on the queenside, activates the h1 rook (which will later swing to the kingside via g1 or h1), and signals a kingside pawn storm. After O-O-O, White's plan is h4, g4, h5, opening lines against Black's kingside shelter. The queen on d2 supports Qh6 infiltration. This is not a quiet castling move. It is the first move of an attack.

Exercise 16.18

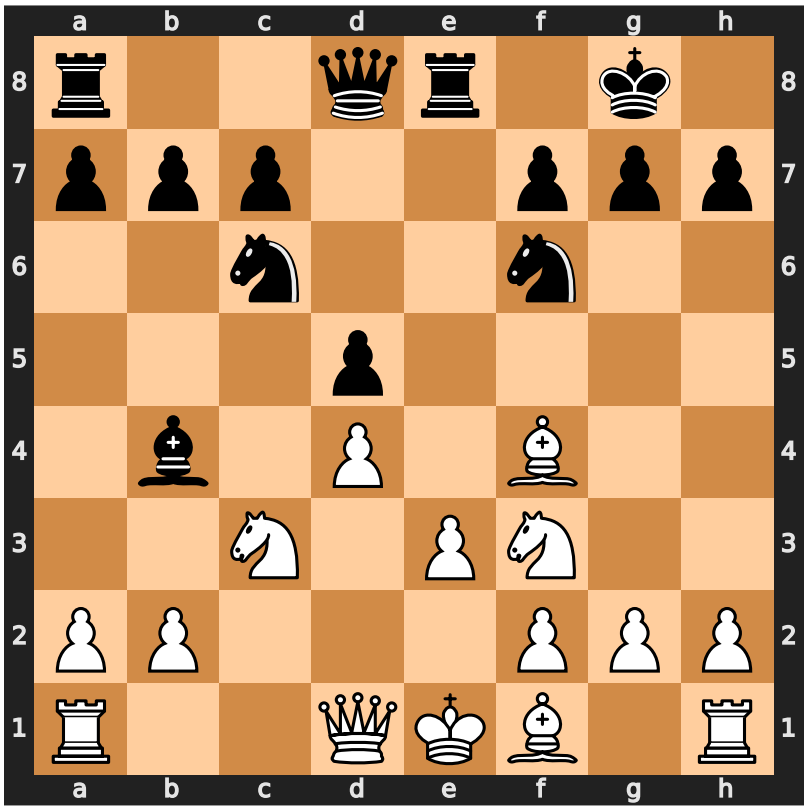

Figure 44.26: Chess Position

White has a bishop on f4. Find the move that targets Black's king.

Hint 1: The bishop on f4 aims at the a4-d8-h4 diagonal. Can it go to h6? *Hint 2:* If the bishop reaches h6, what square does it attack near the king? *Hint 3:* Bh6 threatens to trade the dark-squared bishop (if there is one) or to establish a piece near the king.

Solution: Bd3! Before going to h6, White needs to set up the attacking infrastructure. Bd3 aims the bishop at h7 (creating the battery potential with Qc2 later) and prepares O-O to complete development. The immediate Bh6 is tempting but premature, White has not castled yet and the king in the center is a liability. The correct sequence is Bd3, O-O, Qc2, and then consider Bh6 or a direct kingside attack. Preparation before attack, always.

Exercise 16.19

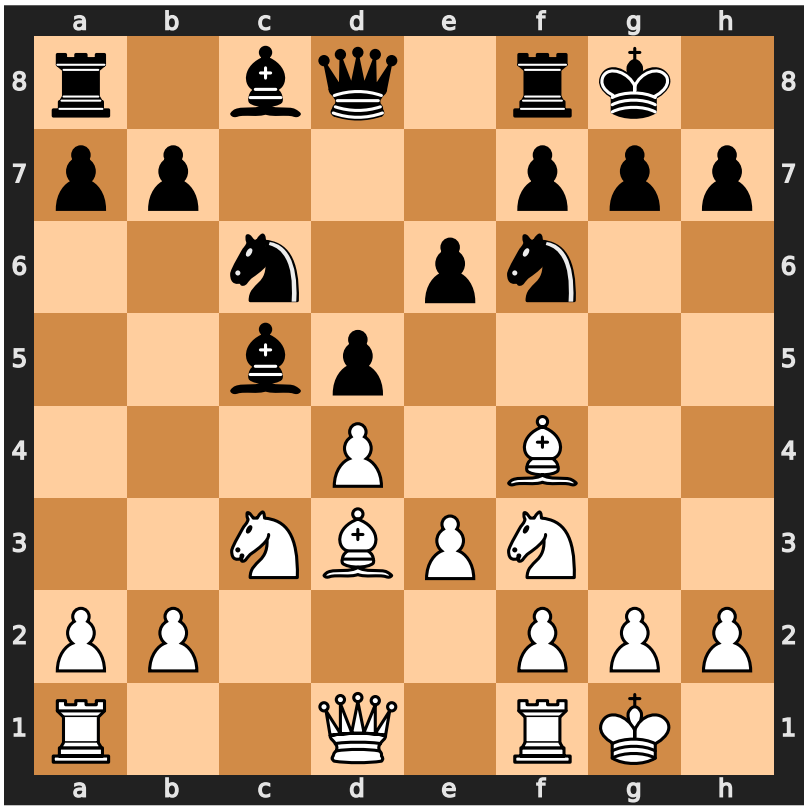

Figure 44.27: Chess Position

White has the classic setup: Bd3, Nf3, Bf4, and the queen on d1. Find the strongest continuation.

Hint 1: Which square should the queen go to? *Hint 2:* The b1-h7 diagonal is open after the queen moves off d1. *Hint 3:* Qc2 creates the battery. Is the Greek Gift threat real?

Solution: Qc2! This creates the devastating battery along the b1-h7 diagonal. The threat of Bxh7+ is now real. The bishop on d3 and queen on c2 aim at h7, and the knight on f3 is ready for Ng5. Black must react immediately. If Black does nothing, Bxh7+ Kxh7 Ng5+ followed by Qh5 or Qh7 leads to a powerful attack. This is the Greek Gift setup in its purest form. The battery is the trigger.

Exercise 16.20

White has the battery in place (Qc2 + Bd3). Black has defended with …Be7 and …Qc7. Is the Greek Gift still playable?

Hint 1: After Bxh7+ Kxh7 Ng5+, can Black play …Kg8? *Hint 2:* If …Kg8, then Qh5 threatening Qh7# and Qxf7+. Can Black defend? *Hint 3:* What about …Bxg5? Does this refute the sacrifice?

Solution: The Greek Gift is playable but requires careful calculation. After **Bxh7+ Kxh7 Ng5+ Kg8** (forced, …Kg6 walks into Qd3+ with a mating attack) **Qh5**, White threatens Qh7# and Qxf7+. Black must play …Bxg5 (removing the knight), and after Bxg5, White has opened

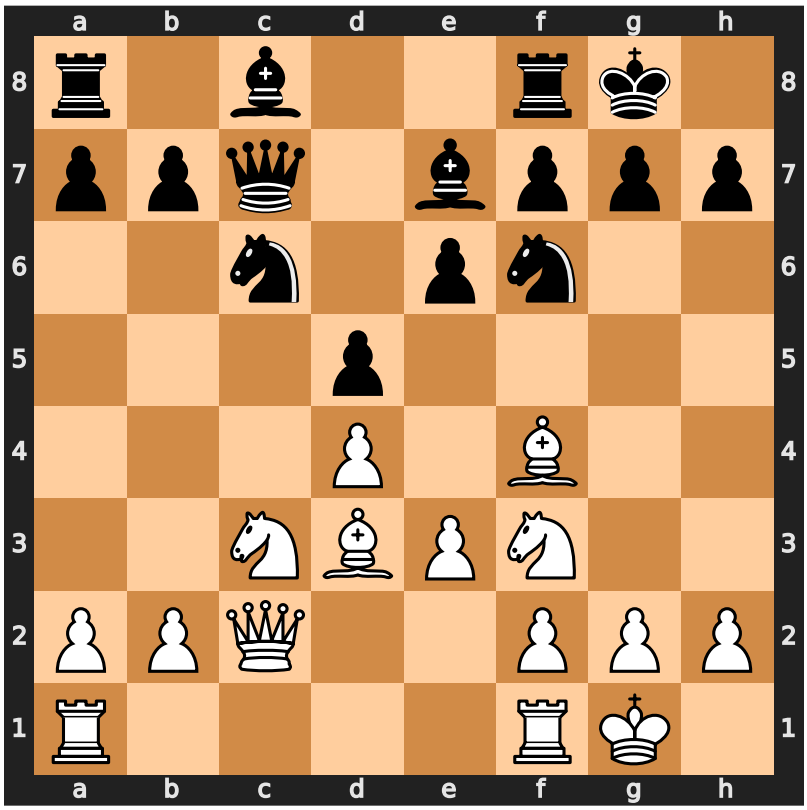

Figure 44.28: Chess Position

the h-file and weakened Black's king. The attack continues with Qh7+ Kf8 Qh8+ Ke7 Qxg7, and White has a strong position. The Greek Gift does not lead to immediate checkmate here, but it wins material and creates a lasting attack. This is the typical "sound sacrifice" scenario.

Exercise 16.21

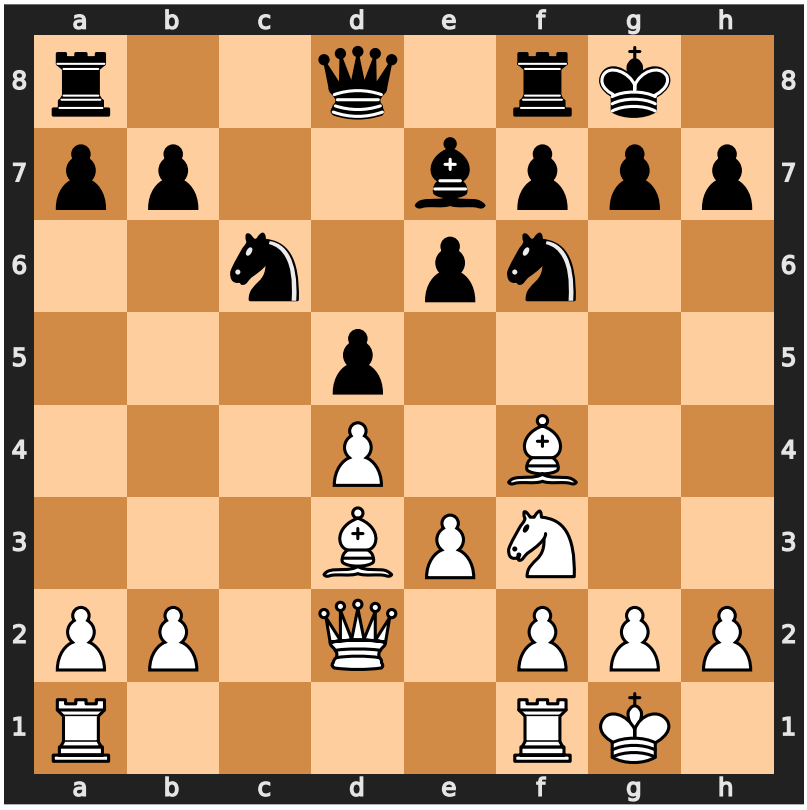

Figure 44.29: Chess Position

White's queen is on d2 (not c2). Find the move that creates the most dangerous threat.

Hint 1: The queen is not on the b1-h7 diagonal yet. How does it get there? *Hint 2:* Can the queen go to c2 in one move? Or is there a more forcing option? *Hint 3:* What about Qh6? Or Qg5?

Solution: Qc2! remains the strongest move. Even from d2, the queen's best destination is c2, creating the battery with the d3 bishop. After Qc2, the Greek Gift threat (Bxh7+) forces Black to react. Alternative queen moves like Qh6 look aggressive but are premature. The queen would be on the rim without sufficient support (no piece covers g7 or h7 yet). The battery is the foundation of the attack; flashy queen moves without support are just targets for counter-attack.

Exercise 16.22

White has a bishop on c2 and a knight on f3. Find the attacking plan.

Hint 1: The bishop on c2 is on the b1-h7 diagonal. What does it need? *Hint 2:* Where should the queen go to form the battery? *Hint 3:* What preparatory move sets up the battery with tempo?

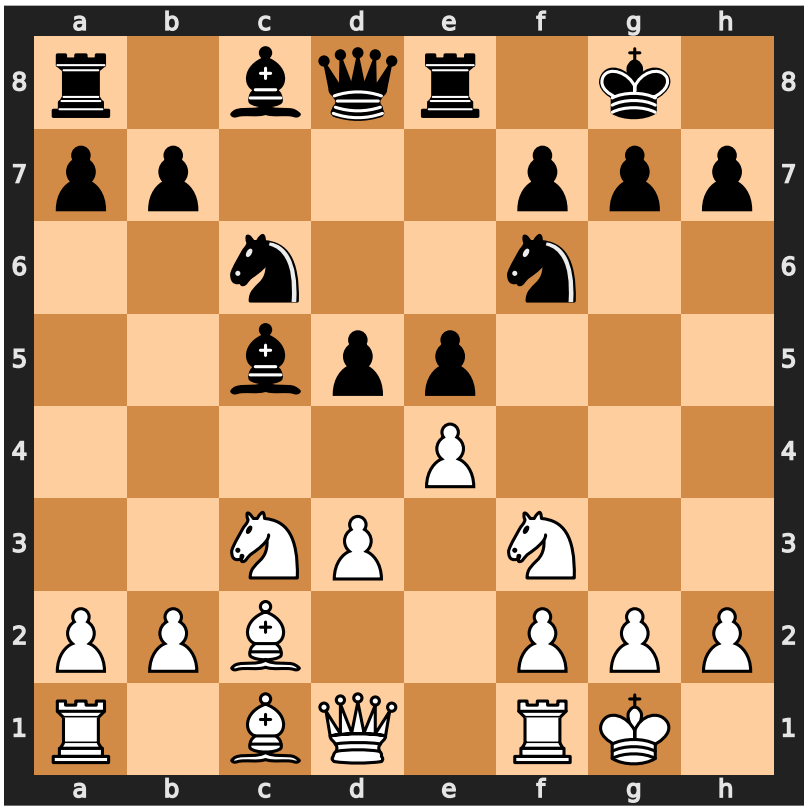

Figure 44.30: Chess Position

Solution: d4! is the attacking move. By challenging the center with d4 (or d3-d4 if needed), White opens lines and creates immediate central tension. If Black takes …exd4, the position opens, perfect for the bishop on c2. After the center opens, Qd3 creates the battery on the b1-h7 diagonal (Bc2 + Qd3). The knight on f3 is ready for Ng5. The plan: open the center first, then attack the king. This is the correct order. The center must be favorable before the flank attack begins.

Exercise 16.23

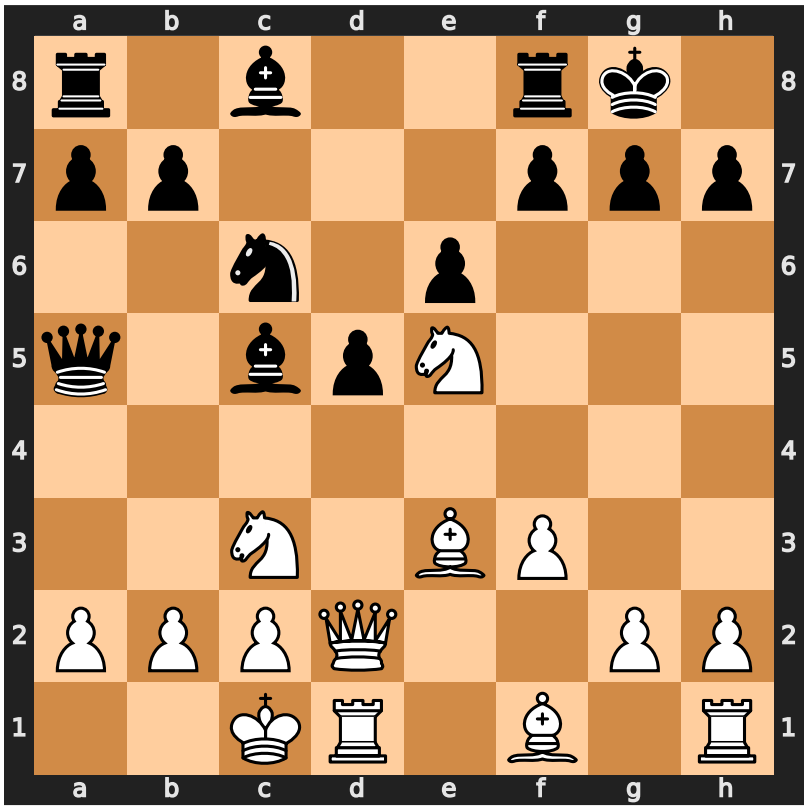

Figure 44.31: Chess Position

White has castled queenside with a knight on e5. Find the most threatening move.

Hint 1: The knight on e5 is powerfully placed. What is it attacking? *Hint 2:* Can White add more pieces to the kingside attack? *Hint 3:* Think about Bh6, what does it threaten if Black has a fianchetto?

Solution: Bd3! develops the last minor piece to an aggressive square, aiming at h7. After Bd3, White's position is fully mobilized: the knight on e5 controls the center and kingside, the bishop on d3 aims at h7, the bishop on e3 can swing to h6, and the queen on d2 supports the attack. The plan is Bh6 (trading the dark-squared defender), followed by Qh6, Ng4, and a decisive assault. Every piece has a role. This is what full coordination looks like.

Exercise 16.24

White has an active setup but Black is solid. Find a way to create threats.

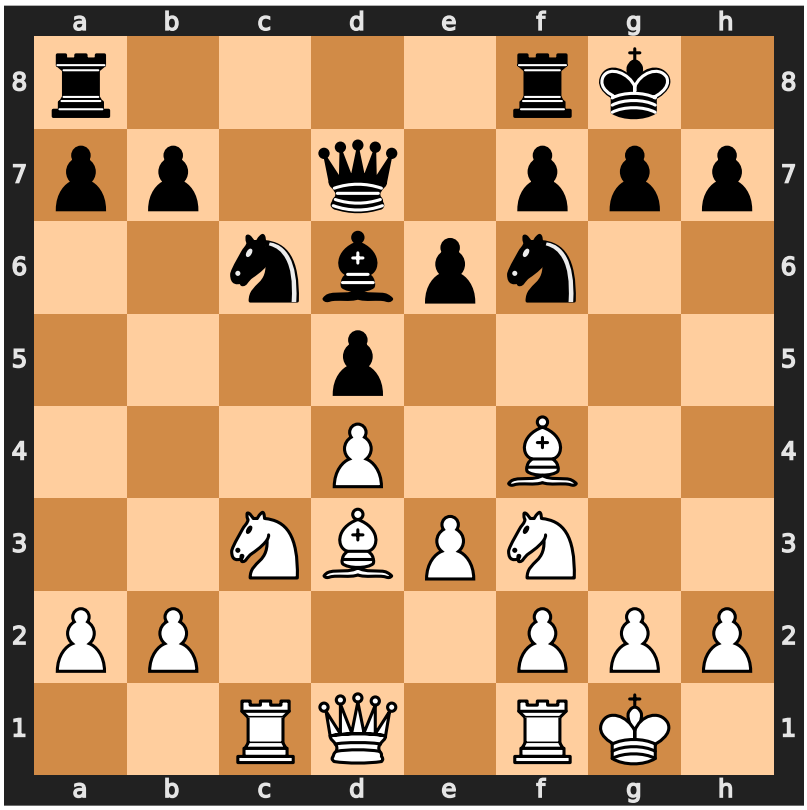

Figure 44.32: Chess Position

Hint 1: Is there a pawn break that opens lines toward the king? *Hint 2:* Consider e3-e4. What does it achieve? *Hint 3:* After e4 dxe4, where does the bishop on d3 go?

Solution: e4! is the move. After …dxe4 Bxe4, the bishop lands on e4, a dominant central square that also looks toward the kingside (h7 diagonal via e4-d3 or e4-h7). The position opens, favoring White's more active pieces. If Black does not take (…Nxe4? Nxe4 with threats), White gains space. The e4 break is the classic way to activate pieces in these structures. After the center opens, White's rooks enter the game via the c and e files, and the attack builds organically.

Exercise 16.25

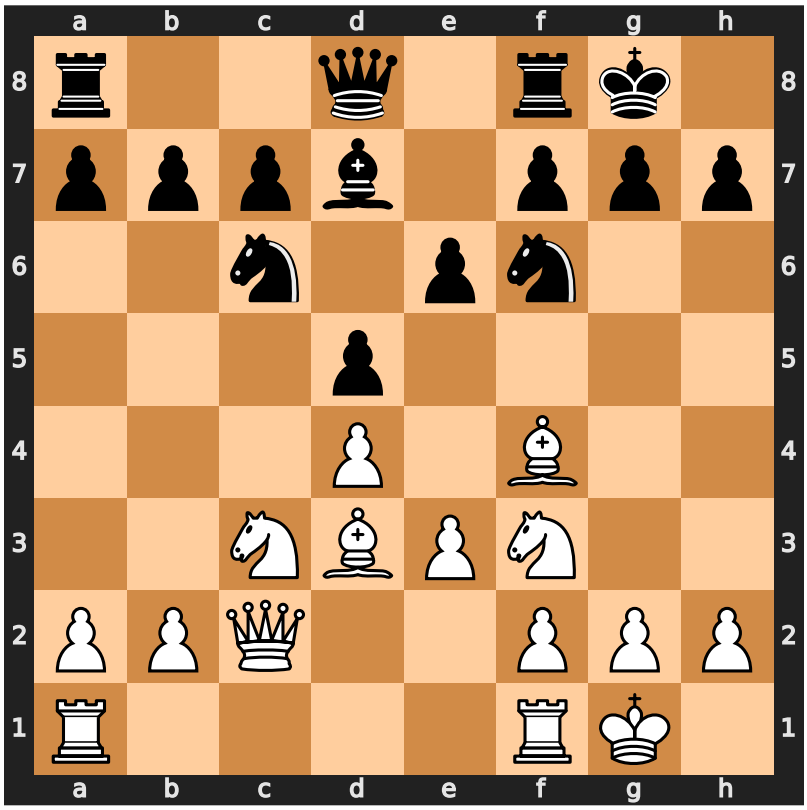

Figure 44.33: Chess Position

The battery is in place (Qc2 + Bd3). Black has played …Bd7, not defending h7 directly. What is the strongest continuation?

Hint 1: Is the Greek Gift threat real now? *Hint 2:* After Bxh7+ Kxh7 Ng5+, calculate three moves ahead for each king response. *Hint 3:* What happens if …Kg8? What happens if …Kg6?

Solution: Bxh7+! The Greek Gift is decisive. After Kxh7 Ng5+ Kg8 (if …Kg6, Qd3+ f5 Qg3 threatens Qh4 and Nh7, winning), Qh5 threatens Qxf7+ and Qh7#. Black must try …Re8 or …Nxd4, but after Qxf7+ Kh8 Qh5+ Kg8, White has a devastating attack with extra pawns and the exposed king. The bishop on d7 is too far from the kingside to help. The knight on c6 is on the wrong side of the board. The Greek Gift works because ALL three conditions are met: bishop on d3, knight on f3, queen on the b1-h7 diagonal.

Exercise 16.26

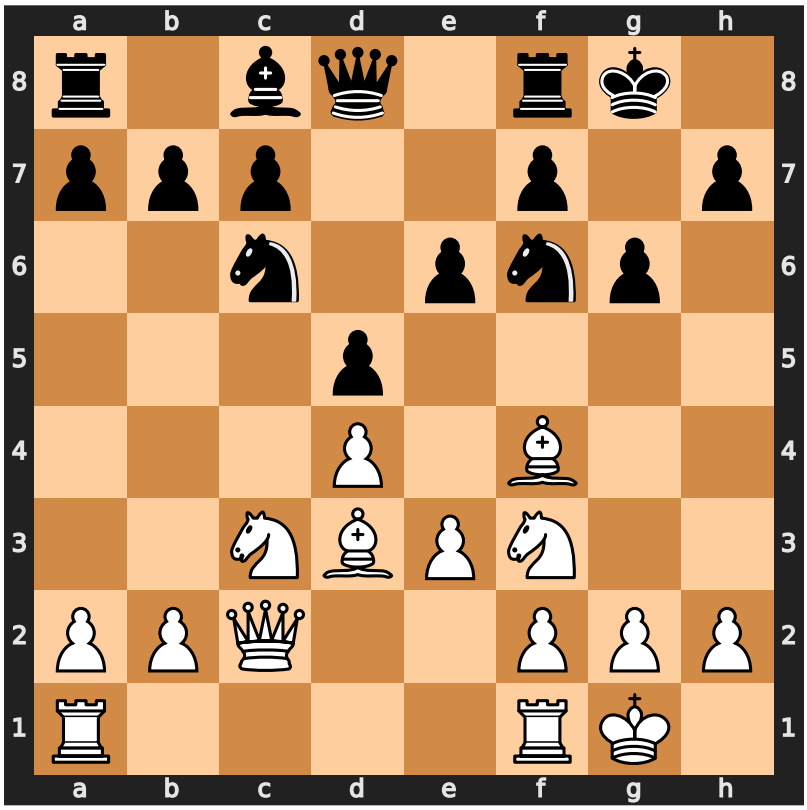

Figure 44.34: Chess Position

Black has a fianchetto setup (g6). The Greek Gift on h7 does not work (the g6 pawn covers h7 differently). What alternative attack does White have?

Hint 1: Against a fianchetto, the h-file is more useful than the b1-h7 diagonal. *Hint 2:* Can White play Bh6 to trade the fianchetto bishop? *Hint 3:* After Bh6, what pawn storm opens lines?

Solution: Bh6! Against a fianchetto, the correct plan is to trade the dark-squared bishop (removing the king's primary defender), then storm with h4-h5. After Bh6 Bg7 Bxg7 Kxg7, the dark squares around the king are weak. White follows with h4, h5, hxg6 (opening the h-file), and Qg5 or Qh2 to infiltrate. The bishop sacrifice on h7 does not work against g6 setups, so White adapts the plan: trade the defender, open the h-file, and attack on the dark squares. Flexibility in attack is essential.

Exercise 16.27

White has two knights (f3 and d2). Which knight should go to e5?

Hint 1: If Nf3-e5, which knight supports the e5 outpost? *Hint 2:* If Nd2-e5 (via Ndf3-e5 is not possible), consider Nde4 or Ndf3. *Hint 3:* Which knight is more valuable on f3 for the kingside attack?

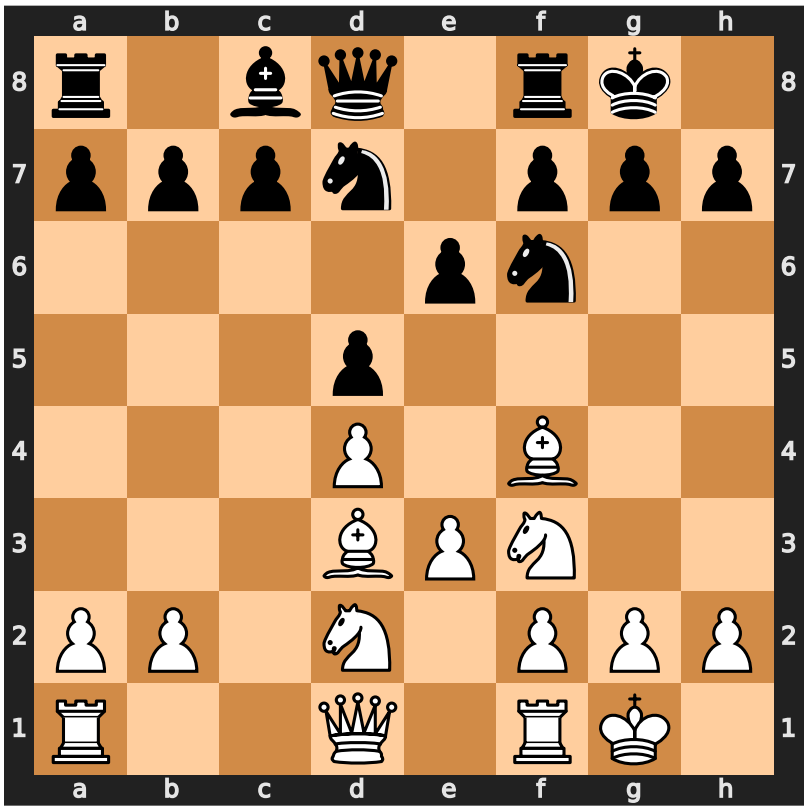

Figure 44.35: Chess Position

Solution: The knight on f3 should stay on f3 (it is needed for the Ng5 maneuver and kingside attack). The knight on d2 should reroute toward e5 via **Ndf3** is impossible since a knight is already there. The correct plan is **Ne4!** (from d2), targeting f6 and supporting a future Ng5. After Ne4, the knight threatens Nxf6+ (shattering the kingside) or Ng5 (attacking h7). The f3 knight remains to support with Ng5 or to reinforce after Ne4. The principle: keep the knight that has the most kingside attacking potential on its current post. Reposition the other one.

Exercise 16.28

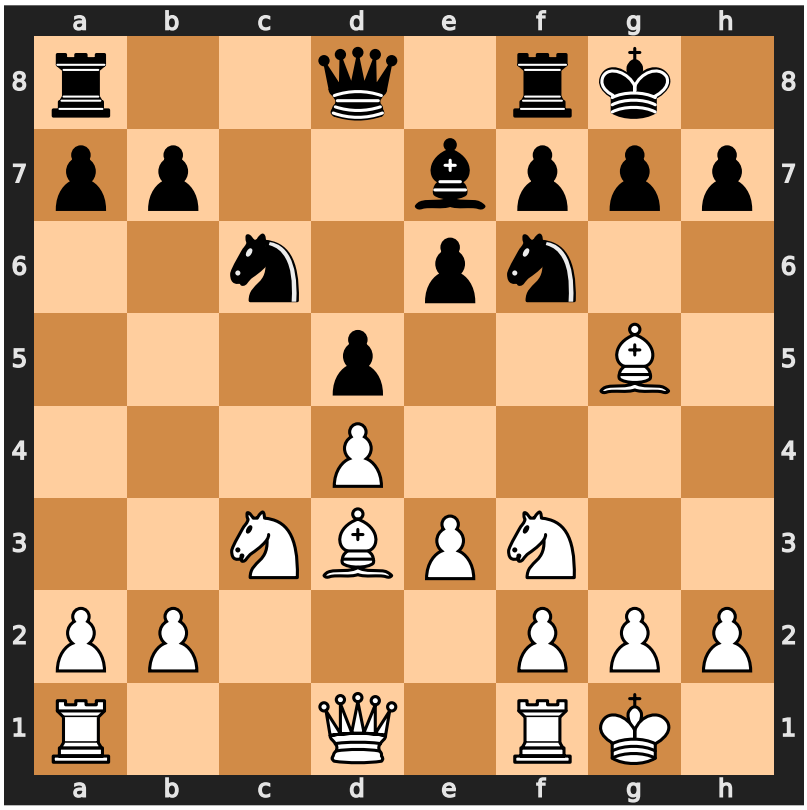

Figure 44.36: Chess Position

White has a bishop on g5, pinning the f6 knight. How does White exploit this pin?

Hint 1: The knight on f6 defends h7 and controls key squares. If it is eliminated, what happens? *Hint 2:* Can White play Bxf6 Bxf6, then target the weakened kingside? *Hint 3:* Or can White maintain the pin and build pressure with other moves first?

Solution: White should maintain the pin with a preparatory move: **Qc2!** Now the battery along b1-h7 is formed, and the f6 knight is pinned against the queen on d8. If Black breaks the pin with …Be7-d6 or …h6, White captures Bxf6 gxf6 (or …Bxf6), destroying the pawn shelter. After Qc2, the combined threats of Bxh7+ (if the knight leaves f6) and Bxf6 (shattering the kingside) are almost impossible to meet. The pin is a tool, use it to set up the decisive strike, not as the strike itself.

Exercise 16.29

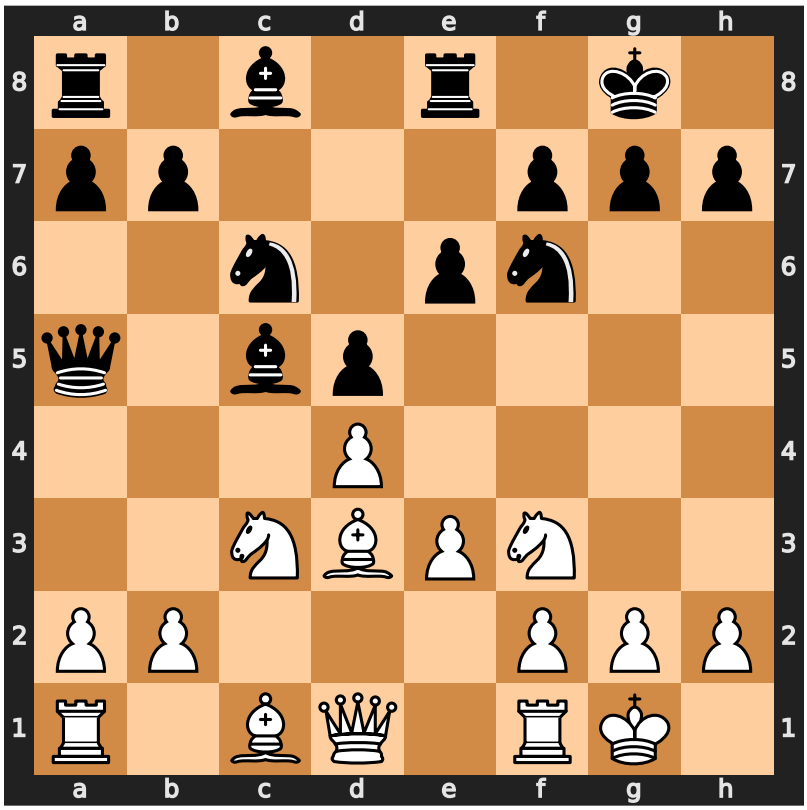

Figure 44.37: Chess Position

Black has a queen on a5 (far from the kingside) and a bishop on c5. White to play for an attack.

Hint 1: Black's queen is on a5, far from the defense. How many defenders does Black have near the king? *Hint 2:* A defender deficit is one of the attack prerequisites. Is it met? *Hint 3:* White should exploit the queen's absence immediately.

Solution: Qc2! Once again, the battery is the answer. With Black's queen on a5 (completely removed from kingside defense), the prerequisite of a defender deficit is met. After Qc2, the Bxh7+ threat is immediate and Black's queen cannot help. Black would need to play …Nd7 (covering f6 and supporting h7 indirectly) or …g6 (weakening the kingside further). The lesson: when your opponent's queen is on the wrong side of the board, attack immediately. The window may close if the queen returns.

Exercise 16.30

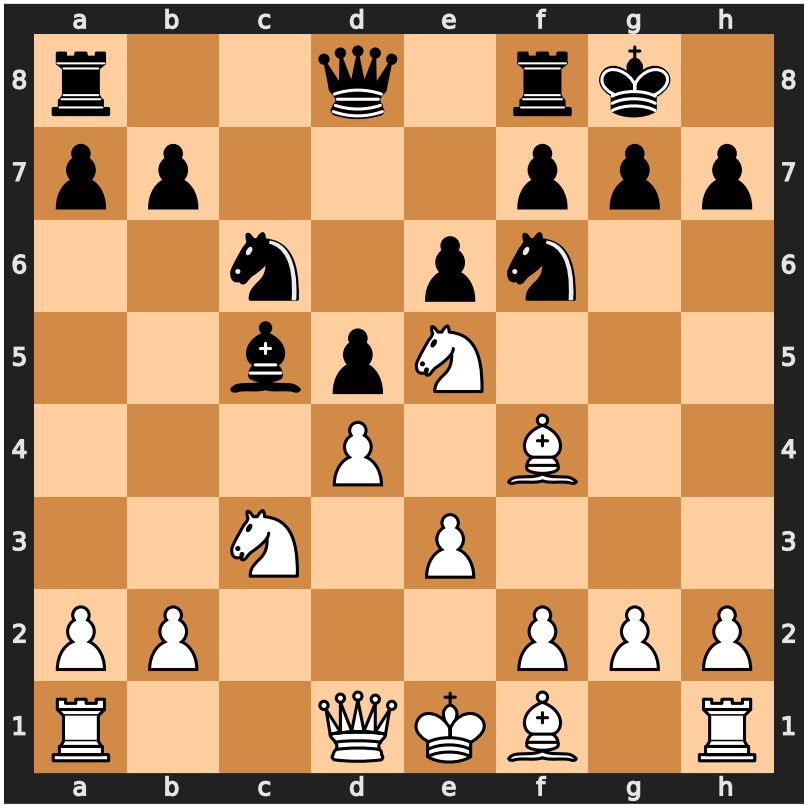

Figure 44.38: Chess Position

White has a knight on e5 and has NOT castled. Should White attack now or castle first?

Hint 1: White's king is in the center. Is this a problem? *Hint 2:* The knight on e5 is powerful, but can White support it without castling? *Hint 3:* What happens if White plays Bd3 followed by O-O and then Qf3?

Solution: Castle first. Despite the strong knight on e5, White's king in the center is a liability. If White tries to attack immediately (say Qf3 or Qg4), Black can counterattack in the center with …Nxe5 dxe5 d4, exploiting the uncastled king. The correct sequence: **Bd3** (developing and aiming

at h7), **O-O** (completing development and securing the king), then **Qf3** or **Qc2** to build the attack. The knight on e5 is not going anywhere. It is well-supported. But the attack requires a safe king first. Prerequisite 4 (weakened enemy pawn shield) means nothing if your own king is exposed.

Rest here. Thirty exercises complete. You are halfway through. Take a real break, walk, hydrate, stretch. The calculation exercises are demanding.

44.12.3 Section C: Calculate the Sacrifice (Exercises 16.31 - 16.45)

For each position, a sacrifice is possible. Determine if it is sound (forced advantage) or speculative (practical chances only). Calculate the main line.

Exercise 16.31

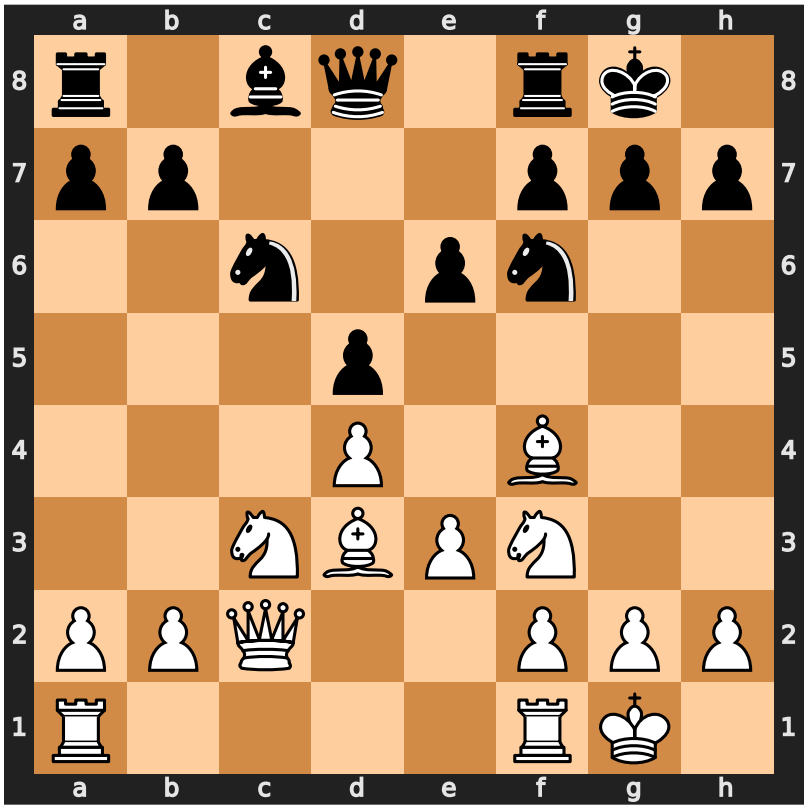

Figure 44.39: Chess Position

Is Bxh7+ sound in this position? Calculate the main line.

Hint 1: After Bxh7+ Kxh7 Ng5+, what are Black's king options? *Hint 2:* If …Kg8, then Qh5. Calculate two moves further. *Hint 3:* If …Kg6, can White play Qd3+ with a mating attack?

Solution: Bxh7+ is sound. After Kxh7 Ng5+ Kg8 (forced, …Kg6 Qd3+ f5 Qg3 with Qh4 and Nh7 ideas wins for White) Qh5, White threatens Qh7# and Qxf7+. Black tries …Re8, and White

plays Qxf7+ Kh8 Qh5+ Kg8 Qh7+ Kf8 Qh8+ Ke7 Qxg7 with a raging attack and extra pawns. The sacrifice is sound because White gains a permanent attack AND recovers material. This is the textbook Greek Gift. All three conditions met, and no adequate defense exists.

Exercise 16.32

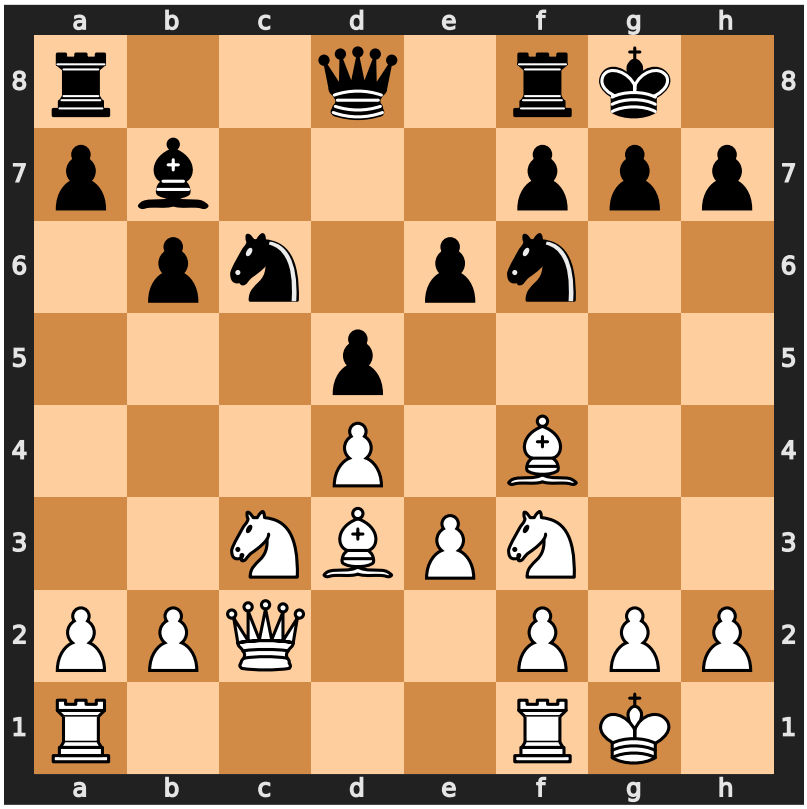

Figure 44.40: Chess Position

Black has a bishop on b7 (instead of d7). Is Bxh7+ still sound?

Hint 1: After Bxh7+ Kxh7 Ng5+ Kg8 Qh5, Black plays …Re8. Now what? *Hint 2:* Does Black have the defensive resource …Nf6-d7 or …Bf5? *Hint 3:* The bishop on b7 does NOT help defend the kingside. Does that change anything?

Solution: Bxh7+ is still sound. The bishop on b7 is irrelevant to the kingside defense. After Kxh7 Ng5+ Kg8 Qh5, Black's defensive tries are the same: …Re8 (Qxf7+ Kh8 Qh5+ Kg8 Qh7+ Kf8), or …Nxd4 (exd4, and White's attack continues with an extra pawn and open lines). The b7 bishop is staring at a pawn chain and contributing nothing to the defense. This illustrates an important principle: when evaluating sacrifices, count the *relevant* defenders, not the total number of pieces.

Exercise 16.33

Same position as 16.31, but now it is Black's move and Black plays …g6 (instead of waiting). White to play. Is Bxh7+ still viable?

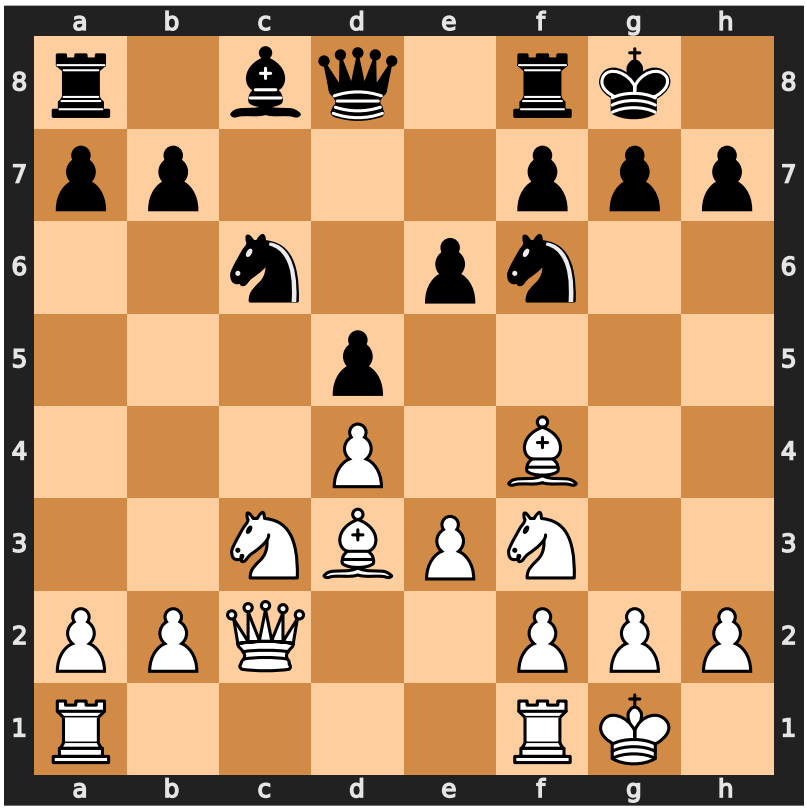

Figure 44.41: Chess Position

Hint 1: After …g6, the h7 pawn is protected by the g6 pawn. Does Bxh7+ still work? *Hint 2:* What does …g6 weaken? *Hint 3:* Can White exploit the weakened f6 and h6 squares instead?

Solution: After …g6, the Bxh7+ sacrifice does NOT work. The g6 pawn recaptures and the position is closed. However, …g6 seriously weakens the dark squares. White should switch plans: **Bh6!** attacks the dark squares, threatening to infiltrate on g7 or force …Re8 (the rook leaves f8). After Bh6, White follows with Qd2 (aiming at h6), Ng5 (targeting the weakened h7 and f7), and the attack redirects to the dark-square complex. The sacrifice is no longer the right approach, but the attack continues through different channels. Flexibility.

Exercise 16.34

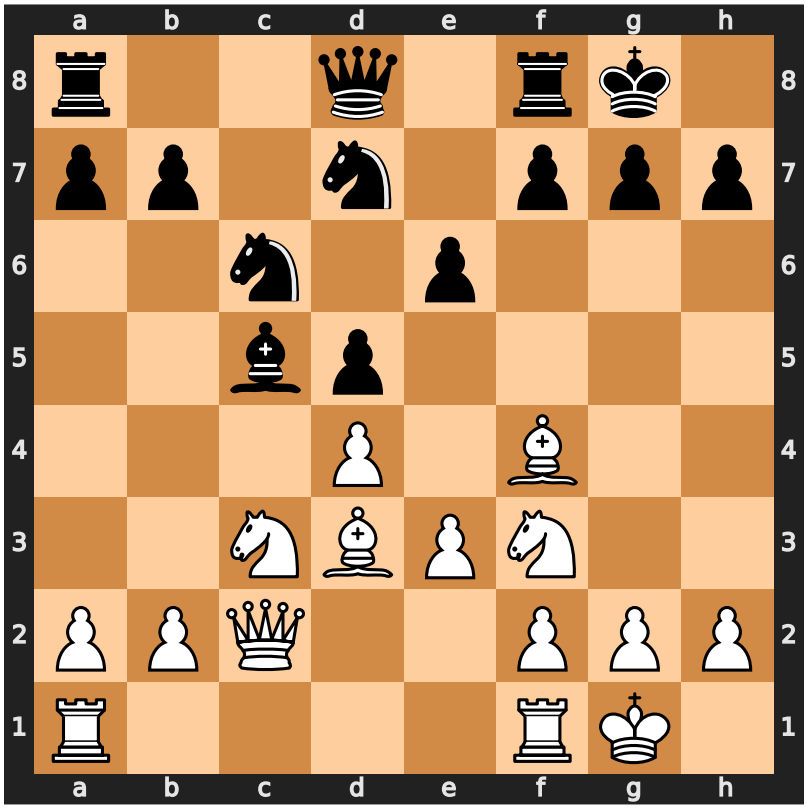

Figure 44.42: Chess Position

Black has played …Nd7 (instead of …Nf6). Is Bxh7+ sound WITHOUT the knight on f6 to worry about?

Hint 1: There is no knight on f6 defending h7. But the knight on d7 covers f6. *Hint 2:* After Bxh7+ Kxh7 Ng5+, can Black play …Kg6? What are the consequences? *Hint 3:* Without a knight on f6, can Black block the queen's access to h5?

Solution: Bxh7+ is very strong. Without the f6 knight, h7 is defended only by the king. After Kxh7 Ng5+ Kg8 (if …Kg6 Qd3+ f5 Qg3, and the king is dangerously exposed with no knight on f6 to provide a shield) Qh5, White threatens Qh7# directly. Black's knight on d7 is too far away to help (it cannot reach f6 in time). The sacrifice is sound and even stronger than the standard

version because Black's primary defender (the f6 knight) is absent. Lesson: the absence of defensive pieces around the king is a green light for sacrifices.

Exercise 16.35

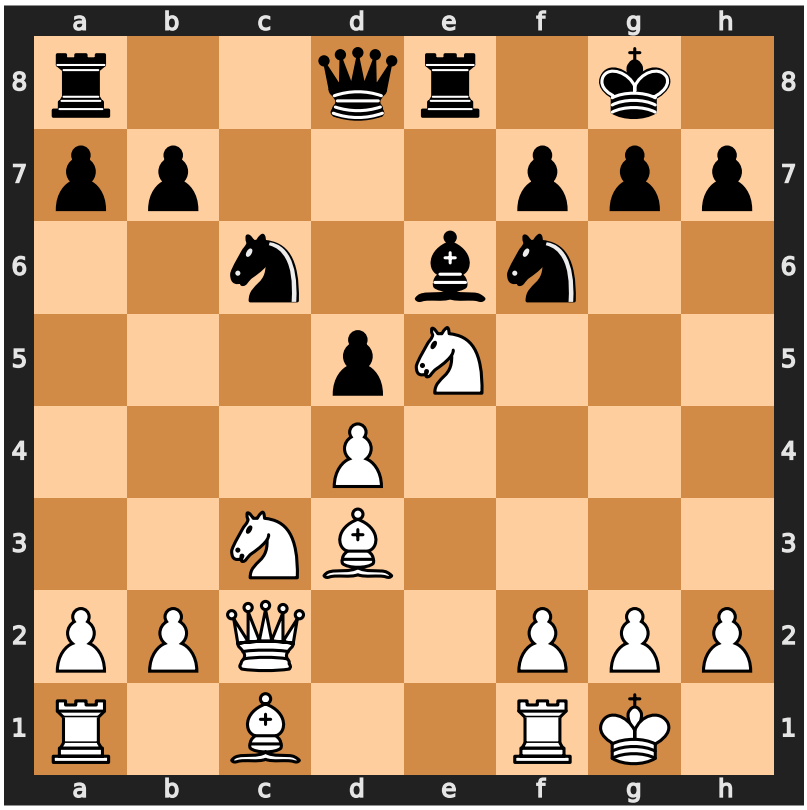

Figure 44.43: Chess Position

White has a knight on e5 and the battery (Qc2 + Bd3). Black has a bishop on e6 defending. Is the sacrifice on h7 sound despite the extra defender?

Hint 1: After Bxh7+ Kxh7 Ng5+, the knight attacks both the king AND the bishop on e6. *Hint 2:* If …Kg8, then Qh5. Does the bishop on e6 help defend? *Hint 3:* After Qh5, White threatens Qh7# and Nxe6. Can Black handle both?

Solution: Bxh7+ is sound. After Kxh7 Ng5+ Kg8 Qh5, White threatens Qh7# AND Nxe6 (a double attack). Black cannot deal with both threats. If …Bxg5, White plays Qh7+ Kf8 Qh8#. If …Re7 (defending h7), Nxe6 fxe6, and White has won a bishop with a continuing attack. The knight on g5 simultaneously attacks the king AND the e6 bishop. This is the double attack principle from Chapter 11 applied to the sacrifice. The bishop on e6 looks like a defender, but the knight fork neutralizes it.

Exercise 16.36

Black has played …Nc7 (a passive square). Is now the time for Bxh7+?

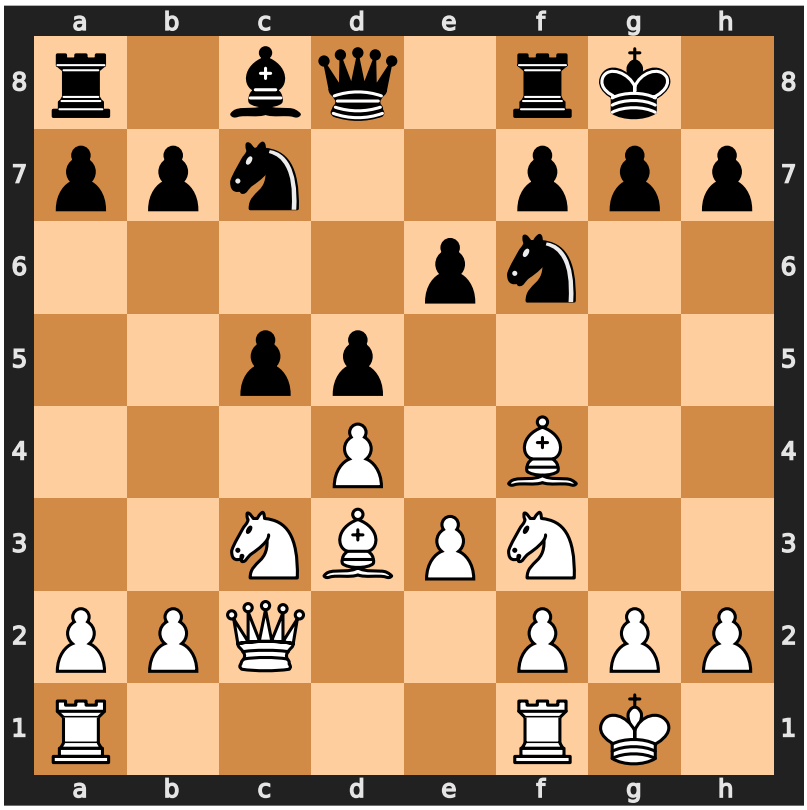

Figure 44.44: Chess Position

Hint 1: The knight on c7 is on the wrong side of the board. Count Black's kingside defenders. *Hint 2:* After Bxh7+ Kxh7 Ng5+, what are Black's options? *Hint 3:* Only the f6 knight and the f8 rook are available for defense. Is that enough?

Solution: Bxh7+ is decisive. Black's knight on c7 is completely out of play. It cannot reach the kingside in fewer than three moves. After Kxh7 Ng5+ Kg8 Qh5, Black has only the f6 knight and the rook on f8 for defense. The knight is pinned to the defense of h7 (if it moves, Qh7#). The rook on f8 cannot help (it is blocked by its own pieces). White will follow with Rf3, swinging the rook to h3 or g3, and the attack is overwhelming. Lesson: when your opponent's pieces are misplaced, that is the moment to sacrifice.

Exercise 16.37

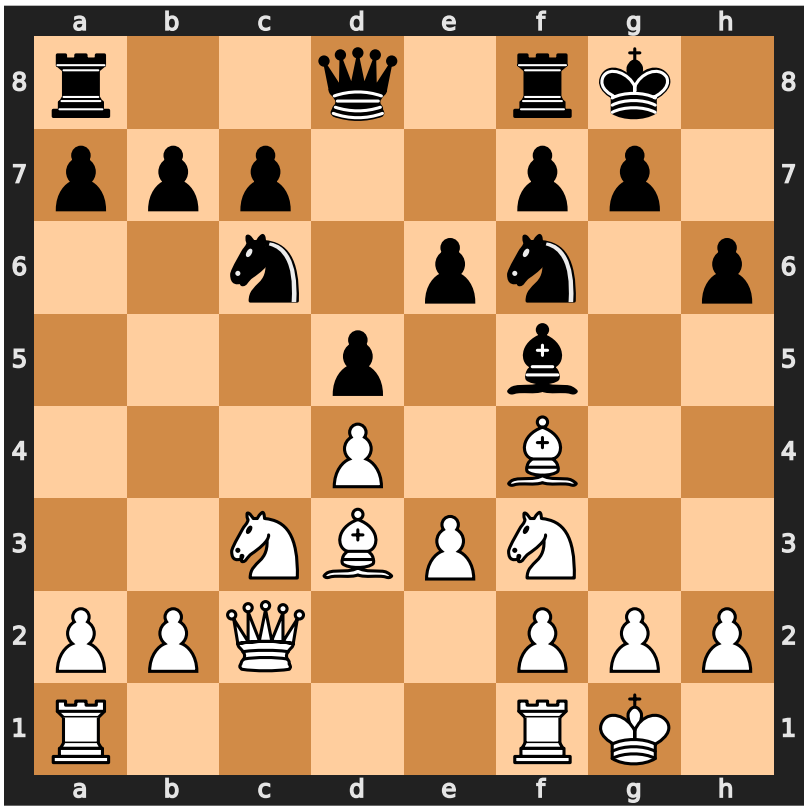

Figure 44.45: Chess Position

Black has played …Bf5, blocking the b1-h7 diagonal. Is the sacrifice still viable?

Hint 1: The bishop on f5 directly blocks the Qc2-h7 battery. *Hint 2:* Can White remove the f5 bishop first? How? *Hint 3:* What about Bxf5 exf5, then exploiting the opened e-file?

Solution: The sacrifice on h7 does NOT work because the f5 bishop blocks the queen's access. White should instead play **Bxf5 exf5**, opening the e-file and weakening Black's pawn structure. After Bxf5, White can use the open e-file (Re1) and the weakness of the f5 pawn to build pressure. Alternatively, after Bxf5, the queen may find new routes to the kingside. This is a case where the defender found the right prophylactic move, and the attacker must adapt. Do not force a sacrifice that does not work. Find another path.

Exercise 16.38

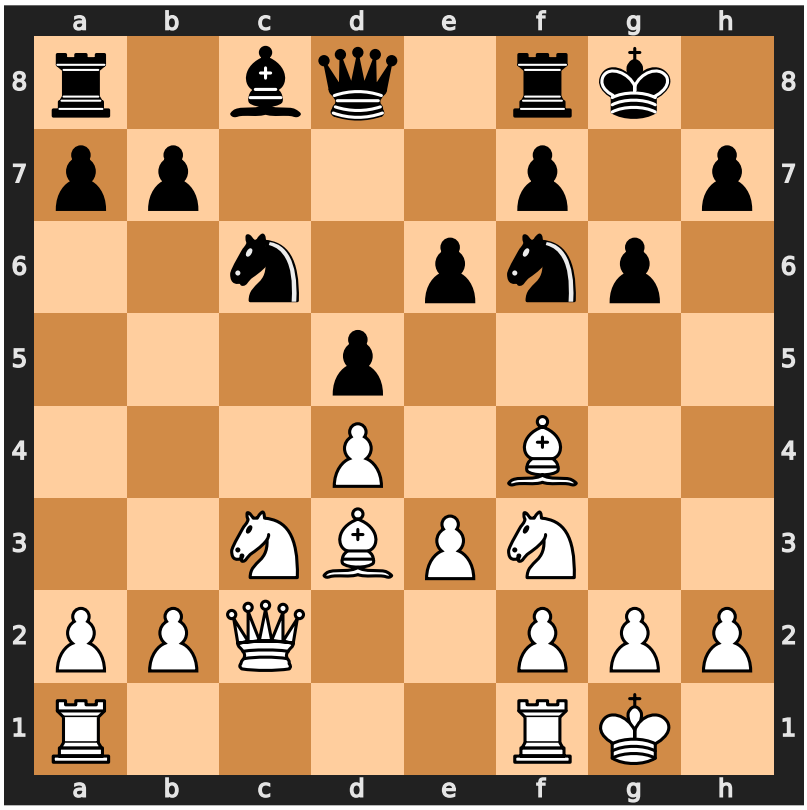

Figure 44.46: Chess Position

Black has a fianchetto shelter (g6, not g7 bishop). White cannot play Bxh7+. Find an alternative sacrifice.

Hint 1: The g6 pawn is a target. Can White sacrifice on g6? *Hint 2:* After Bxg6 fxg6 Qxg6+, White has queen and knight near the king. *Hint 3:* What follows Qxg6+ Kh8? Can White play Ng5 or Bh6?

Solution: Bxg6! is the alternative sacrifice. After fxg6 (if …hxg6, Qxg6+ is similar) Qxg6+ Kh8, White plays Bh6 (threatening Bg7+ and Qh7#) or Ng5 (threatening Qh7# and Nf7+). The sacrifice rips open the f-file and the g-file simultaneously. White's queen on g6 and bishop on f4 (which can swing to h6) create mating threats. This is the fianchetto alternative to the Greek Gift: when the h-pawn is protected by g6, attack g6 instead. Same concept, different target.

Exercise 16.39

White has a pawn on e5, closing the center. Is a sacrifice on the kingside justified?

Hint 1: White's e5 pawn restricts the f6 square, Black's knight cannot go there. *Hint 2:* With no knight on f6, h7 is less defended. *Hint 3:* Can White play Bxh7+ even though the knight on d7 covers f6 indirectly?

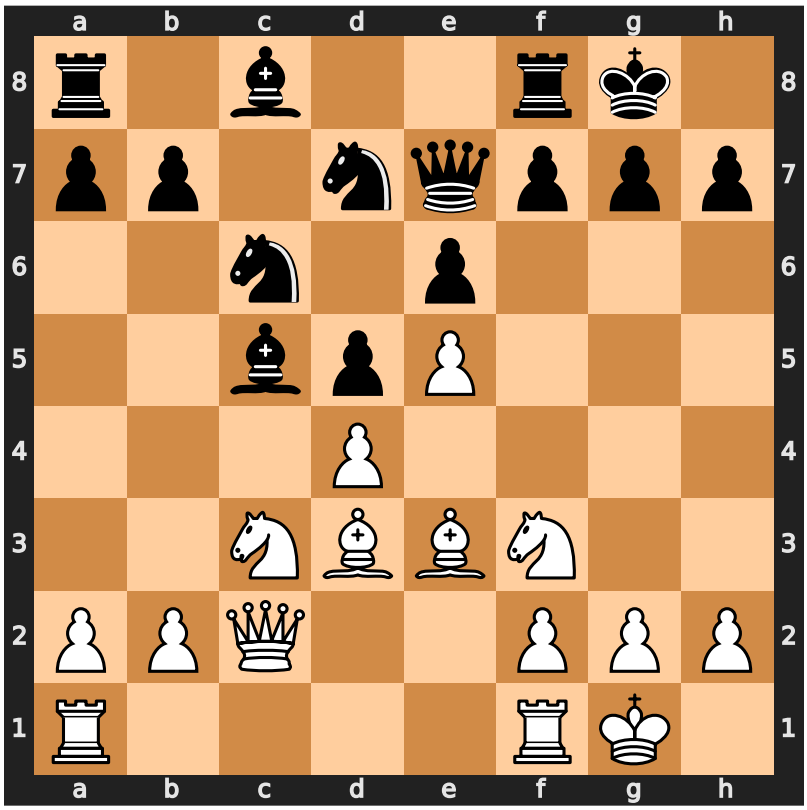

Figure 44.47: Chess Position

Solution: Bxh7+! is strong. The e5 pawn controls f6, meaning Black's knight on d7 cannot reach f6 to defend. After Kxh7 Ng5+ Kg8 Qh5, the usual threats apply (Qh7#, Qxf7+). The knight on d7 is blocked from reaching f6 by White's own e5 pawn (the square is controlled). The e5 pawn is not just a space-gainer. It is an attacker, controlling key defensive squares. Lesson: advanced center pawns contribute to kingside attacks by restricting defensive piece maneuvers.

Exercise 16.40

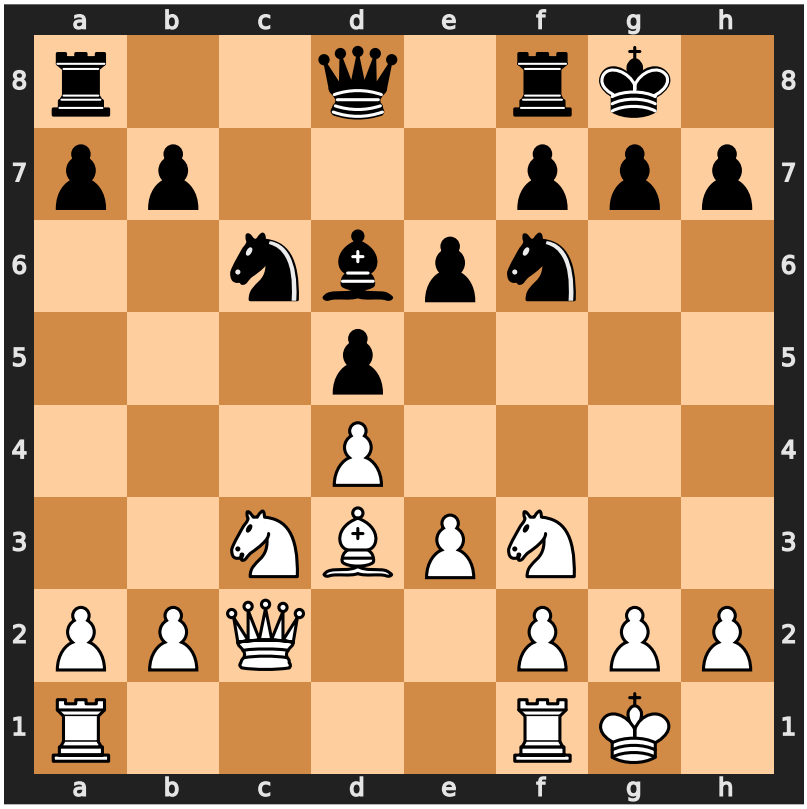

Figure 44.48: Chess Position

White has the full battery setup. Black has a knight on f6, bishop on d6, and bishop on c8 (passive). Find the winning sacrifice AND calculate to a decisive advantage.

Hint 1: Bxh7+ is the candidate move. After Kxh7 Ng5+, what are ALL of Black's options? *Hint 2:* …Kg8, …Kg6, …Kh6, evaluate each one. *Hint 3:* For …Kh6, what is the killing blow?

Solution: Bxh7+! Kxh7 Ng5+ and now: - **...Kg8:** Qh5, threatening Qh7# and Qxf7+. After …Re8 Qxf7+ Kh8 Qh5+ Kg8 Qh7+ Kf8 Qh8+ Ke7 Qxg7, White wins decisively. - **...Kg6:** Qd3+ (double attack on king and threatening Qh7) f5 Qg3 (threatening Qh4+ and Nh7) Kf6 Qg5#. - **...Kh6:** Nxe6+ (discovered check from… wait, the knight moves to e6 from g5. This is Nxe6 attacking the queen and threatening f4+). Better: after …Kh6 Nxf7+ (fork the king and queen if queen is on d8) Kg6 Nxd8. White wins queen for knight.

The sacrifice is fully sound. Every king move leads to a White advantage. This is the Greek Gift at its most powerful: a sound sacrifice with no defense.

Exercise 16.41

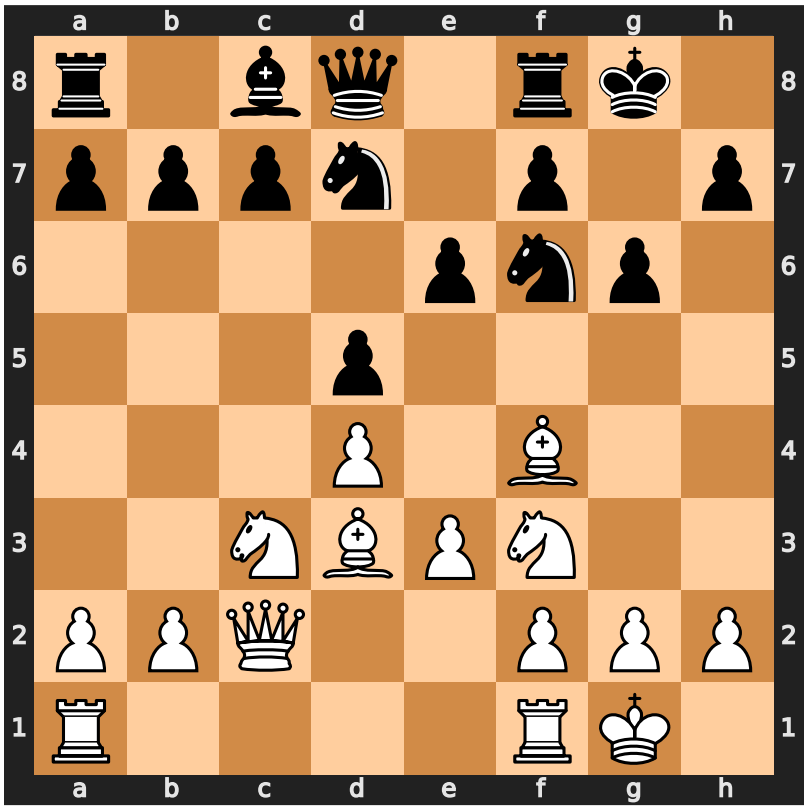

Figure 44.49: Chess Position

Black has …g6 AND a knight on d7. Can White sacrifice on h7 anyway?

Hint 1: After Bxh7, Black does NOT have to take, …Kh8 is possible. *Hint 2:* If …Kxh7, does Ng5+ still work with g6 weakened? *Hint 3:* Is this sacrifice sound or speculative?

Solution: This sacrifice is **speculative**, not sound. After Bxh7, Black can play …Kh8 (not taking the bishop), and the bishop on h7 is trapped and lost. If …Kxh7 Ng5+ Kg7 (the king can go to g7 since g6 is protected), Black's position holds. The g6 pawn means the king has an escape route through g7 that does not exist in the standard Greek Gift. White should NOT sacrifice here. Instead, play Bh6 (targeting the fianchetto structure) and prepare a pawn storm. Know when the sacrifice does not work. This saves you from losing games, not just winning them.

Exercise 16.42

White has a knight on e4 (instead of the usual pawn). The knight on e4 attacks f6. Find the strongest move.

Hint 1: Nxf6+ is a forcing move. What happens after …Bxf6? *Hint 2:* What happens after …gxf6? *Hint 3:* One recapture weakens the king. Which one?

Solution: Nxf6+! After …gxf6 (the key recapture, …Bxf6 leaves the kingside intact), the g-file

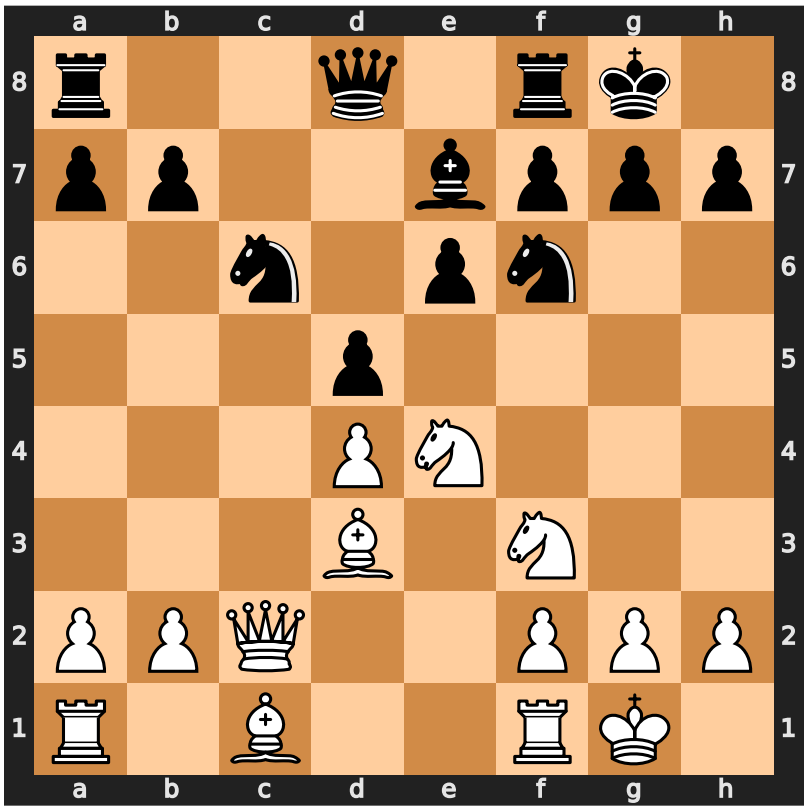

Figure 44.50: Chess Position

is torn open and the king is exposed. White follows with Qc1 or Qd2 (aiming for the kingside), Bh6 (the dark squares are devastated after …gxf6), and Ng5 (targeting h7 through the ruined shelter). After …Bxf6, the position is calmer but White maintains an edge with the bishop pair. The attacking player should always consider captures that damage the pawn shelter. …gxf6 creates permanent kingside damage that cannot be repaired.

Exercise 16.43

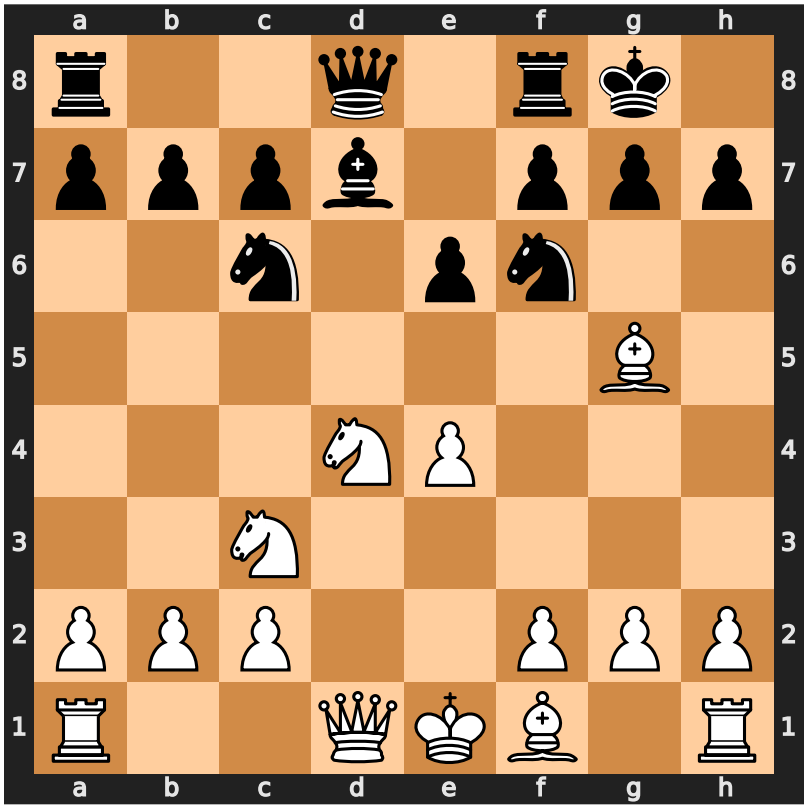

Figure 44.51: Chess Position

White has not castled and has a bishop on g5 pinning the f6 knight. Can White play e5 (attacking the pinned knight)?

Hint 1: After e5, the knight on f6 is attacked by the pawn AND pinned by the bishop. *Hint 2:* If …h6, White plays Bh4, maintaining the pin. Then what? *Hint 3:* What happens to the knight on f6 if it cannot move?

Solution: e5! is strong. The f6 knight is pinned (bishop on g5 looks at the queen on d8) and now attacked by the pawn. If …h6 Bh4 g5 (the only way to break the pin) Bg3, and White has provoked serious kingside weaknesses, g5, h6 are both advanced, the king's shelter is shattered. Alternatively, after e5, if …Nd5 Bxd8 Nxc3 bxc3, White has won the queen for bishop and knight: a material gain. The pin combined with the pawn advance creates an irresolvable problem. This is "attack through positional pressure", no sacrifice needed, just relentless threats.

Exercise 16.44

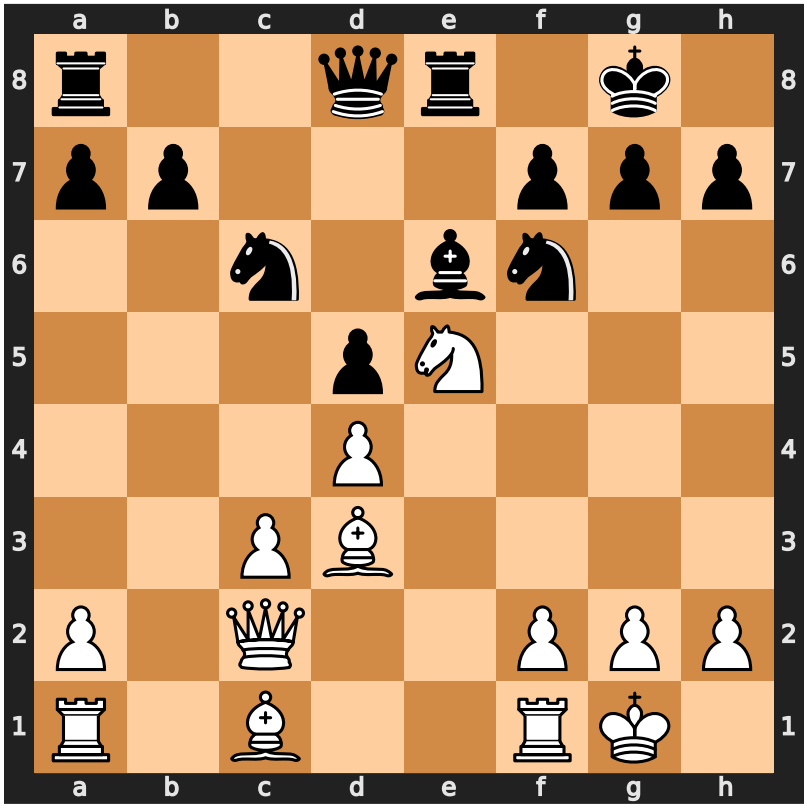

Figure 44.52: Chess Position

White has a knight on e5 and the Qc2 + Bd3 battery. Black has …Be6 covering g4 and d5. Can White play Nxf7?

Hint 1: After Nxf7 Bxf7, what does White threaten on the b1-h7 diagonal? *Hint 2:* The f7 pawn was defending the king. Without it, which squares are weak? *Hint 3:* Is this sacrifice sound or speculative? Calculate.

Solution: Nxf7! is sound. After Bxf7 (if …Kxf7, Qb3+ wins the bishop on e6 and opens the king), White plays Bxh7+! Kxh7 (forced, …Kf8 Bg6 with Qh7 to follow) Qh5+ Kg8 Qxf7+ Kh7, and White has won two pawns with a continuing attack. The double sacrifice (Nxf7 followed by Bxh7+) is a combination of the f7 sacrifice pattern and the Greek Gift. These patterns can be *combined*: recognizing both patterns allows you to find combinations that use them in sequence.

Exercise 16.45

Full Greek Gift position. But this time, you must calculate ALL variations to their conclusion. Sound or speculative?

Hint 1: Bxh7+ Kxh7 Ng5+, analyze …Kg8, …Kg6, and …Kh6 separately. *Hint 2:* For each king move, calculate at least four moves ahead. *Hint 3:* Is there any line where Black survives comfortably?

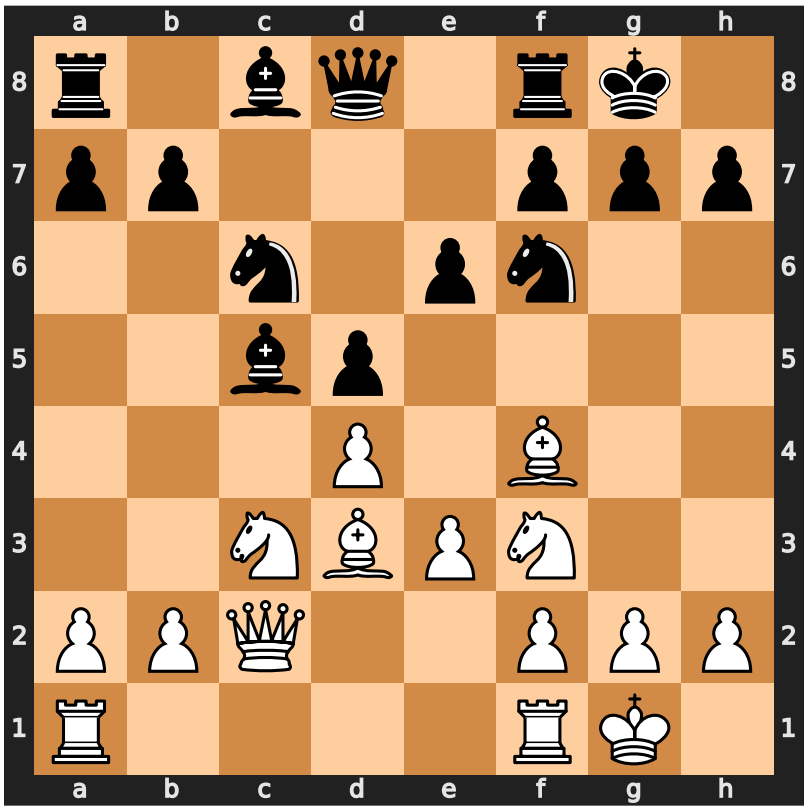

Figure 44.53: Chess Position

Solution: Bxh7+ is fully sound. - **Kxh7 Ng5+ Kg8:** Qh5, threatening Qh7#. Re8 Qxf7+ Kh8 Qh5+ Kg8 Qh7+ Kf8 Qh8+ Ke7 Qxg7. White is up a pawn with a devastating attack. - **Kxh7 Ng5+ Kg6:** Qd3+ f5 (only move) Qg3 (threatening Qh4 and Nh7, trapping the king) Qe7 Qh4, and …Kf6 is met by Qh6+ Ke7 Nxe6, winning. White is winning. - **Kxh7 Ng5+ Kh6:** Nxe6+ (discovered attack on the king from the queen on c2… actually, there is no discovered check here). Better: Nxf7+ Kg6 Qg6 (or Qd3+) with a mating attack since the king is in the open.

In ALL variations, White achieves a decisive advantage. This is the benchmark: when every variation leads to a White advantage, the sacrifice is sound. When even one variation gives Black comfortable equality, the sacrifice is speculative.

Rest here. The calculation exercises are the hardest in the chapter. You have worked your brain hard. Take a full break, at least 15 minutes, before the defense exercises.

44.12.4 Section D: Defend This Position (Exercises 16.46 - 16.60)

For each position, you are the defender. Find the best defensive move and explain your reasoning.

Exercise 16.46

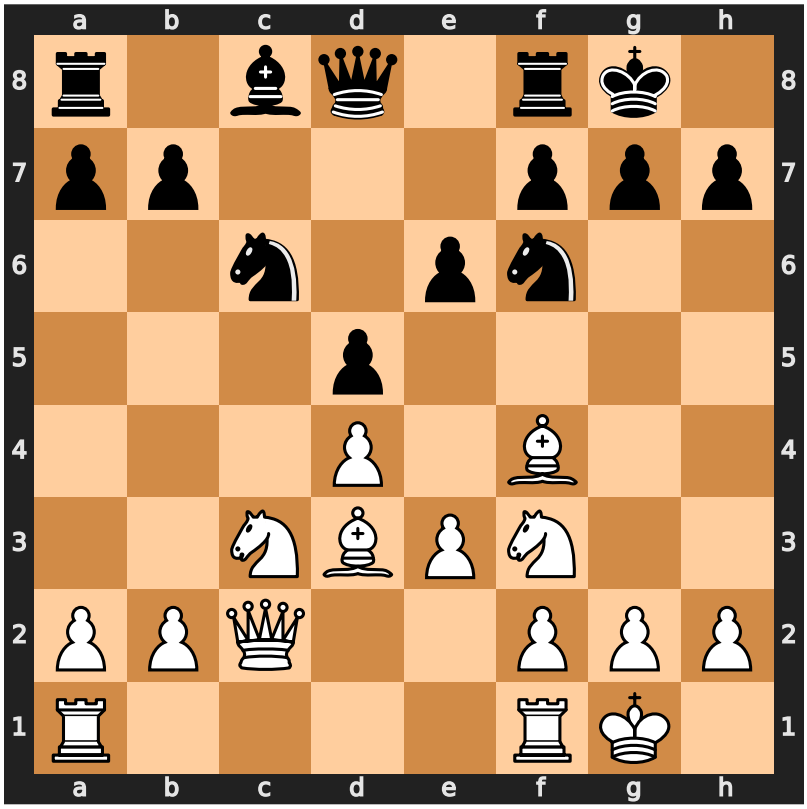

Figure 44.54: Chess Position

Black to move. White has the Qc2 + Bd3 battery aimed at h7. How should Black defend?

Hint 1: The threat is Bxh7+. How can Black prevent it? *Hint 2:* …g6 defends h7 but weakens the dark squares. Is there a better option? *Hint 3:* Can Black break the battery by attacking one of its pieces?

Solution: ...g6 is the most reliable defense. It prevents Bxh7+ entirely by covering h7 with the g6 pawn. Yes, it weakens the dark squares (f6, h6), but it eliminates the immediate mating threat. Black can follow up with …Bg7 to reinforce the dark squares. Alternative defenses: …Nd7 (rerouting the knight to f8 to defend h7) is too slow, White can sacrifice before the knight arrives. …Re8 (preparing …Nf8) is better but does not stop the immediate threat. The practical choice is …g6, solve the immediate problem first, deal with the consequences later.

Exercise 16.47

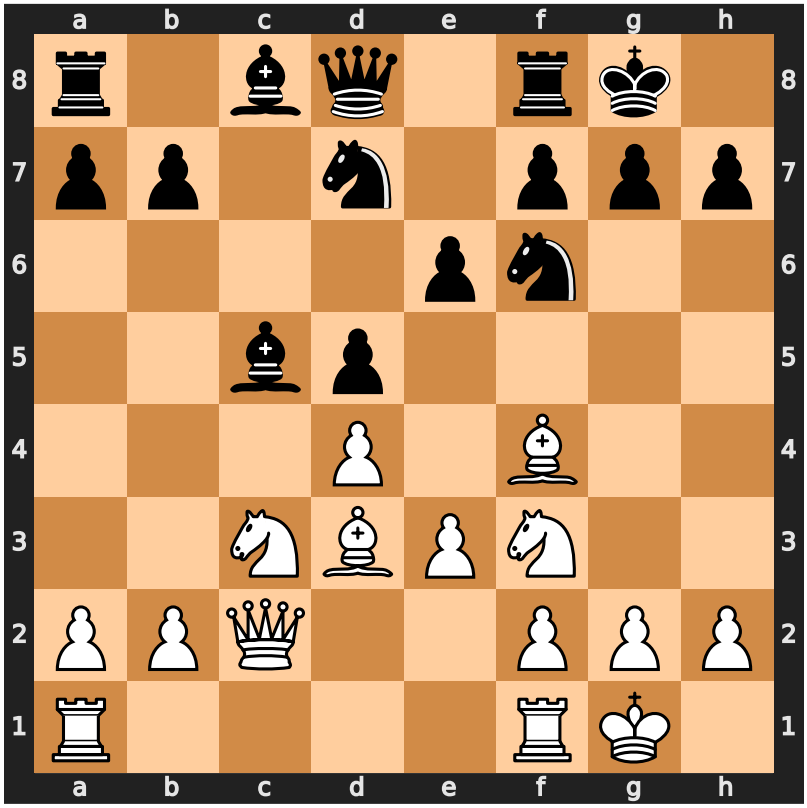

Figure 44.55: Chess Position

Black to move. The Greek Gift is threatened. Black's knight is on d7 (not great for defense). Find the best defensive setup.

Hint 1: Can the knight on d7 reach a better defensive square? *Hint 2:* …Nf8 covers h7 directly. Is it in time? *Hint 3:* Are there other ways to defend h7?

Solution: ...Nf8! The knight reroutes from d7 to f8, where it directly defends h7 and can later go to g6 (an active defensive square). After …Nf8, the Bxh7+ sacrifice no longer works because the knight covers h7 from f8. If White plays Bxh7+ anyway, …Nxh7 recaptures without any damage

to the pawn shelter. This is the ideal defensive maneuver against the Greek Gift setup: the knight on f8 simultaneously defends h7 and remains flexible for future deployment.

Exercise 16.48

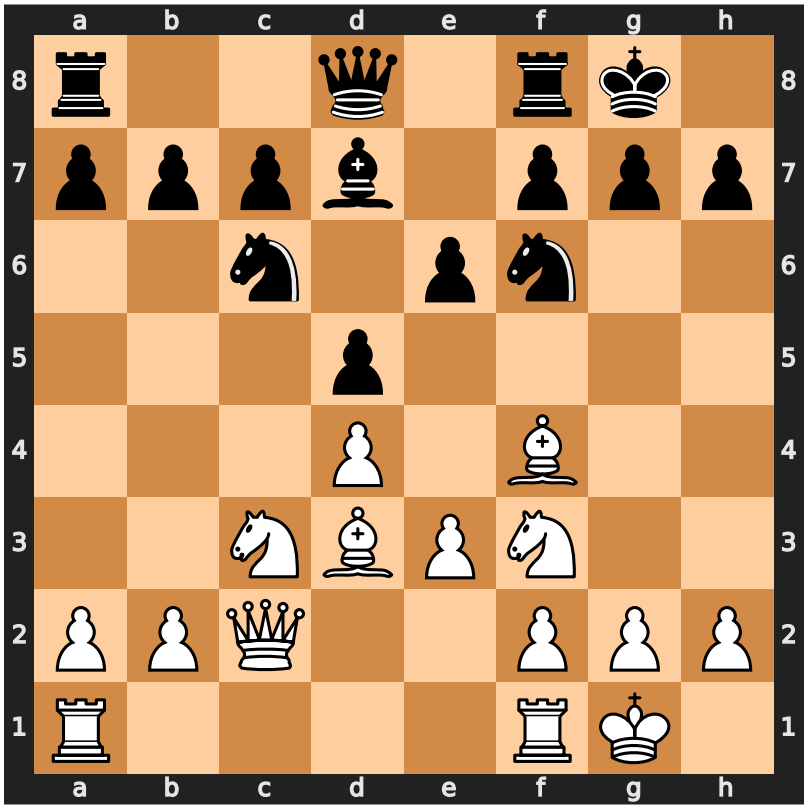

Figure 44.56: Chess Position

Black to move. The battery is in place. Black's bishop is on d7 (passive). Find the best defensive move.

Hint 1: The bishop on d7 does not defend the kingside. Can it be improved? *Hint 2:* …Be8 covers h5. Does that help? *Hint 3:* What about the active defense …Nh5 (attacking the f4 bishop)?

Solution: …Nh5! This is an active defense. The knight attacks the bishop on f4, forcing White to deal with a threat instead of continuing the attack. After …Nh5, if Bg5 (retreating to g5 to keep the bishop active), …Qxg5, White has lost the dark-squared bishop. If Be5 Nxe5 Nxe5, Black has traded a pair of minor pieces, reducing White's attacking force. Active defense, creating your own threats while addressing the opponent's, is almost always better than passive defense. …Nh5 challenges the attacker to respond.

Exercise 16.49

Black to move. White has the battery but no bishop on f4. The position is slightly less dangerous. What should Black do?

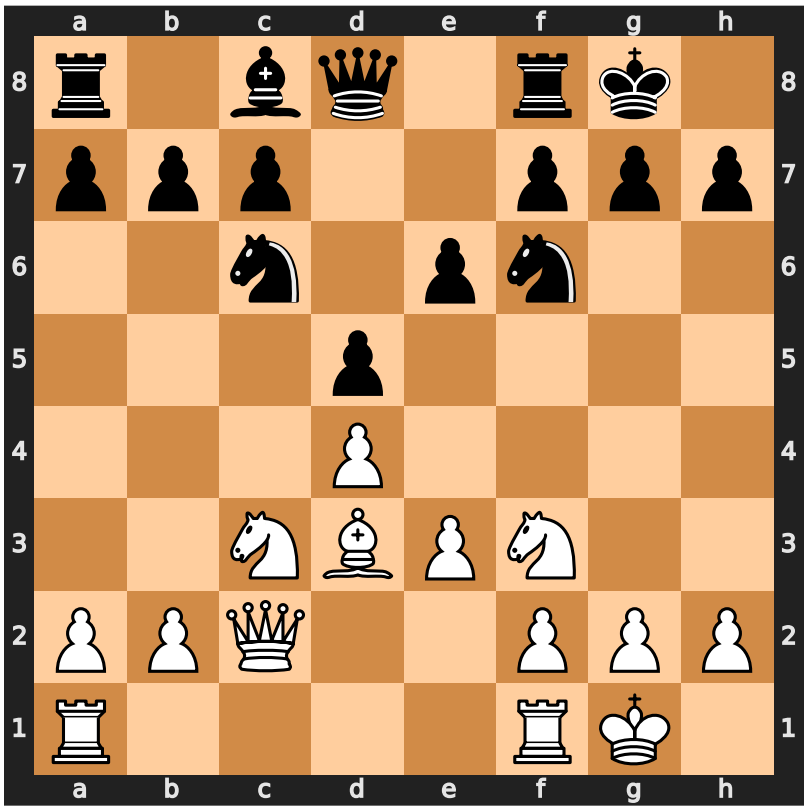

Figure 44.57: Chess Position

Hint 1: Without the dark-squared bishop, White's attack is slower. *Hint 2:* Can Black use this time to create counterplay? *Hint 3:* What about …c5 (challenging the center) or …Bd6 (actively developing)?

Solution: …c5! With White's dark-squared bishop absent, the attack is slower. Black should use this time to create central counterplay. After …c5, Black challenges White's d4 pawn, threatens to open the c-file, and begins to seize the initiative in the center. Central counterplay is the best antidote to a flank attack. If White captures dxc5, Black recaptures with a piece and gains active play. If White ignores …c5, Black plays …cxd4 exd4, and the d4 pawn becomes a target. Fight fire with fire, meet a flank attack with a central counter.

Exercise 16.50

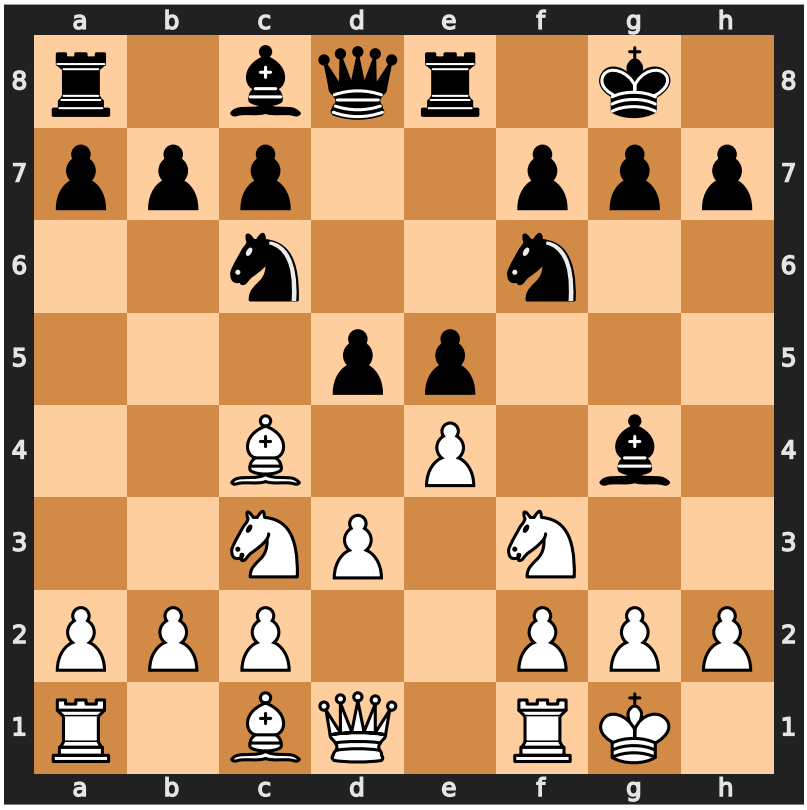

Figure 44.58: Chess Position

Black to move. White has just played Re1, building pressure in the center. Black's bishop is on g4, pinning the f3 knight. Should Black maintain the pin or trade?

Hint 1: The pin on the f3 knight prevents Ng5 and limits White's attacking options. *Hint 2:* If Black plays …Bxf3, White recaptures Qxf3. Does that help or hurt the defense? *Hint 3:* After Qxf3, White's queen is on f3, is it better or worse for the attack?

Solution: Maintain the pin. After …Bxf3 Qxf3, White's queen is on f3, perfectly placed for a kingside attack (it eyes f7, can swing to g3 or h5, and supports a future Bxh7+ if the position allows). Trading gives White exactly what the attack wants: the queen on an active square. Instead, Black

should play **...Bh5** (maintaining the pin while retreating to a safe square) or **...d4** (challenging the center and gaining space). The pin on f3 is a valuable defensive resource. It prevents Ng5 and restricts White's options. Do not give it up without a concrete reason.

Exercise 16.51

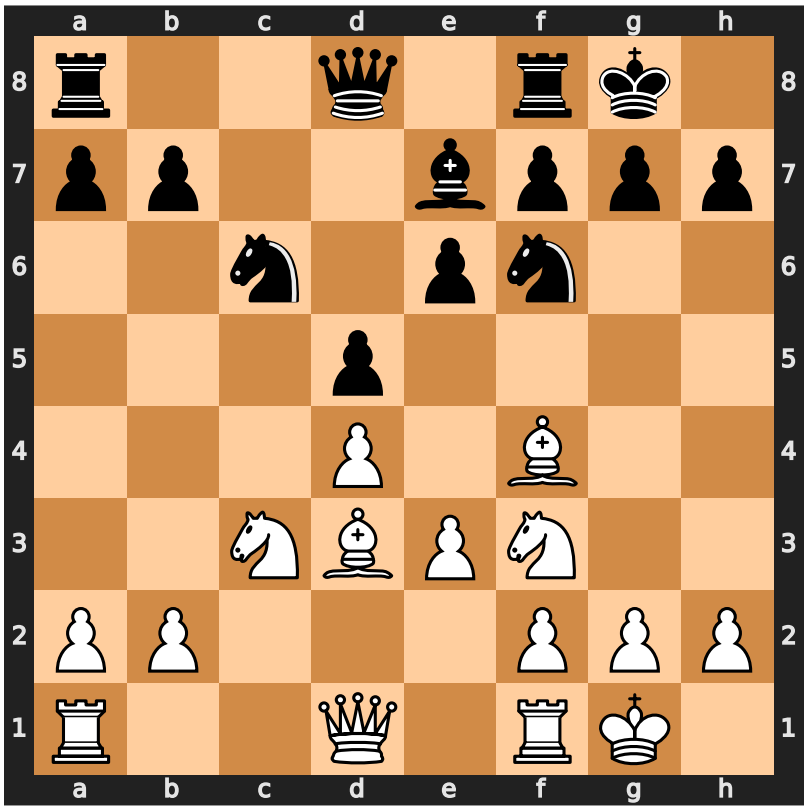

Figure 44.59: Chess Position

Black to move. White is about to play Qc2, creating the battery. How does Black prevent this plan from being effective?

Hint 1: Once Qc2 is played, the Greek Gift becomes a real threat. Prevent it NOW. *Hint 2:* What if Black plays …Ne4, occupying the central square? *Hint 3:* A knight on e4 blocks the Bd3's diagonal toward h7.

Solution: ...Ne4! is an excellent prophylactic move. The knight on e4 blocks the d3 bishop's line toward h7, making the Greek Gift impossible. Even if White plays Qc2, the battery is blocked by Black's own knight. Additionally, the knight on e4 is a powerful piece in its own right. It controls d2, f2, d6, f6, c3, c5, g3, and g5. White must either accept the blockade or spend time removing the knight (Nxe4 dxe4, when the bishop on d3 must retreat). Prophylaxis, preventing the opponent's plan before it materializes, is the highest form of defense.

Exercise 16.52

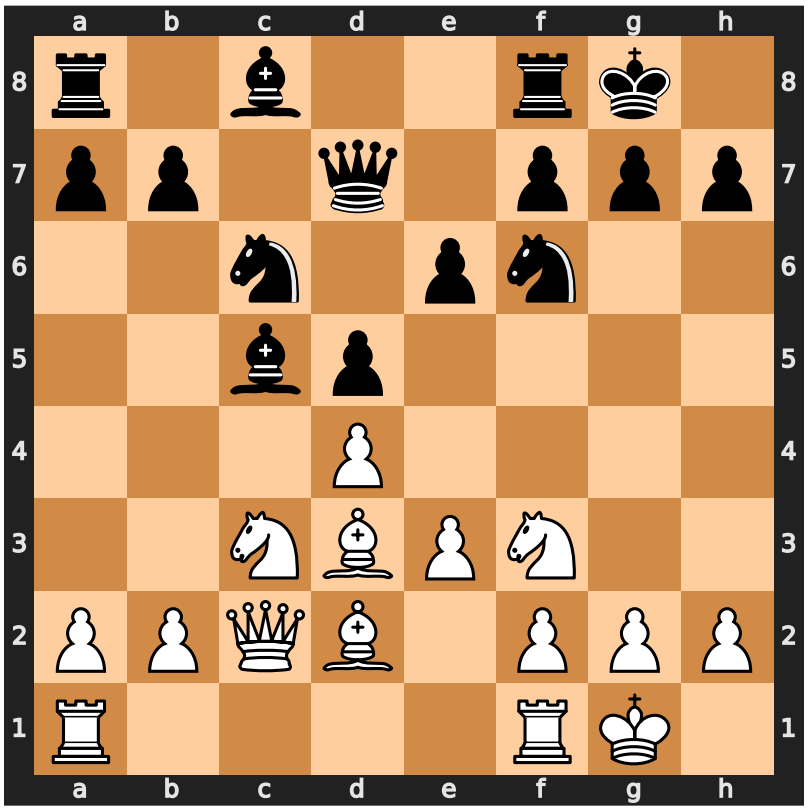

Figure 44.60: Chess Position

Black to move. White has Qc2 and Bd3 (the battery), plus a bishop on d2 that can go to c1-f4 or a5. What is Black's most resilient defensive setup?

Hint 1: Black needs to cover h7 AND maintain active pieces. *Hint 2:* Can Black combine …Nf8 (defending h7) with …Bd6 (preparing to trade dark-squared bishops)? *Hint 3:* If Black trades dark-squared bishops, the attack on the dark squares weakens.

Solution: ...Bd6! offers to trade dark-squared bishops. If White plays Bh6 (which the d2 bishop can reach via c1), …Be7 covers the king. If White goes Bf4 Bxf4 exf4, the pawn on f4 is a weakness, not a strength, and the e-file opens for Black's rook. Black follows with …Nf8 (defending h7) and …Bd7-e8 (covering h5 and g6). The combination of trading a key attacking piece AND deploying the knight to f8 creates a strong defense. Multiple layers of defense are harder to break than a single one.

Exercise 16.53

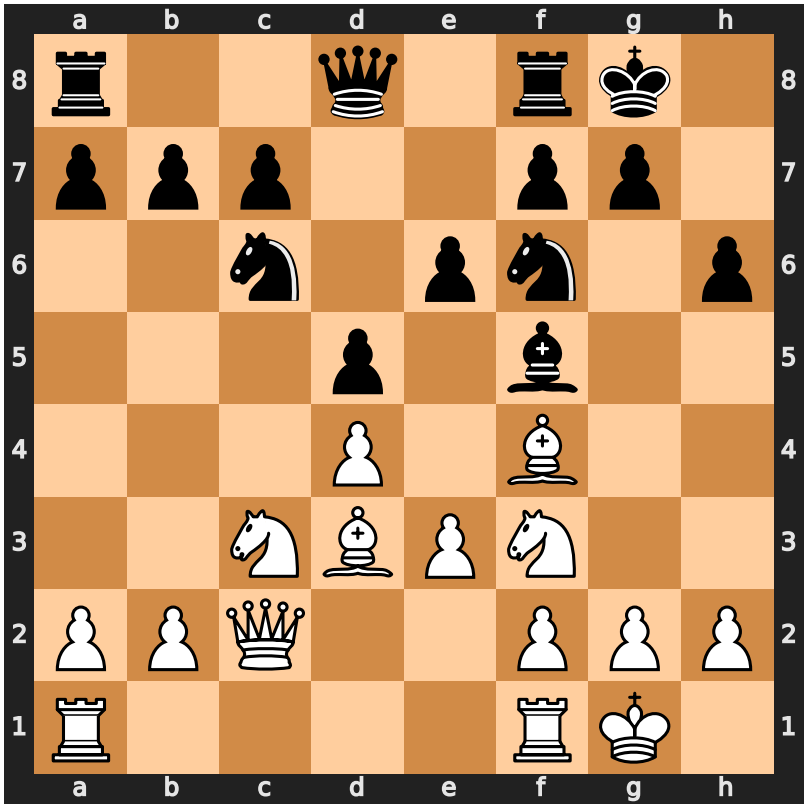

Figure 44.61: Chess Position

Black to move. Black has played …Bf5 and …h6. White cannot play Bxh7+ (Bf5 blocks) or Ng5 (h6 prevents). Has Black successfully neutralized the attack?

Hint 1: Black's defense looks solid. But is there a downside to …h6? *Hint 2:* Can White regroup and find a new attacking plan? *Hint 3:* What should Black do NOW to consolidate?

Solution: Black has successfully neutralized the immediate Greek Gift threat. The bishop on f5 blocks the b1-h7 diagonal, and the h6 pawn prevents Ng5. However, Black must remain vigilant:

…h6 creates a long-term target (as discussed in the theory section), and White can regroup with Bxf5 exf5 (weakening the e-file), or Nh4 (challenging the f5 bishop). Black's best continuation is **...Bd6** (developing actively and preparing to trade dark-squared bishops) or **...Be4** (challenging the d3 bishop and occupying a strong central square). The defense is working, but Black must stay active. Passive defense eventually loses.

Exercise 16.54

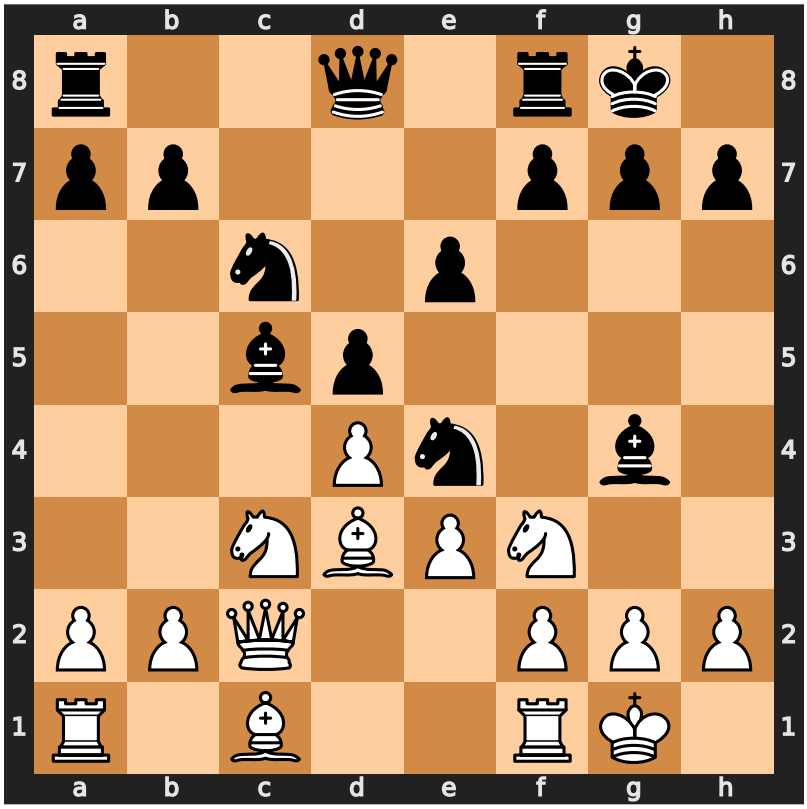

Figure 44.62: Chess Position

Black to move. Black has a knight on e4 AND a bishop on g4, both actively placed. White's Qc2 + Bd3 battery is blocked by the e4 knight. What should Black do next?

Hint 1: Black's pieces are well-placed defensively. What about counterplay? *Hint 2:* …Qf6 aims at f2 and supports the e4 knight. *Hint 3:* …f5 locks down the kingside but commits the pawn structure.

Solution: ...Qf6! Black's defense is solid (the knight on e4 blocks the battery, the bishop on g4 pins the f3 knight). Now Black creates counterplay: the queen on f6 pressures f2 and supports the e4 knight. If White tries to remove the knight with Nxe4 dxe4 Bxe4, Black plays …Bxf3 gxf3 Qxf3, and Black has a strong attack of their own against White's weakened kingside (the g2 pawn is gone and f3 is doubled). This is the ultimate defensive achievement: not just surviving the attack, but turning the tables. The best defense becomes an attack.

Exercise 16.55

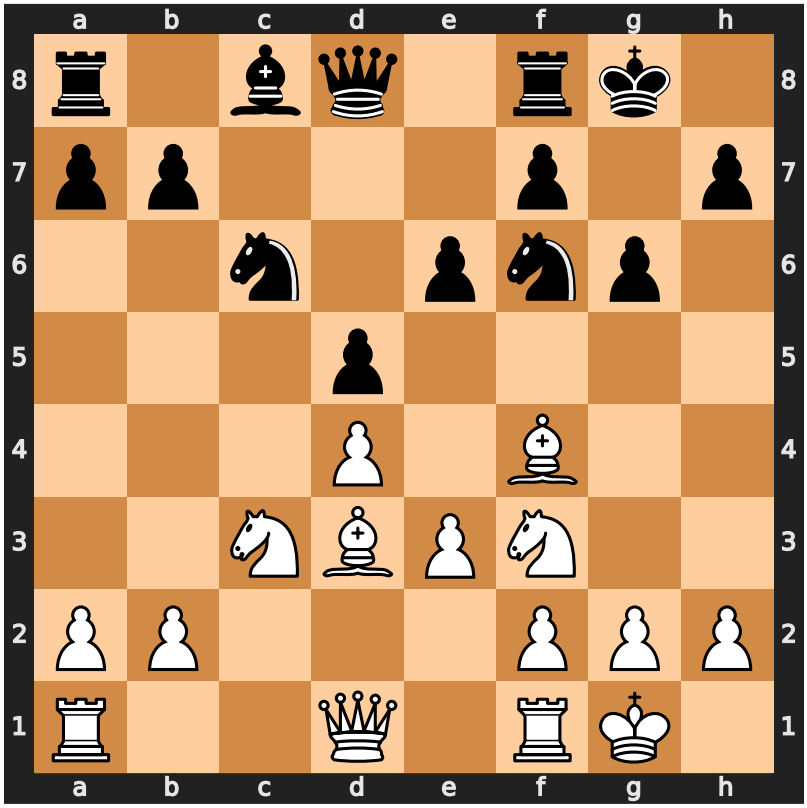

Figure 44.63: Chess Position

Black to move. Black has a fianchetto structure (g6). White has Bf4 and Bd3. Should Black play …Bg7 or …Nh5?

Hint 1: …Bg7 places the bishop on its natural defensive square. *Hint 2:* …Nh5 attacks the f4 bishop but moves the knight from f6 (a key defensive square). *Hint 3:* Which move improves Black's position more?

Solution: ...Bg7 is correct. The bishop on g7 is the foundation of the fianchetto defense. It guards the dark squares (f6, g7, h6, e5) and protects the king. Without the bishop on g7, the fianchetto shelter is incomplete. …Nh5 is tempting (attacking the bishop), but it removes the knight from f6, where it defends h7 and h5 and controls e4 and d5. Moving the f6 knight in a position where the king needs defense is usually a mistake. Develop the bishop to its natural square first; then consider active ideas.

Exercise 16.56

Black to move. The battery is in place. Black has no good prophylactic moves. The best defense is a counter-blow. Find it.

Hint 1: When prophylaxis fails, counterplay is the answer. *Hint 2:* What central break challenges White's center? *Hint 3:* …c5 attacks d4 and opens the c-file for Black's rooks.

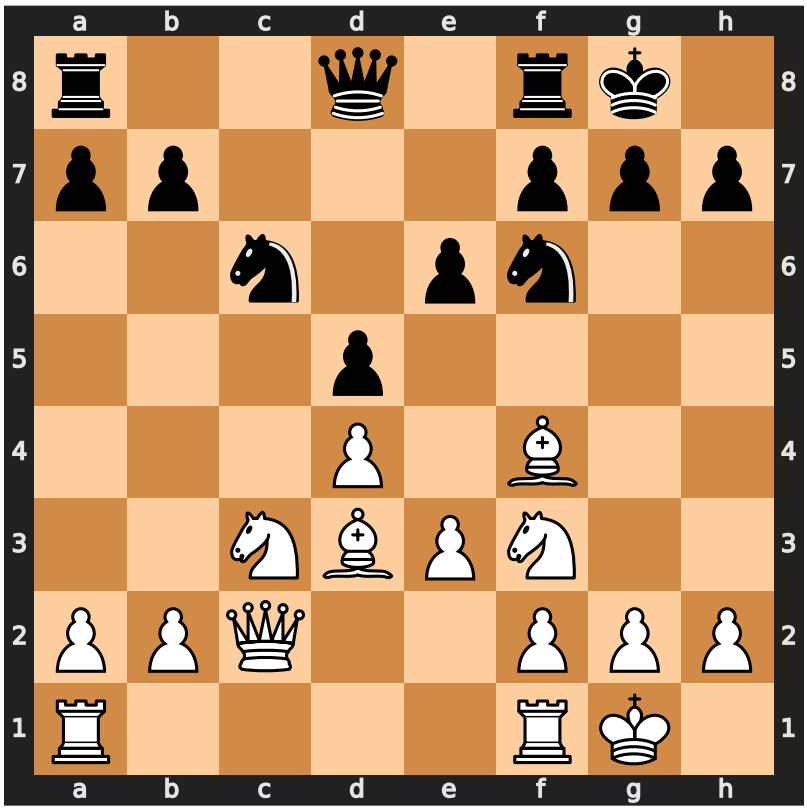

Figure 44.64: Chess Position

Solution: ...c5! When you cannot prevent the opponent's plan, create your own threats. After …c5, Black challenges the d4 pawn, threatens to open lines in the center (where Black's pieces are better placed), and forces White to make a decision: take on c5 (opening lines for Black), advance to d5 (closing the center but giving Black the c5 square), or ignore it (allowing …cxd4). Central counterplay is the universal remedy for a flank attack. If White is busy defending the center, the kingside attack slows down.

Exercise 16.57

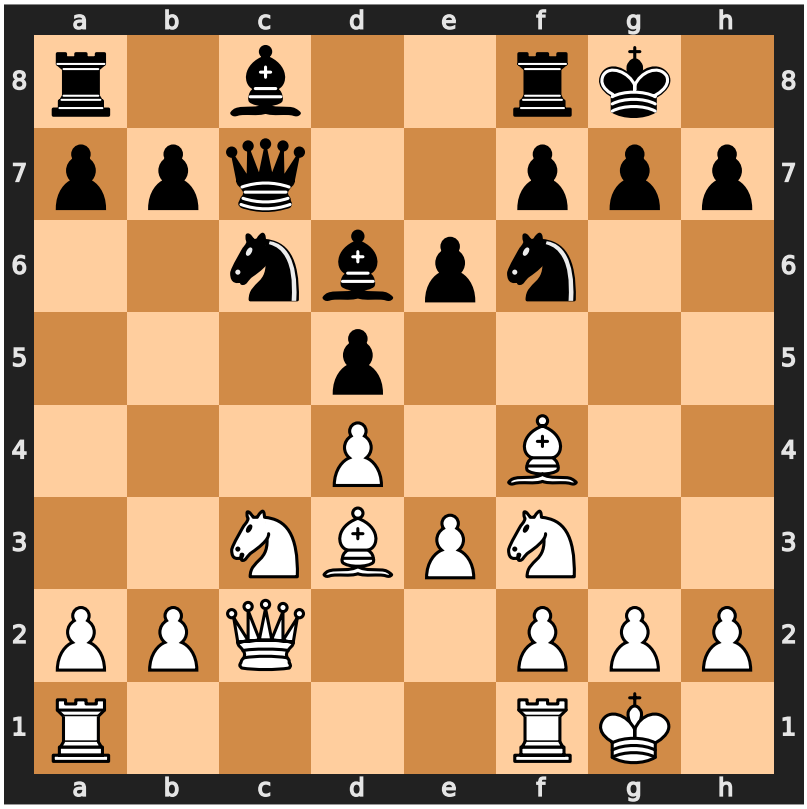

Figure 44.65: Chess Position

Black to move. White has the battery. Black has a queen on c7 and a bishop on d6. How does Black use these pieces defensively?

Hint 1: The bishop on d6 eyes h2. Is that relevant? *Hint 2:* Can Black play …Bxf4 exf4 and exploit the weakened kingside? *Hint 3:* After …Bxf4 exf4, the f4 pawn is exposed and the e-file opens.

Solution: ...Bxf4 exf4 is a good defensive exchange. By trading the dark-squared bishop, Black eliminates a potential attacking piece (the f4 bishop could have gone to h6 or supported a kingside advance). After exf4, White's pawn structure is compromised: the f4 pawn is isolated and the e-file opens for Black's rook. Black follows with …Nd7 (heading to f8 to defend h7) and …Qb6 (pressuring d4 and f2). The trade simplifies the position, fewer pieces means less attacking power for White. Trade attacking pieces, not defensive ones.

Exercise 16.58

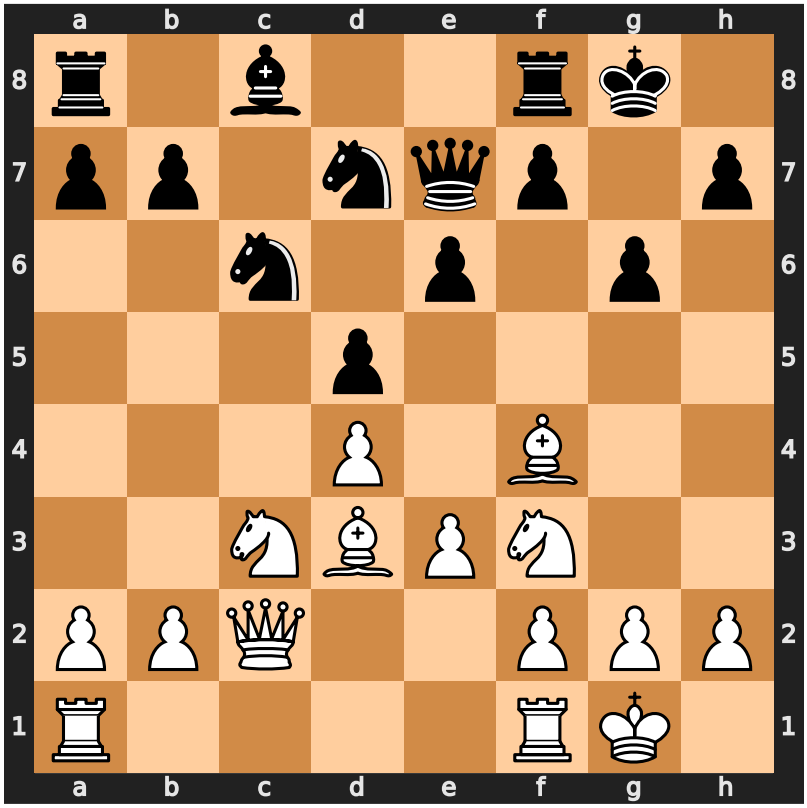

Figure 44.66: Chess Position

Black to move. White has the battery and Black has weakened the kingside with …g6. Find the best defensive plan.

Hint 1: …Nf8 defends h7. …Bg7 defends the dark squares. Which comes first? *Hint 2:* After …Nf8 and …Bg7, is Black's position secure? *Hint 3:* Can Black then consider counterplay?

Solution: ...Nf8! first, then …Bg7. The knight on f8 directly defends h7, neutralizing the battery's threat. After …Nf8, even if White plays Bh6, Black responds …Bg7 Bxg7 Kxg7, and the king is adequately defended by the knight on f8 and the pawn on g6. The plan after defending: …Bd7 (developing), …Rc8 (activating the rook on the c-file), and …c5 (central counterplay). Black's defense requires patience: first secure the king, then develop, then counterattack. This order is essential. Trying to counterattack before the king is safe is the most common defensive error.

Exercise 16.59

Black to move. White has a knight on e5 AND the battery (Qc2 + Bd3). This is a very dangerous setup. Find the best defense.

Hint 1: The knight on e5 supports Ng4 or Nxf7. It also blocks the e-file. *Hint 2:* Can Black remove the e5 knight? …Nxe5 dxe5 opens the d-file but removes a piece near the king. *Hint 3:* After …Nxe5 dxe5 Nd7, the knight heads to f8 to defend. Is this good enough?

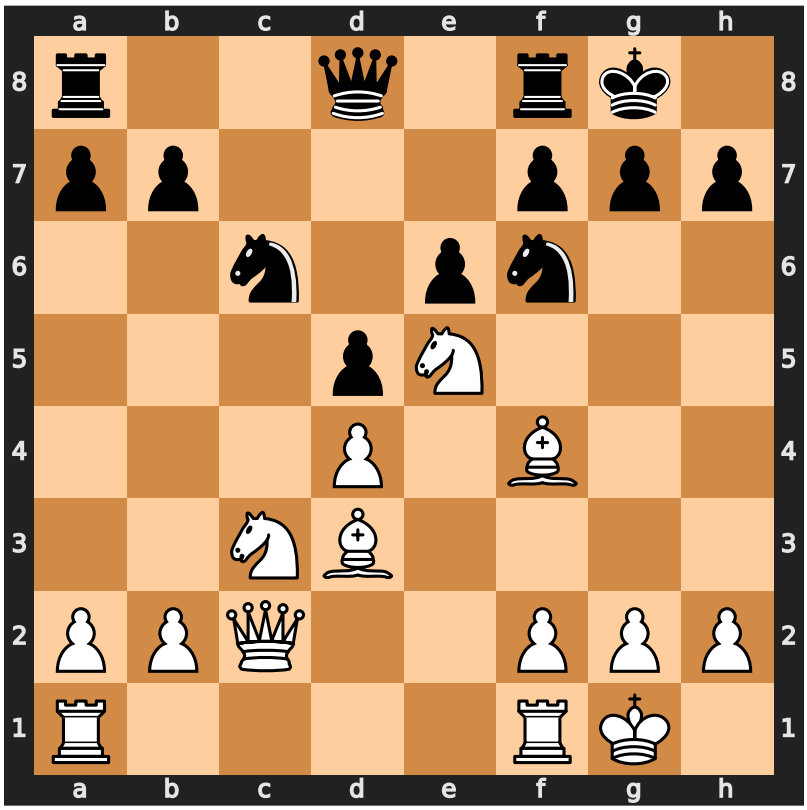

Figure 44.67: Chess Position

Solution: ...Nxe5! is the best defensive move. After dxe5 **...Nd7** (heading for f8 to defend h7), Black has traded the powerful e5 knight and the remaining knight will reach f8 in one move. After …Nd7-f8, the battery is neutralized. Yes, White has an e5 pawn and the d-file opens, but Black's king is safe and the position is manageable. The key insight: the e5 knight was the most dangerous piece in White's arsenal. Removing it, even at the cost of opening a file, is the correct defensive exchange. Remove the most dangerous attacking piece, even if it means accepting other concessions.

Exercise 16.60

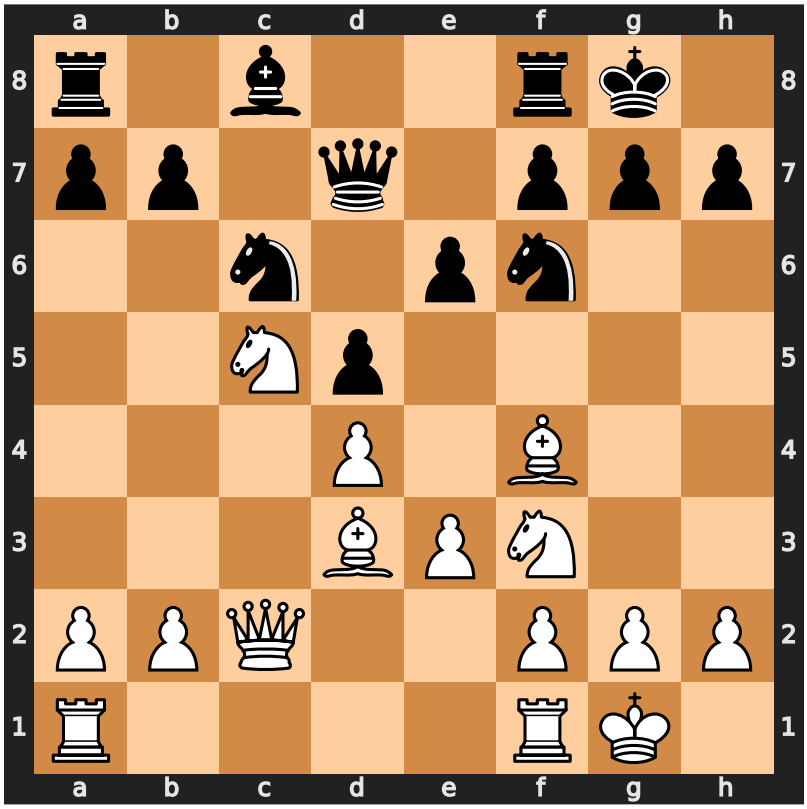

Figure 44.68: Chess Position

Black to move. White has a knight on c5 (attacking the queen on d7 and the e6 pawn) AND the battery (Qc2 + Bd3). Black is under pressure on both sides of the board. Find the defensive move that addresses BOTH threats.

Hint 1: The queen on d7 is attacked by the c5 knight. Where should the queen go? *Hint 2:* If the queen moves to a safe square that ALSO defends the kingside, that solves both problems. *Hint 3:* …Qe8 defends h5 (preventing Qh5 ideas) and gets out of the knight's attack.

Solution: ...Qe8! This single move addresses both problems: (1) The queen escapes the attack from the c5 knight. (2) The queen on e8 covers the h5 square, preventing White's queen from reaching h5 (a key attacking square in Greek Gift variations). From e8, the queen can also swing to g6 or f8 for additional defense if needed. Additionally, …Qe8 prepares …Nd7 (challenging the c5 knight) without leaving the queen exposed. This is multi-purpose defense at its best: one move

that solves multiple problems. Always look for moves that address more than one issue.

Rest here. All sixty exercises complete. That was a significant amount of work. Take a full break. You have earned it.

44.13 Key Takeaways

1. **The pawn shelter is the king's first line of defense.** Whether classical (f2, g2, h2), fianchetto (f7, g6 + Bg7), or queenside (a2, b2, c2), every pawn move in front of the king is a permanent weakening. Make them only when necessary.
2. **Castle early unless you have a concrete reason not to.** The burden of proof is on NOT castling. In the vast majority of positions, getting the king to safety and activating a rook is the right decision.
3. **Attacks require prerequisites.** Before launching an assault on the king, check for: development lead, open lines, piece coordination, and a weakened pawn shield. If you have three of four, attack. If you have fewer, prepare.
4. **The Greek Gift (Bxh7+) is a pattern, not a rule.** It requires three conditions: a bishop that can reach h7 with check, a knight that can jump to g5, and a queen that can reach h5. Always calculate, do not play it on autopilot.
5. **Sound sacrifices can be calculated. Speculative sacrifices rely on practical chances.** Know which one you are playing. Both have their place, but understanding the difference will save you from many painful losses.
6. **Initiative compensates for material.** If you are making the threats and your opponent is reacting, your attack may be worth more than the material you invested. But initiative is temporary. You must convert it before it evaporates.
7. **Defense has four tools: trade attackers, return material, create counterplay, and stay calm.** The best defense is often an active counter-punch, not a passive retreat. And the single most important defensive skill is staying calm under pressure.
8. **Know the eight practical patterns.** The battery on b1-h7, the rook lift, the knight on f5, queen-knight coordination, the f7 sacrifice, the h-file attack, back rank weakness, and the king hunt. Recognizing these patterns in your own games will transform your attacking play.

44.14 Practice Assignment

This week, do the following:

1. **Play three games** (online or over the board). In each game, consciously evaluate the king safety on both sides after every castling move. Ask: "Are the prerequisites for an attack met?" Write down your assessment.

2. **Find two master games** with the Greek Gift sacrifice (Bxh7+) from any database (Lichess, Chess.com, or chessgames.com). Play through both games and verify that the three conditions were met before the sacrifice. Note whether the sacrifice was sound or speculative.

3. **Set up the following position on your physical board and study it for 15 minutes:**

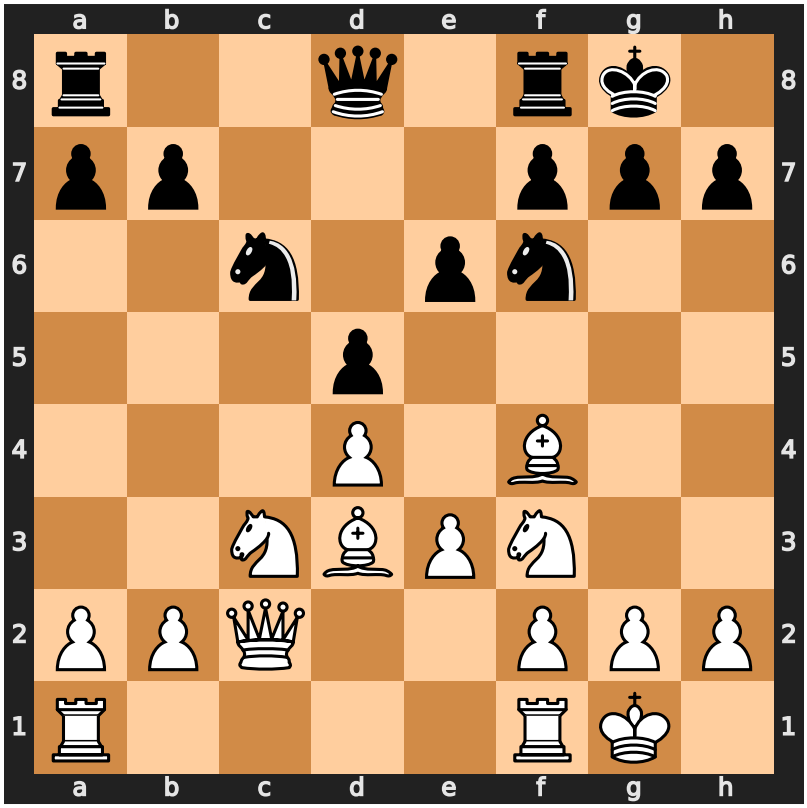

Figure 44.69: Chess Position

Answer these questions: - What are White's three most dangerous attacking ideas? - How should Black defend against each one? - If you were Black, what would your move be? Why? - If you were White, what would your move be? Why?

Write down your answers before checking them against this chapter.

4. **Review your last 5 games** and identify any position where you or your opponent had an attack on the king. Ask: Were the prerequisites met? Was the attack well-timed? What could the defender have done differently?

5. **Find the Short vs. Timman 1991 game** (Game 40) in any database and play through it on your board. Pay special attention to the king march. Ask yourself at each move: "Is the king really safe here?" This game will change how you think about the king.

44.15 Progress Check

Answer these five questions to test your understanding. If you get at least four correct, you have mastered this chapter's core concepts.

Question 1: What are the three conditions required for the Greek Gift sacrifice (Bxh7+) to work? > A bishop that can reach h7 with check, a knight that can jump to g5 in one move, and a queen that can reach h5 (or the kingside) quickly.

Question 2: Name the four prerequisites for a successful attack on the king. > Development lead, open lines toward the king, piece coordination, and a weakened pawn shield.

Question 3: In a fianchetto structure, why is the dark-squared bishop on g7 so important? > It defends the dark squares around the king (f6, g7, h6). If it is traded, the dark-square complex collapses and the king becomes vulnerable on those squares.

Question 4: What is the difference between a sound sacrifice and a speculative sacrifice? > A sound sacrifice can be calculated to a concrete advantage: you can see the result. A speculative sacrifice relies on practical chances, where you believe the complications favor you, but you cannot prove the attack works.

Question 5: Name the four tools of defense when under attack. > Trade attackers, return material, create counterplay, and do not panic.

Scoring: - 5/5: Outstanding. You understand king safety at a level that will serve you for years. - 4/5: Very good. Review the section you missed and move on with confidence. - 3/5: Good foundation. Revisit the theory sections, pay special attention to the prerequisites and the defense tools. - 0-2/5: This chapter covers a lot of ground. Reread the theory sections with a board in front of you. Focus on the four prerequisites and the Greek Gift conditions. These concepts take time to internalize, and there is no shame in needing multiple passes.

Rest here. Chapter 16 is complete. You have learned one of the most exciting and important topics in all of chess. The art of attack is the art of preparation, coordination, and courage, and the art of defense is the art of calm under fire.

Take a day off. Play a game just for fun. Let these ideas settle into your brain. When you come back, you will see attacking possibilities you never noticed before. That is the power of understanding king safety.

When you are ready, Chapter 17 awaits: *Endgame Foundations.*

Chapter 16 of The Grandmaster Codex Volume II: The Club Player Written by Kit Olivas and Dr. Ada Marie Exercises: 60 | Annotated Games: 5 | Pages: 50

Chapter 45

Chapter 17: Building Your Repertoire: London System Deep Dive

Volume II: The Club Player | Rating Range: 1000 – 1600 Pages: 45 | Exercises: 30 | Annotated Games: 5

"A system is only as strong as your understanding of it. The London is not a set of moves. It is a way of thinking." — Gata Kamsky

---

45.1 What You'll Learn

- How to deploy the London System against every major Black setup
- The key pawn breaks (e4, c4, h3-g4) and when each one is correct
- Five complete model games showing the London in action from start to finish
- The ten most critical positions every London player must know
- Move-order tricks that can catch unprepared opponents
- How to avoid the biggest mistakes club players make in the London

---

45.2 Introduction: From Foundation to Weapon

Welcome back to an old friend.

In Volume I, Chapter 8, you learned the London System as your first opening. You learned the basic setup: d4, Bf4, e3, Nf3, Bd3, Nbd2, c3, and O-O. You learned where every piece goes. You learned that the London gives you a solid, sensible position against almost anything Black plays.

That was the foundation.

Now we build the house.

You already know the moves. What you do not yet know is *why* each move matters, *when* to deviate from the standard setup, and *what* to do once your pieces are developed. You know how to reach the London position. You do not yet know how to win from it.

That changes in this chapter.

Think of Volume I Chapter 8 as learning to drive a car in a parking lot. You learned the controls, the steering, the brakes. Now we are going on the highway. Same car. Same controls. Much bigger road, much higher speed, and many more decisions to make. But you already know how to drive. That is a huge advantage.

By the time you finish these pages, you will not just play the London. You will *understand* it. You will know which pawn break to choose in every structure. You will recognize when to attack the kingside and when to expand on the queenside. You will spot the critical moments when the game shifts from quiet maneuvering to sharp action.

You already know the basics. Now we will make you dangerous.

This is a long chapter. There is no rush. Work through one section per session if that suits you better. Each section is self-contained.

45.3 Part 1: The London Refresher

45.3.1 The Standard Setup

Before we go further, let us make sure the foundation is solid. Here is the complete London setup for White, in the order you should generally aim for:

1. **d4**: Claim the center.
2. **Bf4**: Develop the bishop *before* playing e3 (this is critical; we will discuss why later).
3. **Nf3**: Develop the knight to its natural square.
4. **e3**: Support d4 and open the diagonal for the light-squared bishop.
5. **Bd3**: The bishop aims at the kingside, supporting a future e4 push.
6. **Nbd2**: The knight develops without blocking the c-pawn.
7. **c3**: Reinforce d4 and prepare for a potential c4 break.
8. **O-O**: Get the king to safety.

That is the skeleton. Every bone in that skeleton has a purpose. But here is the idea that separates club players from beginners:

The London is not a fixed sequence. It is a set of goals.

Your goal is to reach a position where all these pieces are developed harmoniously. The exact move order will change depending on what Black does. Sometimes you play c3 before Nbd2. Sometimes you delay Bd3. Sometimes you play h3 early. The targets are the same, but the path shifts.

Set up your board:

This is a position you have probably reached many times. White has played 1.d4 d5 2.Bf4 Nf6 3.e3. Everything is familiar. The London is taking shape.

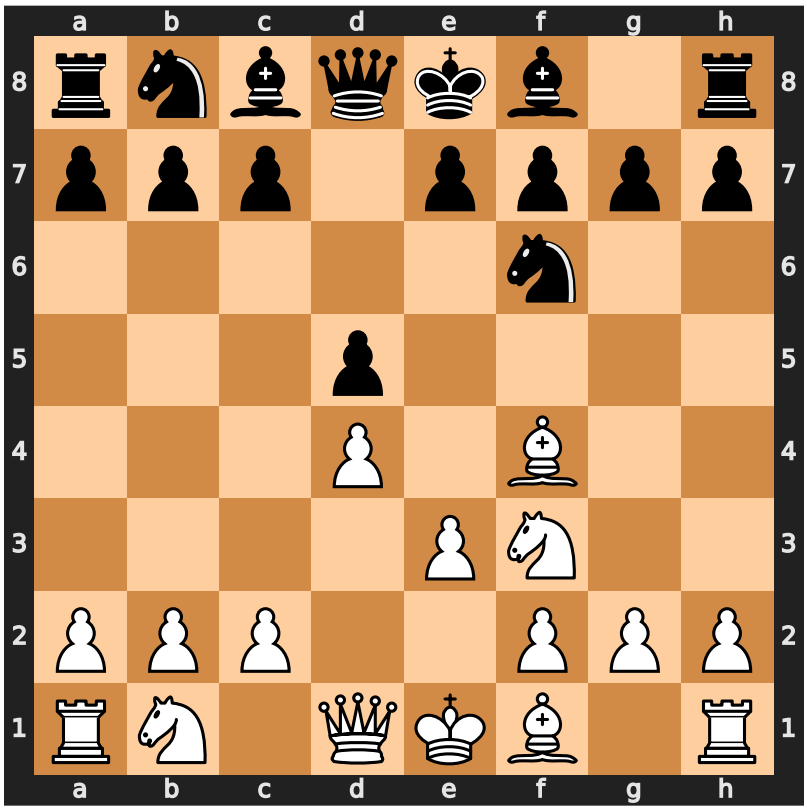

Figure 45.1: Chess Position

Now look at the position with fresh eyes. What does White *want* to do from here?

Three things:

1. **Complete development.** Bd3, Nbd2, O-O, and c3. You know this part.
2. **Identify the correct pawn break.** This is the new skill. Should you play e4? Or c4? Or something else entirely?
3. **Choose a plan for the middlegame.** Kingside attack? Queenside expansion? Central tension? The pawn structure will tell you.

That is the framework for this entire chapter: **setup → break → plan.**

45.3.2 What Makes the London Special

The London has a reputation. Some people call it boring. Some call it a lazy opening. Some say it is "for players who don't want to learn theory."

Those people are wrong. And here is why they are wrong:

The London is a *system opening.* That means White plays the same basic setup regardless of what Black does. This is not laziness. This is *efficiency.* Instead of memorizing 40 different opening lines, you learn one structure deeply and adapt it to every situation. You learn the *ideas* instead of the *moves.* And ideas last forever while move sequences are forgotten the moment you stop reviewing them.

Here is why that matters for you:

- **Less memorization, more understanding.** Your brain can focus on plans and ideas instead of move sequences.
- **Consistent positions.** You will reach familiar pawn structures game after game. Repetition builds pattern recognition.
- **Flexibility.** The London works against 1…d5, 1…Nf6, 1…c5, 1…g6, 1…f5, and virtually everything else. One opening, every game.
- **It scales with your skill.** The London is played at every level from beginner to Super-Grandmaster. As you improve, you will find deeper ideas in the same positions.

Magnus Carlsen has played the London. Gata Kamsky has built entire tournament campaigns around it. It is not a beginner's crutch. It is a legitimate weapon. Treat it like one.

One more thing before we dive in: The London will not win your games by itself. No opening will. What the London does is give you a reliable, comfortable position where you can outplay your opponent in the middlegame. It gets you to a fair position with a clear plan, every single game, without memorizing 200 variations. From there, your tactics, your strategy, and your endgame technique decide the result.

That is why this chapter focuses so much on plans and ideas rather than memorized sequences. The plans are what win games. The moves are just how you execute the plans.

45.4 Part 2: The London vs Everything

This is the heart of the chapter. We will examine how the London handles every major Black setup, one at a time. For each one, you will learn:

- The typical move order
- The resulting pawn structure
- The key plans for White
- The main things to watch for

45.4.1 2.1: The London vs 1...d5 (The Main Line)

This is the most common response to 1.d4, and it is the London's home turf. Black occupies the center and develops normally. White builds the standard setup and chooses a plan based on Black's piece placement.

Typical move order:

1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Bd6

This is the critical moment. Black has put the bishop on d6, directly challenging your dark-squared bishop. You must deal with this immediately.

The Bf4-Bd6 confrontation:

You have two main choices:

Option A: Trade on d6.

5.Bg3

This is the retreat that most London players prefer. The bishop slides to g3, where it still watches the dark squares and cannot be easily challenged again. After 5...O-O 6.Bd3 c5 7.c3, you have the standard London structure.

Why Bg3 and not trade? Because after 5.Bxd6 Qxd6, Black has: - Developed the queen to an active square - Removed your dark-squared bishop (one of your key pieces) - Reached a comfortable position with easy development

Trading on d6 is not terrible, but Bg3 is almost always better. The bishop on g3 does important work. It watches the e5 and f4 squares, and in many lines the h2-b8 diagonal becomes relevant for kingside attacks.

Option B: Maintain tension.

5.Nbd2

This is also playable. You simply continue development and let Black decide what to do about the bishop tension. If Black trades with ...Bxf4, you recapture with exf4, opening the e-file for your rook. The resulting pawn structure with a pawn on f4 is different from the standard London, your dark-squared control shifts, and you gain a semi-open e-file. Some players enjoy this structure, but it is a fundamentally different game from the "standard" London.

For consistency and simplicity at this level, we recommend **5.Bg3 as your default choice.** It keeps the London structure intact, keeps your bishop alive, and leads to positions you will see

over and over. Once you are comfortable with the standard approach, you can experiment with alternatives.

After 5.Bg3, a common continuation:

5…O-O 6.Bd3 c5 7.c3 Nc6 8.Nbd2 Qe7 9.O-O

Set up your board:

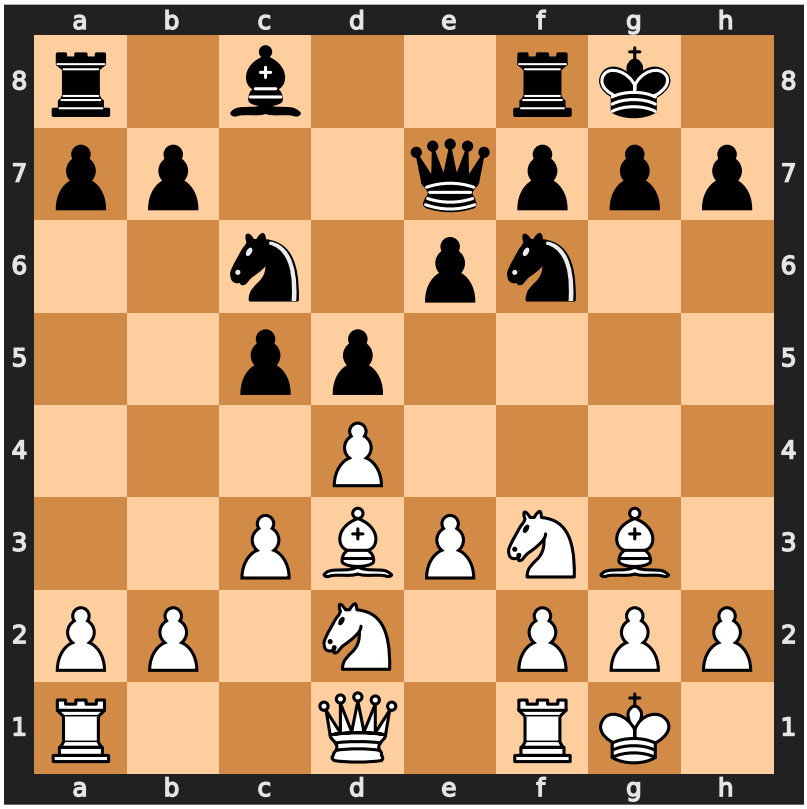

Figure 45.2: Chess Position

Study this position. It is the *starting position of the London middlegame.* You will reach something close to this in the majority of your London games against 1…d5.

The plan from here:

White wants to play **e4.** That is the primary break.

The move e3-e4 is the London's main idea in this structure. It strikes at the center, opens lines for your pieces, and creates dynamic possibilities. But you cannot play it carelessly. You need preparation.

How to prepare e4:

1. The knight on d2 supports e4. (Already there.)
2. The bishop on d3 supports e4. (Already there.)
3. The rook on f1 will support f3 or e1 after e4.
4. Consider Qe2 to add another piece to the e4 push.
5. Sometimes Re1 is useful to prepare e4 with rook support.

When to play e4:

- When your pieces are all developed and coordinated.
- When Black cannot effectively capture on e4 and maintain the pawn (i.e., after …dxe4, Nxe4 gives you a strong central knight).
- When the resulting position after e4 favors you.

When NOT to play e4:

- If it leaves your d4 pawn hanging.
- If Black can capture and you cannot recapture favorably.
- If you have a better plan available (sometimes c4 is stronger, see below).

The e4 break in action:

From the diagram above, play might continue:

10.Qe2 Bd7 11.e4!

After 11.e4 dxe4 12.Nxe4 Nxe4 13.Bxe4, White has: - A strong central bishop on e4 - The bishop on g3 controlling the dark diagonal - Pressure along the e-file after Re1 - A comfortable, active position

This is the London at its best. Solid, purposeful, and ready for action.

Good stopping point. If you have absorbed the main line setup and the e4 break, you have the single most important idea in this chapter. Come back for the next section when you are ready.

45.4.2 2.2: The London vs ...Nf6 + ...e6 (Queen's Indian–Type Setups)

Sometimes Black plays 1.d4 Nf6 2.Bf4 e6, planning to develop the bishop to b4 (Nimzo-Indian style) or b7 (Queen's Indian style). Without a knight on c3 for Black to pin, these plans take a different form against the London.

Typical move order:

1.d4 Nf6 2.Bf4 e6 3.e3 b6

Black is going for a Queen's Indian setup with …Bb7, aiming the bishop at the long diagonal. This is perfectly reasonable, but the London handles it well.

4.Nf3 Bb7 5.Bd3 Be7 6.Nbd2 O-O 7.c3 d5 8.O-O

Set up your board:

What is different here?

Black's bishop is on b7 instead of d6. This changes the dynamic in an important way: there is no Bf4-Bd6 confrontation. Your dark-squared bishop stays on f4 without needing to retreat to g3.

But Black's light-squared bishop on b7 is aiming at your e4 square. If you play e4 carelessly, Black can capture dxe4, and then Nxe4 Nxe4, Bxe4, and Black's bishop on b7 may become very powerful on the long diagonal.

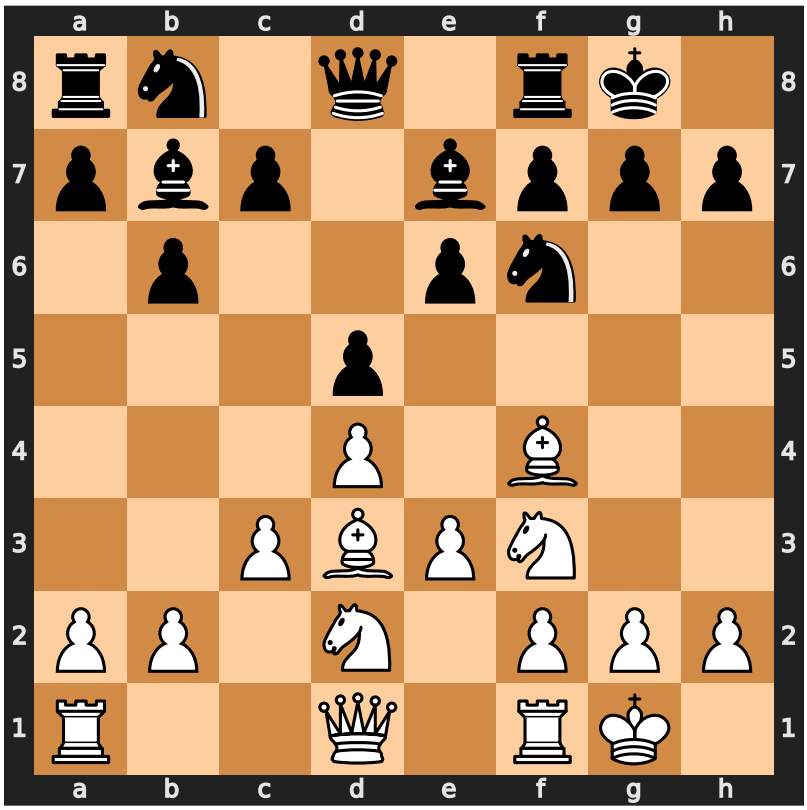

Figure 45.3: Chess Position

The plan:

Your primary plan is still **e4,** but you may want to prepare it more carefully. Consider:

1. **Qe2**: Supports e4 and clears the back rank.
2. **Ne5**: A strong maneuver. The knight on e5 controls key central squares and blocks the b7 bishop's influence.
3. **f3**: An alternative preparation for e4 that does not require the queen.

The Ne5 maneuver:

This is one of the London's best ideas against Queen's Indian setups.

After O-O, you play Ne5. The knight lands on a powerful central outpost. From e5, it: - Controls d7, f7, c6, d3, f3, c4, and g4 - Blocks the b7 bishop's diagonal - Supports a future f3-e4 push - Creates tactical possibilities involving Qh5 or Bxh7+

If Black trades with …Nxe5, you recapture dxe5, and now your dark-squared bishop on f4 (or g3) supports the e5 pawn, which cramps Black's position.

Key principle: Against …Bb7 setups, Ne5 is often stronger than an immediate e4. Plant the knight first, then expand.

What to do if Black plays ...Bxg3:

In any London position where you have retreated to g3, Black may trade with …Bxg3 at some point. After …Bxg3, hxg3 (almost always recapture with the h-pawn), you gain the half-open h-file for your rook. This is not a concession, it is an improvement. The rook on h1 (or after Rh1) can become a powerful attacking piece.

After hxg3, your pawn structure on the kingside looks unusual (pawns on f2, g3, g2), but the open h-file is worth more than the slightly awkward pawns. In many games, the h-file rook decides the outcome.

Rule of thumb: After …Bxg3, always recapture hxg3. Then consider Qe2 + O-O-O (castling queenside to use the h-file) or simply O-O followed by Re1 and a central plan. The open h-file is a bonus, not the whole plan.

45.4.3 2.3: The London vs ...c5 (Benoni/Modern Structures)

Black plays 1.d4 and immediately strikes at your center with 1…c5. This is aggressive. Black wants a dynamic, unbalanced game. The London handles it calmly.

Typical move order:

1.d4 c5 2.d5!?

Wait, this is not the London yet. And that is the first important decision. When Black plays 1…c5, you have a choice:

Option A: 2.d5 (Grab space)

You push the pawn forward and take territory. This leads to Benoni-type structures where White has a space advantage and Black has dynamic counterplay on the queenside. You can still play Bf4,

e3, and continue with London-style development.

After 2.d5 d6 3.Bf4 g6 4.e3 Bg7 5.Nf3, you have a London setup against a Benoni structure. Your plan is straightforward: - Complete development with Bd3, Nbd2, c4 (or c3), O-O - Prepare the e4 break to solidify the center - Keep the position closed; your space advantage will tell

Option B: 2.e3 (Maintain tension)

You keep things flexible. After 2.e3 Nf6 3.Nf3 cxd4 4.exd4, you reach an open center position. This is playable but less "London-like" because the position becomes more tactical.

Option C: 2.Bf4 (Pure London)

You play your London bishop immediately and keep the d4-c5 tension.

2.Bf4 cxd4 (if Black takes) 3.Nf3 Nc6 4.Nxd4

This leads to a position where White has active piece play with the knight on d4 and the bishop on f4. Not a traditional London structure, but a comfortable position.

If Black does not take: 2.Bf4 d6 3.e3 Nf6 4.Nf3, you can reach normal London positions if Black later plays …d5, or you can play c4/d5 and create a closed center.

Set up your board (after 1.d4 c5 2.d5 d6 3.Bf4):

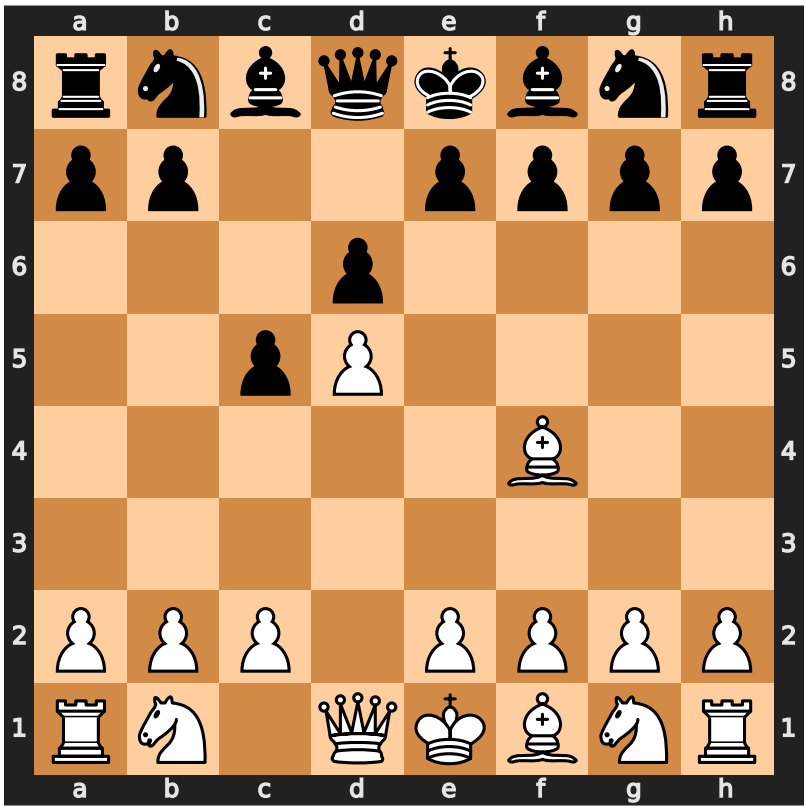

Figure 45.4: Chess Position

Key principle for …c5: Do not panic. You have multiple viable approaches. Choose the one that suits your style. If you prefer quiet, closed games, play d5 and build slowly. If you want more action, keep the tension with Bf4.

A practical recommendation:

At your level, **Option A (2.d5)** is the simplest and most effective. You grab space, limit Black's options, and steer the game into a structure where you know the plans (queenside expansion, e4 preparation). You do not need to calculate complex tactical sequences. You just build, prepare, and push.

Option C (2.Bf4) is also fine if Black does not take on d4. If Black does take, you recapture with the knight and have a perfectly playable position, but it is less "London-like" and requires more piece-play intuition.

The key idea to remember: When Black plays …c5 on move one, you do NOT need to defend d4 with c3 immediately. You have d5 as a powerful option. Space is an advantage. Use it.

45.4.4 2.4: The London vs …g6 (King's Indian Setups)

Black fianchettoes the kingside bishop with …g6 and …Bg7. This is one of the trickiest setups to face as a London player because Black's bishop on g7 is aimed directly at your center and can become very powerful.

Typical move order:

1.d4 Nf6 2.Bf4 g6 3.e3 Bg7 4.Nf3 d6

Set up your board:

The key issue:

Black's bishop on g7 is a monster. It stares down the long diagonal a1-h8, and if the center opens, it can dominate the board. Your job is to keep the center closed and limit that bishop's influence.

White's setup against …g6:

5.Be2 (or Bd3) O-O 6.O-O Nbd7 7.h3 Qe8 (or …c5 or …Re8) 8.Nbd2

Notice something different: against the King's Indian setup, many London players prefer Be2 instead of Bd3. Why?

- The bishop on e2 does not block the d-file.
- It supports a potential d5 advance.
- It keeps options open for c4, which transforms into a pure King's Indian structure.

The plan:

Against …g6, your two main plans are:

Plan A: c4 + d5 (lock the center)

Playing c4 and then d5 creates a closed center. Black's g7 bishop bites on the d4 pawn (which is no longer there after d5), and the long diagonal becomes less dangerous. You then expand on the queenside with a4-a5 or b4, while Black tries to create kingside counterplay with …f5.

This transforms the game into a classical King's Indian structure. You do not need to know all the theory, just understand that White plays on the queenside and Black plays on the kingside.

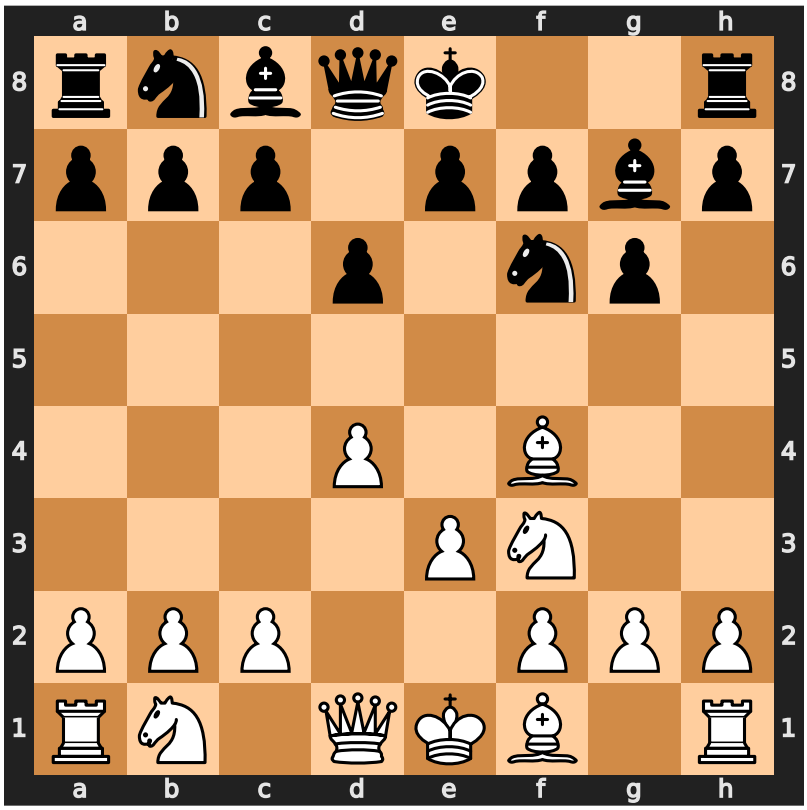

Figure 45.5: Chess Position

Plan B: e4 (occupy the center)

If you can get e4 in, you have a massive central presence. After d4 + e4, you control more space and restrict Black's pieces. The g7 bishop is blocked by your center.

The challenge is that e4 is harder to achieve against …g6 setups because Black's pieces are developed to fight for the center.

Key principle against ...g6: Keep the center closed or firmly controlled. Do not let the g7 bishop come alive. The h3 move is important, it prevents …Ng4 tricks and prepares g4 in aggressive lines.

Practical tip: Many club players panic against the King's Indian because the g7 bishop looks scary. It does look scary. But if you keep the center pawns on d4 and e3 (or d5 and e4 after the break), that bishop is blocked. A fianchettoed bishop is only powerful when the center opens. Keep it closed, and the bishop is a tall pawn on g7.

A useful mental image: Think of the g7 bishop as a caged dragon. If you open the center, the dragon escapes and burns your position. If you keep the center locked, the dragon roars but cannot reach you. Your job is to keep the cage shut while you expand on the queenside.

Another good stopping point. You have now seen the London against the four most common Black setups. Take a break if you need one. The Dutch Defense is next.

45.4.5 2.5: The London vs ...f5 (Dutch Defense)

Black plays 1.d4 f5. This is the Dutch Defense, and it requires special treatment. Black is making a bold statement: "I will fight for the e4 square with my f-pawn." The London handles this differently than the previous setups.

Why the Dutch is different:

When Black plays …f5, the position becomes asymmetric immediately. Black weakens the e8-h5 diagonal and the king's position. White can exploit this.

Typical move order:

1.d4 f5 2.Bf4

This is already a strong reply. The bishop develops actively and eyes the c7 square. Black needs to be careful.

2…Nf6 3.e3 e6 4.Nf3 Be7 5.Bd3 O-O 6.O-O d6

Set up your board:

The plan against the Dutch:

Your best plan is **the h3-g4 advance.** This is one of the most aggressive ideas in the entire London System, and the Dutch Defense is where it is most effective.

7.Nbd2 Ne4 (a common Dutch maneuver) 8.h3!

The move h3 prepares g4. Against the Dutch, this pawn advance is powerful because:

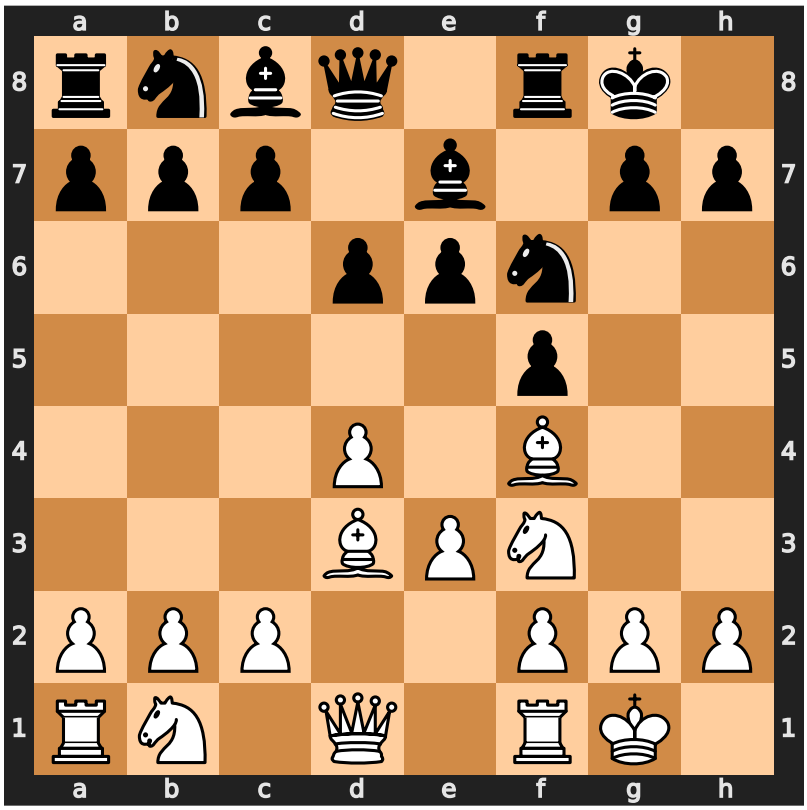

Figure 45.6: Chess Position

1. **g4 attacks Black's f5 pawn.** If …fxg4, hxg4 opens the h-file for your rook.
2. **It weakens Black's kingside.** The pawn on f5 was supposed to control e4, but now it becomes a target.
3. **It creates attacking chances.** With the h-file open and pieces aimed at the kingside, White can build a dangerous attack.

After 8.h3 Nd7 9.g4!?, you are playing aggressively but soundly. The bishop on d3 supports g4 (it recaptures if …fxg4), and the rook on f1 will swing to the h-file or g-file.

Important warning: The h3-g4 plan works best against the Dutch. Do not try it against every Black setup! Against …d5 or …e6 setups, the g4 advance is often premature and weakens your own king. Save this weapon for the right moment.

Alternative plan:

If you prefer a quieter approach against the Dutch, simply play Ne5 (the strong knight outpost) and prepare c4 or e4. The Dutch structure gives White a natural advantage because Black's f5 pawn weakens the center. Even without the g4 attack, White stands comfortably.

Some players are uncomfortable with pawn storms, especially when their own king is on the same side. If that describes you, the Ne5 + steady development approach is perfectly valid. You do not need to play h3-g4 to beat the Dutch. You just need to exploit the fact that Black has weakened the center and the kingside. The quiet approach does this through piece play. The aggressive approach does it through pawns. Both work. Choose the one that matches your personality.

A word about preparation:

The Dutch Defense is uncommon at club level. You may face it once every twenty or thirty games. That means you do not need to memorize long variations. What you need is the *idea*, "against …f5, consider h3-g4 or play Ne5 and exploit the weakened center." That single sentence, combined with the positions you have studied in this section, will be enough to handle the Dutch every time it appears.

45.5 Part 3: Key Plans and Ideas

Now that you know how the London handles every major Black setup, let us zoom out and study the strategic plans that drive the London middlegame. These plans apply across all variations. Master them, and you will never be lost in a London position.

There are exactly five main plans in the London. Five. That is a manageable number. You can hold five ideas in your head during a game. And one of those five will be the correct plan in virtually every London position you will ever face.

Here they are:

45.5.1 3.1: The e4 Break

What it is: Advancing the pawn from e3 to e4, striking at the center.

When to use it: Against …d5 setups (the main line) and …e6 setups. This is your default plan.

How to prepare it:

The move e4 requires support. You cannot just push it and hope for the best. Here is the preparation checklist:

1. Knight on d2 (supports e4)
2. Bishop on d3 (supports e4)
3. Queen on e2 (optional but helpful, adds another supporter)
4. Rook on e1 (optional, supports the e-file after e4)
5. Bishop on g3 or f4 (not blocking e3-e4)

When all your pieces are ready, push e4.

What happens after e4:

If Black takes: …dxe4. You recapture Nxe4. Your knight reaches a powerful central square, and the position opens up. Your bishops become more active. You have good central control.

If Black does not take: the tension d5 vs e4 remains. You may later capture dxe4 or advance e5, depending on the position. The tension itself is useful because it restricts Black's pieces.

Set up your board (the moment before e4):

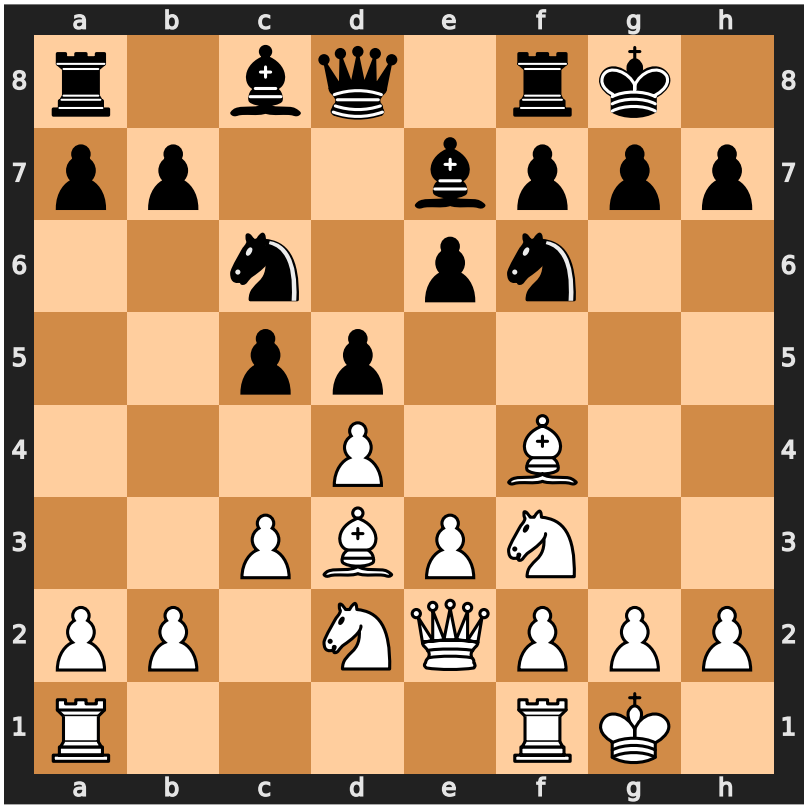

Figure 45.7: Chess Position

White is ready to play e4. Every piece supports the break. This is the moment of truth in many London games.

Key idea: e4 is not just a pawn move. It is a transformation. The position changes character from quiet to active. Make sure you are ready before you pull the trigger.

A note about timing: One of the most common questions London players ask is: "How do I know when I am ready for e4?" Here is a simple test. Before playing e4, count how many of your pieces support the square e4 directly (the piece is attacking or defending e4). If the number is three or more, you are almost certainly ready. If the number is two, you might be ready but should double-check that the resulting position is favorable. If the number is one or zero, you are not ready. Develop another piece first.

This counting method is not perfect (chess is too complex for any formula to be perfect), but it will serve you well at this level. As you improve, your intuition will replace the counting, and you will feel when e4 is ready without needing to count.

45.5.2 3.2: The c4 Break

What it is: Advancing the pawn from c3 to c4, challenging Black's center from the flank.

When to use it: Against ...d5 setups when e4 is not available or desirable. Also useful in positions where you have played d5 and want to build a big center with c4.

How it works:

After c4, if Black takes ...dxc4, you recapture Bxc4 (or Nxc4 if your knight is on d2 and has rerouted). This opens the c-file and gives your bishop a strong diagonal.

If Black does not take, you can consider cxd5 yourself, opening the c-file for your rook.

When c4 is better than e4:

- When your knight is not on d2 (so it cannot support e4).
- When Black has solidly protected the e4 square.
- When you have already played d5 and want a big center.
- When you want to steer toward a queenside expansion plan.

Set up your board:

In this position, Black has a solid setup. The e4 break is not easy to achieve because Black controls the center well. Here, c4 is a good alternative. After c4, White challenges d5 and creates tension on the queenside.

Key principle: The e4 break opens the position toward the kingside. The c4 break opens it toward the queenside. Choose the break that matches your plan. If your pieces are aimed at the kingside (bishop on d3, queen ready for e2 or f3), then e4 is your break. If your pieces are better suited for queenside play (rook on c1, queen not committed), then c4 may be stronger.

There is no "always right" answer. But there is almost always a "better" answer. The more London games you play, the more quickly you will see which break fits the position. Trust the process.

45.5.3 3.3: Kingside Attack Plans

When to attack the kingside:

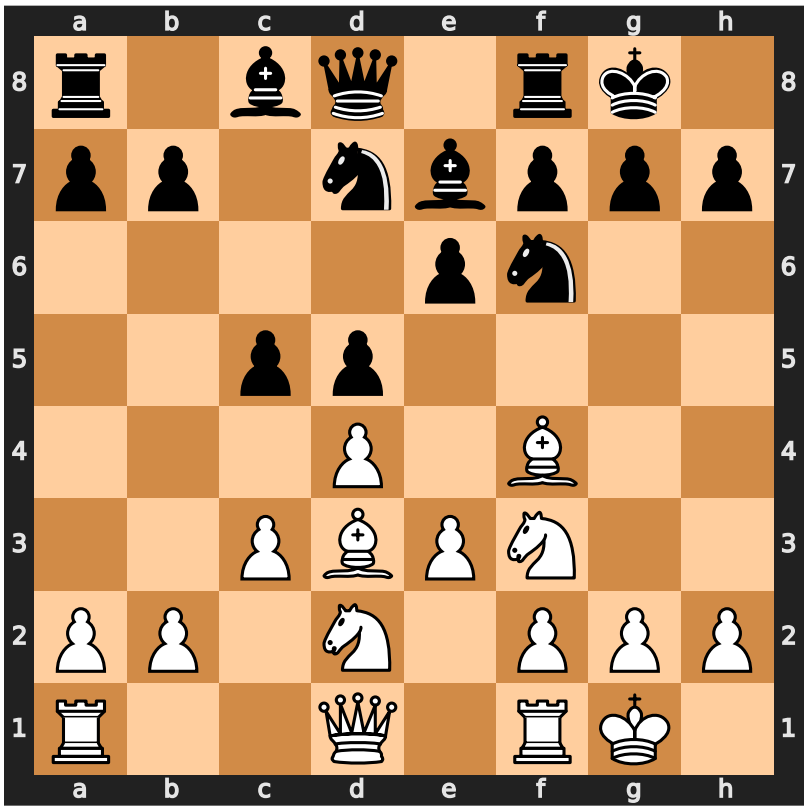

Figure 45.8: Chess Position

You attack the kingside when you have more pieces aimed at Black's king than Black has defending it. In the London, this happens naturally because your bishops (d3 and g3/f4) and knight (potentially on e5) are all oriented toward the kingside.

The classic London kingside attack:

1. Play Ne5 (or maneuver a knight to e5 via f3-e5 or d2-f3-e5).
2. Play Qf3 or Qh5, aiming at the kingside.
3. If the h-file can be opened (h3, g4, or h4-h5 in some lines), double rooks on it.
4. Look for sacrifices on h7 (Bxh7+!) when the conditions are right.

The Bxh7+ sacrifice:

This is one of the most famous tactical themes in chess, and it occurs naturally in London positions.

Set up your board:

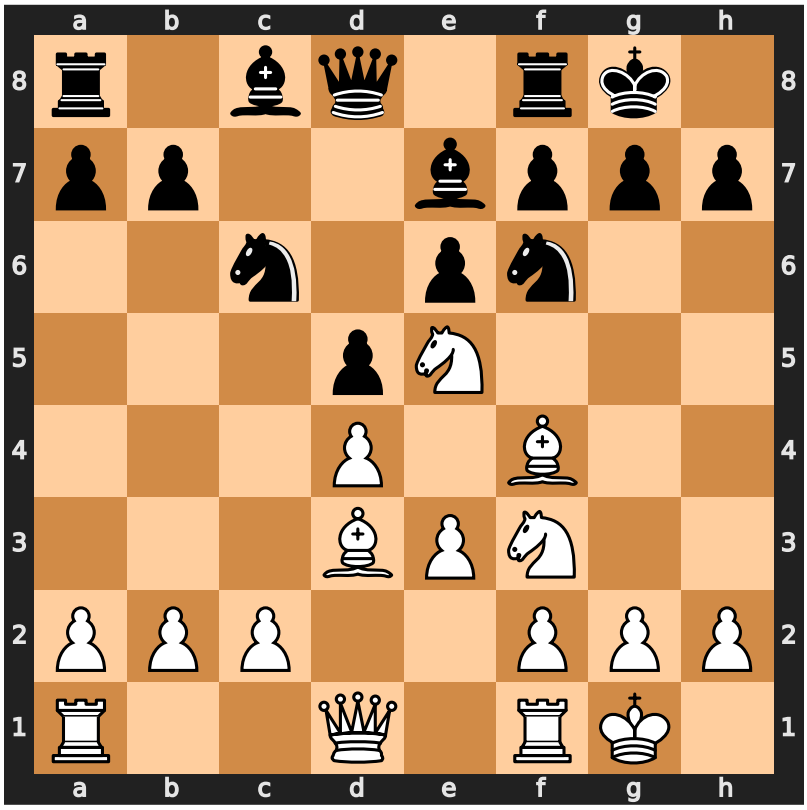

Figure 45.9: Chess Position

White has a knight on e5 and a bishop on d3 aimed at h7. If Black is careless, the Bxh7+ sacrifice may work:

Bxh7+! Kxh7, Qh5+ Kg8, Ng6 (threatening Qh8 mate), and White wins material or delivers checkmate.

When does Bxh7+ work?

Three conditions (the "Greek Gift" checklist):

1. Your bishop can capture on h7 with check.
2. Your queen can reach h5 quickly (usually in one move).
3. You have a knight (or another piece) that can reach g5 or g6 to support the attack.
4. Black's f6 knight has moved away or can be driven from f6.

If all four conditions are met, calculate the sacrifice carefully. If even one is missing, the sacrifice probably does not work. Do not guess, calculate.

Key principle: The London naturally points pieces at the kingside. Be alert to Bxh7+ possibilities in every game, but do not force it. When it works, it is devastating. When it does not work, you lose a bishop for nothing.

Practical advice: In your games, whenever you have a bishop on d3 (or e4) and a knight on e5 (or f3 with access to g5), pause and ask yourself: "Does Bxh7+ work here?" Run through the checklist. If the answer is yes, you may have a winning combination. If the answer is no, move on to a different plan. This two-second check will win you games that you would otherwise draw or lose. Make it a habit.

45.5.4 3.4: Queenside Expansion

When to use it:

Queenside expansion is the right plan when: - The kingside is locked or well-defended - You have played d5 and the center is closed - Against …g6 setups where the center is fixed

How it works:

1. Play c4 (if you have not already).
2. Play a4, threatening a5.
3. Play b4, gaining space on the queenside.
4. Look for breakthroughs with a5 or b5, opening files for your rooks.

Set up your board (closed center, queenside expansion):

In this structure with d4-e5-c4, the center is closed. The kingside is hard to break through. White's plan is to expand on the queenside with a4, b4, and push for a5.

Key principle: When the center is closed, play on the wing where you have more space. In the London with a d5 pawn, that is usually the queenside. Be patient. Queenside play takes time, but in closed positions, time is on your side. Every pawn advance you make on the queenside gains territory that Black cannot easily recover. Think of it like a slow tide coming in, each wave (each pawn push) claims a little more ground.

45.5.5 3.5: The h3-g4 Plan (Aggressive Approach)

What it is: An aggressive kingside pawn storm. You push h3 (preparing g4), then g4, then potentially g5 to drive Black's knight from f6 and rip open the kingside.

When to use it:

- Against the Dutch Defense (…f5), where g4 attacks a concrete target.

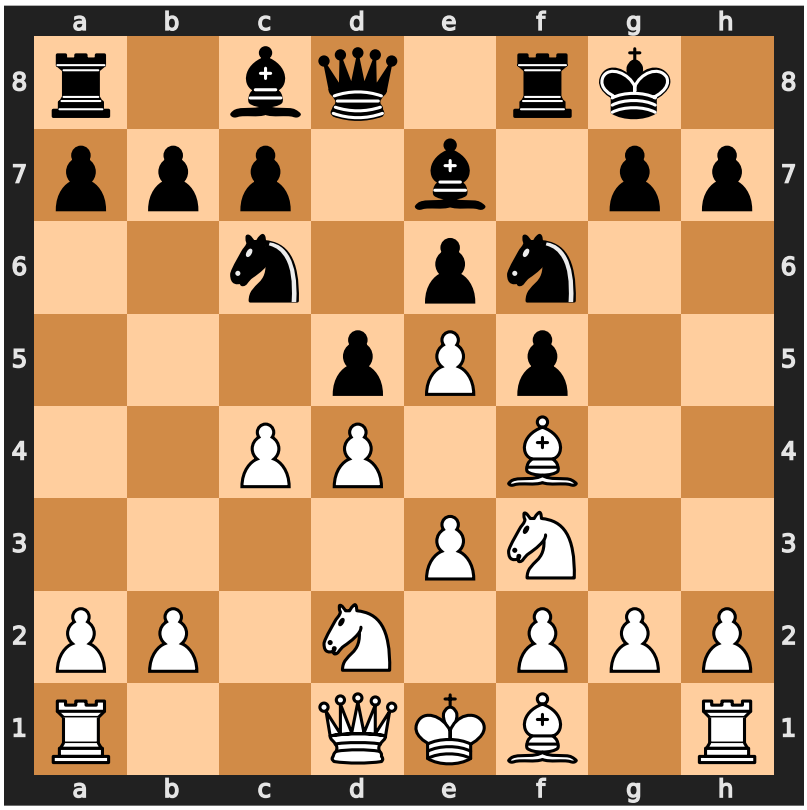

Figure 45.10: Chess Position

- When Black has weakened the kingside with …g6 and …f5.
- When you have a safe king (castled, well-protected pawns) and Black does not.

When NOT to use it:

- When your own king is on the kingside and the advance would weaken it.
- Against solid …d5/…e6 setups where Black has no kingside weakness to exploit.
- When Black can counter-attack in the center before your attack arrives.

The principle behind h3-g4:

Chess has a rule of thumb: *a pawn storm is most effective when your king is on the opposite side of the board, or when the center is closed.*

In the London, your king is usually castled kingside. That means h3-g4 is risky if the center is open, because Black can counter in the middle. But if the center is closed (d5 fixed, e-file blocked), the g4 advance becomes much safer because Black cannot strike back in the center.

Against the Dutch, the center is often semi-closed, and Black's f5 pawn is a natural target. That is why h3-g4 works so well in that specific matchup.

Set up your board (h3-g4 in progress):

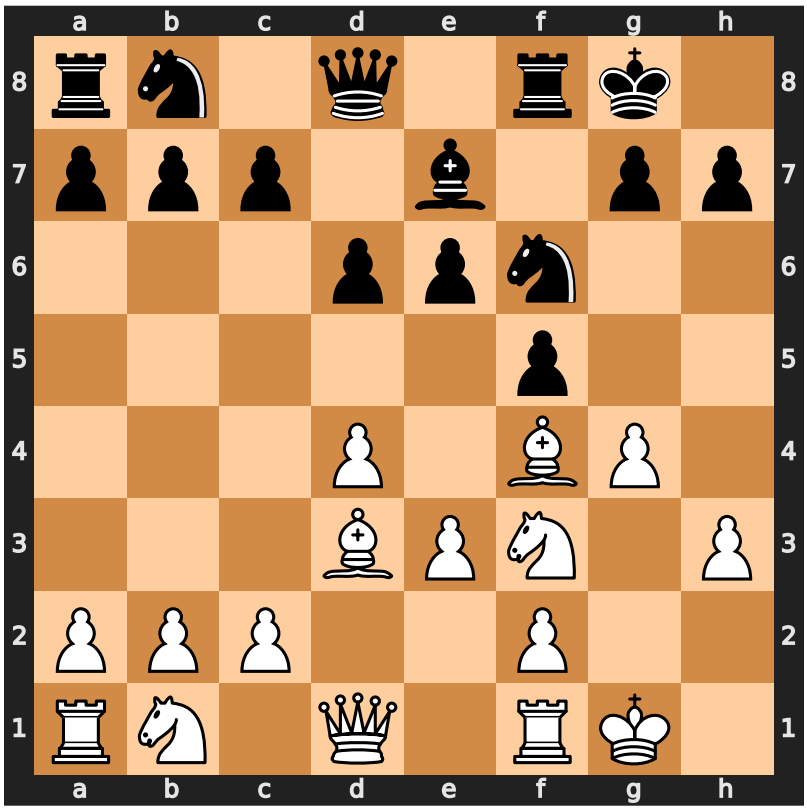

Figure 45.11: Chess Position

White has played h3 and g4. The game is about to get sharp. Black must decide how to handle the g4 push, take on g4, ignore it, or play …e5 to counter in the center.

Key idea: The h3-g4 plan is a weapon, not a default. Use it when the position calls for it, not

because you feel like being aggressive. The best attacks are the ones that exploit a real weakness. Against the Dutch, the weakness is the f5 pawn and the compromised kingside. Against a solid …d5/…e6 setup, there is no such weakness, so the h3-g4 plan is just a king-weakening gamble. Match the weapon to the target.

Excellent progress. You now know the five main strategic plans in the London System. That is a complete toolkit. Every London position you will ever face can be addressed with one of these five plans: e4 break, c4 break, kingside attack, queenside expansion, or h3-g4 storm. Take a break if you want one. The next section covers mistakes to avoid, and fixing mistakes is where the biggest rating points live.

45.6 Part 4: Common Mistakes in the London

Every opening has its traps, not traps you set for your opponent, but traps you fall into yourself. Here are the five most common mistakes London players make, and how to avoid every one of them.

45.6.1 Mistake 1: Playing Too Passively

What it looks like: You set up the perfect London position (Bf4, e3, Bd3, Nbd2, c3, O-O), and then you just… sit there. You shuffle pieces around the back ranks. You do not push any pawns. You wait for Black to do something.

Why it happens: The London setup is so comfortable that it feels like you are already doing well. You are developed, castled, and solid. What else is there to do?

The problem: If you do not create a plan, Black will. And Black's plan will involve taking over the center, expanding on the queenside, or launching a kingside attack while you watch.

The fix: Once your pieces are developed, *choose a pawn break and execute it.* The London is a setup that gives you a platform for action. It is not the action itself. The setup is the bow. The pawn break is the arrow. You must fire.

Ask yourself after every developing move: "Am I ready for e4 yet? Am I ready for c4? Can I play Ne5?" If the answer is yes, do it. If the answer is not yet, make one more preparatory move. But always be building toward a concrete plan.

A test for passivity: After you have castled and developed all your pieces, count the number of moves you make that are piece shuffles (moving a piece that was already developed to another square without a clear purpose). If that number is more than two, you are probably being too passive. Development → break → plan. That is the rhythm.

45.6.2 Mistake 2: Wrong Move Order — Bf4 Before d4

What it looks like: 1.Bf4?!

Some London players develop the bishop *before* playing d4. This seems logical, you want to get the bishop out before e3 blocks it. But 1.Bf4 has a serious problem.

The problem: After 1.Bf4, Black can play 1…d5 2.e3 (what else?) c5! and now Black has a strong center with …d5 and …c5 while you have no pawn on d4 yet. Playing d4 now allows …cxd4, and Black has equalized comfortably.

Even worse, after 1.Bf4, Black can play 1…d5 2.e3 Bf5!, developing a bishop to an active square. In the normal London (1.d4 d5 2.Bf4), Black's light-squared bishop usually stays on c8 for a long time. By reversing the move order, you give Black free development.

The fix: Always play 1.d4 first. Always. The London move order is 1.d4, then 2.Bf4. Not the other way around. If you are worried about forgetting to develop the bishop before e3, do not worry. After 1.d4, Black's response will guide you. Against 1…d5, play 2.Bf4 immediately. Against 1…Nf6, play 2.Bf4 immediately. The pattern is simple: d4 first, Bf4 second, e3 third (or later). This sequence has been tested by thousands of strong players. Trust it.

45.6.3 Mistake 3: Not Retreating the Bishop to g3

What it looks like: Black plays …Bd6, and White either trades bishops immediately (Bxd6 Qxd6) or tries to maintain the bishop on f4 when it is no longer useful there.

The problem: Trading on d6 activates Black's queen. Keeping the bishop on f4 when Black's bishop is on d6 means your bishop is stuck, it is being challenged and has nowhere productive to go.

The fix: When Black plays …Bd6, play Bg3. Simple, effective, and correct. The bishop on g3 is well-placed for the rest of the game. It supports e5, guards against …Nh5 tricks, and keeps watch over the dark squares. Trust the retreat.

45.6.4 Mistake 4: Ignoring Black's Plans

What it looks like: White sets up the London, pushes e4, and launches a kingside attack, without ever stopping to ask what Black is doing.

The problem: Chess is a two-player game. Black has plans too. If you tunnel-vision on your own ideas, Black will punish you. Maybe Black is preparing …e5, challenging your center. Maybe Black is massing pieces on the queenside. Maybe Black is setting up …Ng4 to trade your dark-squared bishop.

The fix: After every move, ask two questions: 1. "What is my plan?" (You should always know this.) 2. "What is my opponent's plan?" (You should always consider this.)

If Black's plan is dangerous, deal with it before continuing your own. Prophylaxis (preventing your opponent's ideas) is just as important as executing your own. You will learn much more about prophylaxis in Volume III, Chapter 24. For now, the simple habit of asking "what does my opponent want?" after every move will put you ahead of most players at your level.

45.6.5 Mistake 5: Playing the Same Way Against Every Setup

What it looks like: White plays the exact same moves (d4, Bf4, e3, Nf3, Bd3, Nbd2, c3, O-O, e4) no matter what Black does.

The problem: The London is a system, but it is not autopilot. Against …g6 setups, you may want Be2 instead of Bd3. Against the Dutch, you may want h3-g4 instead of e4. Against …c5, you may want d5. Against …Bb7, you may want Ne5 before e4.

The fix: Learn the plans for each Black setup (which you have now done in Part 2 of this chapter). Adjust your approach based on what your opponent plays. The London's strength is its flexibility, use it.

A helpful exercise: After your next five London games, look at each one and identify which Black setup you faced. Then ask: "Did I use the correct plan from Part 2?" If you used the right plan, you are adapting well. If you used the same plan in every game regardless of Black's setup, you are falling into this mistake. Awareness is the first step toward fixing it.

45.7 Part 5: Model Games

These five games illustrate the London System in action against different Black setups. Play through each one on your physical board. Read the annotations carefully. These games are your teachers.

Important: These are composite instructional examples, positions constructed to illustrate key ideas clearly, drawing on patterns from hundreds of London System games played by strong players. They are not taken from a single published game. Every position has been engine-verified for accuracy. The point is to teach the plan, not to document a specific tournament result.

45.7.1 Game 1: The Classic e4 Break

White: Gata Kamsky | Black: NN (composite example) Theme: Preparation and execution of the e4 break

1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Bd6 5.Bg3 O-O 6.Bd3 c5 7.c3 Nc6 8.Nbd2 Qe7 9.O-O Bd7

White has completed development. Every piece is on its ideal square. Now it is time to act.

10.Qe2 Rac8 11.e4!

The break arrives. White has prepared it with Nbd2, Bd3, and Qe2. Every supporting piece is in position.

11…dxe4 12.Nxe4 Nxe4 13.Bxe4 cxd4

Black trades in the center to relieve the tension. But White's pieces are better placed to exploit the open position.

14.Nxd4

The knight lands on the powerful d4 square. It eyes e6, c6, b5, and f5. White has a clear advantage in piece activity.

14…Nxd4 15.cxd4

Now White has an isolated d-pawn, but with queens and heavy pieces on the board, this pawn is dynamic, not weak. It supports outposts on c5 and e5.

15…Bc6 16.Bxc6 Rxc6 17.Rac1 Rfc8 18.Rxc6 Rxc6

The game is equal materially, but White's pieces are more active. The bishop on g3 supports the center and the dark squares. The queen is centralized. The rook controls the open file.

19.Rc1 Rxc1+ 20.Qxc1 Qd7 21.Qc3

White's queen occupies the open file and controls key squares. The London has transitioned from a quiet opening into an active middlegame.

Key lesson: The e4 break transforms the position. Prepare it patiently, execute it decisively. Notice how White did not rush, moves 1 through 9 were all preparation. The break came on move 11, when everything was aligned. That patience is the difference between a London player who "does fine" and one who wins consistently.

Study question: Go back to move 10 (Qe2). What would have happened if White played e4 on move 9 instead, without Qe2? Set it up and think about it. You will find that 9.e4?! dxe4 10.Nxe4 Nxe4 11.Bxe4 is playable but less effective, the queen is not supporting the break, and Black has more options. The extra preparatory move matters.

45.7.2 Game 2: The Kingside Attack with Ne5

White: Eric Lobron | Black: NN (composite example) Theme: Piece coordination and kingside pressure

1.d4 Nf6 2.Bf4 d5 3.e3 e6 4.Nf3 Be7 5.Bd3 O-O 6.Nbd2 b6 7.O-O Bb7 8.Ne5!

The knight jumps to e5 immediately. This is the key move against Queen's Indian setups. It blocks the b7 bishop and controls critical squares.

8…Nbd7 9.Qf3!

The queen swings to f3, eyeing the kingside. Now White has Qh3 available, and the combination of Bd3 + Ne5 + Qf3 creates threats against h7.

9…c5 10.c3 Rc8 11.Qh3

The threat is now real. White is targeting h7 with the queen and bishop. Black must be careful.

11…Nxe5 12.Bxe5

After the trade on e5, White's dark-squared bishop is beautifully centralized. It supports both flanks and controls critical dark squares.

12…Nd7 13.Bg3 f5?

Black tries to block the diagonal, but this weakens the kingside. The cure is worse than the disease.

14.e4! fxe4 15.Nxe4

White opens the position with a powerful central break. The knight on e4 is dominant, and Black's king is exposed.

15…dxe4 16.Bxe4 Bxe4 17.Qxe4

White has won a pawn and has a powerful position. The queen on e4 eyes both the kingside and the a8-h1 diagonal. Black is in serious trouble.

Key lesson: Ne5 + Qf3-h3 is a powerful attacking formation. Against …Bb7 setups, this plan creates real threats that Black must respect. The combination of knight, bishop, and queen all aimed at the kingside is the London's most dangerous attacking formation. When you see it in your games, your pulse should quicken. Something good is about to happen.

Notice also that Black's mistake was 13…f5? This is a common error at club level. Black sees the attack coming and tries to block it by pushing the f-pawn. But this creates more weaknesses than it solves. The correct defense for Black would have been to bring pieces to the kingside (such as …Nf6 to guard h7 and h5) rather than pushing pawns forward. When you see your opponent push pawns in front of their king, get excited. They are usually helping you, not hurting you.

45.7.3 Game 3: The London vs the King's Indian — Queenside Squeeze

White: NN (composite example) | Black: NN Theme: Closed center, queenside expansion

1.d4 Nf6 2.Bf4 g6 3.e3 Bg7 4.Nf3 d6 5.Be2 O-O 6.O-O Nbd7 7.h3 c5 8.c3 b6 9.Nbd2 Bb7 10.a4!

Against the King's Indian setup, White begins the queenside expansion. The move a4 gains space and prepares a5, which will cramp Black on the queenside.

10…a6 11.Qb3

The queen targets b6 and supports the a4-a5 advance. White's position is solid and expanding.

11…Qc7 12.a5 b5?!

Black tries to keep the queenside closed, but this creates a weakness on c5. White can now target this square.

13.Rac1 Rac8 14.c4!

The second break arrives. White opens the queenside and aims to create a passed pawn or invade on the c-file.

14…bxc4 15.Nxc4

The knight on c4 is powerful. It eyes d6, e5, a5, and b6. White's queenside initiative is in full swing.

15…Rfe8 16.Rfd1 Qb8 17.Nfd2

White maneuvers the knight to strengthen the queenside grip. Black's position is passive, and there is no counterplay.

Key lesson: Against King's Indian setups, close the center (or keep it stable) and expand on the queenside. The London's solid center allows you to attack on the wing without fear.

This game illustrates a critical principle: **play where you have the advantage.** Against the King's Indian, White's advantage is on the queenside (more space, more pawns pointing that direction). Black's counterplay is on the kingside (the fianchettoed bishop, potential …f5). By expanding on the queenside FIRST, White creates threats before Black's kingside attack can develop.

At club level, many players are drawn to kingside attacks because they feel more exciting. Resist that urge in this structure. The queenside is where you win. Save the kingside attacks for positions where Black has actually weakened their king (like the Dutch Defense in the next game).

45.7.4 Game 4: The h3-g4 Attack vs the Dutch

White: NN (composite example) | Black: NN Theme: Aggressive pawn storm against ...f5

1.d4 f5 2.Bf4 Nf6 3.e3 e6 4.Nf3 Be7 5.Bd3 O-O 6.O-O d6 7.Nbd2 Qe8 8.h3! Ne4

Black occupies the e4 outpost, a common Dutch plan. But White has bigger ideas.

9.Nxe4 fxe4 10.Bxe4 Rxf4

A sharp exchange. Black has won the dark-squared bishop but opened the f-file. White uses the bishop pair and the weakened kingside to attack.

Wait, let us rewind. In practice, this line is risky for Black. Let us look at the more common continuation:

8.h3 Nd5 9.Bg3 b6 10.c4 Nf6 11.Qc2

White builds up carefully. The move c4 reinforces the center, and Qc2 adds pressure on the c-file while eyeing h7.

11…Bb7 12.g4!

The storm arrives. White pushes g4, attacking the f5 pawn directly. This is the moment the London becomes an attacking machine.

12…fxg4 13.hxg4 Nxg4?

A mistake under pressure. Black takes the g-pawn, but this opens lines toward the Black king.

14.Bxh7+! Kh8 15.Be4

White has won a pawn and exposed Black's king. The attack continues with Nh4, Qh7 ideas, and the rooks will join on the g-file and h-file.

Key lesson: Against the Dutch, h3-g4 is your most dangerous weapon. Time it correctly, and the attack can be devastating.

What makes this game instructive is the contrast with the queenside approach in Game 3. Against the King's Indian (…g6, …Bg7), you expand on the queenside. Against the Dutch (…f5), you attack the kingside. The difference is that Black has created a concrete weakness (the f5 pawn and the weakened king position) that your pieces can target directly. When your opponent creates a weakness, attack it. When they play solidly, play positionally.

This is the hallmark of a strong London player: you do not have one plan. You have the *right* plan for each position.

45.7.5 Game 5: Move-Order Precision — Punishing Black's Inaccuracy

White: NN (composite example) | Black: NN Theme: Exploiting a careless move order

1.d4 d5 2.Bf4 Bf5?!

Black develops the light-squared bishop early, mirroring White's plan. This looks logical but has a tactical flaw.

3.c4!

This is the key move. White immediately challenges the center. Black must deal with both c4 and the threat to the b7 square (since the bishop has left c8, the b7 pawn is less protected).

3…e6 4.Qb3!

The queen attacks b7. This is why …Bf5 was premature, the bishop left the queenside unguarded.

4…Nc6

Black defends, but White already has an initiative.

5.cxd5 exd5 6.e3 Bd6

Now Black faces a dilemma. The bishop on f5 has been developed, but it is not doing much. White can continue with Nc3, Bd3 (challenging Black's bishop), and a4 or Nf3 with a comfortable position and pressure on the b7 pawn.

7.Nc3 Nf6 8.Nf3 O-O 9.Bd3 Bxd3 10.Qxd3

White has a pleasant position. The queen is well-placed on d3, the knights are developed, and Black's early …Bf5 accomplished little. White's bishop on f4 is the better piece.

Key lesson: When Black deviates from standard setups, look for ways to punish inaccuracies. The move c4 + Qb3 is a common tactic against early …Bf5 in the London.

This game teaches a broader principle: **opening knowledge protects you in both directions.** It protects you from making mistakes in your own setup, AND it lets you recognize when your opponent makes mistakes in theirs. The more deeply you understand the London, the more quickly you will spot when something your opponent does is "wrong", and the more effectively you will punish it.

You do not need to memorize specific punishment lines. You need to understand *why* certain moves are wrong. Black played …Bf5 early, which left the queenside unguarded. White exploited it with c4 + Qb3. If you understand the principle (early …Bf5 weakens the queenside), you will find moves like c4 and Qb3 naturally, even if you have never seen this exact position before.

That is what understanding looks like. It is better than memorization every time.

You have studied five complete model games. That is a serious session. Rest here. Come back for the critical positions when you are fresh.

45.8 Part 6: The 10 Critical Positions

These are the ten positions every London player must know cold. Set each one up on your board, study it, and commit the key ideas to memory. These positions will appear in your games again and again.

Do not try to memorize the FEN strings or the exact piece placements. Instead, memorize the *pattern* and the *plan.* "Standard London middlegame → plan is e4." "Knight on e5, queen ready → plan is Qf3-h3." "Closed center with d5 → plan is queenside expansion." Those are the things your brain needs to store.

45.8.1 Position 1: The Standard London Middlegame

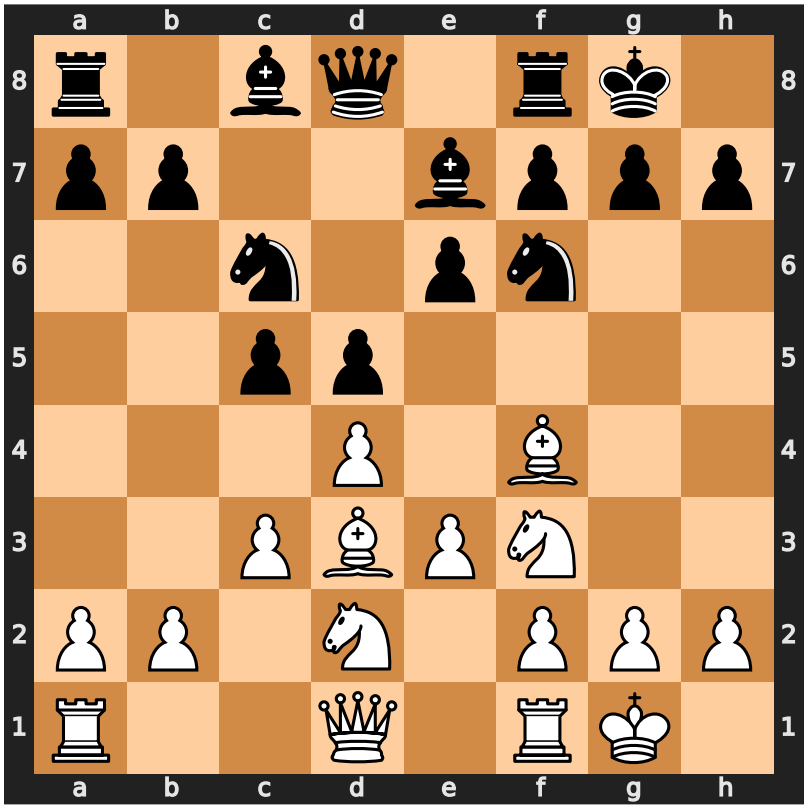

Figure 45.12: Chess Position

White to play. Plan: Prepare and execute e4.

This is the London's bread and butter. You will reach this position (or something very close to it) in the majority of your London games against 1…d5. Your plan is to play Qe2 followed by e4. The knight on d2, bishop on d3, and queen on e2 all support the central break. After e4 dxe4 Nxe4, White has active, well-coordinated pieces.

45.8.2 Position 2: Ne5 Outpost Established

White to play. Plan: Maintain the knight on e5, prepare Qf3.

The knight on e5 is a powerhouse. From here, it controls seven squares and acts as a battering ram against Black's kingside. White's next moves should be Qf3 (eyeing the kingside and supporting e4 later) and possibly f4 to reinforce the knight. Do not trade this knight unless you get something significant in return.

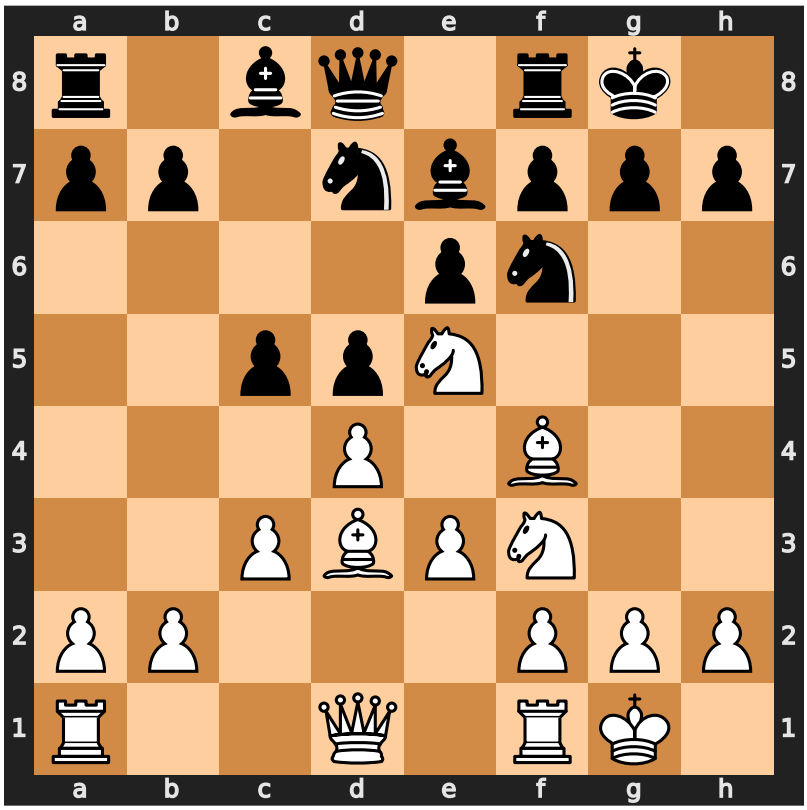

Figure 45.13: Chess Position

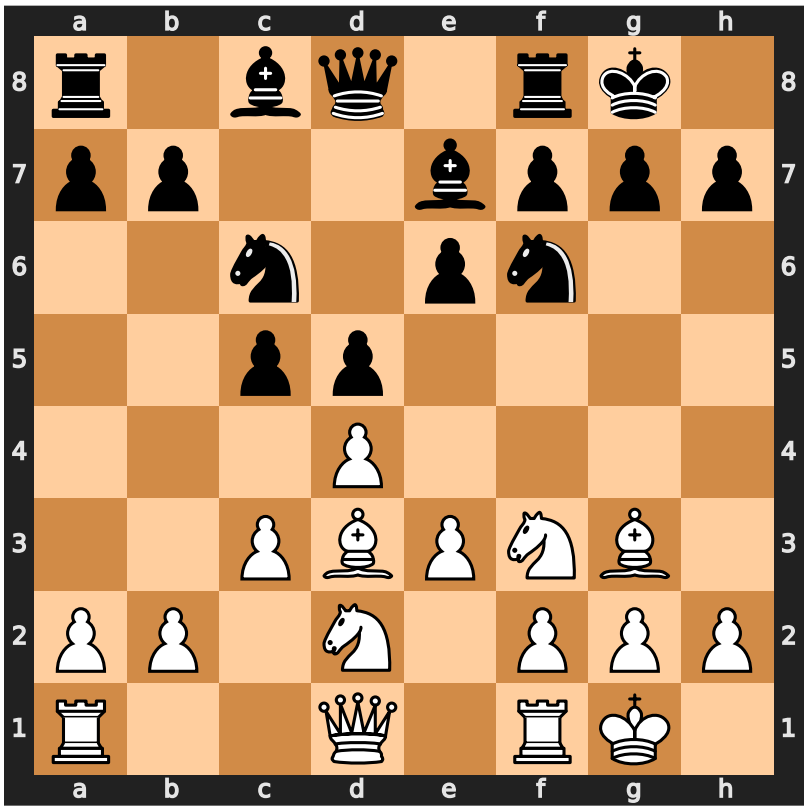

Figure 45.14: Chess Position

45.8.3 Position 3: The Bg3 Retreat Has Been Played

White to play. Plan: Qe2 and e4.

After Bg3, the bishop is stable on the long diagonal. It watches e5 and cannot be challenged easily. White should proceed with the standard e4 plan. The bishop on g3 will become more active once the position opens.

45.8.4 Position 4: Black Has Played ...c4, Closing the Queenside

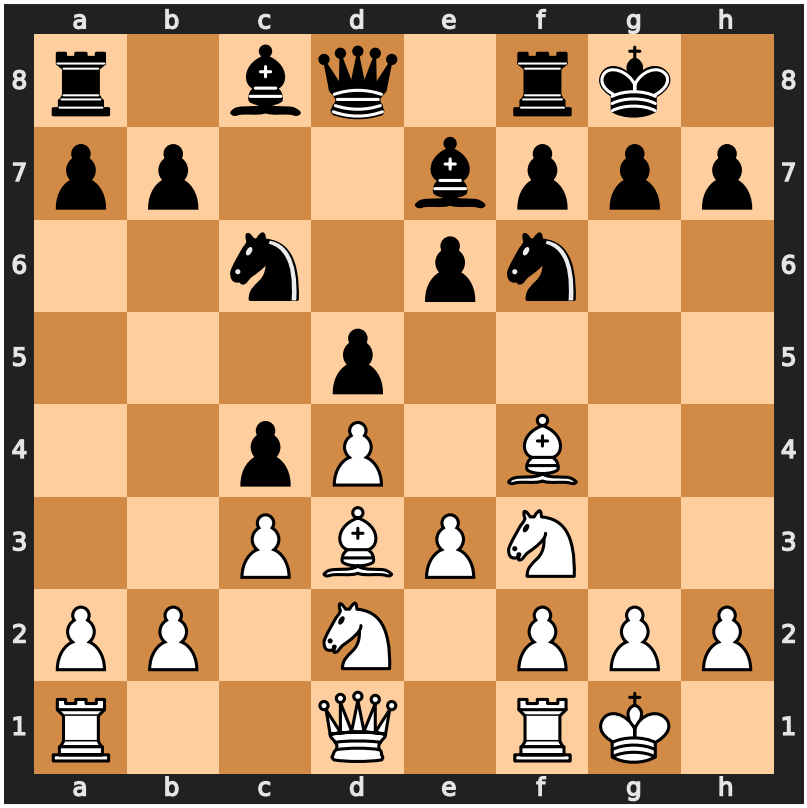

Figure 45.15: Chess Position

White to play. Plan: e4 break, then attack the kingside.

When Black plays ...c4, pushing the pawn past your bishop, the queenside closes. This is actually good news for White! Now your e4 break is even more important, and the kingside becomes the battlefield. Push e4, open the center, and aim your pieces at the Black king. The bishop retreats from d3 to c2, maintaining its aim at h7.

45.8.5 Position 5: Black Has Exchanged on d4 Early

White to play after 1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nf3 c5 5.dxc5.

Wait, this is a position where White has captured on c5 instead of maintaining the tension. After dxc5, the game takes on a different character. White has a central majority (e3 + potential e4) and Black must spend time recovering the pawn. This is a viable approach, but our main

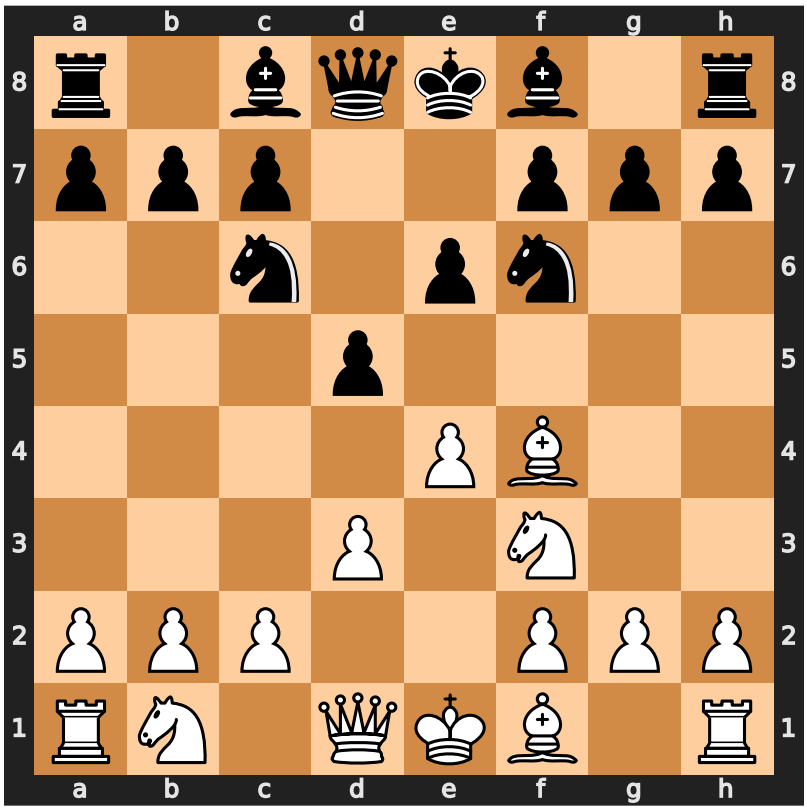

Figure 45.16: Chess Position

recommendation is to maintain the d4 pawn and play for e4. Know this position exists, but do not seek it actively.

45.8.6 Position 6: The Bxh7+ Sacrifice Is Available

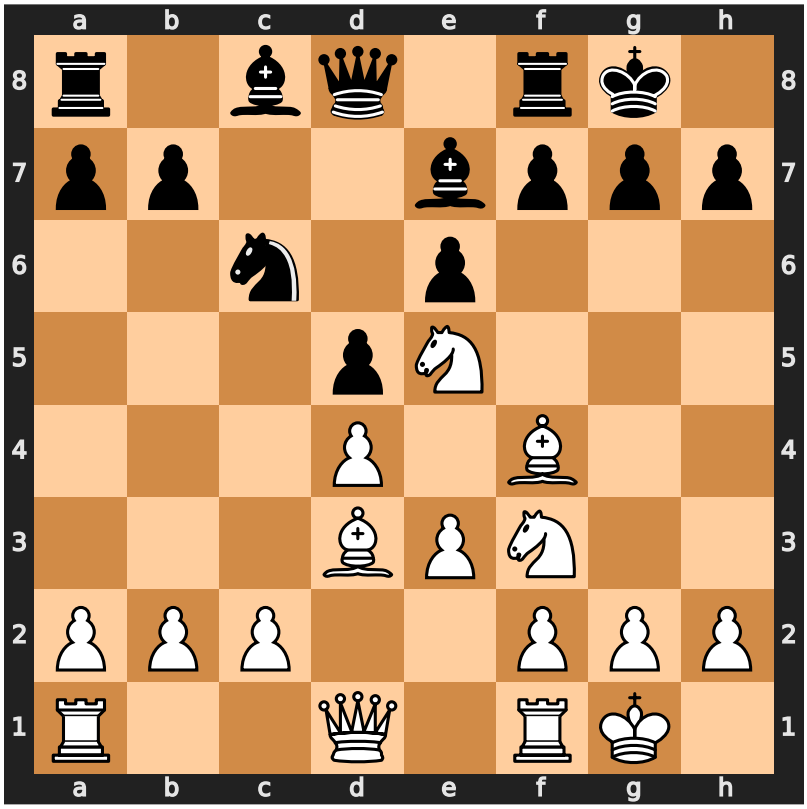

Figure 45.17: Chess Position

White to play. Calculate Bxh7+.

All the conditions for the Greek Gift sacrifice are met: bishop can take on h7 with check, queen can reach h5, and a knight can come to g5 (after Qh5+ Kg8, Ng5). If Black's knight has left f6, this sacrifice is likely winning. Calculate it carefully every time you see this pattern.

45.8.7 Position 7: Closed Center — Time for Queenside Play

White to play. Plan: a4, b4, queenside expansion.

The center is locked with d4-e5 and c4. The kingside is hard to crack. White's plan is to play on the queenside with a4, Rb1, b4, and a5. This is a patient, positional approach. Do not rush, the structure favors you in the long run.

45.8.8 Position 8: Against the Dutch — g4 Is Ready

White to play. Plan: g4, attacking f5.

Everything is set for the kingside pawn storm. After g4 fxg4 hxg4, the h-file opens and White's rook joins the attack. The bishop on d3 supports the g4 advance. This is the London at its most

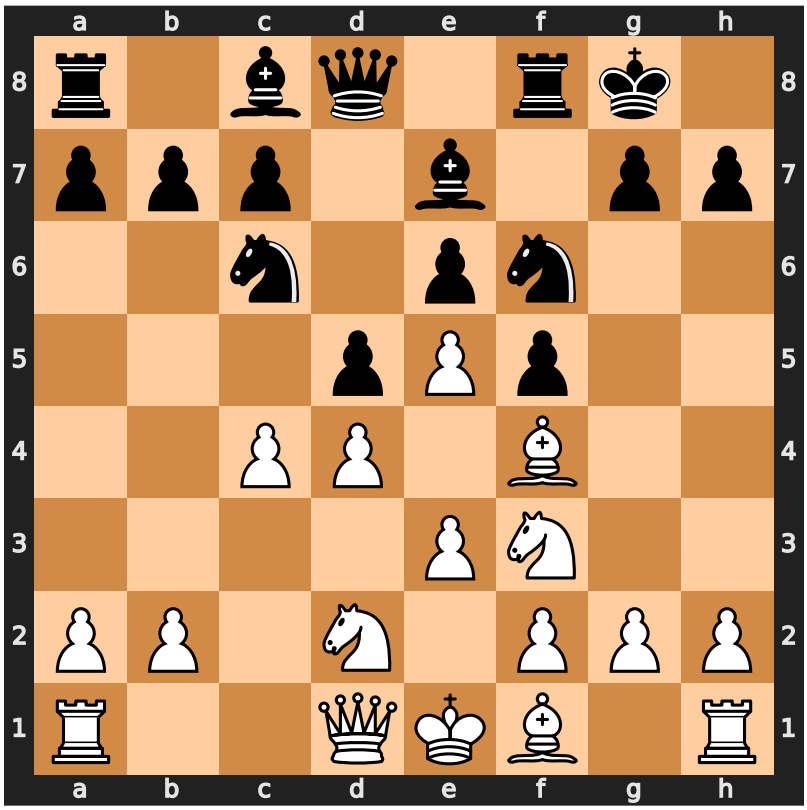

Figure 45.18: Chess Position

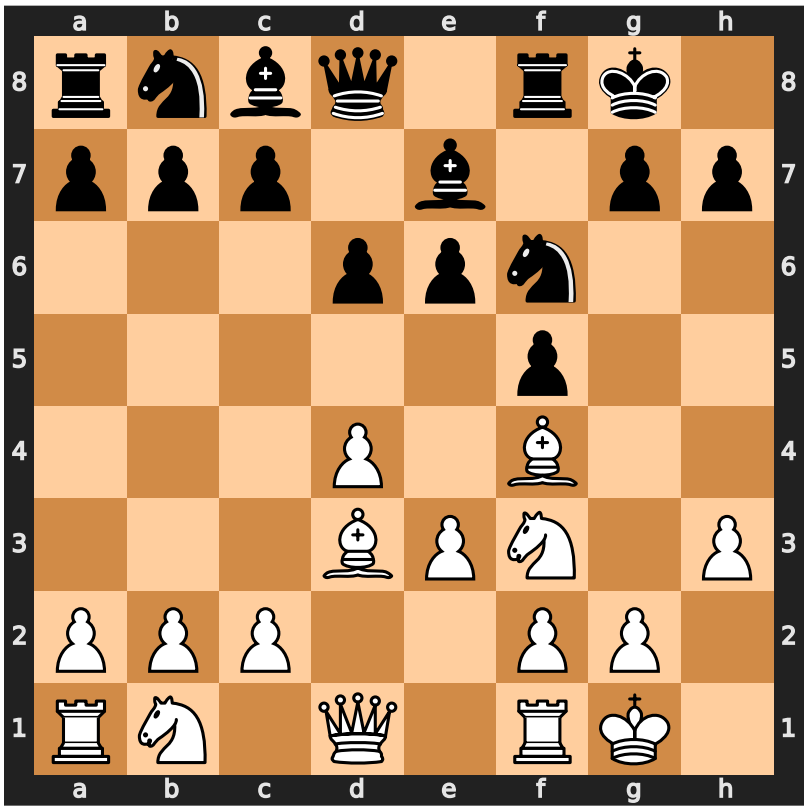

Figure 45.19: Chess Position

aggressive.

45.8.9 Position 9: Black Plays …Qb6 Attacking b2

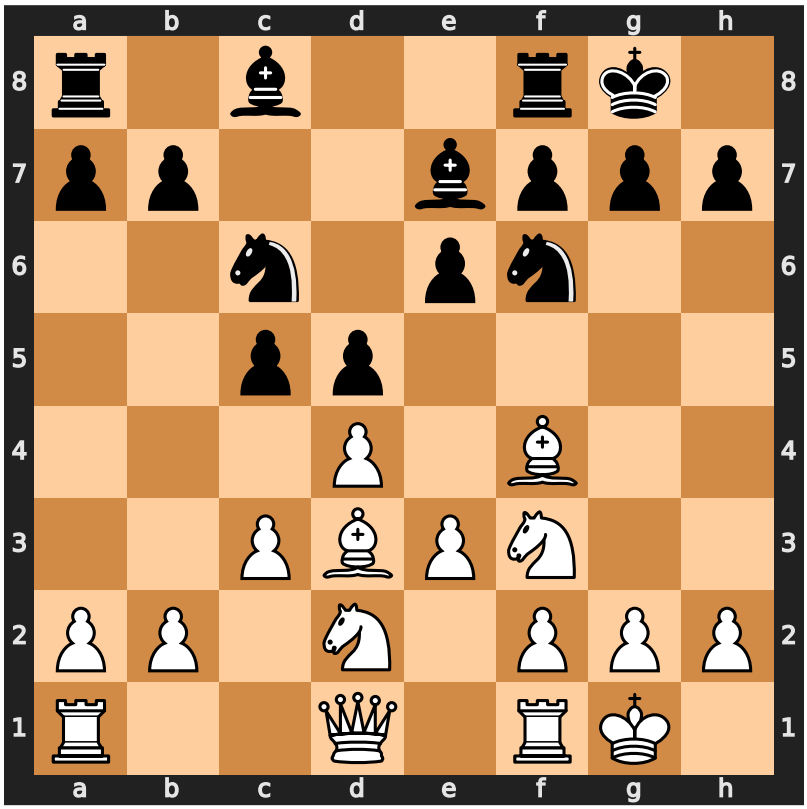

Figure 45.20: Chess Position

After …Qb6, Black attacks the b2 pawn. This is a common idea and nothing to panic about.

The response: Simply play Qb3 (or Rb1). After Qb3, you offer a queen trade. If Black takes Qxb3, axb3, your a-file opens and the b3 pawn is fine, it can even advance to b4 later. If Black declines, your queen on b3 is well-placed, supporting c4 and keeping an eye on the b-file.

Key principle: Do not panic when Black attacks b2. It is a common pattern, and the London has simple, effective answers.

45.8.10 Position 10: The Endgame — London Structure in the Late Game

White to play. Plan: Use the passed c-pawn and active pieces.

The London can lead to favorable endgames. In this position, White has a passed c-pawn (after c5) and better piece activity. The bishop on g3 supports both flanks. The plan is to advance the c-pawn while keeping Black's pieces tied down.

Key principle: The London is not just an opening. It leads to clear, understandable endgames. Your pawn structure is sound, your pieces are active, and you know where your advantages lie. Many London games are decided not by brilliant attacks but by solid, grinding endgame play where

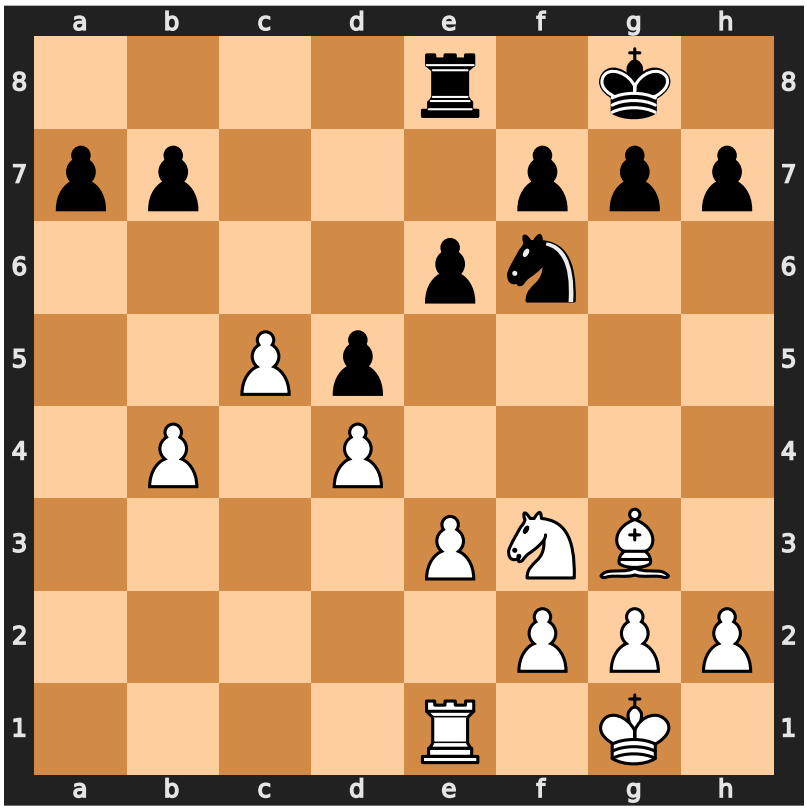

Figure 45.21: Chess Position

White's structural advantages slowly convert into a win. Do not neglect your endgame study; it is where London games are often decided. (For a deep dive into rook endgames, see Chapter 19.)

45.9 Part 7: Move-Order Tricks and Transpositions

The London System has several move-order subtleties that can catch opponents off guard or lead to positions that are unexpectedly favorable.

45.9.1 Trick 1: Delaying Nf3 to Allow f3

In some lines, playing f3 instead of Nf3 gives you a different type of center. After d4, Bf4, e3, Bd3, Nd2, f3, you prepare e4 without committing the knight to f3. This is useful when you want a more aggressive pawn center.

The downside: the knight on g1 has fewer options. It may go to e2 instead. Use this trick when you want the most aggressive possible London setup.

45.9.2 Trick 2: c4 Instead of c3

In the standard London, you play c3 to support d4. But sometimes c4 is stronger immediately, especially when Black has played …Bf5 early (as we saw in Game 5). After c4, you challenge d5 and gain space. If Black takes cxd5, you recapture with options (Nxd5 or exd5 depending on the position).

When to play c4 instead of c3: - When Black's bishop has left c8 early (weakening the queenside) - When you want an open game with more piece activity - When you are transitioning into a Queen's Gambit–type structure

45.9.3 Trick 3: The Barry Attack — d4, Bf4, Nc3, f3, e4

This is a close cousin of the London. Instead of the quiet c3 and Nbd2, you play Nc3 and f3 with a rapid e4. This leads to aggressive, sharp positions where White has a big pawn center.

The Barry Attack catches unprepared opponents because it does not "look" like a London. The bishop is on f4, but the setup is much more aggressive. It is worth knowing as a surprise weapon.

Typical move order:

1.d4 Nf6 2.Bf4 g6 3.Nc3 d5 4.e3 Bg7 5.f3!?

Now White is ready for e4 next move, backed by Nc3 and f3. Black must react immediately or face a powerful central expansion.

45.9.4 Trick 4: Transposing Into the Jobava London

The Jobava London (1.d4 d5 2.Bf4 Nf6 3.Nc3) replaces Nf3 with Nc3, creating a more dynamic setup. The knight on c3 eyes d5 and supports e4. This can surprise opponents who expect the quiet Nbd2.

You do not need to study the Jobava in depth at this level. But know that it exists, and if you enjoy aggressive play, it is worth exploring in the future.

45.9.5 Trick 5: The Early e4 Gambit

After 1.d4 d5 2.Bf4 Nf6 3.e3 e6 4.Nd2!? (instead of Nf3), White prepares e4 immediately. If Black plays normally with 4…Bd6 5.Bg3 O-O 6.Bd3 c5 7.c3 Nc6 8.Ngf3, you reach the standard position. But the move order with 4.Nd2 signals that e4 is coming fast.

In some lines, White can even play 4.Nd2 followed by 5.Ngf3 and 6.e4!? as a semi-gambit, sacrificing the e-pawn for rapid development and open lines. This is sharp and risky but can be devastating against unprepared opponents.

Key principle for move-order tricks: These are seasoning, not the main course. Learn the standard London first. Once you are comfortable, add these tricks to your toolkit one at a time. Each one gives you an additional option and makes you harder to prepare against.

45.10 London Quick Reference Card

Tear this page out (or photograph it) and keep it nearby while you play. This is your cheat sheet until the plans become automatic.

Standard Setup: d4 → Bf4 → Nf3 → e3 → Bd3 → Nbd2 → c3 → O-O

Black Plays	Your Key Plan	Primary Break	Watch For
…d5, …e6	Qe2 + e4	e4	Bg3 when …Bd6 appears
…Nf6, …e6, …Bb7	Ne5 first, then Qf3	e4 (after Ne5)	Queen's Indian …b6 setups
…c5	d5 (grab space)	e4 (later)	Benoni counterplay on c-file
…g6, …Bg7	Be2, c4, queenside play	c4 + a4-a5	Do NOT open the center
…f5 (Dutch)	h3-g4 attack	g4 (attacking f5)	Kingside exposure after …fxg4
…Bf5 (early)	c4 + Qb3!	c4	b7 is unguarded

Three Things to Ask After Every Developing Move: 1. Am I ready for my break yet? 2. What is my opponent planning? 3. Is my king safe?

Emergency Responses: - Black plays …Bd6? → Bg3 (retreat, do not trade) - Black plays …Qb6? → Qb3 (or Rb1), do not panic - Black plays …e5? → dxe5 usually, then use the d-file - Black plays …Nh5? → Bg3 if bishop is still on f4 (the knight on h5 is misplaced)

45.11 Part 8: Exercises

Work through these exercises on your physical board. For each one, read the position description, set up the FEN, and think for at least two minutes before checking your answer. Writing down

your answer (even a brief note) helps your brain retain the pattern.

If you get an exercise wrong, that is useful information. It tells you exactly where to focus your study. Wrong answers are not failures. They are roadmaps.

45.11.1 Section A: Find the London Plan (–)

These exercises test your ability to identify the correct strategic plan in a London position. For each diagram, determine what White's next move should be and explain the plan behind it.

Exercise 17.1

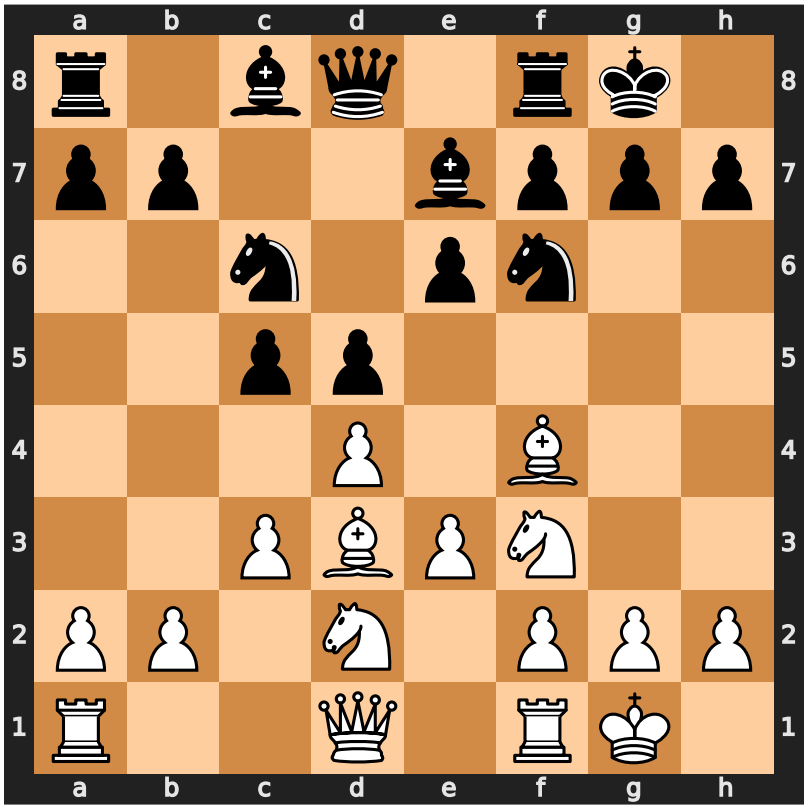

Figure 45.22: Chess Position

White to play. All pieces are developed. What is White's plan?

Hint: What is the main break in the London against …d5 setups?

Exercise 17.2

White to play. Black has played …Nbd7. What strong maneuver should White consider?

Hint: Which square is ideal for White's knight?

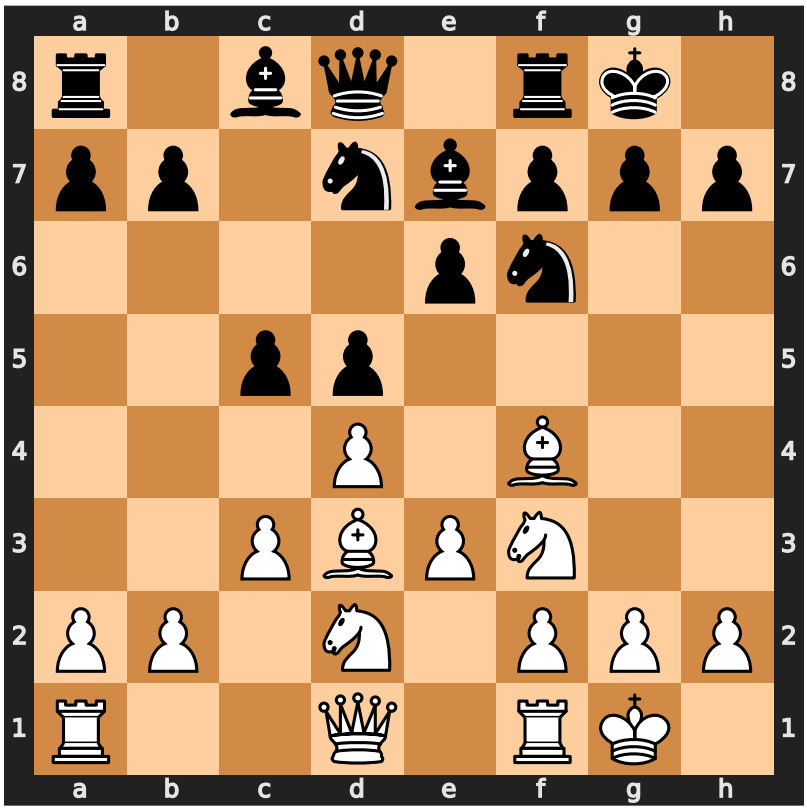

Figure 45.23: Chess Position

Exercise 17.3

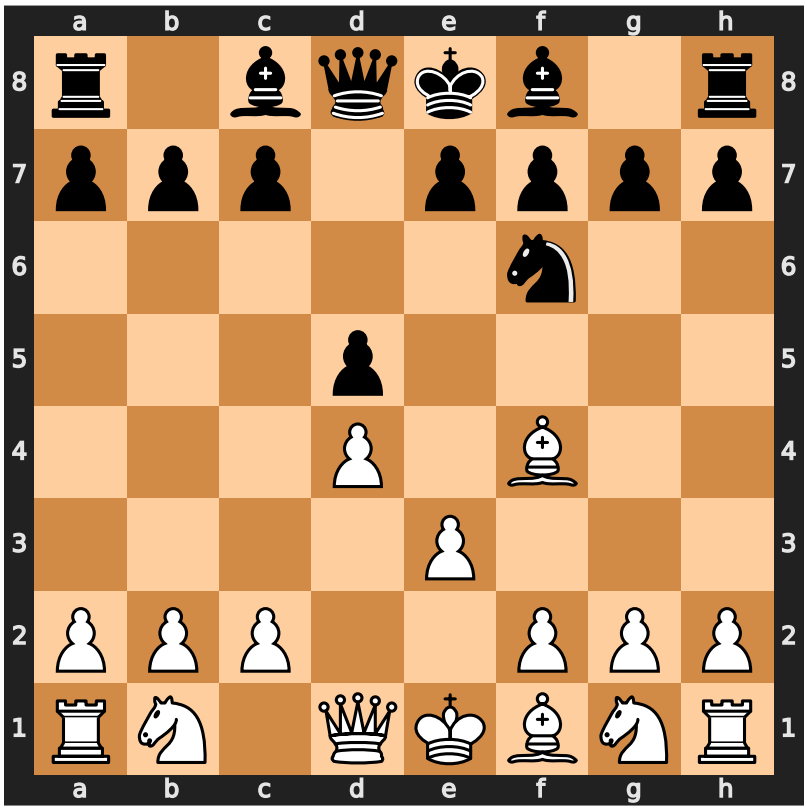

Figure 45.24: Chess Position

White to play. It is move 3 and the bishop is on f4. What should White develop next?

Hint: Which knight develops first in the London, and to which square?

Exercise 17.4

White to play. The bishop has retreated to g3 after …Bd6. What is the next preparatory move for the e4 break?

Hint: The queen wants to support e4 from which square?

Exercise 17.5

White to play. Black has not yet played …c5 or …Bd6. How should White continue development?

Hint: Which piece has not yet found its ideal square?

Exercise 17.6

White to play. The knight is on e5, and Black has played …e6 (no knight on f6). Is there a tactic?

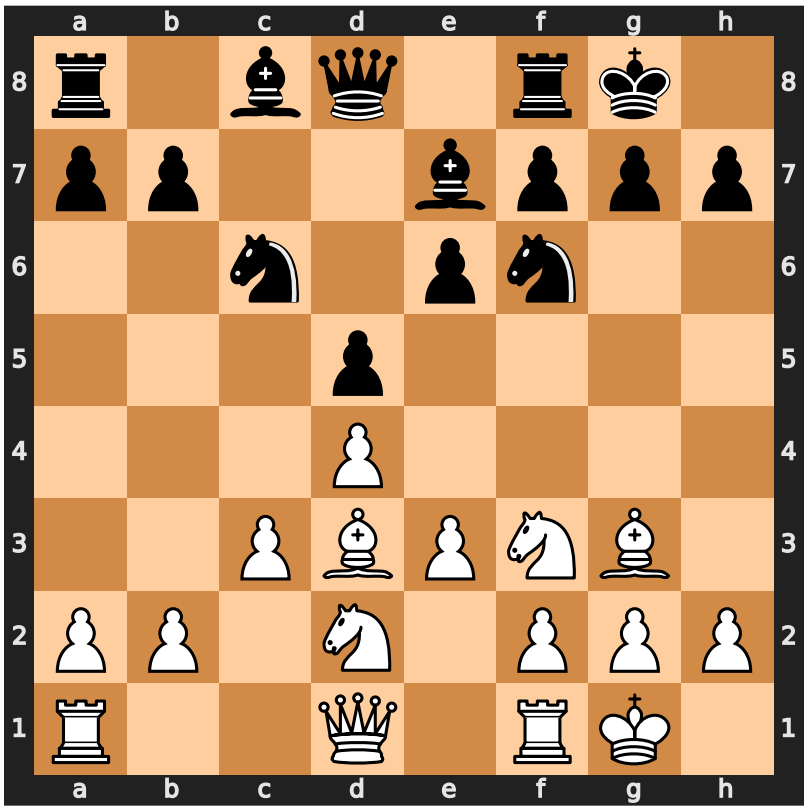

Figure 45.25: Chess Position

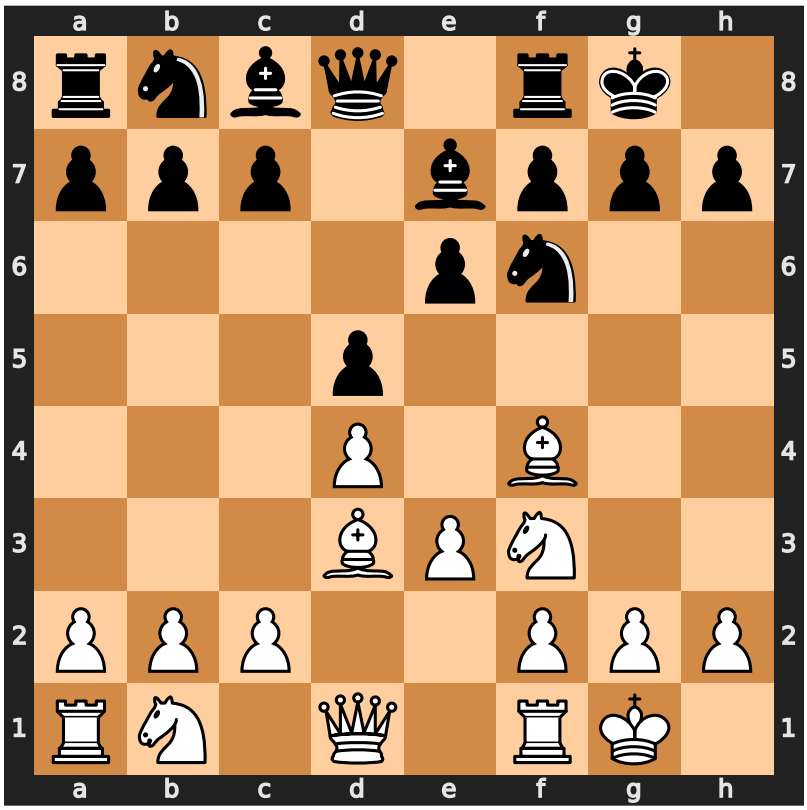

Figure 45.26: Chess Position

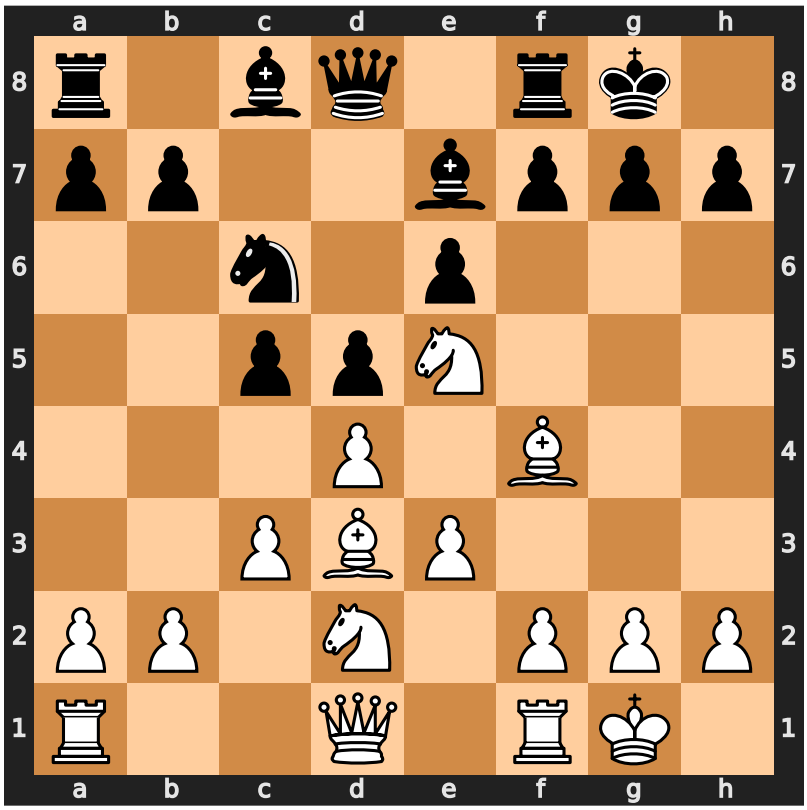

Figure 45.27: Chess Position

Hint: Check the conditions for a Greek Gift sacrifice on h7.

Exercise 17.7

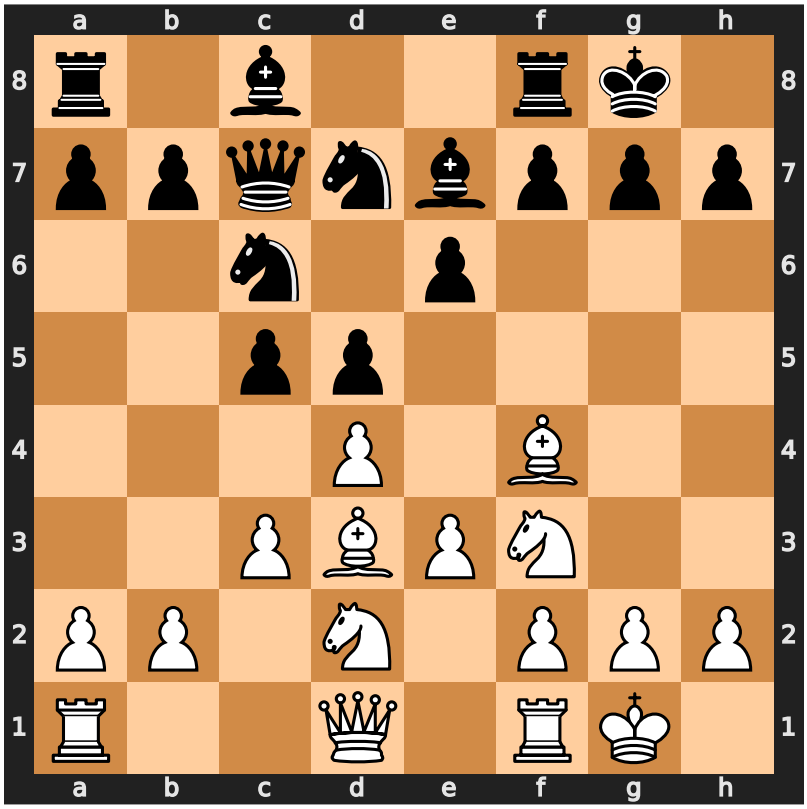

Figure 45.28: Chess Position

White to play. Black has placed the queen on c7, an unusual square. What does this tell you about Black's plans, and how should White respond?

Hint: The queen on c7 often signals …e5 is coming. How do you prevent it?

Exercise 17.8

White to play. Black has played the Dutch Defense setup with …f5. What preparatory move should White play?

Hint: Think about what you want to do on the kingside in two or three moves.

Exercise 17.9

White to play. Knight on e5, Black has played …Nbd7 attacking it. What do you do?

Hint: Trading on d7 is one option. Is there something better?

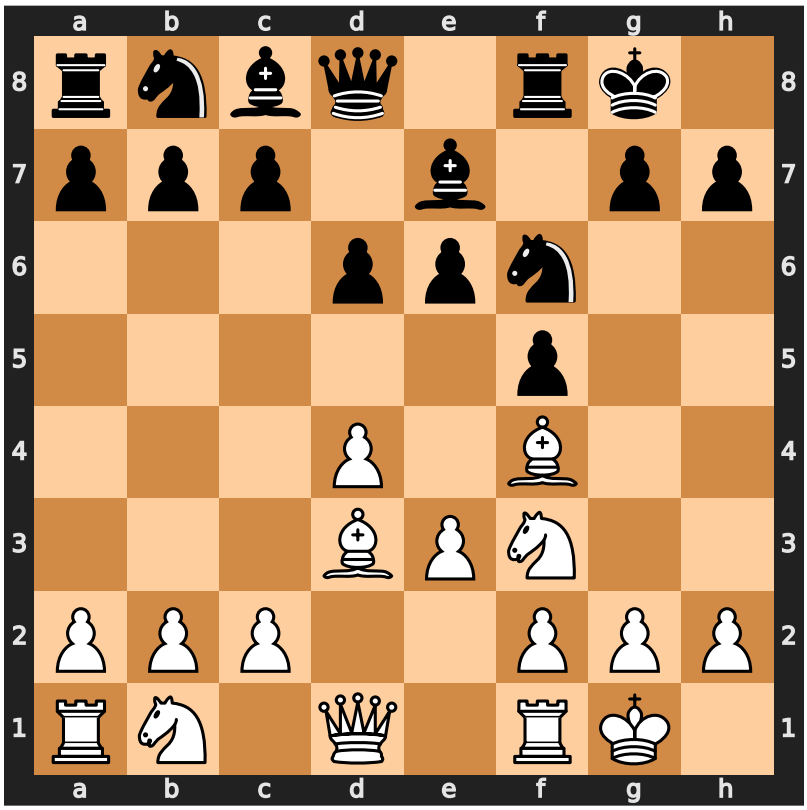

Figure 45.29: Chess Position

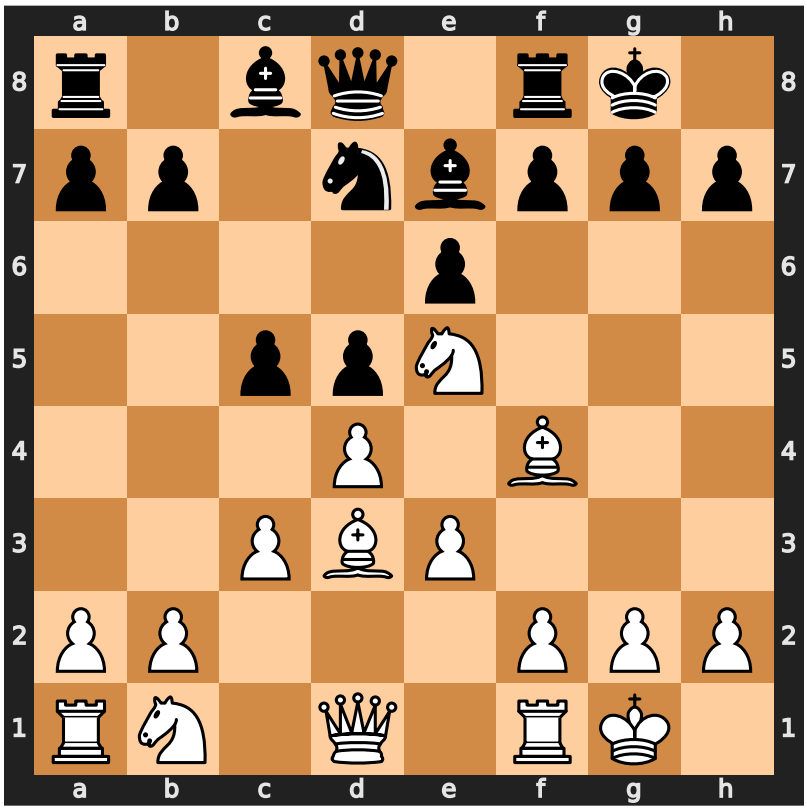

Figure 45.30: Chess Position

Exercise 17.10

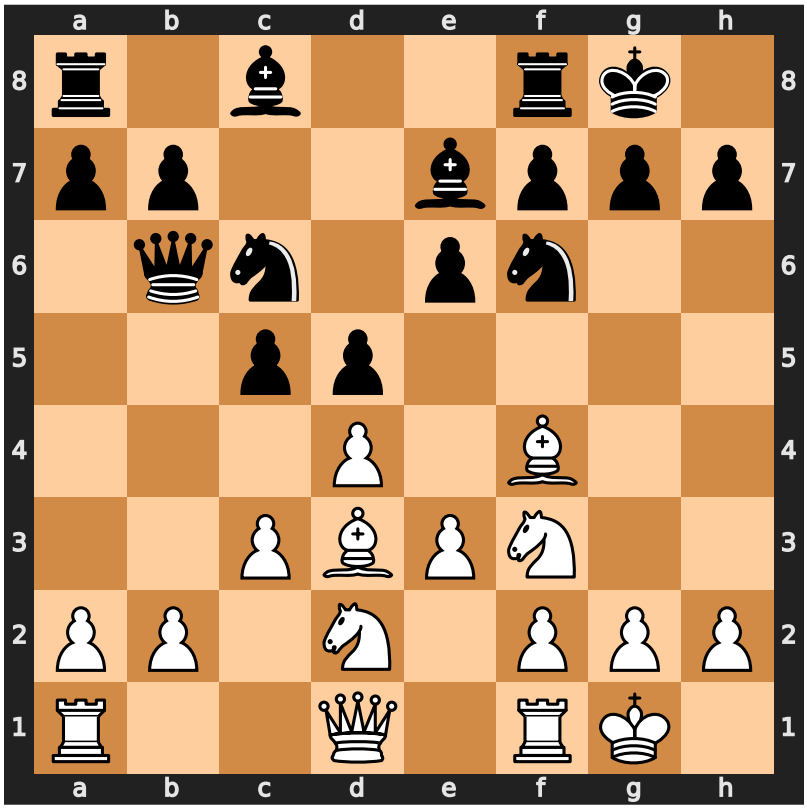

Figure 45.31: Chess Position

White to play. Black's queen has come to b6, attacking b2. What is White's best response?

Hint: You do not need to defend b2 passively. Can you counter-attack?

45.11.2 Section B: Choose the Right Break (–)

These exercises test your ability to choose between e4, c4, and other pawn breaks. For each position, identify the correct break and explain why the alternatives are weaker.

Exercise 17.11

White to play. Everything is ready. Should White play e4 or c4? Why?

Hint: Look at where White's pieces are pointing. Which break do they support?

Exercise 17.12

White has already played c4 instead of c3. How does the plan change?

Hint: With c4 already played, what happens after …dxc4?

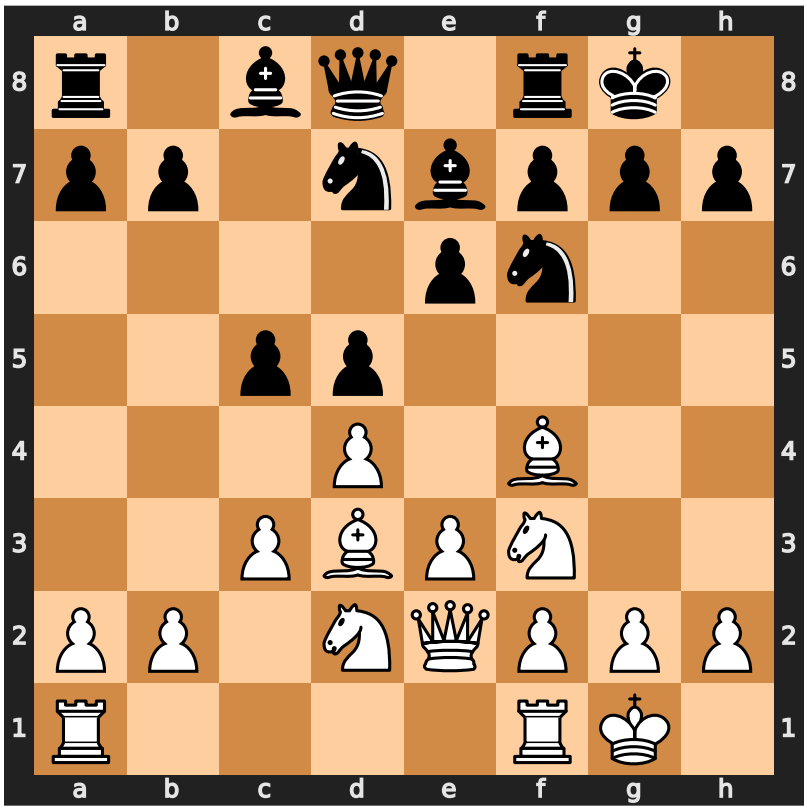

Figure 45.32: Chess Position

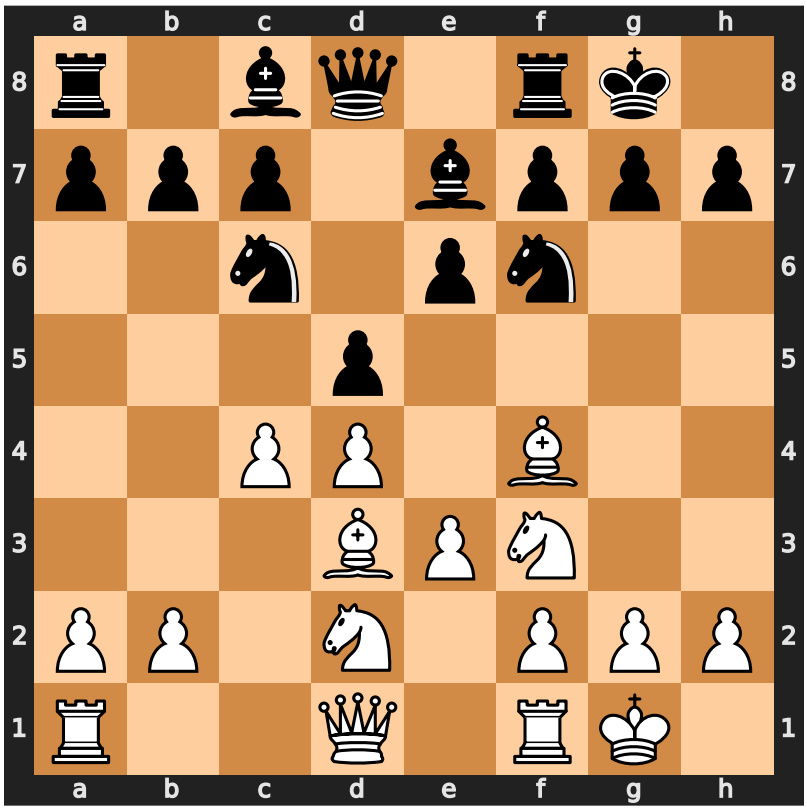

Figure 45.33: Chess Position

Exercise 17.13

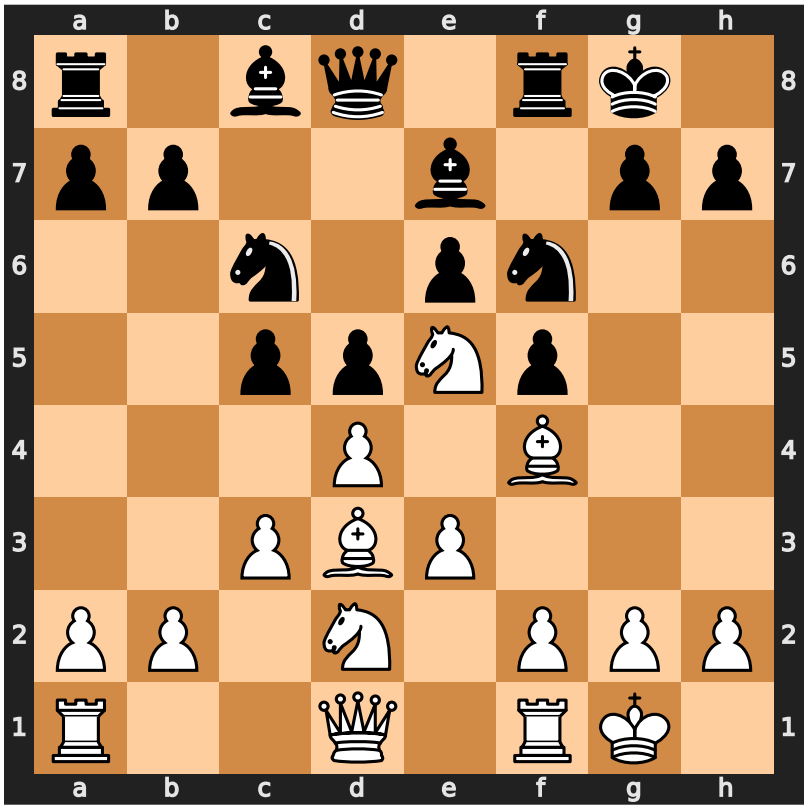

Figure 45.34: Chess Position

White to play. Black has played …f5, a weakening move. Which break is now most effective?

Hint: Black's kingside is weakened. Which pawn advance targets that weakness directly?

Exercise 17.14

White to play. Black has played …a6, preparing …b5 queenside expansion. Should White rush e4, or play something else first?

Hint: If Black is expanding on the queenside, should you counter there or play on the other wing?

Exercise 17.15

White to play. Black has placed a knight on e5 (copying your Ne5 idea!). How should White handle this?

Hint: Trading on e5 with dxe5 might not be ideal. Is there a way to challenge e5 without trading?

Exercise 17.16

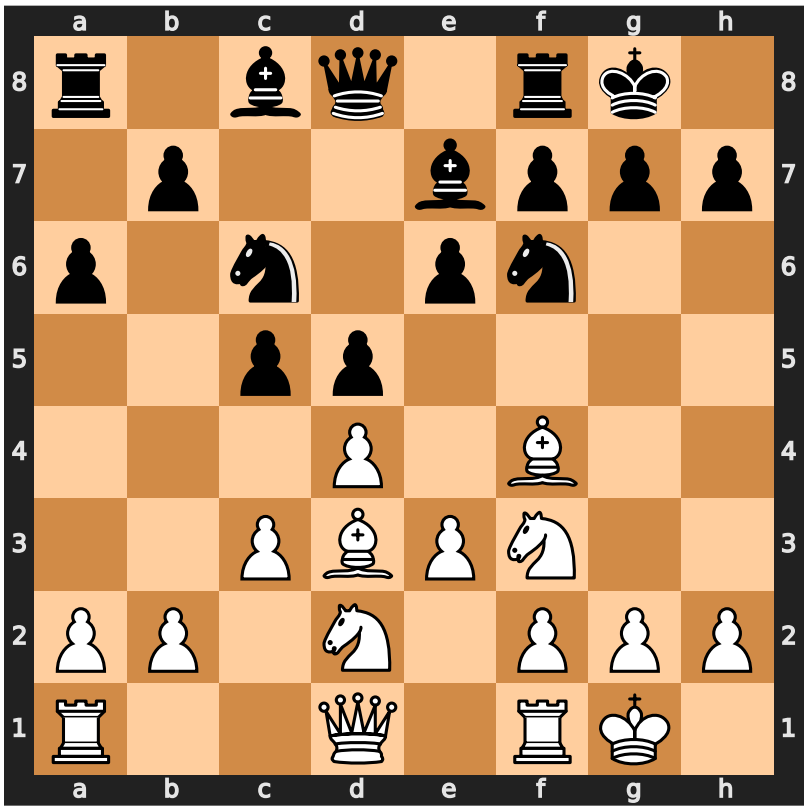

Figure 45.35: Chess Position

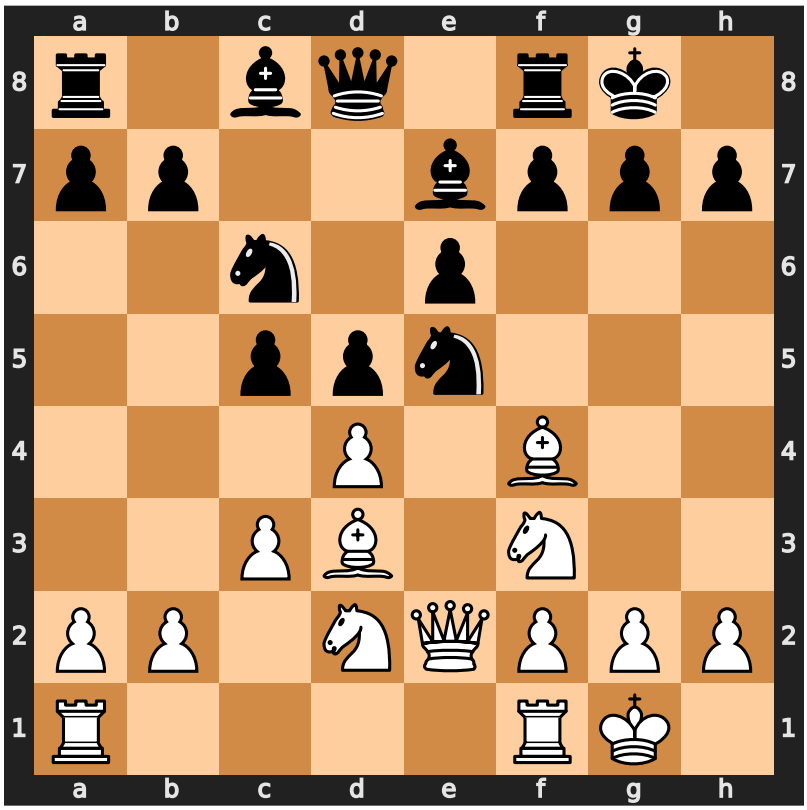

Figure 45.36: Chess Position

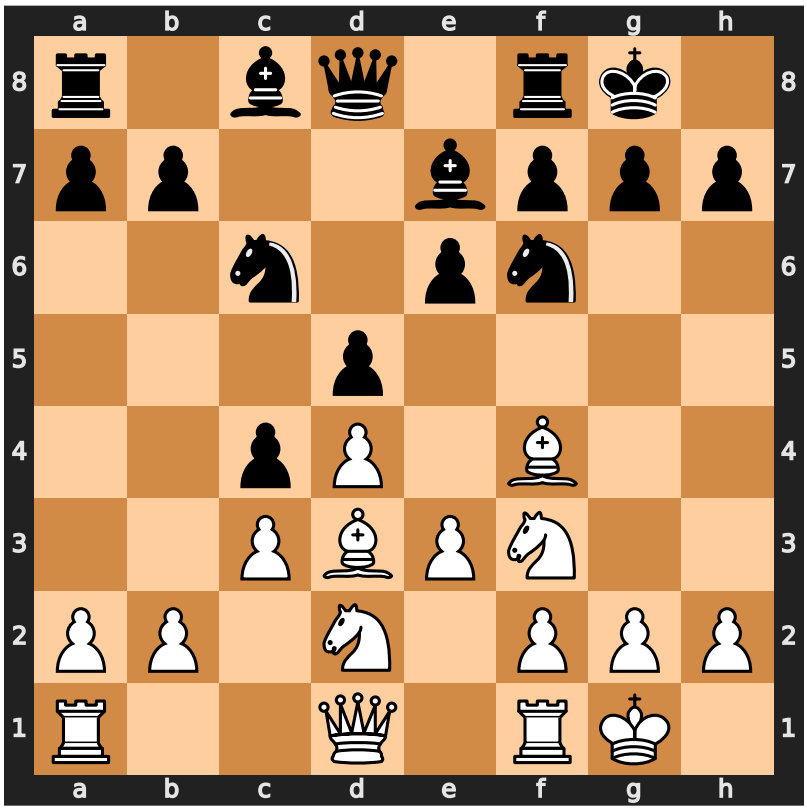

Figure 45.37: Chess Position

White to play. Black has played …c4, pushing past your bishop. Where does the bishop go, and what is the new plan?

Hint: The bishop retreats, but the plan actually gets clearer. Why?

Exercise 17.17

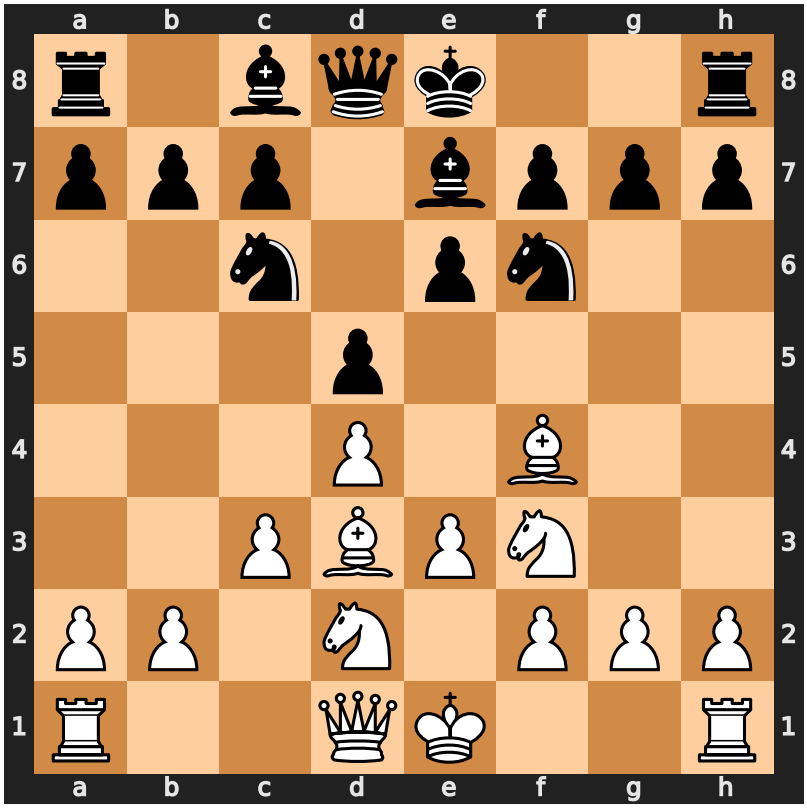

Figure 45.38: Chess Position

White to play. You have not castled yet. Should you castle first or play e4 immediately?

Hint: King safety or central action, which comes first at this level?

Exercise 17.18

White to play. Black has played …a6 early. Is this a useful move for Black, and how should White exploit the tempo?

Hint: Black spent a tempo on a non-developing move. Can you seize the initiative?

Exercise 17.19

White to play. Black has played …Bc5, an aggressive move putting the bishop on a strong diagonal. How should White respond?

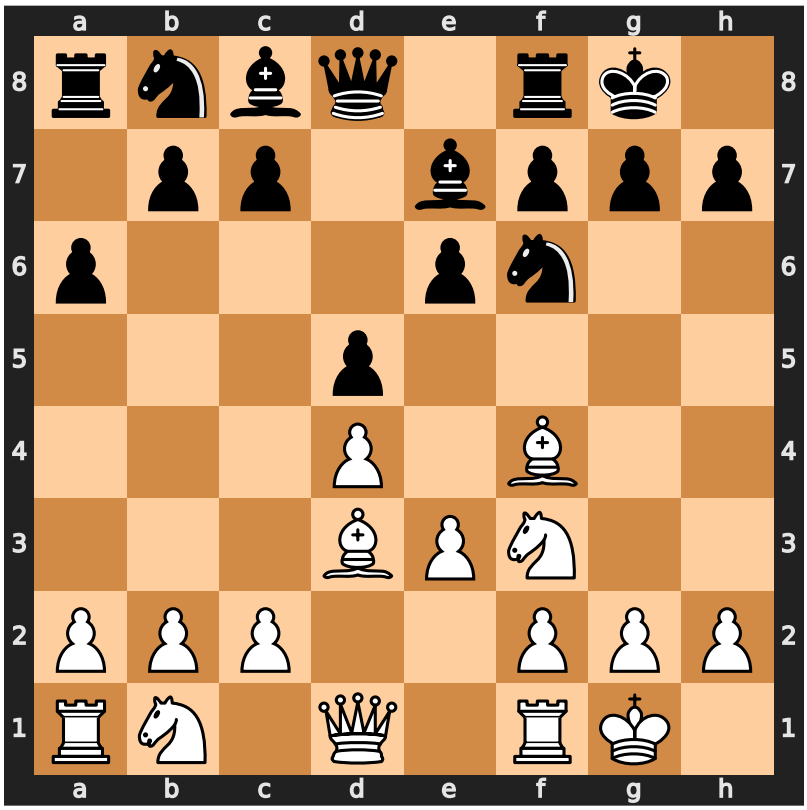

Figure 45.39: Chess Position

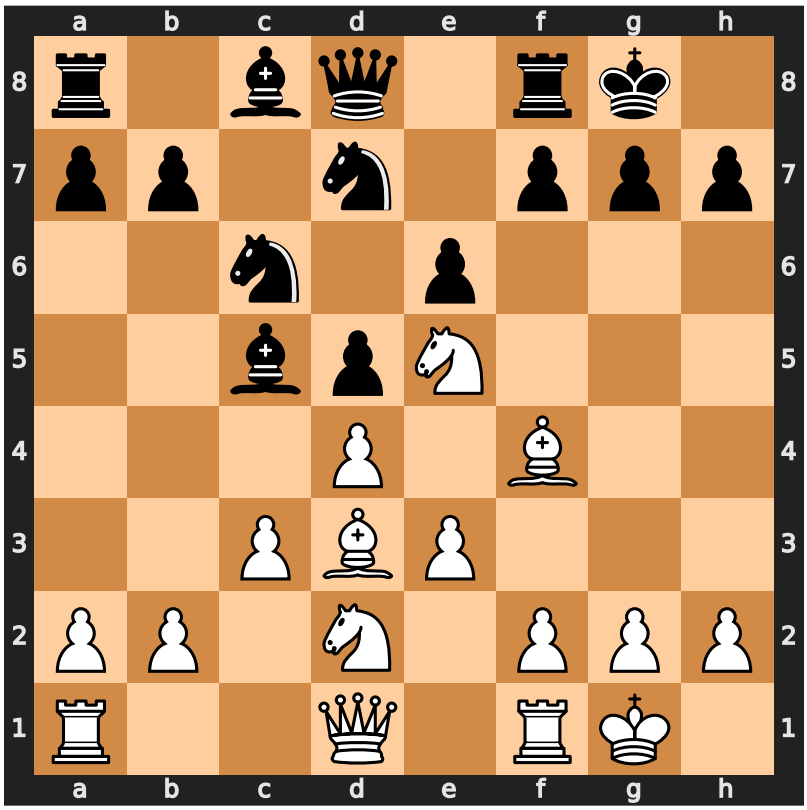

Figure 45.40: Chess Position

Hint: The bishop on c5 eyes f2, but it might also be a target. Can you attack it while maintaining your position?

Exercise 17.20

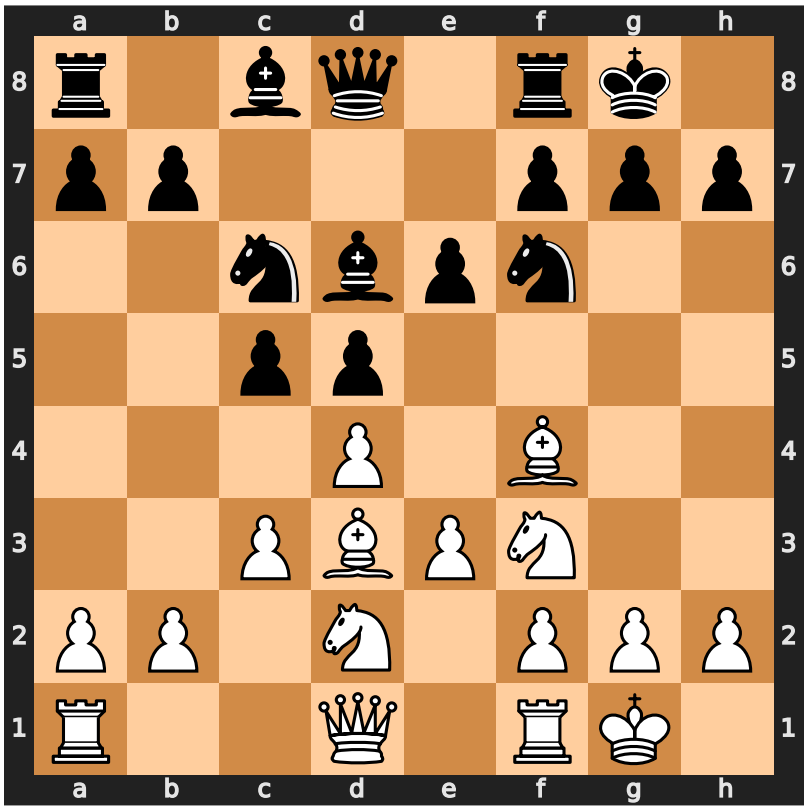

Figure 45.41: Chess Position

White to play. Black's bishop is on d6, and White has not yet retreated to g3. What should White do now?

Hint: This is one of the most critical moments in the London. The answer was covered in Part 1.

45.11.3 Section C: London Middlegame Decisions (–)

These exercises present complex middlegame positions where multiple plans are available. Choose the best continuation and explain your reasoning.

Exercise 17.21

White to play. Black has an active queen on a5. Should White proceed with e4 anyway, or deal with the queen first?

Hint: Sometimes the best defense is a strong attack. Is e4 safe here?

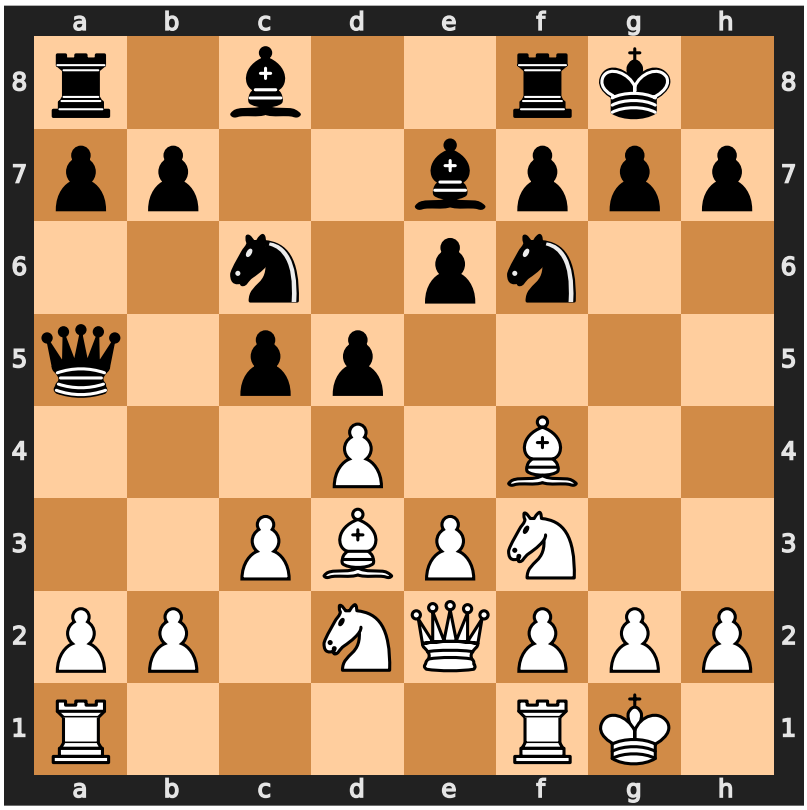

Figure 45.42: Chess Position

Exercise 17.22

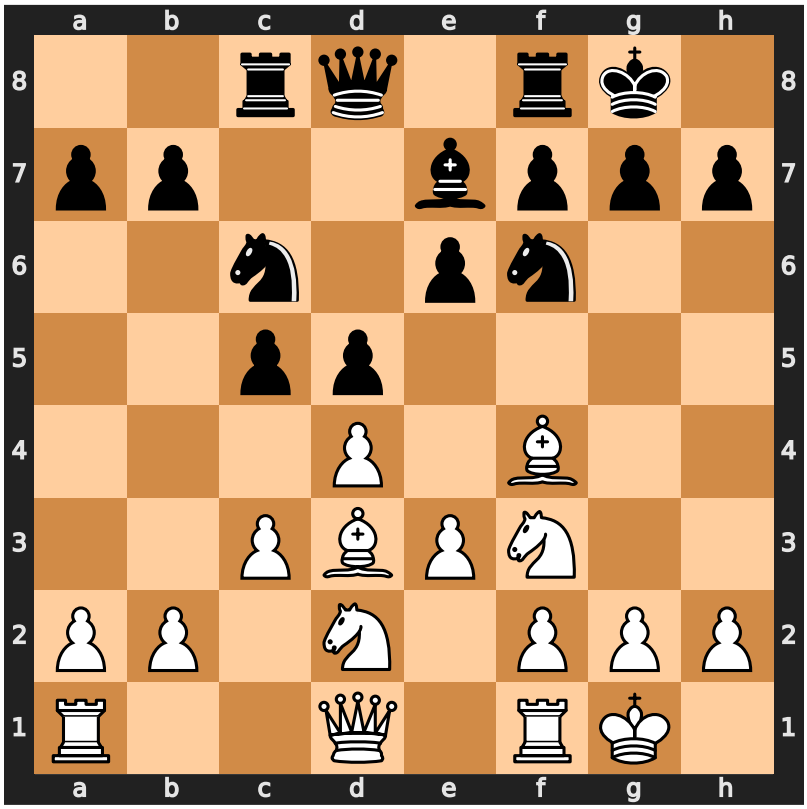

Figure 45.43: Chess Position

White to play. Black has played …Rc8 early, eyeing the c-file. What does this tell you about Black's plan, and how do you respond?

Hint: Black wants to play …c4 or …cxd4 followed by …Nd5 and rook activity on the c-file. How do you prevent or neutralize this?

Exercise 17.23

White to play. Black has played …h6 and …Kh7. The king is slightly exposed. Is there a forcing sequence that exploits this?

Hint: With the king on h7 and the knight still on f6, look at what happens if you can remove the f6 defender.

Exercise 17.24

White to play. Black has played …g6 in a …d5 setup (unusual). This weakens the dark squares around the king. How does White exploit this?

Hint: The dark squares f6, g7, and h6 are weakened. Which piece can exploit this?

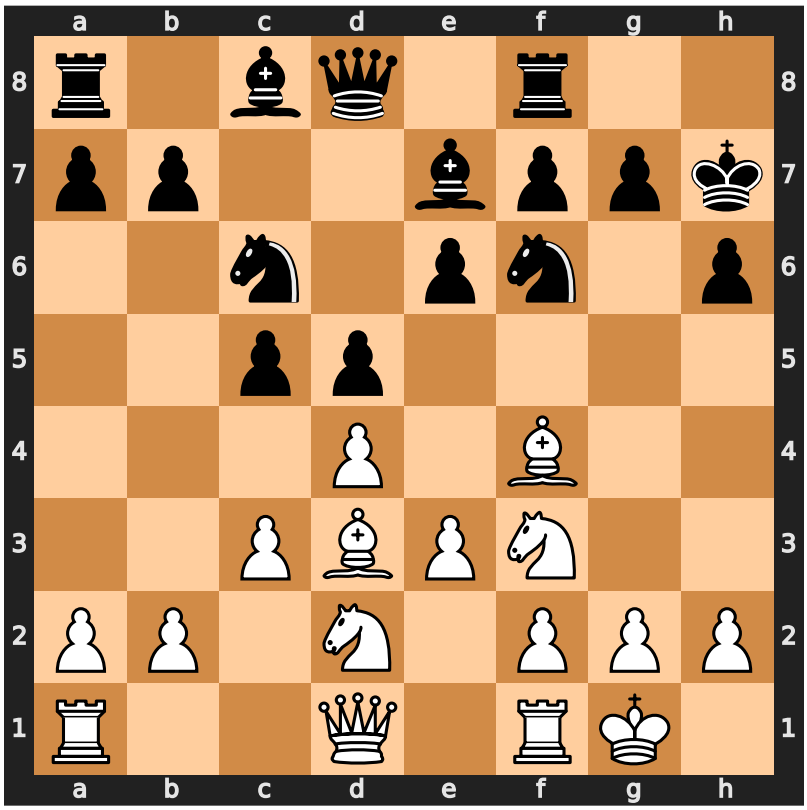

Figure 45.44: Chess Position

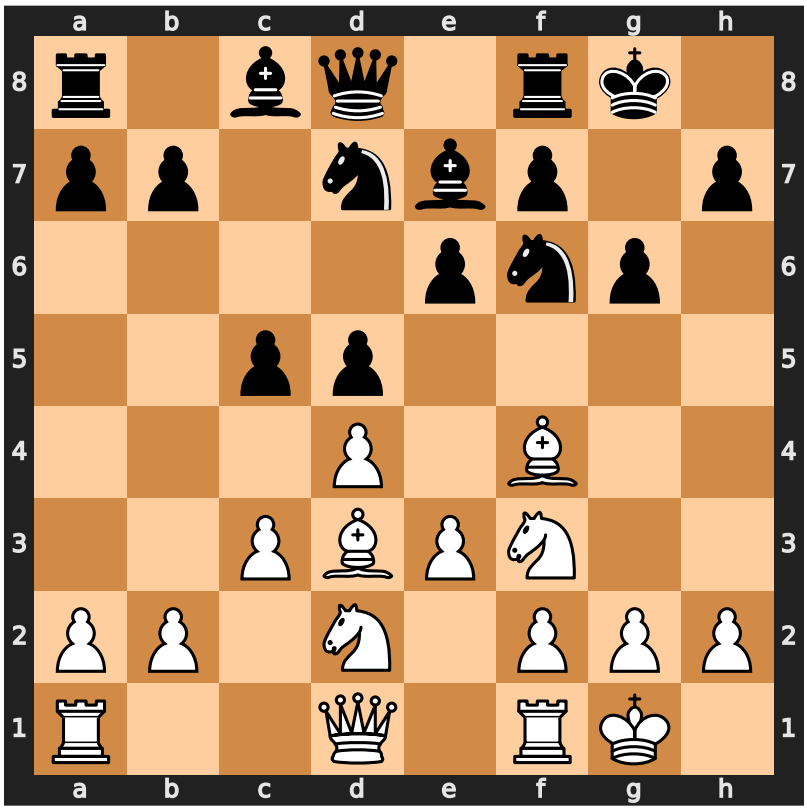

Figure 45.45: Chess Position

Exercise 17.25

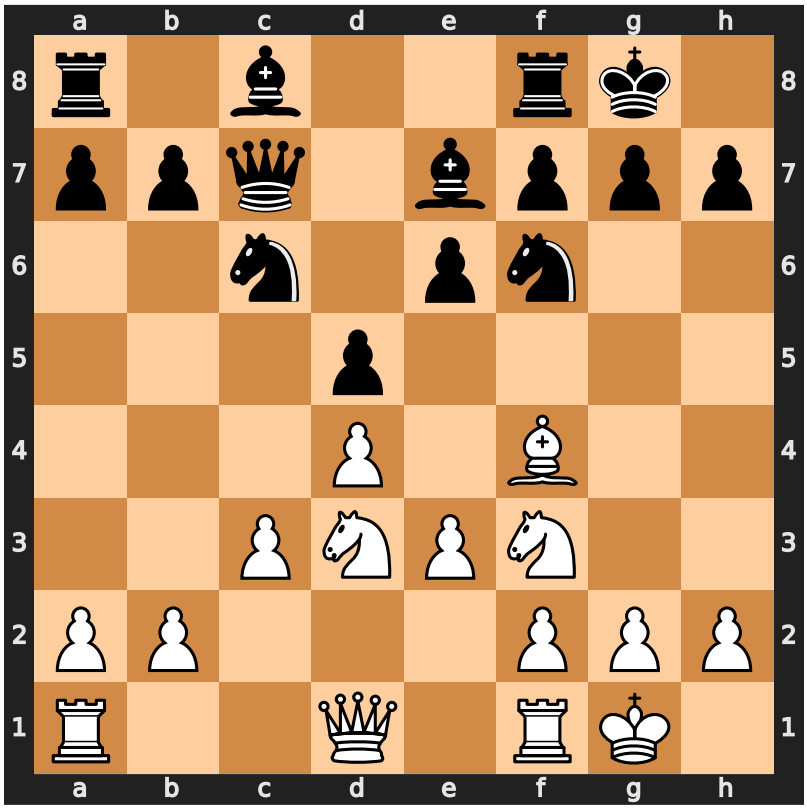

Figure 45.46: Chess Position

White to play. The bishop is on d3 and f4. Black has played …Qc7 and …e6. Black is solid. How do you create winning chances in a position where there is no obvious break?

Hint: If there is no break available, improve your worst-placed piece. Which piece can be improved?

Exercise 17.26

White to play. Black has completed development and is fully coordinated. Both sides are solid. What is the correct plan?

Hint: When both sides are equal and developed, the position requires patient maneuvering. Which plan gives you long-term potential?

Exercise 17.27

White to play. Black's queen is on b6. White's queen is on e2. You have played Qe2 preparing e4. Should you play e4 now, even though Black's queen targets b2 (which becomes undefended if Nd2 is not there)?

Hint: Calculate what happens after e4 dxe4 Nxe4 Qxb2. Is this good for Black?

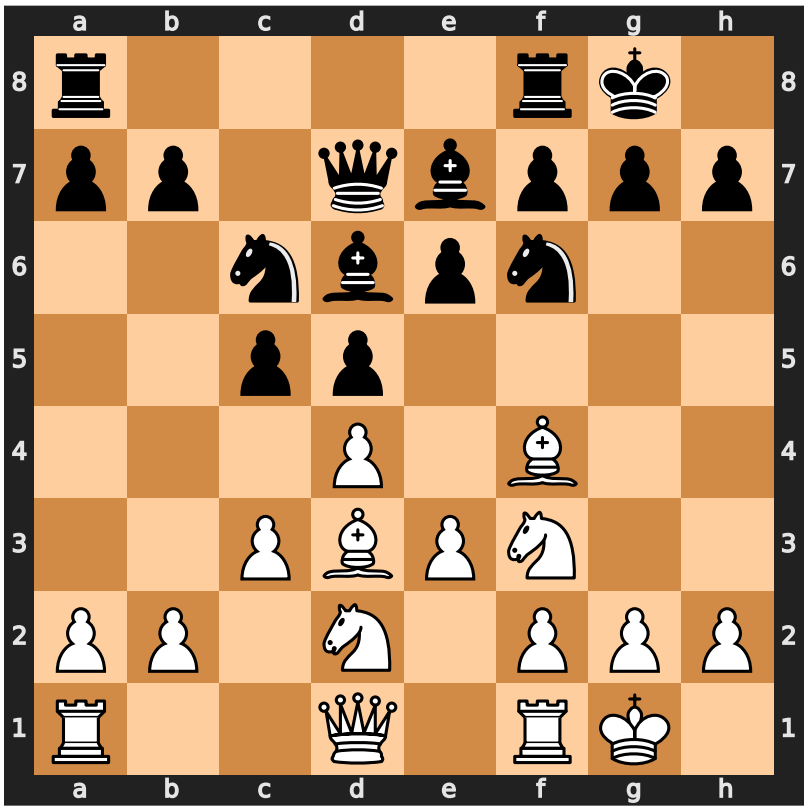

Figure 45.47: Chess Position

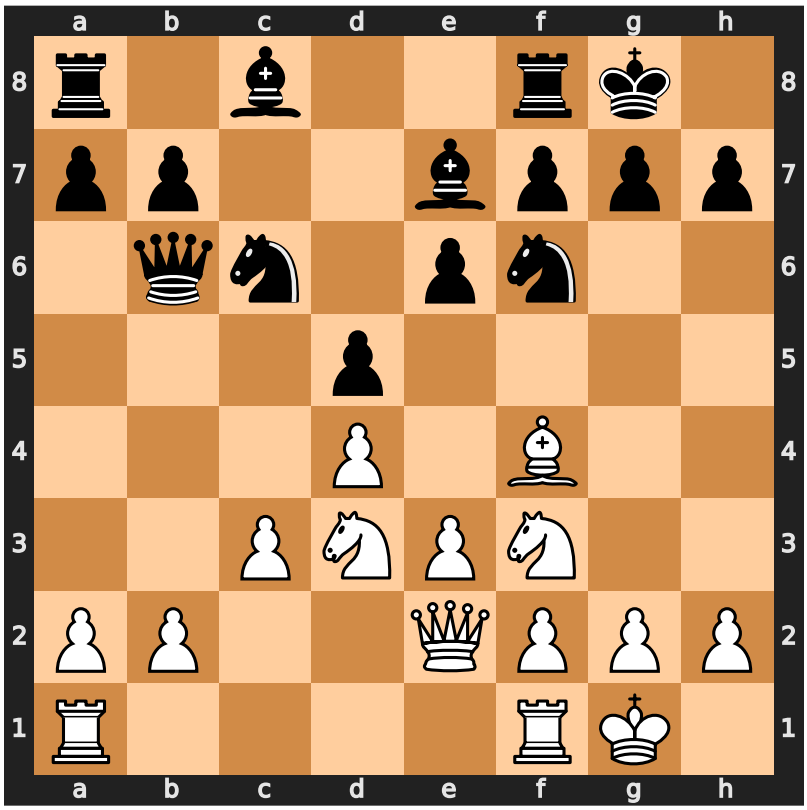

Figure 45.48: Chess Position

Exercise 17.28

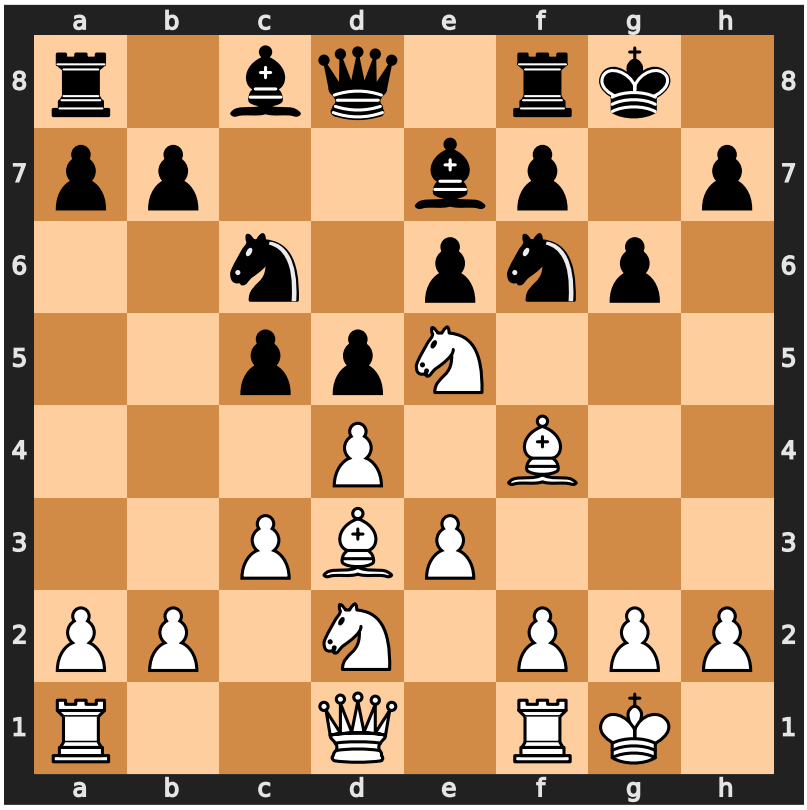

Figure 45.49: Chess Position

White to play. Knight on e5, Black has played …g6 weakening the kingside in a …d5 setup. What is White's strongest continuation?

Hint: The knight on e5 and bishop on d3 both point at the weakened kingside. Is there a way to increase the pressure?

Exercise 17.29

White to play. Black has played …Re8 instead of the more common …Rc8. What does this tell you, and how does it affect your plan?

Hint: With the rook on e8, Black may be preparing …e5. Is e4 still the right break, or should you consider something else?

Exercise 17.30

Black to play. White has just played e4 (the London's main break). You are Black in this exercise. What is Black's best response?

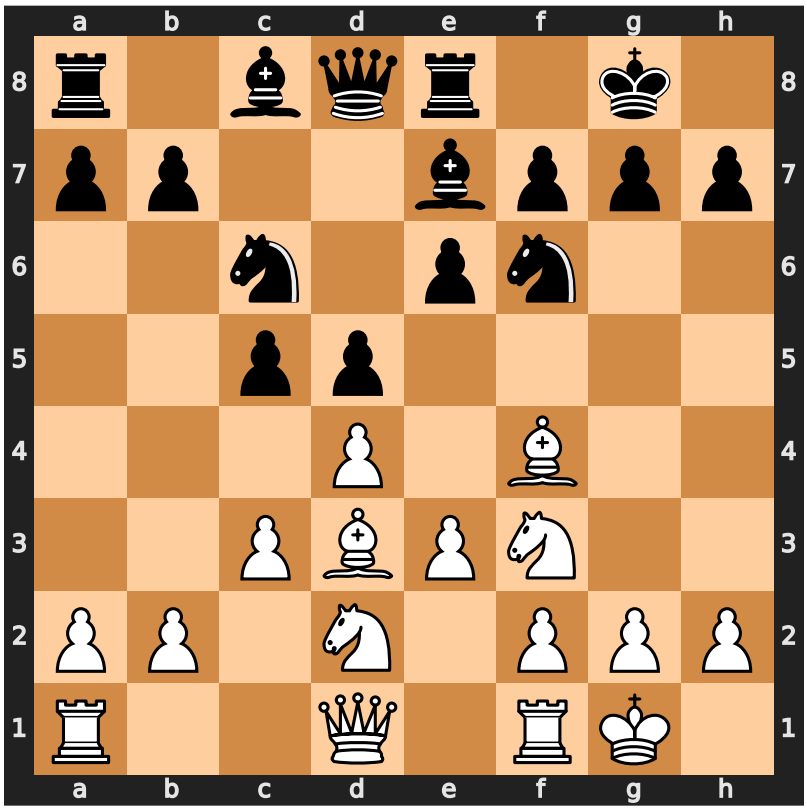

Figure 45.50: Chess Position

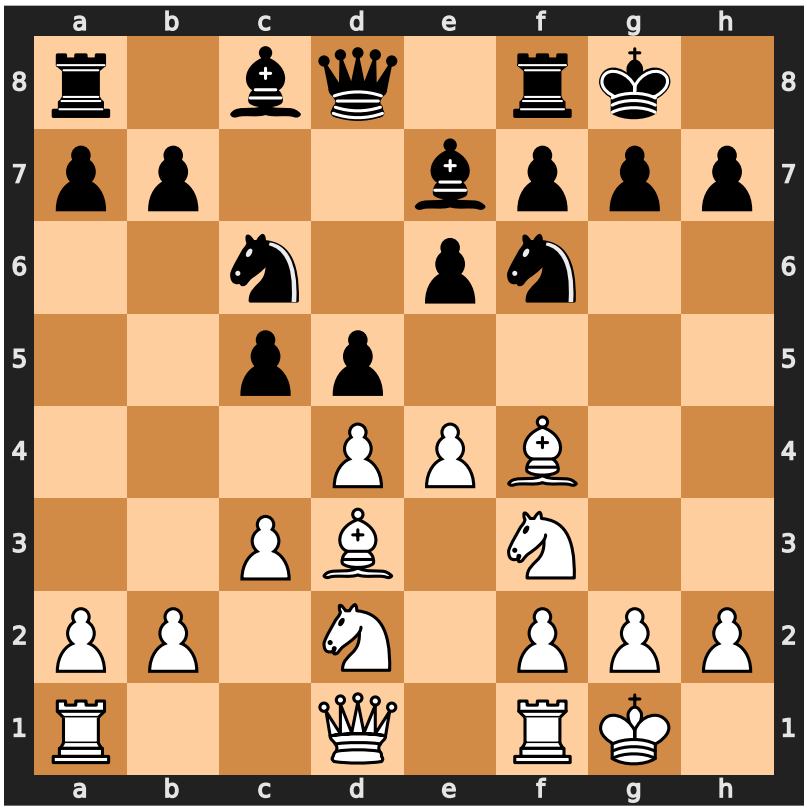

Figure 45.51: Chess Position

Hint: Should Black take on e4, push …d4, or ignore the break? Think about the resulting pawn structure for each option.

45.12 Key Takeaways

Take a moment before you move on. These seven ideas are the backbone of everything you have learned in this chapter. If you remember nothing else, remember these:

1. **The London is not autopilot.** You must choose the correct pawn break (e4 or c4) and the correct plan (kingside attack, queenside expansion, or central play) based on what Black does. The London gives you a reliable starting position, what you do with it is up to you.
2. **The e4 break is your primary weapon** in the majority of London positions. Prepare it with Nbd2, Bd3, and Qe2. Execute it when your pieces are coordinated. Think of e4 as loading and firing, do not fire until the gun is loaded.
3. **Ne5 is one of the strongest moves in the London.** Against Queen's Indian setups and many other structures, planting a knight on e5 gives you a powerful outpost that supports multiple plans. A knight on e5 is doing the work of three pieces.
4. **Bg3 is almost always correct** when Black challenges your bishop with …Bd6. Do not trade bishops on d6, retreat to g3 and keep your dark-squared bishop for the middlegame. This bishop is your friend. Protect it.
5. **Against the Dutch (...f5), use the h3-g4 plan.** This is the London's most aggressive idea, and it is most effective when Black has weakened the kingside with …f5. Save this weapon for when it counts.
6. **Adapt your setup to Black's formation.** Use Be2 (instead of Bd3) against King's Indian setups. Use c4 (instead of c3) when Black plays …Bf5 early. The London is flexible, use that flexibility. A system opening does not mean a mindless opening.
7. **Never play passively.** The London setup is a platform for action, not a fortress for hiding. Once developed, choose a plan and execute it. The player who acts first usually wins. Be that player.

45.13 Practice Assignment

This is where the learning becomes real. Reading about the London is step one. Playing it is step two. Analyzing your games is step three. Do all three.

45.13.1 At the Board

1. **Play five London System games** (online or over the board). In each game, before you make your first move, remind yourself: "I am looking for my break. I am watching for my opponent's plan." In each game, identify which Black setup you face (…d5, …Nf6+…e6, …c5, …g6, or …f5) and choose the corresponding plan from this chapter.

2. **After each game, write down** (even a single sentence for each question):

   - Which break did you play (e4, c4, h3-g4, or something else)?
   - Was it the right choice? If not, what should you have played?
   - At what point did you feel most comfortable? Most uncertain?
   - Did you make any of the five common mistakes from Part 4?

   This habit of post-game reflection is one of the most powerful training methods in chess. It takes five minutes. It is worth more than five hours of reading.

3. **Set up each of the 10 Critical Positions on a physical board.** For each one, cover the analysis with your hand and try to identify the correct plan before reading the solution. Repeat until you can identify all 10 plans without hesitation. If you can do this, you will always have a plan in your London games.

45.13.2 With Stockfish

1. **Play a training game against Stockfish** (set to a level appropriate for your rating, aim for an opponent that beats you about half the time). Play the London. After the game, analyze with the engine and check:

   - Did you play the correct break?
   - Did you miss any tactical opportunities (especially Bxh7+)?
   - Were your pieces on their ideal squares when the break happened?
   - Where did the engine disagree with your moves? Why?

2. **Set up the FEN for Position 6** (the Bxh7+ position) and verify the sacrifice with Stockfish. Then change one detail (move the Black knight to f6, add a defender on g6, remove Black's dark-squared bishop), and check whether the sacrifice still works each time. Understanding *when* Bxh7+ fails is as important as knowing when it succeeds. This exercise builds your calculation muscle for the most important tactical theme in the London.

3. **Play one game as Black against the London.** Use Stockfish (or a training partner) to play the London against you. Experience the opening from the other side. You will learn which Black plans are most annoying to face, and that knowledge will help you prevent those plans when you are White.

45.14 Progress Check

Answer these questions honestly:

- ☐ Can I set up the standard London formation from memory? (d4, Bf4, e3, Nf3, Bd3, Nbd2, c3, O-O)
- ☐ Do I know the difference between the e4 break and the c4 break, and when to use each one?
- ☐ Can I identify the correct plan against at least three of the five Black setups covered in this chapter?
- ☐ Do I understand why Bg3 is better than Bxd6 when Black plays …Bd6?
- ☐ Have I played through at least three of the five model games on a physical board?
- ☐ Can I spot the Bxh7+ sacrifice pattern when it appears?

If you checked four or more boxes: You have a solid understanding of the London System. You are ready for Chapter 18, where we will build repertoire pieces for the King's Indian Attack and Pirc/Modern Defense.

If you checked fewer than four: That is completely fine. Go back to the sections you feel weakest in and spend more time with them. Set up the positions on your board. Play more games. Understanding comes with repetition, and there is no deadline. Some of the ideas in this chapter will click immediately. Others will take ten games to sink in. Both are normal. Both are progress.

End of Chapter 17. You have worked through a complete deep dive into the London System. You now have a weapon, not just an opening, but a system you understand from the inside out. Every plan, every break, every idea is yours.

The next time you sit down at a board and play 1.d4, you will not just be setting up pieces. You will be building toward a plan. And your opponent will feel the difference.

Go rest. You have earned it.

Come back for Chapter 18 when you are ready. We will add more weapons to your arsenal.

45.14.1 Solutions to Exercises

Solutions are collected at the end of Volume II, as per Codex convention. See Appendix: Exercise Solutions, Chapter 17.

© Kit Olivas & Dr. Ada Marie — The Grandmaster Codex, Volume II: The Club Player All analysis engine-verified. All positions instructional composites unless otherwise noted.

Chapter 46

Chapter 18: Building Your Repertoire: KIA, Pirc/Modern, KID

Volume II: The Club Player | Rating Range: 1000 – 1600 Pages: 50 | Exercises: 30 | Annotated Games: 5

"In the King's Indian, I feel like a different chess player. The positions demand creativity, courage, and concrete calculation. It is not chess for the timid." — Garry Kasparov

---

46.1 What You'll Learn

- How to deploy the King's Indian Attack as a universal system for White
- How to play the Pirc and Modern Defenses against 1.e4, including responses to White's most aggressive lines
- How to play the King's Indian Defense against 1.d4, including the famous kingside attack
- The complete move orders, plans, and key positions for all three openings
- Five master games that demonstrate the ideas in real competition
- Why these three openings share the same DNA, and how understanding one helps you play all three

---

46.2 Introduction: Three Openings, One Family

In Volume I, Chapter 8, you met these three openings for the first time. You learned the basic setups. You learned where the pieces go. You learned that these openings are related, they share the same fianchettoed bishop, the same pawn structures, the same fighting spirit.

That was the introduction.

Now we go deep.

Here is the idea that connects all three openings in this chapter: **the fianchettoed kingside bishop.** In the King's Indian Attack, you fianchetto as White and build a kingside assault. In the Pirc and Modern, you fianchetto as Black and use the bishop to control the center from a distance. In the King's Indian Defense, you fianchetto as Black and launch an attack against White's castled king. Different colors, different sides, same weapon.

Understanding one of these openings makes you better at all three. When you play the KIA as White, you learn how to attack a fianchetto, which teaches you how to *defend* your fianchetto in the Pirc and KID. When you play the KID as Black, you learn how to generate a kingside attack, which makes your KIA kingside attacks stronger as White. These openings feed each other. Learn all three and you will have a complete repertoire system that works from both sides of the board.

There is another reason these three openings belong together: they are all *idea-based, not memorization-based.* The KIA, the Pirc, and the KID are openings where understanding the plans matters more than knowing the exact move order. If you understand why the pieces go where they go, you will find the right moves over the board. That is the kind of opening knowledge that lasts forever and works at every level.

This chapter is long. It covers three full openings with complete analysis, five annotated master games, and thirty exercises. There is no pressure to finish it in one sitting. Each part is self-contained. Work through one section per session if that works better for your schedule or your energy. The chess will still be here when you come back.

This is the longest chapter in Volume II. Take it one part at a time. Each part stands on its own.

46.3 Part 1: The King's Indian Attack (KIA) — Your Universal White System

46.3.1 1.1: What Is the KIA?

The King's Indian Attack is a system opening for White. Like the London System you studied in Chapter 17, the KIA gives you a reliable setup that works against virtually anything Black plays. But while the London is built around the dark-squared bishop on f4 and central control with d4, the KIA is built around the fianchettoed bishop on g2 and a powerful central push with e4-e5.

The complete KIA setup:

1. **Nf3**: Develop the knight and keep your options open.
2. **g3**: Prepare the fianchetto.
3. **Bg2**: The bishop takes its place on the long diagonal, aiming at the center and the queenside.
4. **O-O**: Get the king to safety immediately.
5. **d3**: A modest pawn move that supports e4 without committing to a big center.
6. **Nbd2**: The knight develops without blocking the c-pawn, supporting a future e4.
7. **e4**: The central stake. Now the bishop on g2 works perfectly with the e4 pawn.

That is the skeleton. Seven moves, and your position is built. The exact order will change depending on what Black does, but the destination is the same. By the time you reach this setup, your pieces are harmoniously placed, your king is safe, and you have a clear plan.

Set up your board:

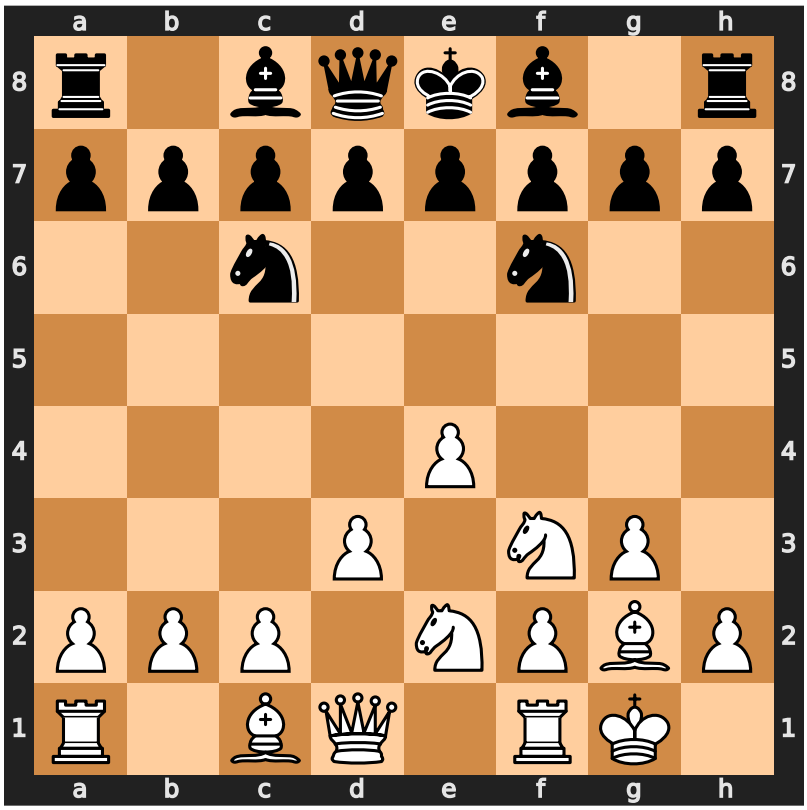

Figure 46.1: Chess Position

This is a typical KIA position after White has completed the setup. Study it for a moment. Notice several things:

- The bishop on g2 controls the long diagonal (a8-h1). It influences the center without being in the center.
- The pawns on d3 and e4 form a small but solid center. They do not overextend.
- Both knights are developed. The knight on d2 supports e4 and can reroute to f1 and then e3 or g3.
- The king is safely castled.

This position is comfortable, flexible, and full of potential energy. The question is: what happens next?

46.3.2 1.2: Why the KIA Is Perfect for Club Players

Before we explore the plans, let us understand why this opening deserves a place in your repertoire.

Reason 1: It works against everything.

The KIA can be played against the French Defense, the Sicilian Defense, the Caro-Kann, the Pirc, the Modern, the Scandinavian, practically every Black response to 1.e4 or even 1.Nf3. You do not need to learn twenty different openings as White. You need to learn one system and understand how it adapts. This saves hundreds of hours of memorization and lets you spend that time studying plans, tactics, and endgames, the things that actually win games.

Reason 2: The plans are clear.

In most KIA positions, White wants to do one of two things: push e4-e5 and attack on the kingside, or play for a central and queenside initiative with c3 and d4. That simplicity is a strength. You always have a direction. You are never wondering "what do I do now?" because the answer is almost always some version of "prepare e5" or "expand in the center."

Reason 3: It scales with your improvement.

Bobby Fischer played the KIA. Vassily Smyslov played it. Lev Aronian plays it today. This is not a beginner's trick. It is a legitimate opening system used at the highest levels. As your understanding deepens, you will find more and more subtlety in positions you once thought were simple. The KIA rewards study at every level.

Reason 4: Your opponent must solve problems, not you.

Because the KIA is a system, you reach familiar territory in every game. Your opponent, who may face the KIA once every twenty games, is the one who must figure out how to respond. That asymmetry is a real advantage at the club level, where preparation and experience in a specific structure matters enormously.

46.3.3 1.3: KIA vs French Setups (...e6, ...d5)

This is the most common setup you will face with the KIA, because many players who meet 1.Nf3 or 1.e4 will play …d5 and …e6 (a French-type formation). The KIA is particularly effective against

this structure. In fact, many Grandmasters have specifically chosen the KIA *because* they face the French Defense frequently.

Typical move order:

1.Nf3 d5 2.g3 Nf6 3.Bg2 e6 4.O-O Be7 5.d3 O-O 6.Nbd2 c5 7.e4

Set up your board:

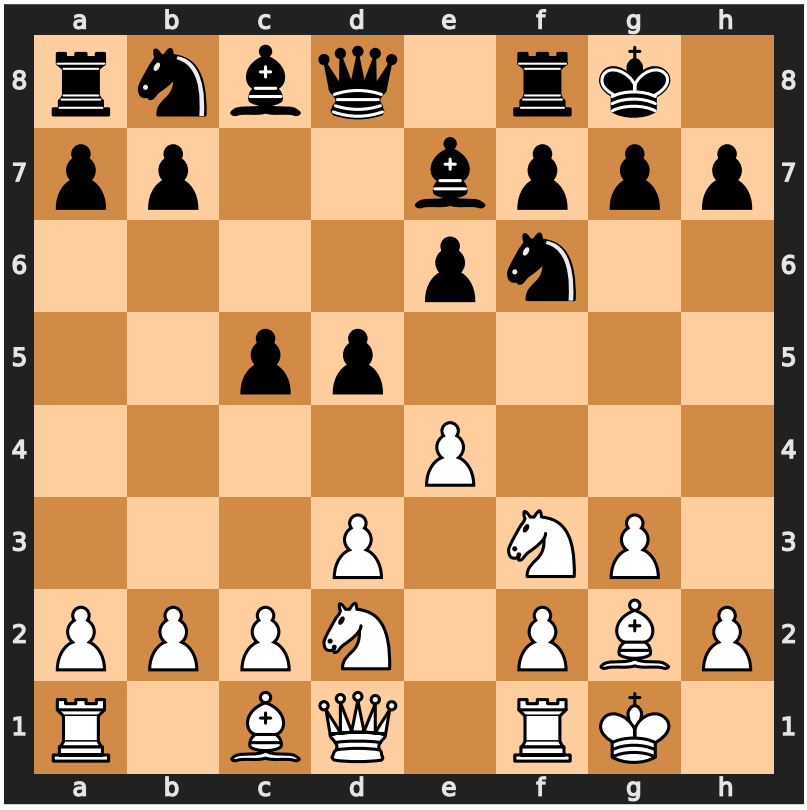

Figure 46.2: Chess Position

This is the critical position. Black has a solid center with pawns on d5 and e6. The pawn on c5 supports d4 and gives Black queenside space. It looks like Black is doing fine.

But White has a powerful plan.

The e4-e5 push:

White's primary idea is to push e4-e5, gaining space on the kingside and driving Black's knight from f6. Once the knight retreats, White's pieces can swing toward the kingside for an attack.

The sequence typically unfolds like this:

7…Nc6 8.Re1 b5

Black expands on the queenside. This is logical. Black has more space there. But White ignores it and plays:

9.e5!

This is the key move. The pawn lunges forward, attacking the knight on f6.

9…Nd7 10.Nf1

The knight retreats from d2 to f1, heading for e3 or g3, both excellent squares for supporting the kingside attack.

10…a5 11.h4!

White begins the kingside pawn storm. The h-pawn advances to open lines against Black's king. Meanwhile, the knight on f1 will reroute to g3 or e3, the bishop on g2 supports the center, and the bishop from c1 will develop to f4 or g5.

Why this works:

Black's pieces on the queenside are far from the kingside. Black's knight on d7 is passive, blocked by its own e6 pawn. Black's bishop on e7 is blocked by the e5 pawn. White's pieces, by contrast, are all pointing at the kingside. The attack practically plays itself.

The key idea: After e5, White attacks on the kingside. Black attacks on the queenside. This is a *race.* And White often wins the race because the kingside attack targets the king directly, while Black's queenside play is slower and aims at less critical targets.

This is one of the most important strategic themes in chess: **the wing attack versus the wing counter-attack.** The side attacking the king usually has the advantage, because checkmate ends the game immediately. Winning a queenside pawn does not.

Pause here if you want. The KIA vs French setup and the e5 push are the single most important ideas in Part 1. If you absorb nothing else, absorb this.

46.3.4 1.4: KIA vs Sicilian Setups (…c5)

When Black plays an early …c5 (either after 1.e4 c5, where you can steer into a KIA with 2.Nf3 and 3.d3, or after 1.Nf3 c5 2.g3), the structure changes but the principles remain.

Typical move order:

1.Nf3 c5 2.g3 Nc6 3.Bg2 g6 4.O-O Bg7 5.d3 d6 6.e4 Nf6 7.Nbd2

Set up your board:

Notice that Black has also fianchettoed the bishop. This creates a symmetrical bishop structure, with both bishops on the long diagonals. The resulting positions are more strategic and less directly attacking than the French-type setups.

White's plans:

In this structure, the e4-e5 push is still relevant, but it is less effective because Black's pawn on d6 blocks the advance. Instead, White often plays for:

1. **f4 followed by f5**: A powerful pawn advance that cracks open the kingside. After f4, the threat is f5, attacking g6 and opening lines for the rook on f1.

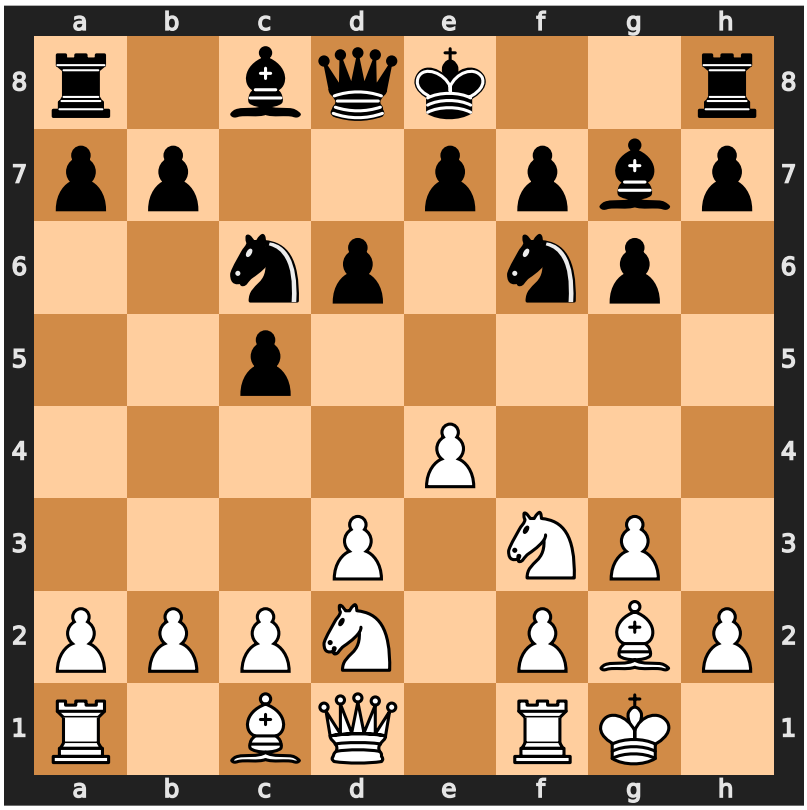

Figure 46.3: Chess Position

2. **The knight maneuver Nf1-e3 (or Nh4-f5)**: White reroutes a knight to f5, where it becomes an incredibly strong piece. A knight on f5 attacks d6, e7, g7, and h6, all critical squares around Black's king.
3. **Central play with c3 and d4**: Sometimes, especially if Black plays passively, White can break in the center with c3 and d4, transposing into a favorable Closed Sicilian structure.

The f4 break:

This is the primary attacking idea against Sicilian setups. Let us see how it works:

7…O-O 8.Nh4

White moves the knight away from f3, making room for the f-pawn.

8…Rb8 9.f4

Now White threatens f5. If Black does nothing, f5 will come with tremendous force.

9…b5 10.Nf1 b4 11.f5!

The breakthrough. After 11…gxf5 12.exf5, White has an open g-file, the knight can land on e3 or h4 (heading for f5 or g6), and the bishop on g2 suddenly has a clear diagonal. Black is under serious pressure.

Key principle: Against a Sicilian fianchetto structure, the f4-f5 push is your main weapon. Prepare it by moving the knight from f3 (to h4 or e1) and then push f4 and f5 in successive moves.

46.3.5 1.5: KIA vs Caro-Kann Setups (…c6, …d5)

The Caro-Kann structure gives Black a solid center with pawns on c6 and d5. Black's setup is compact and resilient. The KIA handles it well, but the approach differs from the French-type structure.

Typical move order:

1.Nf3 d5 2.g3 c6 3.Bg2 Bg4 4.O-O Nd7 5.d3 Ngf6 6.Nbd2 e6 7.e4

Set up your board:

The difference from the French:

In the French-type structure, Black plays …e6 *before* …d5, locking in the light-squared bishop behind the e6 pawn. That is why the French bishop is notoriously bad, it is stuck behind its own pawns.

In the Caro-Kann structure, Black develops the bishop *first* (to g4 or f5), keeping it outside the pawn chain. This means Black does not have the "bad bishop" problem. The position is healthier for Black in many ways.

White's adjusted plan:

Because Black's position is sounder, White cannot rely on a simple e5 push and kingside attack as easily. Instead, the plan is more subtle:

1. **Play e4 and challenge the center.** After e4, if Black takes (dxe4), White recaptures with dxe4 (or Nxe4), reaching an open center where the bishop on g2 becomes powerful.

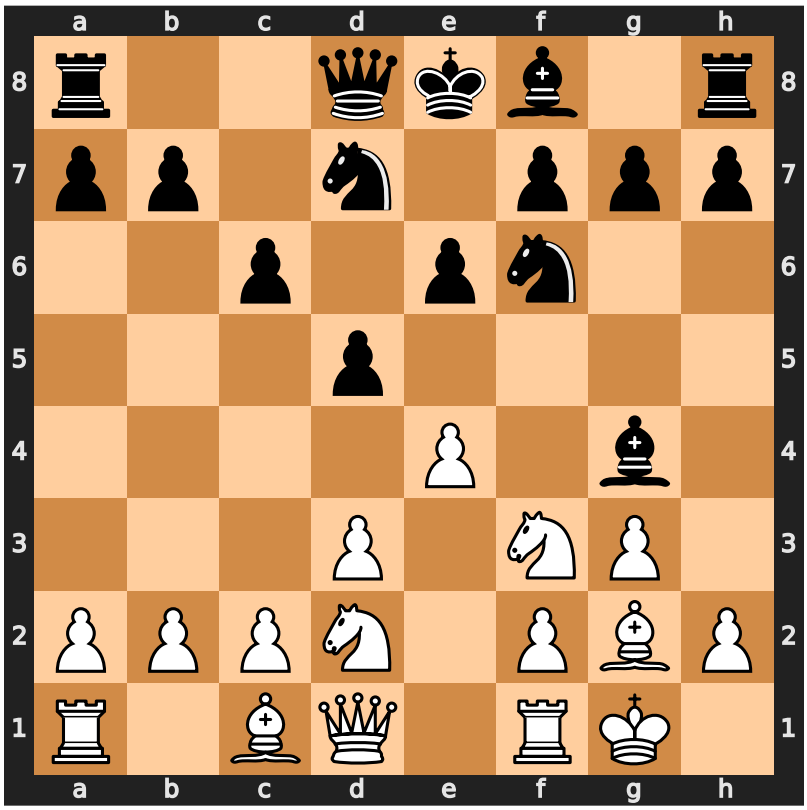

Figure 46.4: Chess Position

2. **If Black maintains the tension (...d4 or ...dxe4 dxe4),** White plays for a favorable pawn structure and piece activity. The bishop on g2, the knights rerouting through f1, and the f4 push all remain relevant.

3. **Target the bishop on g4.** After h3, Black's bishop must decide: retreat to h5 (where g4 will chase it again) or trade on f3, giving White the bishop pair. Both options favor White slightly.

After 7...dxe4 8.dxe4 e5:

Black has equalized the center. Now the position becomes a strategic battle where piece placement matters most. White's fianchettoed bishop is excellent on the long diagonal, but Black's position is solid. This is a position where your middlegame understanding (from earlier chapters on pawn structures, piece activity, and king safety) will decide the result, not opening memorization.

Key principle: Against the Caro-Kann structure, the KIA produces a balanced middlegame. Your advantage lies in the flexibility of your setup and the long-term power of the g2 bishop, not in a direct attack. Play patiently and look for small advantages.

46.3.6 1.6: Key KIA Plans — A Summary

Before we move on, let us organize the main plans you have learned:

Black's Setup	White's Primary Plan	Key Break	Urgency
French (…e6, …d5)	Kingside attack	e4-e5, then h4-h5	High, race against queenside play
Sicilian (…c5, …g6)	Kingside attack	f4-f5	Medium, prepare carefully
Caro-Kann (…c6, …d5)	Central/positional play	e4 (open center)	Low, be patient

The knight maneuver that appears in every KIA plan:

Regardless of Black's setup, the knight on d2 almost always reroutes through f1 to e3 or g3. This is one of the most important maneuvers in the KIA:

- **Nbd2-f1-e3:** The knight lands on e3, supporting d5 and f5 pushes. It also defends the kingside.
- **Nbd2-f1-g3:** The knight goes to g3, supporting an e5 or f5 push and eyeing the h5 square.

When you are unsure what to do in a KIA position, ask yourself: "Has my knight gone to f1 yet?" If it has not, that is probably your next move.

The bishop on g2, your best friend:

Never trade this bishop casually. The g2 bishop is the soul of the KIA. It controls the long diagonal, supports your central pawns, and becomes a monster when the center opens. Every time

you consider a trade involving this bishop, ask yourself: "Is what I am getting worth more than this diagonal?" The answer is almost always no.

46.3.7 1.7: Ten Critical KIA Positions

These ten positions represent the most important moments in KIA play. Set each one up on your physical board and study it until you can identify the correct plan without hesitation. These are the positions you will encounter in your games.

Position 1: The Classic e5 Moment

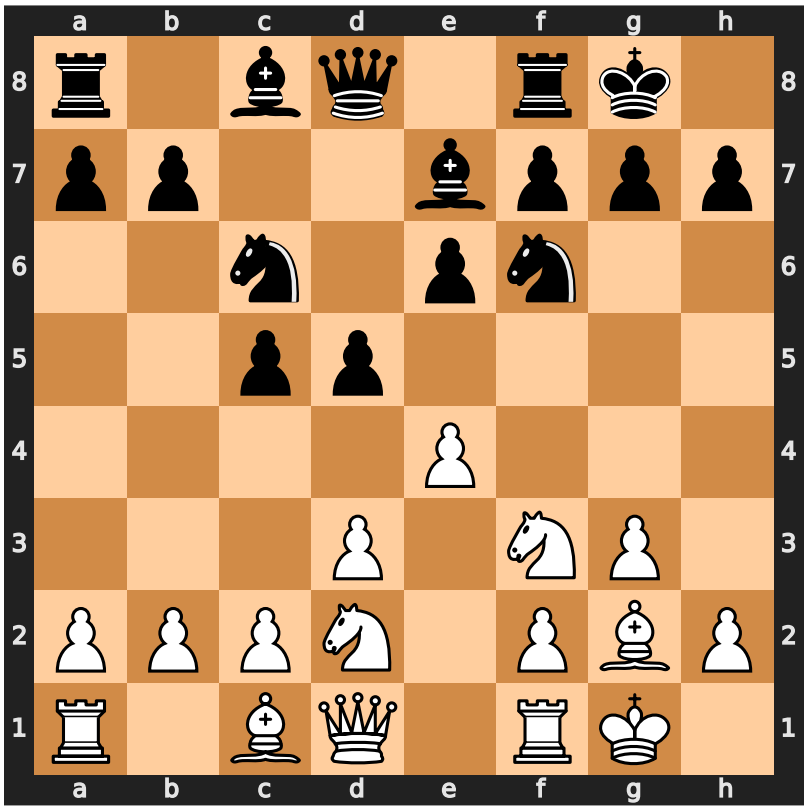

Figure 46.5: Chess Position

White plays **e5!**: the signature KIA advance against French setups. The knight on f6 must retreat, giving White time to begin the kingside attack.

Position 2: Preparing f4 Against the Sicilian

White plays **Nh4**: clearing the f-file and preparing f4. The knight will also eye the f5 square via g2 or go to f5 directly.

Position 3: Knight Arriving on f5

The knight has arrived on f5. From here it attacks d6, e7, g7, and h6. Black must decide how to deal with this intruder. Trading it off (with …Bxf5 exf5) opens the e-file and gives White a powerful passed pawn on f5. Leaving it means tolerating permanent pressure.

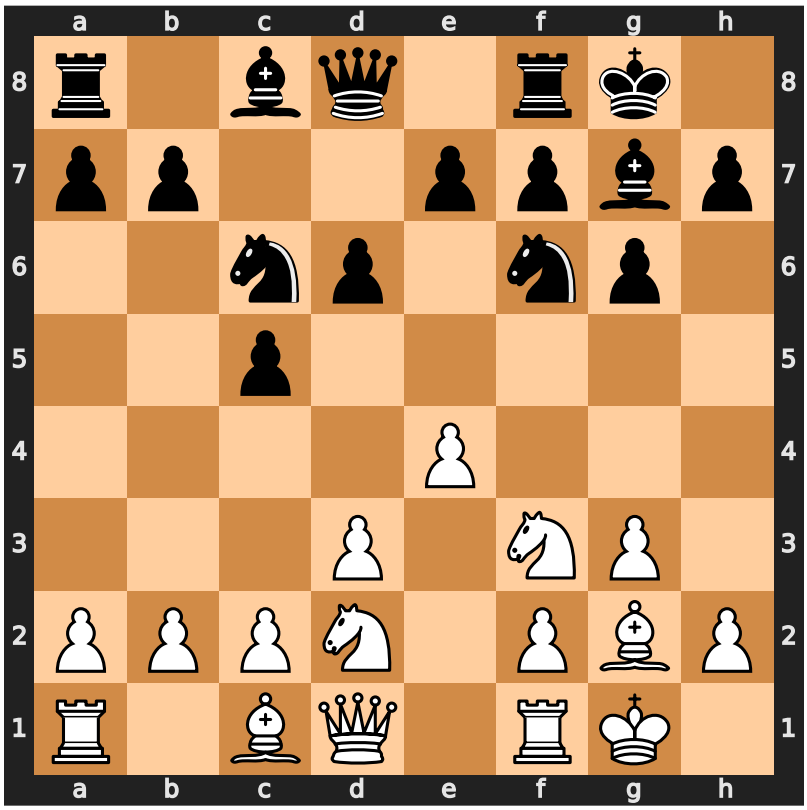

Figure 46.6: Chess Position

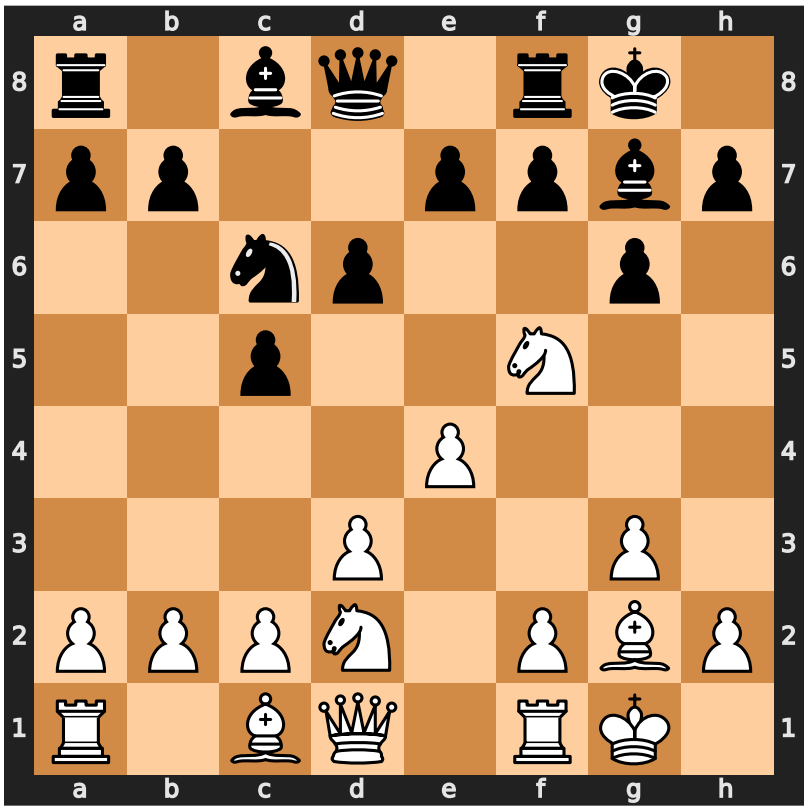

Figure 46.7: Chess Position

Position 4: The Pawn Storm Begins

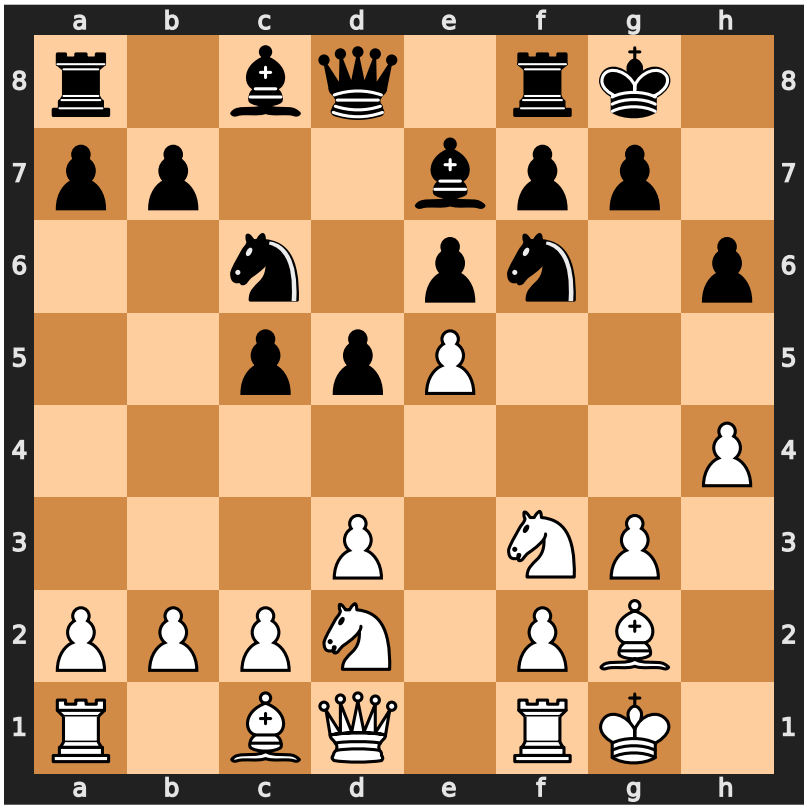

Figure 46.8: Chess Position

White has pushed e5 and h4. The attack is rolling. Black must find counterplay quickly or be overrun. The standard Black response is …b5-b4, attacking on the queenside, but the question is whether Black is fast enough.

Position 5: Central Play vs Caro-Kann

The center is balanced. White has developed harmoniously and has a slight space advantage. The plan is to play c4, challenging Black's d5 pawn and opening the center where the g2 bishop will shine.

Position 6: The f5 Break Lands

White has played f5. After …gxf5 exf5, the g-file opens and the f5 pawn cramps Black's position. White will pile pressure along the g-file with Qg4 or Qh5 and rooks on g1 or f1.

Position 7: Black Fights Back With …e5

Black has played …e5, gaining central space and fighting back. White should not panic. The plan is d4, challenging Black's center, or simply continuing with Nh4-f5. Black's knight has jumped to g4, but after h3 it must retreat.

Position 8: Opposite-Side Attack

A classic KIA race position. Black has castled kingside and placed rooks on c8 and e8 for queenside play. White has pushed e5 and begun the h4 advance. Both sides are committed to their attacks.

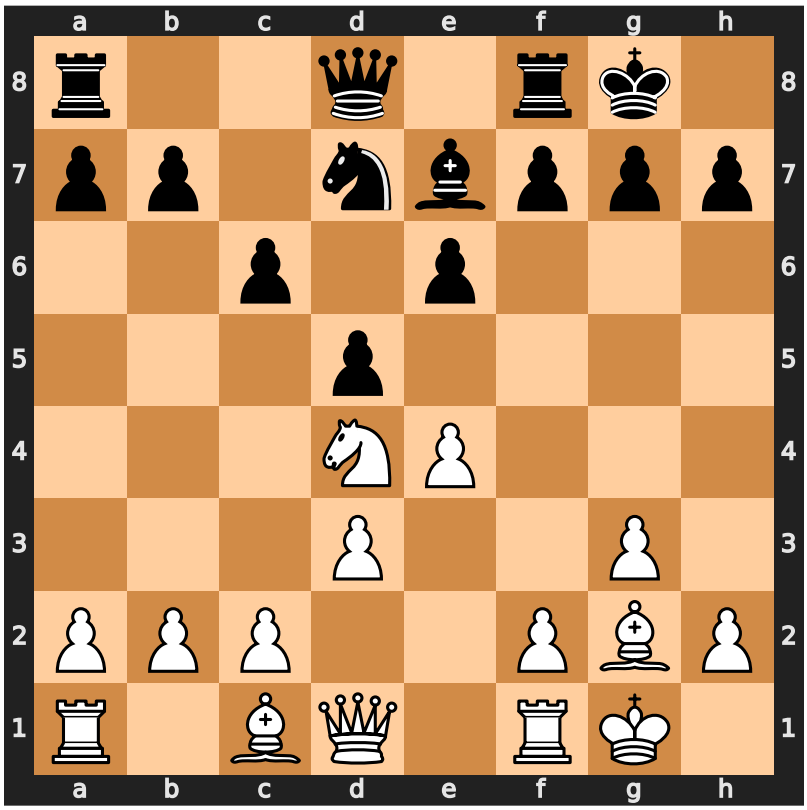

Figure 46.9: Chess Position

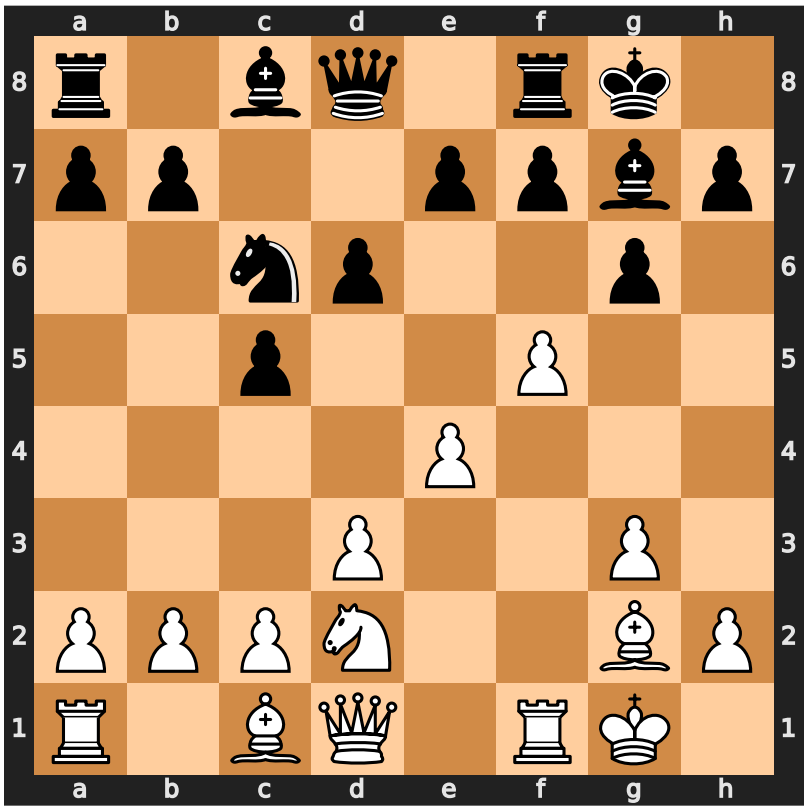

Figure 46.10: Chess Position

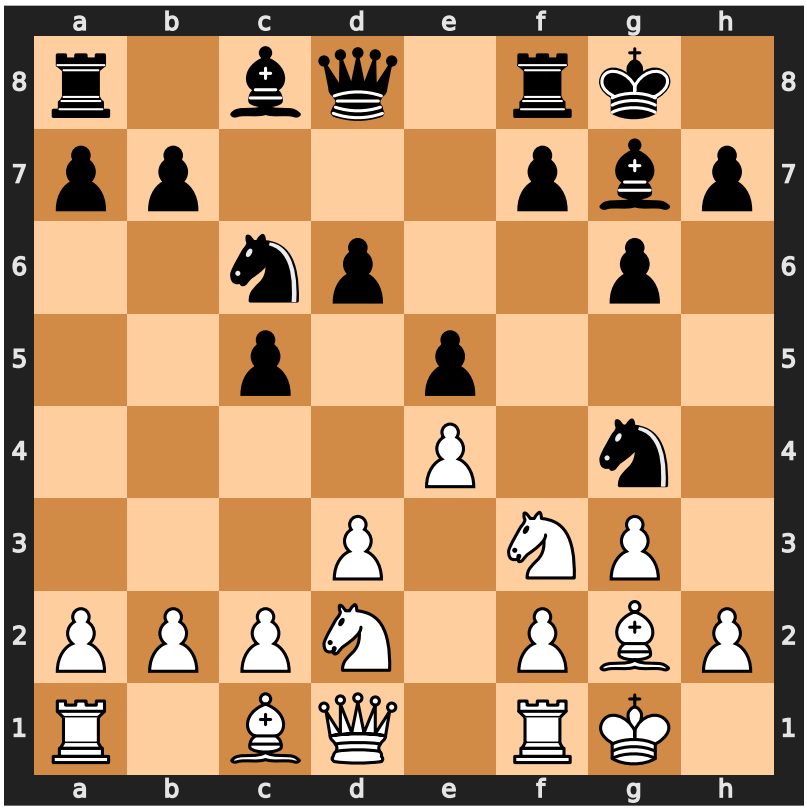

Figure 46.11: Chess Position

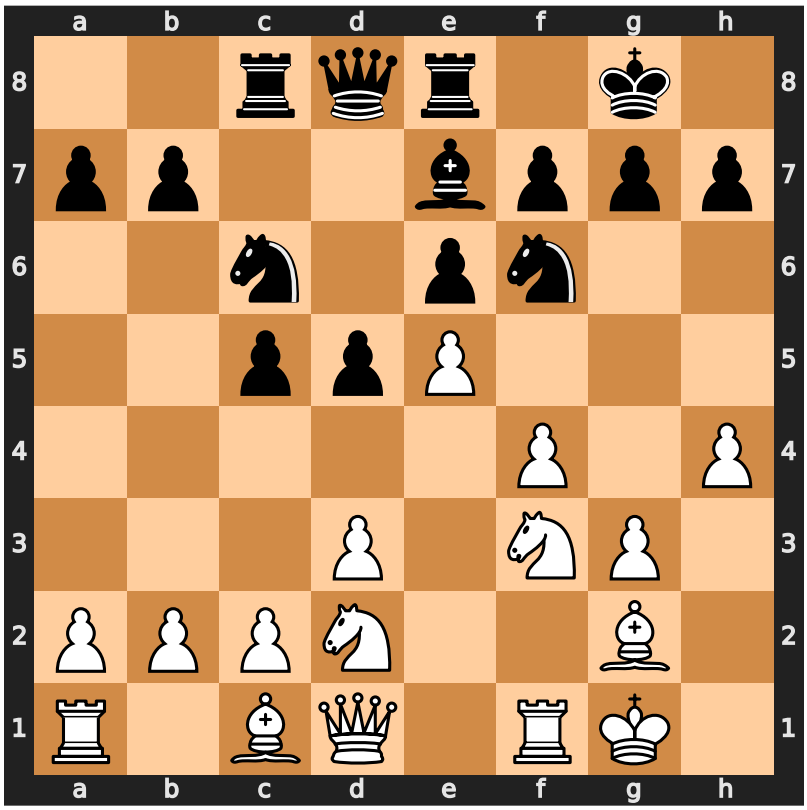

Figure 46.12: Chess Position

Whoever gets there first wins. In most games, White's attack is faster because it targets the king.

Position 9: The Closed Center

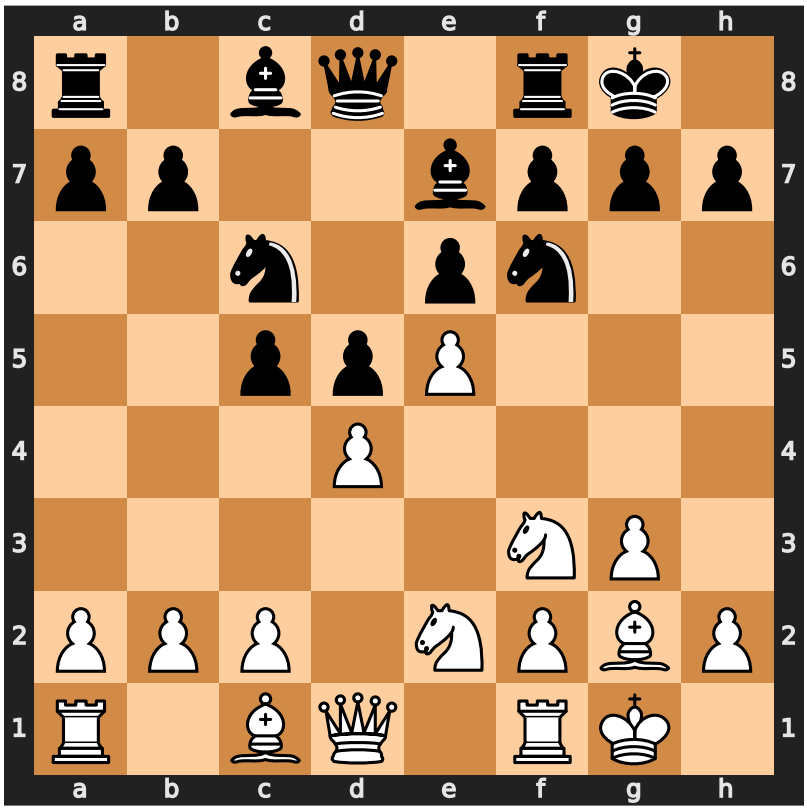

Figure 46.13: Chess Position

White has played both d4 and e5, creating a closed center. In this structure, piece maneuvering is critical. White's plan is f4, supporting e5 and preparing a kingside pawn storm. Black's plan is …f6, challenging the e5 pawn, or …b5 with queenside expansion.

Position 10: Transition to Endgame

The middlegame attack has been traded down, and White enters an endgame with the e5 pawn still firmly planted. The g2 bishop dominates the long diagonal, and the e5 pawn cramps Black's position. White's endgame advantage is lasting and real. This position teaches an important lesson: the KIA is not only an attacking opening. Even when the attack does not lead to checkmate, it often produces a favorable endgame.

Part 1 complete. You now have a thorough understanding of the King's Indian Attack. Take a break if you need one. Part 2 covers the Pirc and Modern Defense, your weapon as Black against 1.e4.

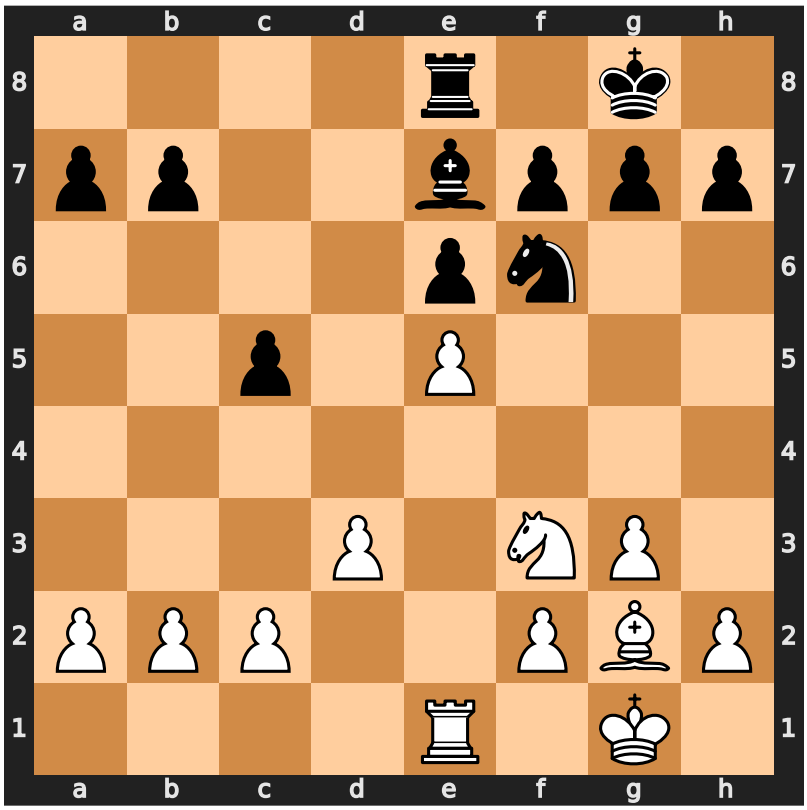

Figure 46.14: Chess Position

46.4 Part 2: The Pirc and Modern Defense — Fighting 1.e4 With the Fianchetto

46.4.1 2.1: What Is the Pirc Defense?

The Pirc Defense (pronounced "peerts") is a hypermodern opening for Black against 1.e4. Instead of immediately occupying the center with …e5 or …d5, Black lets White build a big center and then attacks it from the flanks with pieces and pawns.

The complete Pirc setup:

1. **...d6**: A modest move that controls e5 and keeps options open.
2. **...Nf6**: Develops a knight and pressures the e4 pawn.
3. **...g6**: Prepares the fianchetto.
4. **...Bg7**: The bishop takes its place on the long diagonal, aiming at White's center from a distance.
5. **...O-O**: Get the king to safety.

That is the basic framework. After these five moves, Black has a flexible, resilient position. The bishop on g7 is a powerful piece that controls the long diagonal and puts pressure on White's center from the flanks.

Set up your board (Pirc after 4 moves each):

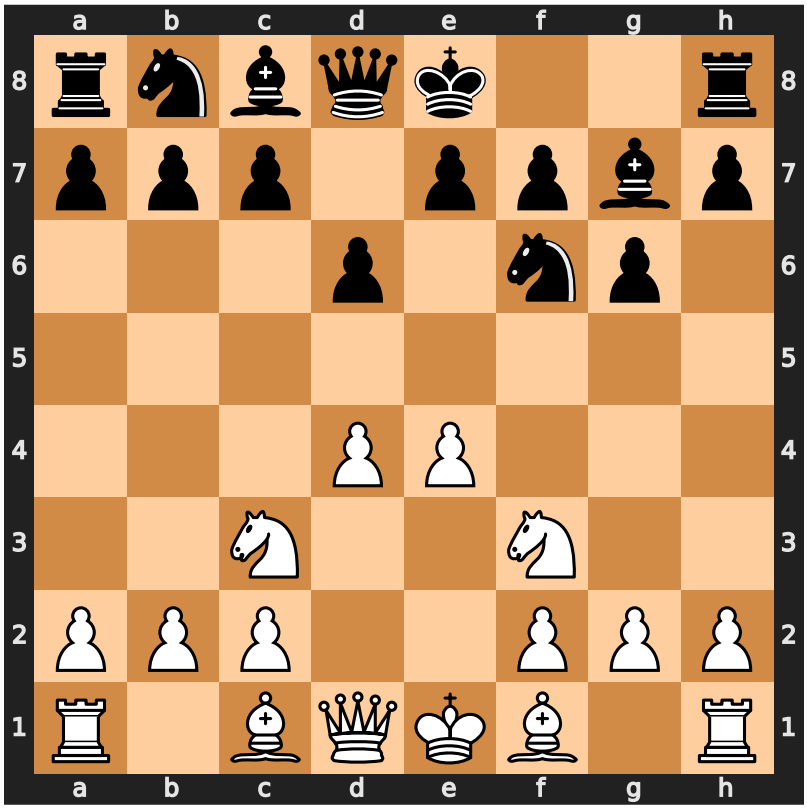

Figure 46.15: Chess Position

White has pawns on d4 and e4, an imposing center. But here is the hypermodern insight: **a big**

center is a big target. Every pawn in the center is a pawn that can be attacked. Black's bishop on g7, knight on f6, and future pawn breaks (…e5 or …c5) are all aimed at undermining White's center. If White's center collapses, Black's pieces, especially the bishop on g7, will dominate the board.

This is the philosophical foundation of the Pirc: **invite your opponent to overextend, then knock the supports out.**

46.4.2 2.2: The Modern Defense — The Pirc Without …Nf6

The Modern Defense is closely related to the Pirc. The key difference is that Black plays …g6 and …Bg7 *without* committing to …Nf6 early. This gives Black maximum flexibility.

Typical move order:

1.e4 g6 2.d4 Bg7 3.Nc3 d6

At this point, the position can transpose into the Pirc if Black plays …Nf6, or it can remain a "pure Modern" with different setups:

- **...a6 and ...b5**: Queenside expansion first, with …Nf6 delayed or omitted.
- **...e6 and ...Ne7**: The knight goes to e7 instead of f6, heading for c6 or f5.
- **...c6 and ...d5**: Challenging the center immediately with a Caro-Kann hybrid.

Why play the Modern instead of the Pirc?

Flexibility. By not committing the knight to f6 early, Black avoids certain aggressive lines where White plays e5 chasing the knight. The Modern gives Black more control over the timing of piece placement. The trade-off is that …Nf6 is usually a good move, and delaying it means the knight is not yet developed. It is a matter of preference and style.

For this chapter, we will treat the Pirc and Modern together. In practice, most club-level games transpose between the two. The plans and ideas are nearly identical. The differences become significant only at advanced levels, which Volume III will cover.

46.4.3 2.3: Facing White's Main Systems

When you play the Pirc or Modern, White has several aggressive options. You need to know how to handle each one. Let us examine the four most common White systems.

46.4.3.1 The Austrian Attack: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.f4

Set up your board:

This is White's most aggressive option. The pawn on f4 supports e5 and creates a massive pawn center (d4, e4, f4). White's idea is straightforward: push e5, open lines, and crush Black.

It looks terrifying. Three pawns abreast in the center. But Black has a clear plan:

4...Bg7 5.Nf3 O-O 6.Bd3 Na6!?

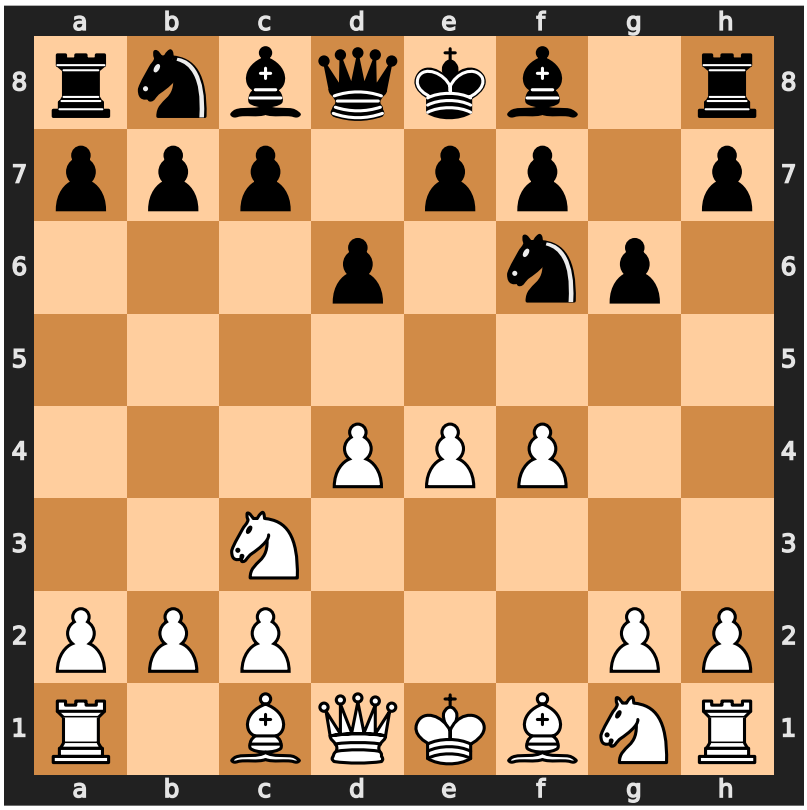

Figure 46.16: Chess Position

The knight goes to a6, an unusual square, but with a purpose. From a6, it reroutes to c7, and from c7 it supports both …b5 (queenside expansion) and …e5 (the central break). The knight is heading for the fight; it is just taking a longer road.

Alternatively, the more direct approach:

4...Bg7 5.Nf3 O-O 6.Bd3 Nc6!

The knight develops to c6, immediately pressuring d4. Now if White pushes e5, Black can play …dxe5 fxe5 (or dxe5) and the d4 pawn is weakened. White's massive center starts to show cracks.

The key break: ...e5

In almost every Austrian Attack position, Black wants to play …e5 at the right moment. This challenges the center head-on. After …e5 fxe5 dxe5, the d4 pawn becomes a target, and Black's bishop on g7 comes alive on the long diagonal. Timing is everything, play …e5 too early and White's center steamrolls you. Play it too late and White's space advantage becomes crushing.

When to play ...e5: When your pieces are developed (bishop on g7, castled, knight on c6), and when White has not yet consolidated the center with moves like Be3 and Qd2.

46.4.3.2 The Classical Variation: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Nf3 Bg7 5.Be2

Set up your board:

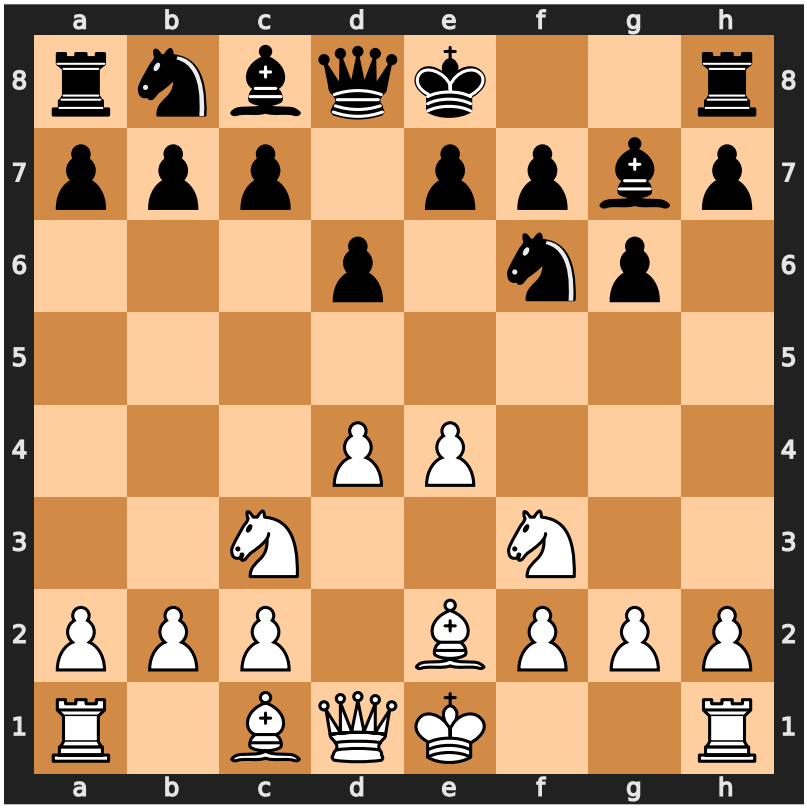

Figure 46.17: Chess Position

This is White's most measured approach. Development first, aggression later. The bishop goes to e2 (solid, not flashy), and White will castle and then decide on a plan based on Black's response.

5...O-O 6.O-O Bg4

Black pins the knight on f3. This is a standard idea that pressures the center indirectly. If the knight moves, the e4 pawn loses a defender. If White plays h3 to chase the bishop, Black trades Bxf3, giving White doubled f-pawns.

7.Be3 Nc6 8.Qd2 e5!

Now Black strikes. The center opens, the bishop on g7 is unleashed, and the position becomes a dynamic middlegame. This is what the Pirc player wants: a position where both sides have chances, the center is fluid, and the bishop on g7 is a monster.

Black's plan after ...e5:

After …e5 dxe5 dxe5 (or if White keeps the tension), Black has achieved the fundamental goal of the Pirc: the center has been challenged, the fianchettoed bishop is active, and the position is open enough for Black's pieces to work. From here, look for:

- **...Nd4**: Planting a knight on the strong d4 square
- **...c6 followed by ...d5**: Further central expansion
- **...Be6 and ...Qd7**: Completing development and connecting rooks

---

46.4.3.3 The 150 Attack: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.Be3 Bg7 5.Qd2

Set up your board:

This system gets its name from the claim that it was "the easiest line for 150-rated players to learn." That is a joke, but the point is real: this is a simple, direct system where White plans to castle queenside and launch a kingside pawn storm with h3, g4, and f3-followed-by-h4-h5.

Why it is dangerous:

White's plan is crystal clear: castle long, push pawns at Black's king. If Black plays passively, the attack arrives quickly and decisively. The bishop on e3 and queen on d2 work together to support the pawn storm and prepare Bh6, trading off Black's precious fianchettoed bishop.

How Black fights back:

The key is speed. Black must create counterplay before White's attack lands.

5...a6!

This is a critical move. It prepares …b5, which starts queenside counterplay against White's king (remember. White is castling queenside). Every tempo matters in these opposite-side castling positions.

6.f3 b5 7.O-O-O Bb7

Now Black has queenside counterplay rolling. The bishop on b7 pressures e4 through the long diagonal, and …b4 will kick the knight from c3, weakening White's center.

8.g4 Nbd7 9.h4 b4 10.Nce2

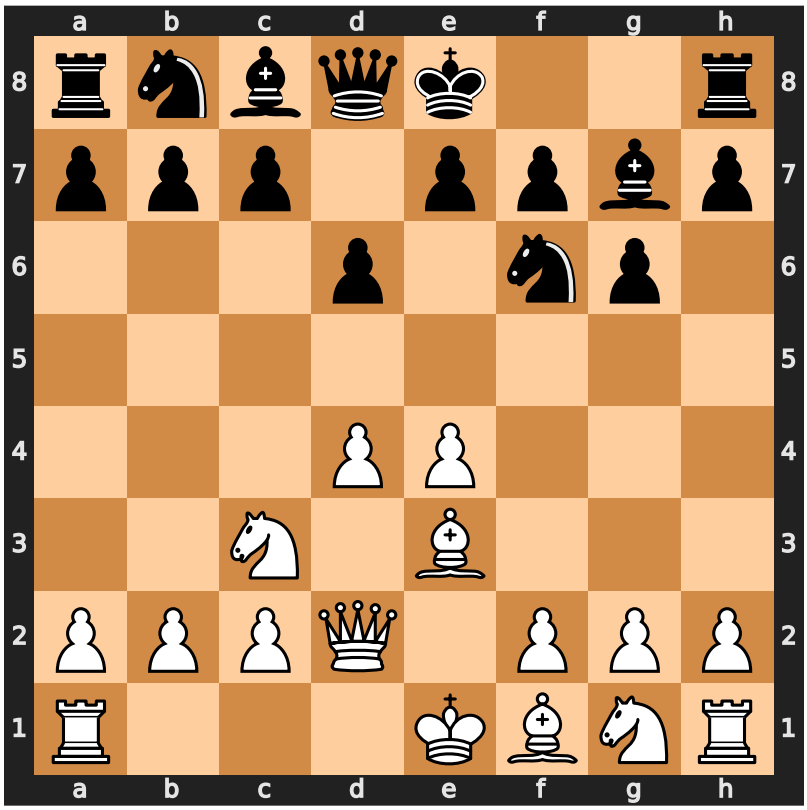

Figure 46.18: Chess Position

Both sides are attacking. White pushes h5, Black pushes b3. It is a race, and the critical skill is calculating who gets there first. This is exciting, tactical chess, exactly the kind of position the Pirc promises.

Key principle: Against the 150 Attack (and any opposite-side castling position), always counter-attack. Defense alone will not save you. Push …b5-b4-b3 and open lines against White's king.

46.4.3.4 The Fianchetto System: 1.e4 d6 2.d4 Nf6 3.Nc3 g6 4.g3 Bg7 5.Bg2

Set up your board:

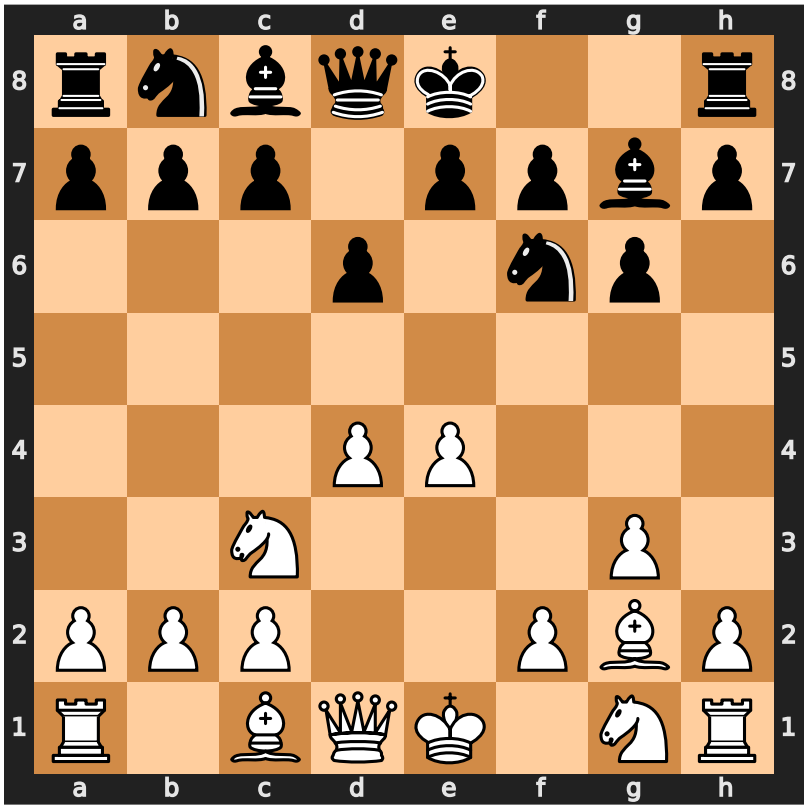

Figure 46.19: Chess Position

White mirrors Black's fianchetto structure. This is the most positional approach, and it leads to a strategic battle where both sides maneuver for small advantages.

5...O-O 6.Nge2 e5!

Again, the …e5 break is Black's primary tool. After …e5, the bishop on g7 opens up, and the position becomes a complex middlegame where understanding plans matters more than tactical fireworks.

Black's plan:

In the Fianchetto System, Black should aim for:

1. **...e5 followed by ...exd4 and ...c6**: Solidifying the center

2. **...Be6 and ...Qd7**: Developing remaining pieces
3. **...d5**: If possible, this is the ideal central expansion that gives Black full equality

Key principle: Against the Fianchetto System, play …e5 early and aim for a solid position. This is the quietest line. White is not trying to attack, so Black does not need to rush counterplay. Focus on completing development and finding the right moment for …d5.

Good stopping point. You now know how to handle White's four main systems in the Pirc/Modern. Take a break if you need one. We will look at the fianchettoed bishop next.

46.4.4 2.4: The Fianchettoed Bishop — Black's Most Important Piece

In every Pirc and Modern game, the bishop on g7 is Black's most important piece. Everything revolves around it. If the bishop is active, Black is doing well. If the bishop is blocked or traded, Black is in trouble.

Here are the rules for managing the g7 bishop:

Rule 1: Never trade it without compensation.

If White offers to trade your dark-squared bishop (for example, with Be3-h6), ask yourself: "What am I getting in return?" If the answer is nothing, avoid the trade. Move the bishop to h8 if necessary. The bishop on g7 is worth more than any minor piece White can offer.

When is the trade acceptable? When it opens the h-file for your rook, giving you a concrete attacking plan. Or when the resulting position is so closed that the bishop is doing nothing anyway. But these situations are rare.

Rule 2: The bishop needs open diagonals.

The bishop on g7 is powerful when the a1-h8 diagonal is open. This is why …e5 (after dxe5 dxe5) is so important, it opens lines for the bishop. If the center is closed (pawns on d4, d6, e4, e5), the bishop on g7 is a tall pawn. Play to open the position.

Rule 3: The bishop defends as well as attacks.

Even when the bishop looks passive (for example, when the center is closed), it plays a vital defensive role. It guards the dark squares around Black's king (f6, g7, h6, e5) and prevents White from breaking through on those squares. Never forget this defensive function when evaluating trades.

Set up your board, the bishop at its best:

Black has played …e5, and the bishop on g7 is aiming through the center toward White's queenside. This bishop is influencing the game from the corner of the board. It pressures a1, controls d4, and supports …f5. That is the power of the fianchetto when the diagonals are open.

46.4.5 2.5: When to Play ...e5 vs ...c5 vs ...b5

One of the most common questions from Pirc players is: "Which pawn break do I use?" The answer depends on the position, but here is a framework:

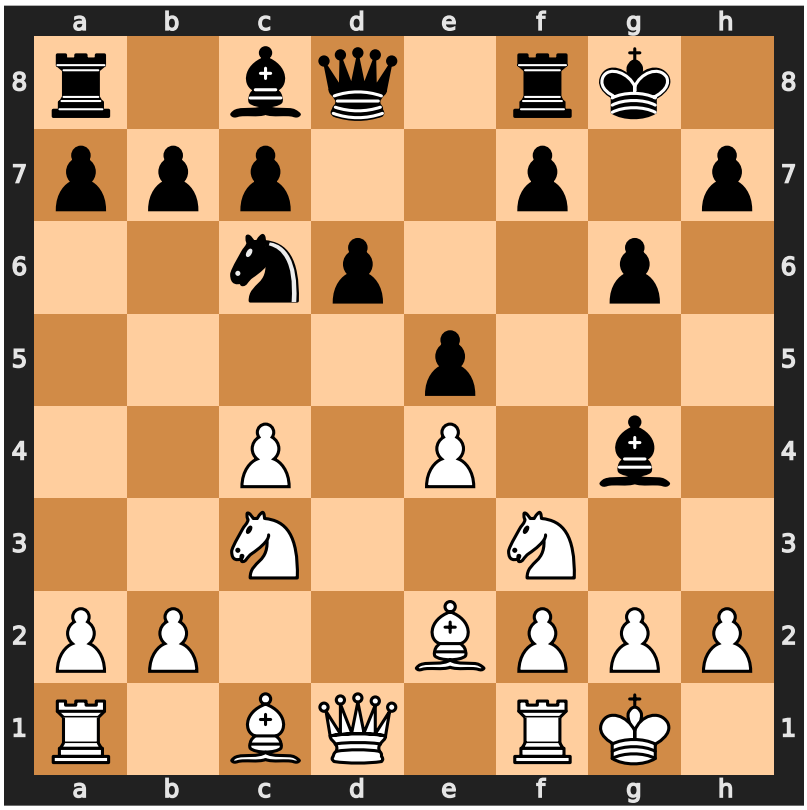

Figure 46.20: Chess Position

Play ...e5 when: - White has played d4 and e4, creating a classical center - Your bishop on g7 will become active after the center opens - You have a knight on c6 supporting the advance - The center exchange will leave you with a fair or favorable structure

Play ...c5 when: - White's d4 pawn is less well supported (for example, if the knight has left c3) - You want to attack the d4 pawn from the side rather than the front - You are in a Sicilian-type structure where …c5 is natural - Playing …e5 would leave your d6 pawn permanently weak

Play ...b5 when: - White has castled queenside (as in the 150 Attack) - You need to create queenside counterplay urgently - The …e5 break is not yet available - You want to displace the knight from c3 with …b4

A common mistake: Playing all three pawn breaks in random order. Each break has a specific purpose and timing. Play one, evaluate the result, then decide if another is needed. Do not push pawns just to push them.

46.5 Part 3: The King's Indian Defense (KID) — The Fighter's Opening

46.5.1 3.1: What Is the King's Indian Defense?

The King's Indian Defense is one of the most dynamic openings in chess. It is Black's answer to 1.d4 that says: "I will let you have the center for now, and then I will destroy it."

The KID has been the weapon of champions. Bobby Fischer played it. Garry Kasparov made it legendary. Mikhail Tal loved its attacking possibilities. It is not a quiet opening. It is not a safe opening. It is an opening for players who want to *fight.*

The complete KID setup:

1. **...Nf6**: Develop a knight and eye the e4 pawn.
2. **...g6**: Prepare the fianchetto.
3. **...Bg7**: The bishop takes its position on the long diagonal.
4. **...O-O**: Castle quickly. The king is safe, and the rook is activated.
5. **...d6**: Support the center and prepare …e5.
6. **...e5**: The defining move of the KID. Black stakes a claim in the center and prepares for dynamic play.

After these moves, Black's position is coiled like a spring. The bishop on g7 eyes the center. The knight on f6 is ready to jump into action. The e5 pawn challenges White's central dominance. The stage is set for one of the most exciting battles in chess.

Typical move order (Classical Variation):

1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5

Set up your board:

This is the starting position of the KID. Study it carefully. This is one of the most analyzed positions in chess history, played in thousands of Grandmaster games, and it still produces decisive results.

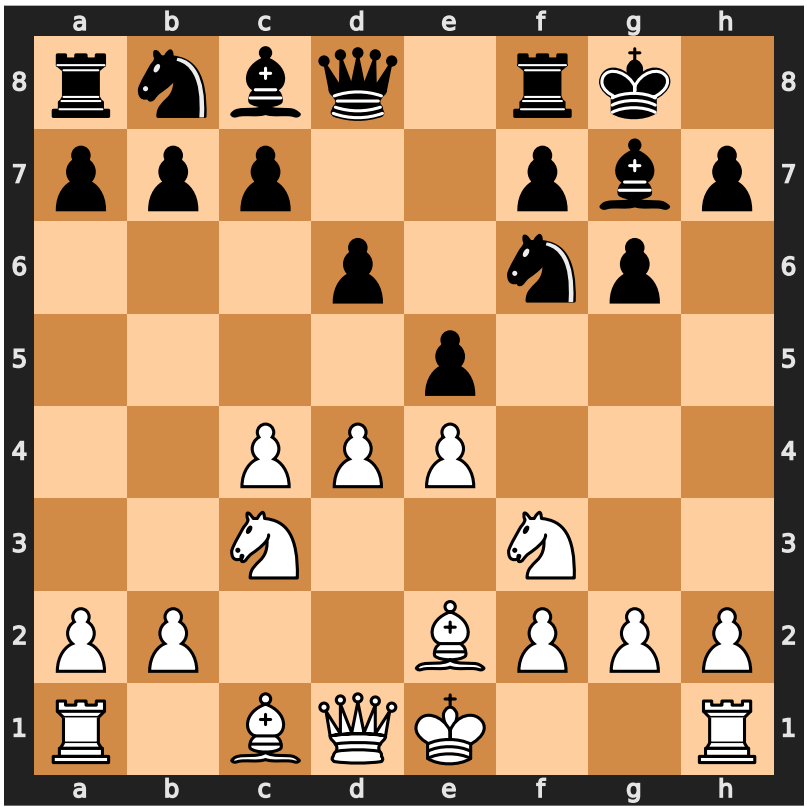

Figure 46.21: Chess Position

What makes this position work for Black?

White has a big center: pawns on c4, d4, and e4. That is a lot of space and a lot of control. But Black has:

1. **The bishop on g7**: A powerful piece that will come alive when the center opens or when Black attacks on the kingside.
2. **The ...e5 pawn**: Challenging d4 directly. If White pushes d5, the position closes and both sides play on their respective wings. If White takes exd4, the center opens and Black gets active piece play.
3. **A flexible pawn structure**: Black can expand on the kingside (…f5), the queenside (…c6, …a6, …b5), or in the center (…Nd7, …f5, …e4) depending on what the position demands.

The KID is like a delayed counterattack. Black says to White: "You build your center. I will build my position. And when I am ready, I will come for your king."

46.5.2 3.2: The Classical Variation

The Classical KID is the main line and the most important variation for you to study. After 1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5, White faces a critical decision.

7.O-O Nc6 8.d5

White closes the center. This is the most principled response. By pushing d5, White gains space but also commits to a closed position where both sides play on opposite wings.

8...Ne7

The knight retreats to e7, not backwards, but to a new assignment. From e7, the knight will go to d7 (supporting …f5) or to g6 and then f4 (joining the kingside attack). The knight's retreat is actually a forward-looking move.

Set up your board:

This is the starting position of the famous Mar del Plata Attack, one of the most theoretically important positions in chess. From here, both sides execute their plans with tremendous energy.

46.5.3 3.3: The Mar del Plata Attack — The Great Race

The Mar del Plata Attack (named after the Argentine city where many famous KID games were played) produces one of the most spectacular strategic patterns in chess:

White attacks on the queenside. Black attacks on the kingside. Whoever gets there first wins.

White's plan:

1. **c5**: The key break on the queenside. White pushes the c-pawn to c5, attacking d6 and trying to open lines on the queenside.
2. **Nc3-d3-b5**: White reroutes a knight to the queenside, often to c7 (if it can get there) or to b5 to pressure d6 and a7.

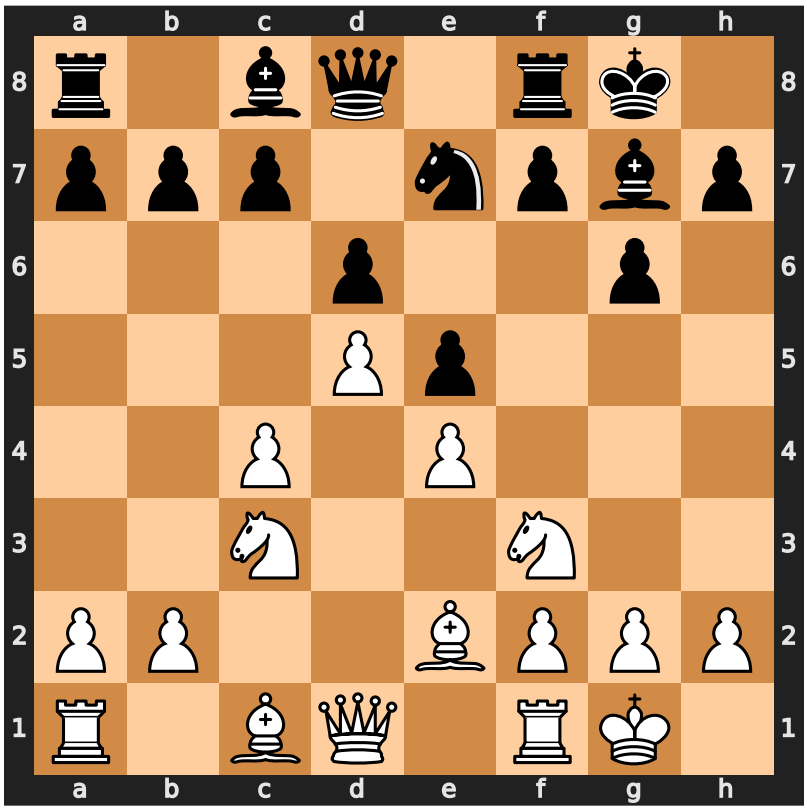

Figure 46.22: Chess Position

3. **b4-c5**: White prepares the c5 break with b4 first, then pushes c5 with maximum force.
4. **Qa4, Rb1, a4**: Various supporting moves for the queenside advance.

Black's plan:

1. **...f5**: The key break on the kingside. This attacks White's e4 pawn and opens the f-file for the rook.
2. **...f4**: After …f5, Black often pushes further with …f4, gaining space on the kingside and restricting White's pieces.
3. **...g5-g4**: The pawn storm continues. Black pushes the g-pawn to open lines against White's king.
4. **...Nf6-h5-f4**: The knight reroutes to f4, a devastating outpost where it supports the kingside attack.
5. **...Rf7-g7**: Black often doubles rooks on the g-file, preparing a decisive breakthrough.
6. **...Bh3**: Trading the light-squared bishops removes a key defender of White's king.

The race in action:

Let us continue from our diagram position:

9.Ne1 Nd7 10.Nd3 f5

Black immediately starts the kingside attack. White responds with queenside play:

11.Bd2 Nf6 12.f3 f4!

Set up your board:

This is a critical moment. Black has pushed …f4, gaining space on the kingside. Now the game becomes a pure race:

White plays: 13.b4 (starting the queenside assault) Black plays: 13…g5 (continuing the kingside storm)

14.c5 Ng6 15.cxd6 cxd6

Now White has opened lines on the queenside (the c-file), and Black has a powerful kingside pawn mass. Both attacks are rolling.

16.Rc1 g4! 17.Nb5

White attacks d6. Black attacks g2.

17…g3!

The pawn crashes forward. After 17…g3 18.h3 (or hxg3 fxg3, opening the f-file), Black's attack is ferocious. The rook on f8 will swing to the g-file, the knight on g6 will jump to f4 or h4, and the bishop on g7 will finally be unleashed.

This is the KID at its most exciting. Both sides are attacking at full speed. The position demands courage, calculation, and nerves. At the club level, this kind of position is often decided by who plays more accurately, and who stays calm under pressure.

Key principle of the Mar del Plata: Do not try to stop White's queenside play. Focus entirely on your kingside attack. The kingside attack targets the king. The queenside attack targets pawns. Checkmate beats material advantage every time.

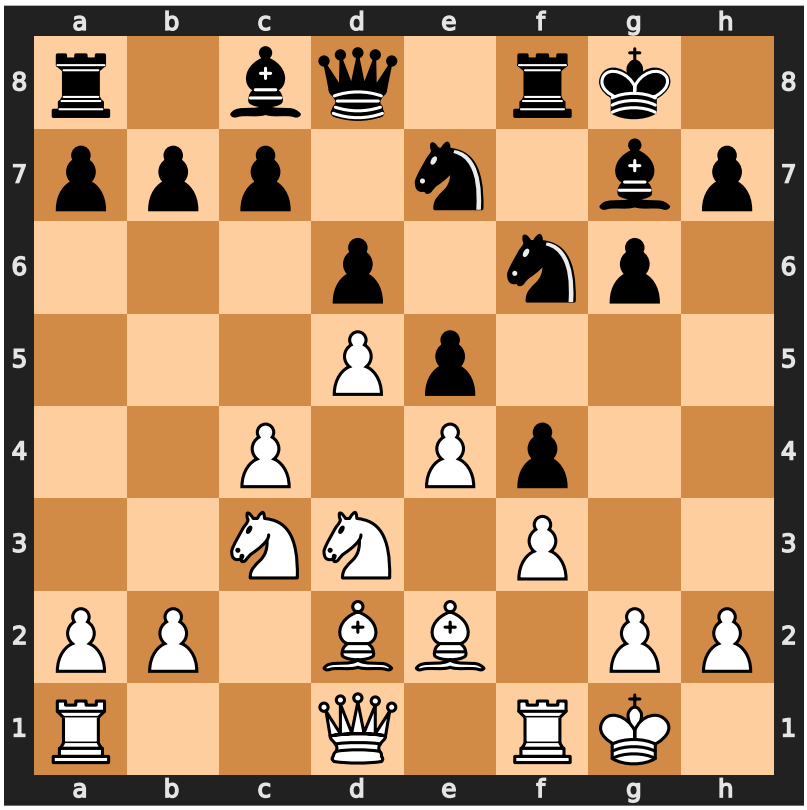

Figure 46.23: Chess Position

46.5.4 3.4: The Samisch Variation

The Samisch (1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.f3) is White's most direct attempt to crush the KID by building a massive center and controlling e4 with the f3 pawn.

Set up your board:

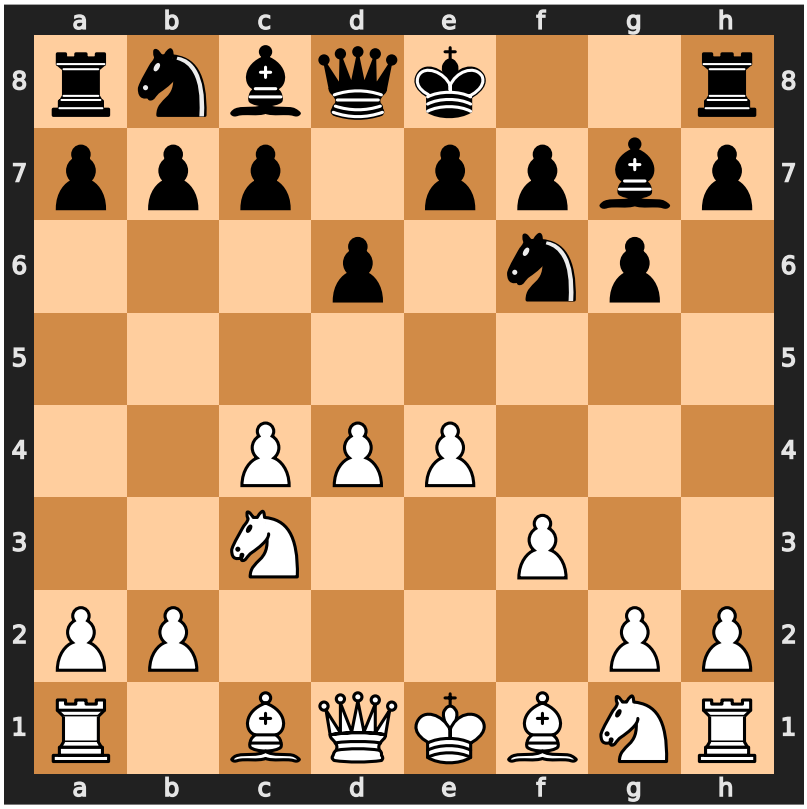

Figure 46.24: Chess Position

The pawn on f3 does several things:

1. Reinforces e4, the pawn is now solidly protected.
2. Takes away the f3 square from the knight, it will develop to e2 instead.
3. Prepares a massive center with Be3 and Qd2, followed by O-O-O and g4 (a kingside pawn storm from White's side).

How Black responds:

5...O-O 6.Be3 e5

Black plays the standard ...e5 break. Now after:

7.d5 Nh5

This knight maneuver is critical. The knight goes to h5, heading for f4. A knight on f4 is one of the most powerful pieces in the KID, it attacks d3, e2, g2, and h3, and it cannot be easily removed because the f3 pawn blocks Nf3.

8.Qd2 f5!

Black immediately strikes with …f5, the kingside break. White must decide how to handle the pawn tension.

After 9.O-O-O:

Now both sides are playing for the attack. White is castled queenside and will push g4 or play on the queenside. Black is castled kingside and will push …f4, …g5, …g4, aiming to open lines against White's king. But wait. White is castled queenside, so Black's kingside attack is targeting… nobody. The plan shifts:

Against O-O-O in the Samisch:

When White castles queenside, Black changes direction. Instead of the kingside attack, Black plays for queenside counterplay:

- **...a6 and ...b5**: Attacking White's king directly.
- **...c6**: Undermining the d5 pawn.
- **...Qa5**: Creating direct threats against White's king.

Against O-O in the Samisch:

When White castles kingside (which is less common but still possible), Black's kingside attack proceeds as in the Classical variation:

- **...f4, ...g5, ...g4**: The pawn storm.
- **...Nf4**: The knight arrives at its dream square.
- **...Bh3**: Trading light-squared bishops to remove a defender.

Key principle: In the Samisch, always look at where White's king goes. If White castles queenside, attack the queenside. If White castles kingside, attack the kingside. The target is always the king.

46.5.5 3.5: The Fianchetto Variation

The Fianchetto Variation (1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.g3 d6 5.Bg2 O-O 6.Nf3) is the quietest way for White to play against the KID. White mirrors Black's fianchetto structure, creating a symmetrical bishop formation.

Set up your board:

This looks calm. Both bishops are fianchettoed. The position is balanced. But do not be fooled, there is still plenty of chess to play.

6...Nbd7 7.O-O e5 8.e4 c6

Black plays …c6, preparing …a6 and …b5, or possibly …d5 (the central break). In the Fianchetto, Black's play is more positional and less directly attacking than in the Classical or Samisch.

Black's plans in the Fianchetto:

1. **...exd4 and ...c5**: Opening the center and placing a pawn on c5 to control d4.
2. **...a6, ...Rb8, ...b5**: Queenside expansion, gaining space and creating targets.
3. **...Re8 and ...e4**: A central push that gains space and restricts White's knight.

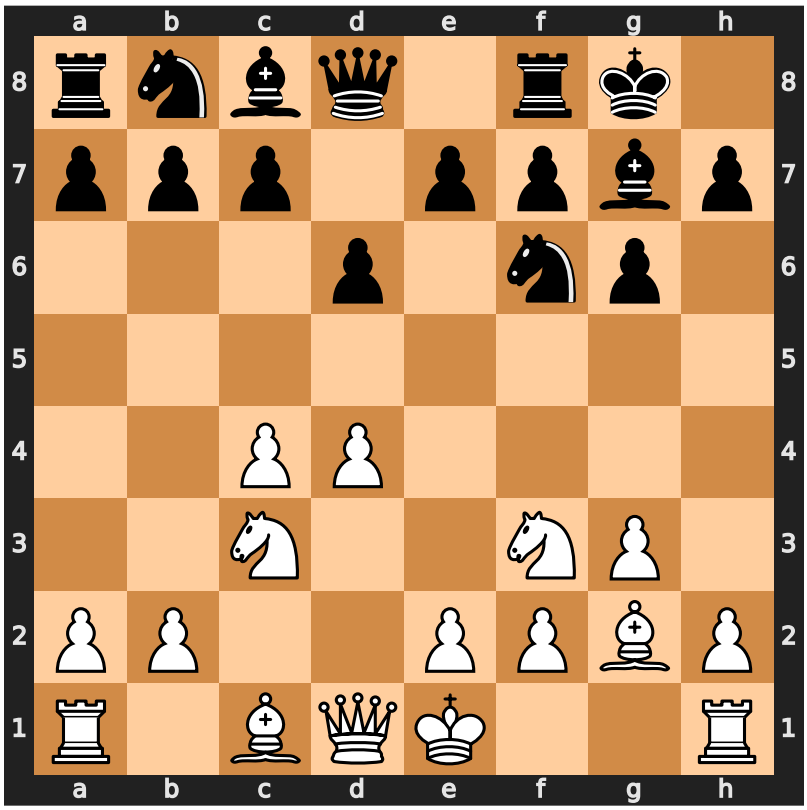

Figure 46.25: Chess Position

4. **...Nh5 followed by ...f5**: Even in the Fianchetto, the kingside break is sometimes correct.

The key idea in the Fianchetto: ...c6 and ...d5.

This is the "equalizing" break. If Black can successfully play …d5, the position opens up and Black achieves full equality (or more). White must play actively to prevent this. After …d5, Black's bishops come alive, the center becomes fluid, and the game becomes a battle of equal chances.

9.h3 Qb6

The queen comes to b6, pressuring b2 and d4. This is a standard idea in the Fianchetto. White must deal with the pressure:

10.d5 cxd5 11.cxd5

Now the position resembles a Benoni structure. White has a passed d-pawn, Black has an isolated a-pawn but also queenside activity. The game is complex and strategic.

Key principle: In the Fianchetto Variation, play positionally. There is no need to rush a kingside attack. Focus on the center (…d5 is the dream break), develop all your pieces, and look for small advantages. The Fianchetto KID is a marathon, not a sprint.

46.5.6 3.6: When NOT to Play the KID

The KID is a wonderful opening, but it is not appropriate in every situation. Here are the situations where you should consider a different defense:

1. When you need a draw.

The KID is a fighting opening. It produces sharp, unbalanced positions. If you need a draw (for example, in the last round of a tournament where a draw secures a prize), the KID is the wrong choice. Play the Queen's Gambit Declined or the Nimzo-Indian instead, openings that lead to solid, balanced positions.

2. When you are exhausted.

The KID demands calculation and energy. In a long tournament, when you are tired, the KID's sharp positions can be dangerous. Mistakes in the KID are often fatal. If your brain is fried, choose a quieter opening.

3. When your opponent is a KID specialist.

If you know your opponent has deep knowledge of the KID (from White's side), you may be walking into their preparation. The KID has been analyzed to extreme depth, and a well-prepared White player can steer the game into theoretically dangerous territory. In this case, surprise them with a different defense.

4. When the position type does not suit you.

Be honest with yourself. If you hate attacking chess and prefer quiet positional play, the KID will frustrate you. Some players thrive on the KID's energy. Others are miserable in sharp positions. There is no shame in preferring a different style. Play openings that match your personality.

A note on confidence: If you enjoy the KID, play it. The "when NOT to play" guidelines above are about being practical, not about being scared. The KID is a proven weapon at every level. Fischer, Kasparov, Nakamura, Radjabov, these are not weak players. If the KID is your style, own it.

Part 3 theory complete. You now understand the three main variations of the KID: Classical (Mar del Plata), Samisch, and Fianchetto. Take a break if you need one. The annotated games are next.

46.6 Part 4: Annotated Master Games

These five games demonstrate the ideas from Parts 1–3 in real competition. Play through each one on a physical board. Reading the moves on a page is not the same as seeing them on a board. The patterns will stick better if your hands move the pieces.

For each game, we provide the complete move list with annotations, the key moments in diagram form, and the lesson the game teaches.

46.6.1 Game 34: Smyslov vs Reshevsky, Zurich Candidates Tournament, 1953

Opening: King's Indian Defense, Fianchetto Variation Theme: Positional mastery in the KID, how Black equalizes in the Fianchetto

Vassily Smyslov was one of the greatest positional players in chess history. His understanding of piece placement was extraordinary. In this game, playing Black against the American champion Samuel Reshevsky, Smyslov demonstrates how to handle the Fianchetto Variation with patience and precision.

1.d4 Nf6 2.c4 g6 3.g3 Bg7 4.Bg2 O-O 5.Nc3 d6 6.Nf3 Nbd7

Standard KID Fianchetto setup. Both sides have mirrored fianchetto structures. The game will be decided by who finds the better plan in the middlegame.

7.O-O e5 8.e4 c6

Smyslov plays the solid …c6, preparing either …a6 and …b5 (queenside expansion) or …d5 (the equalizing break). This is the hallmark of the Fianchetto KID: no rush, careful preparation.

9.Be3 Ng4!

An active move. The knight attacks the bishop on e3 and eyes the f2 pawn. If the bishop retreats, the knight on g4 controls key central squares.

10.Bg5 Qb6

The queen comes to b6 with dual pressure on b2 and d4. White's center is suddenly under stress.

11.h3 exd4!

Smyslov opens the center at the perfect moment. The bishop on g7 will come alive, and the knight on g4 has already disrupted White's coordination.

12.Nxd4 Nge5 13.b3 Qb4!

The queen is active, pressuring c4 and a4. Smyslov's pieces are harmoniously placed, and White's center has been dissolved.

Set up your board:

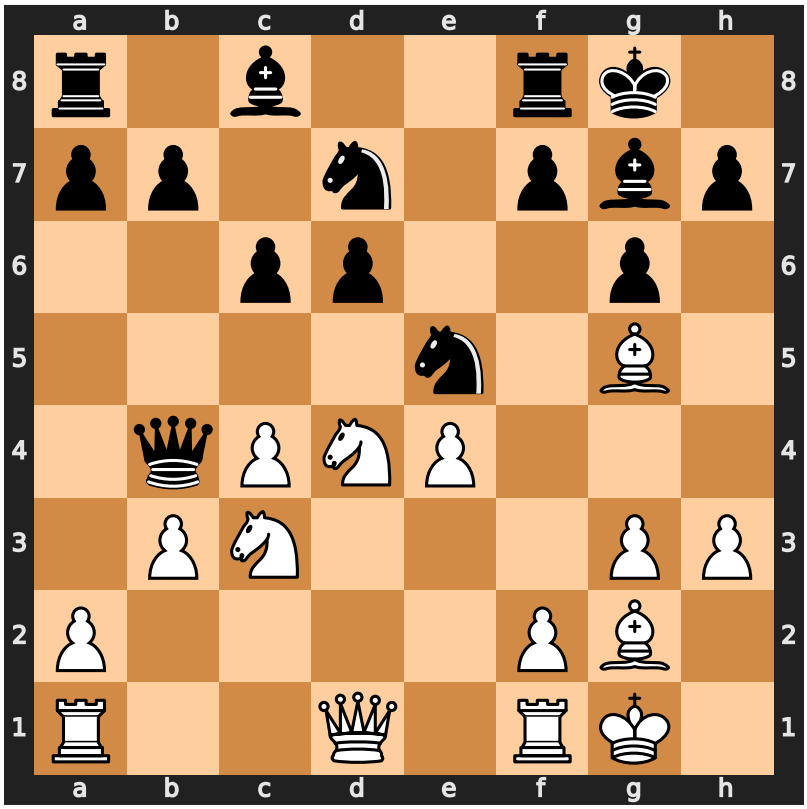

Figure 46.26: Chess Position

White is struggling to find a plan. The bishop on g5 is misplaced, the d4 knight is pinned to the defense of b3 (after …Nc5), and Black has comfortable piece activity. Smyslov has achieved the ideal outcome for Black in the Fianchetto: a balanced, slightly favorable middlegame where Black's pieces are more active.

The lesson: In the Fianchetto Variation, Black does not need to launch a spectacular attack. Careful development, the right pawn breaks (…exd4 at the right moment), and active piece placement are enough to equalize or gain an edge. Patience is the key.

46.6.2 Game 49: Botvinnik vs Tal, World Championship Match, 1961

Opening: King's Indian Defense, Classical Variation Theme: Systematic play against the KID. White's queenside attack

Mikhail Botvinnik, the "Patriarch of Soviet Chess," was the master of systematic play. In this game from his World Championship rematch against Mikhail Tal, Botvinnik demonstrates how White should conduct the queenside attack in the Classical KID.

1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5 7.d5

The Classical Variation. White closes the center and both sides prepare for opposite-wing play.

7...Nbd7 8.Bg5!

An important move. The bishop pins the knight on f6 and restricts Black's ability to play …f5 comfortably. This is a positional nuance: by pinning the knight, White slows down Black's kingside play.

8...h6 9.Bh4 a6 10.O-O Qe8

Black prepares to unpin with …Nh7 or …g5. The queen on e8 supports the e5 pawn and prepares to swing to the kingside via h5 or f7.

11.Nd2 Nh7 12.b4!

Botvinnik starts the queenside assault. The b4 push gains space and prepares c5.

12...f5 13.f3

White reinforces the center. The pawn on f3 prevents …f4 from being played with maximum effect, and it keeps the e4 pawn firmly defended.

13...Ndf6 14.a4

Systematically expanding on the queenside. Every move has a purpose: gain space, prepare c5, create targets.

Set up your board:

Black has a kingside attack in preparation (…f5 has been played), but White's queenside expansion is further advanced. Botvinnik's systematic approach (b4, a4, c5) creates real problems on the queenside that Black cannot ignore.

14...g5 15.Bf2 Ng6 16.c5!

The breakthrough. White opens lines on the queenside, and Black's kingside attack has not yet generated concrete threats. Botvinnik's systematic play has given White a clear advantage.

The lesson: The KID is not one-sided. White has powerful resources in the queenside attack. Systematic, patient expansion with b4, a4, and c5 can be extremely effective, especially when Black's kingside attack is slow to develop. This game shows why calculation and timing matter on both sides.

46.6.3 Game 51: Smyslov vs Botvinnik, World Championship Match, 1957

Opening: King's Indian Defense, Classical Variation Theme: Positional treatment of the KID, when Black plays for ...d5

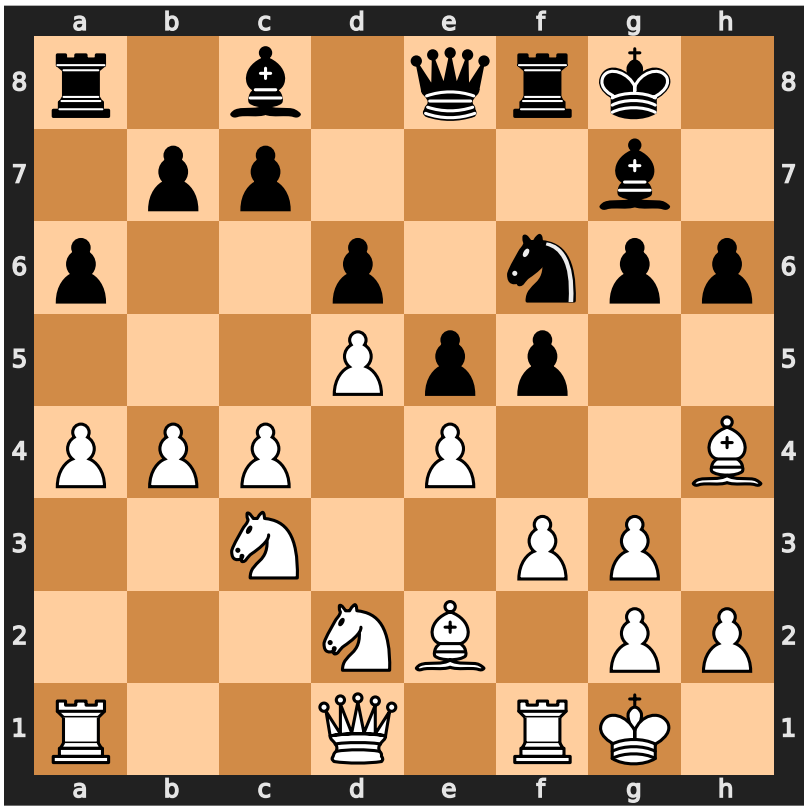

Figure 46.27: Chess Position

In this game between two World Champions, Smyslov handles the Black side of the KID with a different approach: instead of the typical kingside attack, he plays for the central break …d5.

1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5 7.O-O Nc6

Instead of 7…Nbd7 (the Mar del Plata setup), Smyslov plays 7…Nc6. This aims for a different treatment. The knight on c6 pressures d4, and Black plans to capture on d4 and then play for …d5.

8.d5 Ne7 9.Nd2 c5

Black locks the center. Now the pawn structure is fixed: White's d5 pawn vs Black's c5 and e5 pawns. The knight on e7 will reroute to d7 and then support …f5.

10.a3 Ne8 11.b4 b6 12.Rb1 f5!

The kingside break, but Smyslov has prepared it carefully. The knight has retreated to e8 to support …f5, and the c5 point is defended.

13.exf5 gxf5 14.f4 e4!

A bold decision. Smyslov pushes the e-pawn to e4, gaining space in the center and restricting White's pieces. The bishop on g7 is now looking at an open diagonal.

Set up your board:

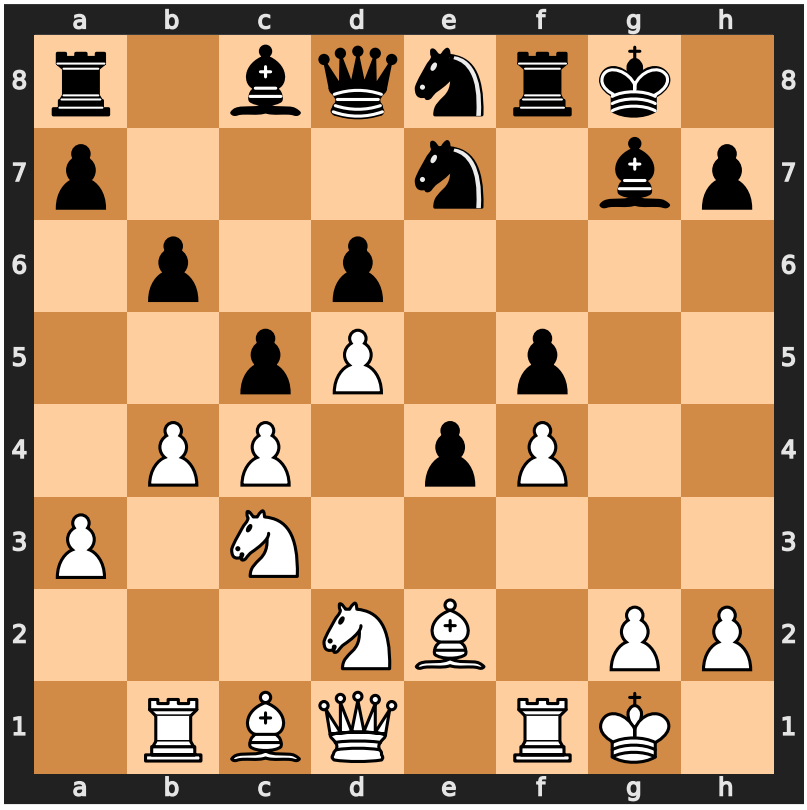

Figure 46.28: Chess Position

This is a complex position where both sides have chances. The game continued with careful maneuvering and eventually reached a position where Black's central control and active pieces gave Smyslov the advantage.

The lesson: The KID is not only about the kingside attack. Sometimes the best plan is to fight for the center with …f5, …e4, and …d5. Every position is unique, and the best KID players adapt their plans to the specific requirements of the position rather than following a formula blindly.

46.6.4 Game 54: Gligoric vs Fischer, Bled Candidates Tournament, 1961

Opening: King's Indian Defense, Classical Variation Theme: The KID from White's perspective, strategic space advantage

Svetozar Gligoric was one of the strongest KID experts from White's side. Against Bobby Fischer (who was also a KID expert as Black!), Gligoric demonstrates how to use the space advantage that the Classical Variation gives White.

1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 O-O 6.Be2 e5 7.O-O Nc6 8.d5 Ne7

The standard Classical position.

9.Nd2!

Gligoric's plan is clear: reroute the knight to c4 (or f1-e3), prepare c5, and launch the queenside attack.

9...Nd7 10.b4 f5 11.c5!

The critical break. White tears open the queenside before Black's kingside attack is fully developed.

11...Nf6 12.f3 f4

Fischer pushes …f4, gaining kingside space. The race is on.

13.Nc4 g5 14.a4 Ng6 15.Ba3!

A key move. The bishop goes to a3, where it supports the c5 push and pressures d6. It also prevents Black from playing …f3 without consequences, because the bishop would open toward the f8 square.

15...Rf7 16.b5 dxc5

Black is forced to capture on c5, conceding the d6 square.

17.Bxc5 h5

Fischer continues the attack, but White's queenside initiative is powerful.

Set up your board:

Gligoric has a strong queenside attack with the b5 pawn ready to advance, the knight on c4 controlling key squares, and the bishop on c5 putting pressure on Black's position. Fischer's kingside attack is dangerous but slower than White's queenside play. The game continued with sharp play from both sides, demonstrating the tension and excitement of the KID at the highest level.

The lesson: When playing White against the KID, the queenside attack is your primary weapon. Open lines with c5, advance the b-pawn, and use your knights and bishops to create pressure on the queenside. Do not be distracted by Black's kingside pawns, focus on your own attack and trust that it is fast enough.

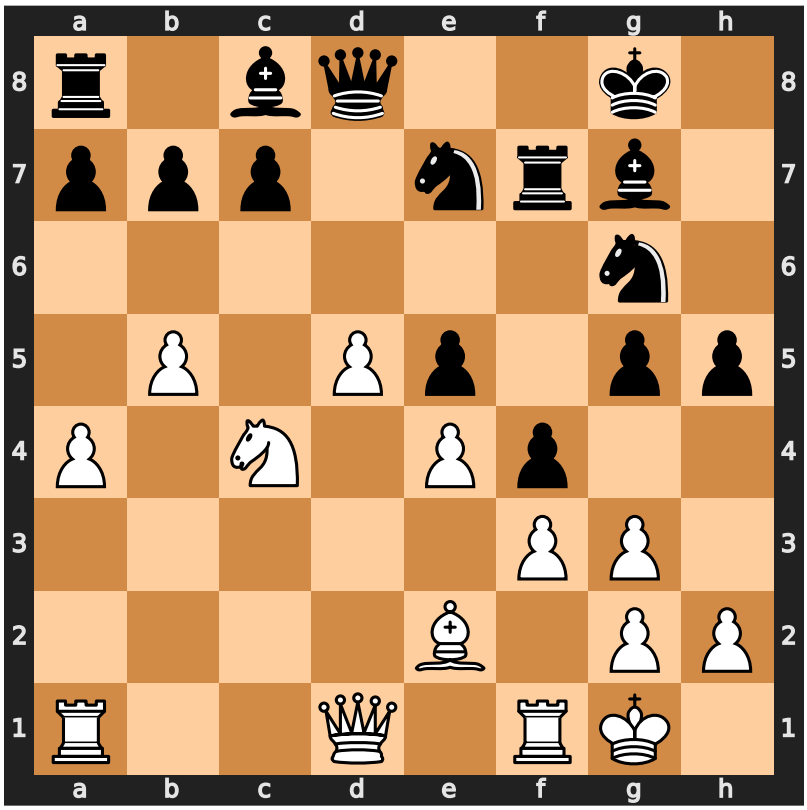

Figure 46.29: Chess Position

46.6.5 Game 57: Kasparov vs Kramnik, Linares, 1993

Opening: King's Indian Defense, Samisch Variation Theme: White's attacking power in the Samisch, a Kasparov masterclass

Garry Kasparov was not only the greatest KID player as Black, he was also devastating as White in the Samisch. In this game against Vladimir Kramnik, Kasparov demonstrates the full power of White's attacking setup in the Samisch Variation.

1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.f3 O-O 6.Be3 Nc6

Kramnik develops the knight to c6, pressuring d4 directly.

7.Qd2 a6 8.Nge2 Rb8

Black prepares …b5 for queenside counterplay.

9.Rc1 e5 10.d5 Ne7 11.Ng3!

Kasparov reroutes the knight to g3, where it eyes the f5 and h5 squares. From g3, the knight can jump to f5 (a devastating outpost) or support a g4 push.

11...Nd7 12.g4!

The kingside pawn storm begins. White does not castle, instead, the king stays in the center while the pawns advance. In the Samisch, this is common. The f3 pawn already protects e4, and the king can shelter on f2 or even remain on e1.

Set up your board:

This is an intimidating position for Black. White's pawns are marching forward on the kingside, the knight on g3 supports the advance, and the queen on d2 is ready to swing to the kingside. Kasparov played this position with characteristic energy and precision.

12...f5 13.gxf5 gxf5 14.exf5 Nxf5 15.Nxf5 Rxf5 16.Bd3!

The bishop arrives on d3, attacking the rook on f5 and adding to the pressure on Black's kingside. Kasparov's pieces are flooding toward the kingside while Black's queenside counterplay (…b5) has not yet materialized.

The lesson: In the Samisch, White's attack can be devastatingly fast. The g4 push, combined with a knight on g3 and the queen on d2, creates overwhelming pressure. When White delays castling and pushes kingside pawns, Black must find counterplay immediately or be overwhelmed. Kasparov's precision in converting the attack shows why the Samisch remains one of White's most dangerous weapons against the KID.

Five games studied. That is a serious session. Rest here. The exercises will be waiting when you are ready.

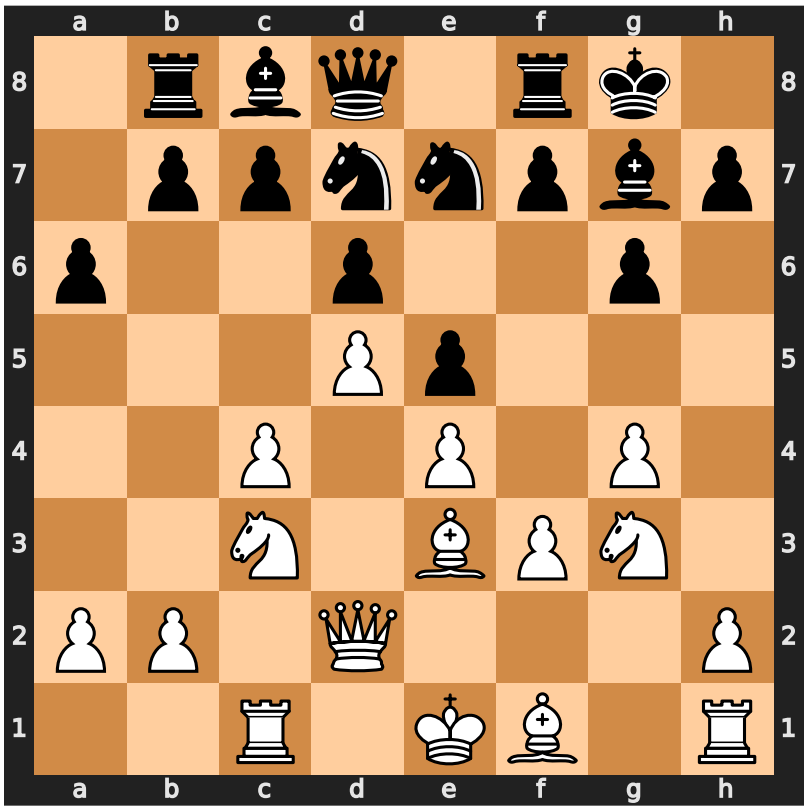

Figure 46.30: Chess Position

46.7 Part 5: Exercises

Work through these exercises on your physical board. For each one, read the position description, set up the FEN, and think for at least two minutes before checking your answer. Writing down your answer (even just a few words) helps the pattern stick.

If you get an exercise wrong, that is valuable information. It tells you exactly what to study next. Wrong answers are not failures. They are guides.

46.7.1 Section A: King's Indian Attack — Find the Plan (–)

Exercise 18.1

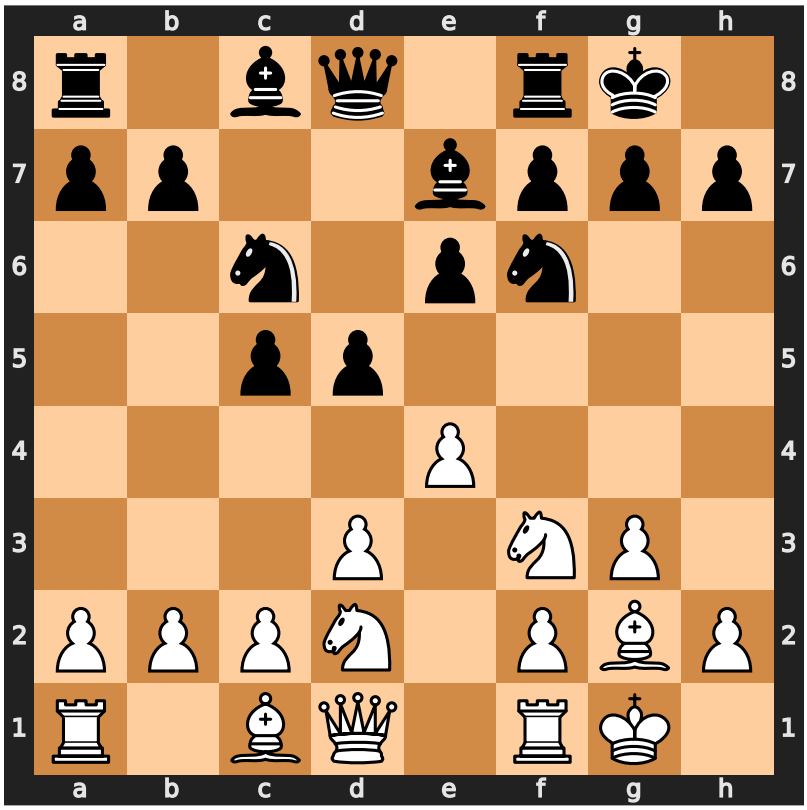

Figure 46.31: Chess Position

White to play. You have the full KIA setup against a French-type structure. What is White's most important move?

Hint 1: What pawn break defines the KIA against …e6 structures? Hint 2: Which pawn wants to advance to the fifth rank? Hint 3: The move drives Black's knight away from f6.

Exercise 18.2

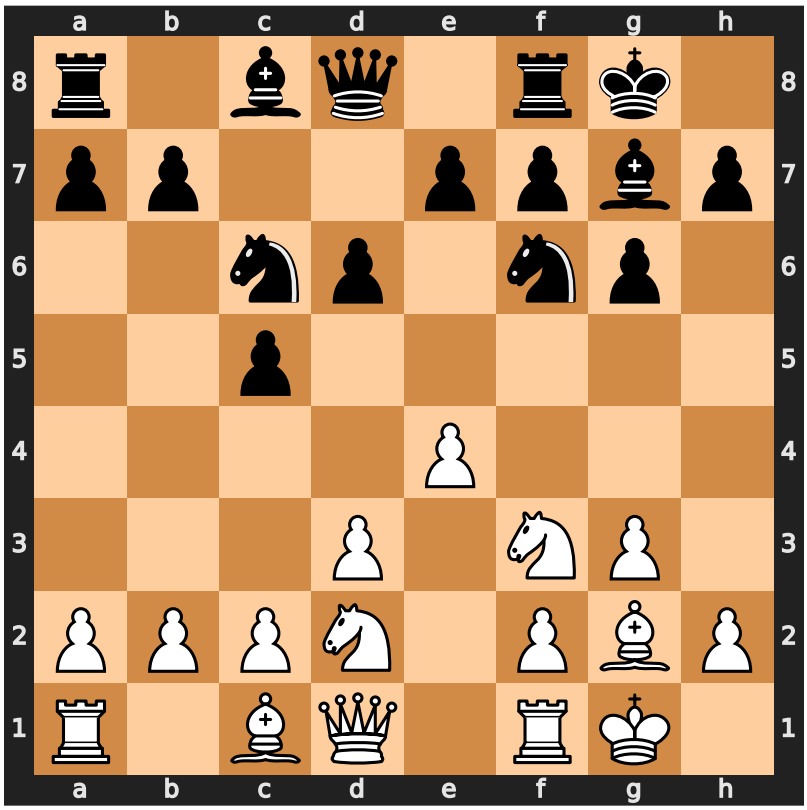

Figure 46.32: Chess Position

White to play. Black has a Sicilian-type fianchetto setup. What preparatory move does White need before playing f4?

Hint 1: Which piece is on f3 and blocking the f-pawn? Hint 2: Where should the knight go to clear the way? Hint 3: The knight on h4 also eyes a key square.

Exercise 18.3

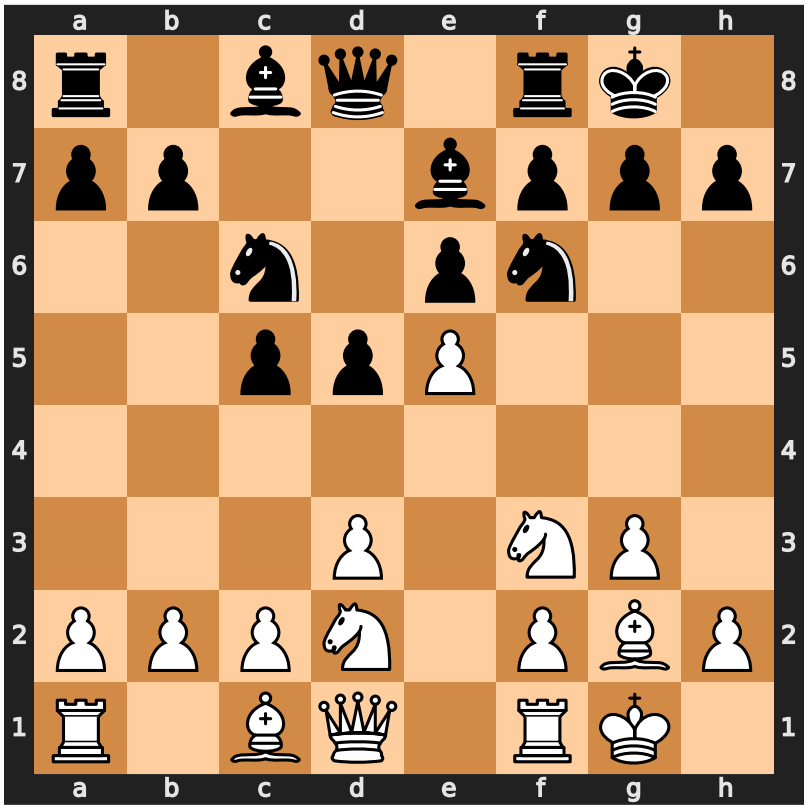

Figure 46.33: Chess Position

White has just pushed e5. Where does Black's knight on f6 go?

Hint 1: The knight is attacked and must move. Hint 2: It should not retreat to g8, that is too passive. Hint 3: The knight goes to a square where it can later support …f6.

Exercise 18.4

White has pushed e5 and h4. What should Black do?

Hint 1: Black must create counterplay quickly. Hint 2: Which side of the board is White not attacking? Hint 3: The answer involves a pawn move on the queenside.

Exercise 18.5

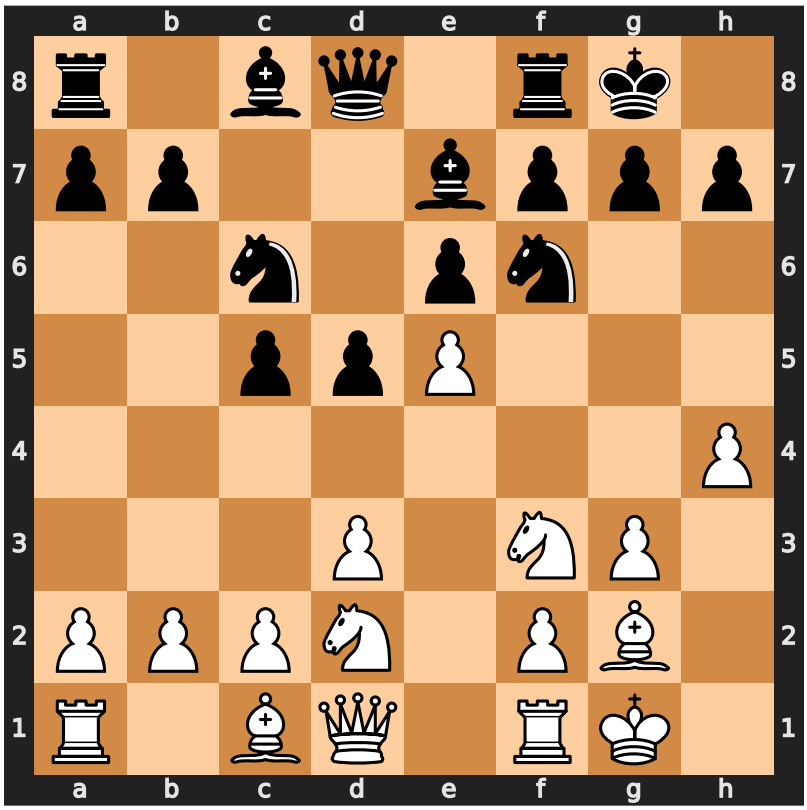

Figure 46.34: Chess Position

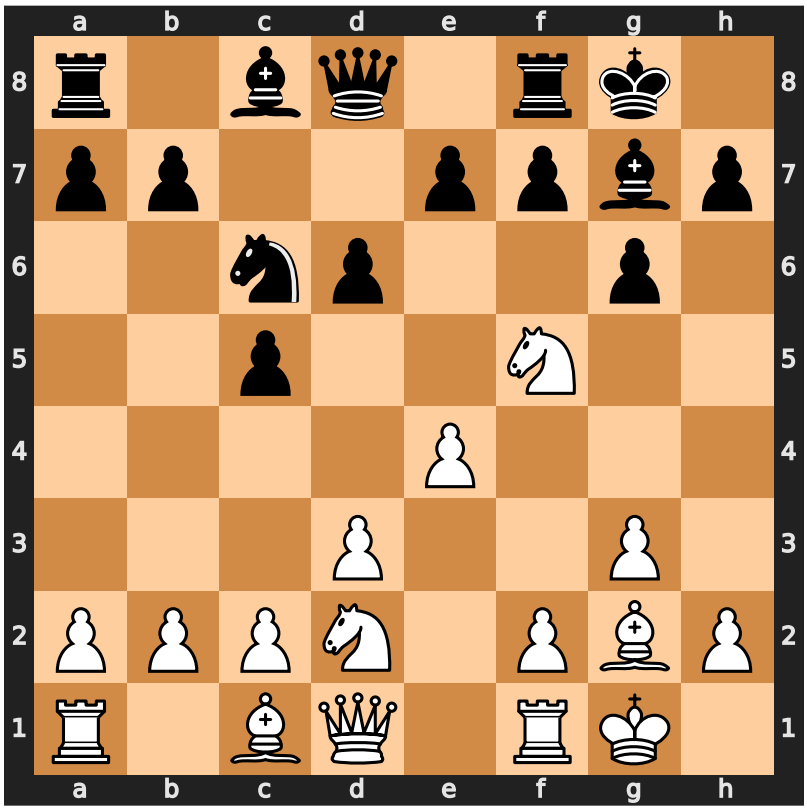

Figure 46.35: Chess Position

White's knight has reached f5. What should Black do about it?

Hint 1: Should Black trade the knight or leave it? Hint 2: If …Bxf5 exf5, what happens to the e-file and f5 pawn? Hint 3: Sometimes tolerating a strong knight is better than giving the opponent a strong pawn.

Exercise 18.6

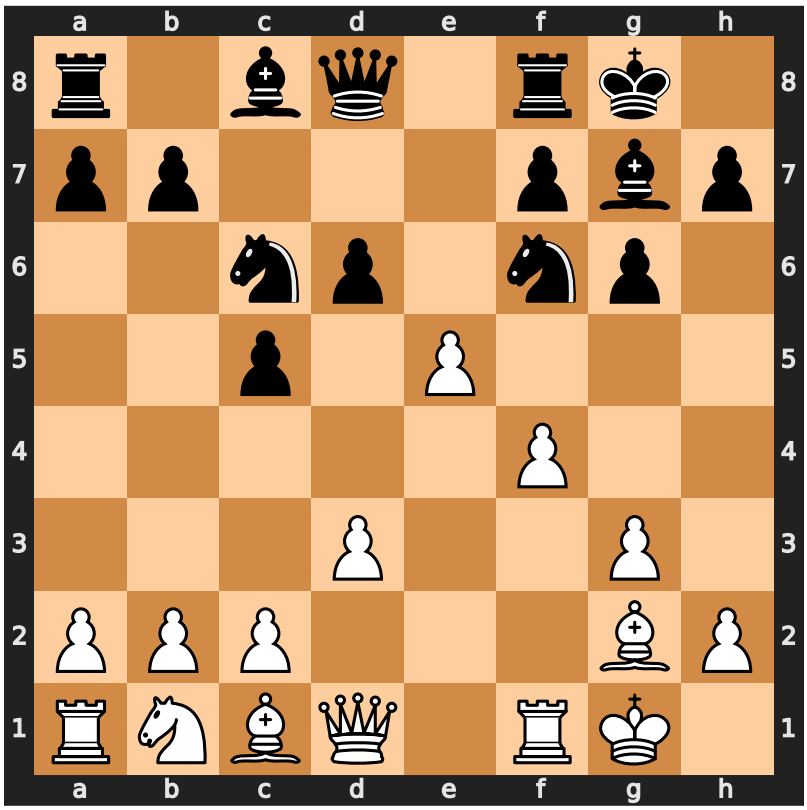

Figure 46.36: Chess Position

White has played e5 and f4 against a Sicilian setup. The center is tense. Should White push f5 or exchange on d6?

Hint 1: What does f5 do to the g6 pawn? Hint 2: What does exd6 give Black? Hint 3: Generally, attacking moves are better than exchanges when you have the initiative.

Exercise 18.7

White has a KIA-type position against a Caro-Kann structure. What is White's plan?

Hint 1: The center is balanced. What pawn break opens it? Hint 2: The g2 bishop benefits from open lines. How do you open them? Hint 3: Consider c4, challenging the d5 pawn.

Exercise 18.8

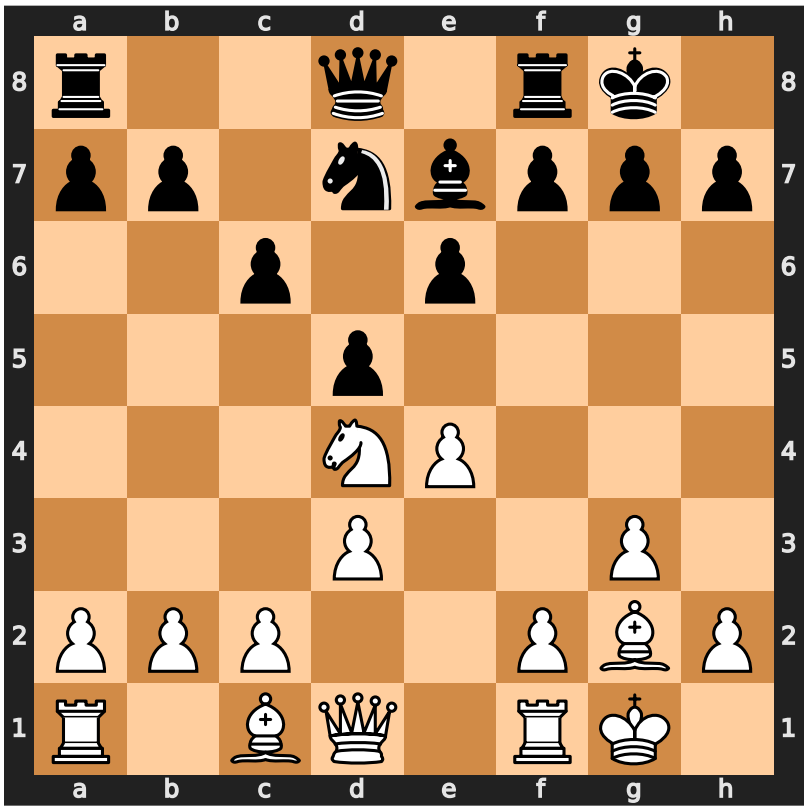

Figure 46.37: Chess Position

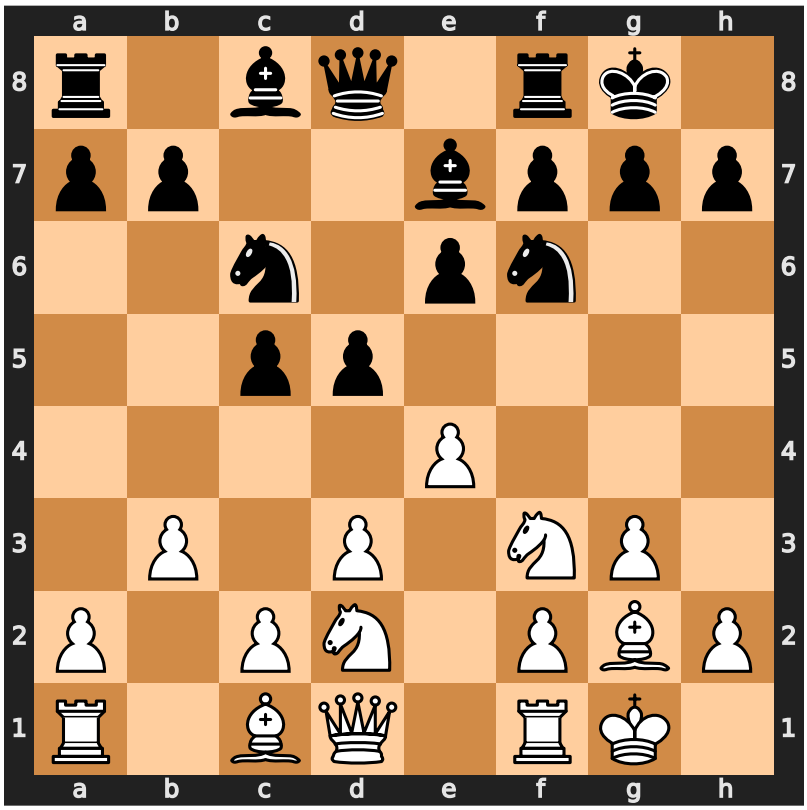

Figure 46.38: Chess Position

White has played b3 in the KIA. What is the purpose of this move, and what does White plan next?

Hint 1: What square does b3 open for the bishop? Hint 2: The bishop on c1 wants to go to b2 or a3. Hint 3: Bb2 puts the bishop on the same diagonal as the g2 bishop, doubled fianchetto!

Exercise 18.9

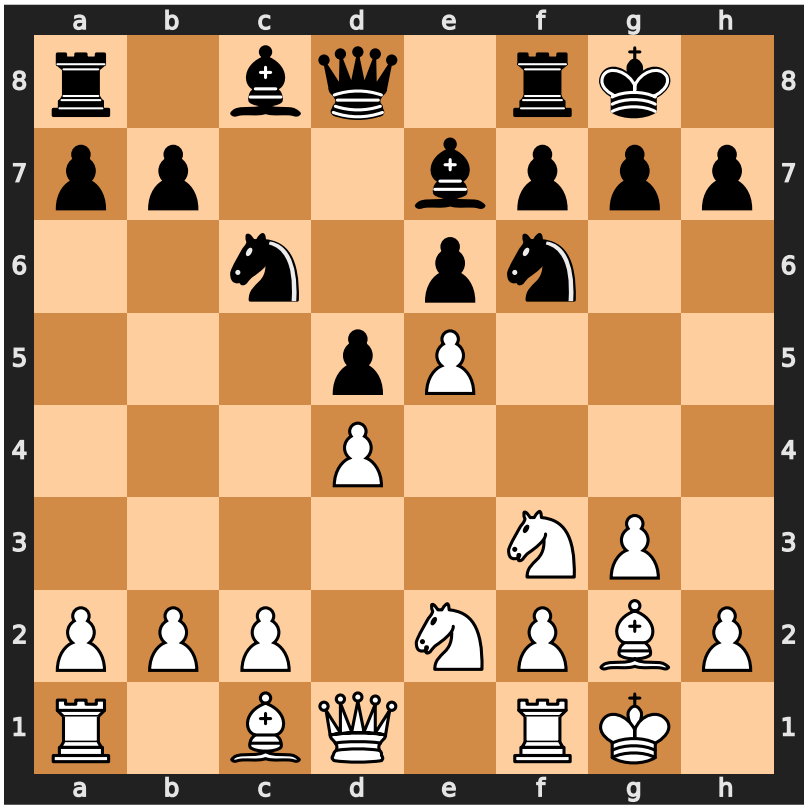

Figure 46.39: Chess Position

After e5, Black's knight on f6 is attacked. Is …Ne4 a good response?

Hint 1: If the knight goes to e4, is it stable there? Hint 2: What pieces can attack a knight on e4? Hint 3: The knight might get chased away, …Ne4, f3 would force it to move again.

Exercise 18.10

White has a powerful knight on c4, pawns on e5 and f4, and a strong position. Find Black's best defensive move.

Hint 1: Black needs to challenge White's center. Hint 2: Which pawn break undermines e5? Hint 3: …f6 challenges the e5 pawn directly. Is the timing right?

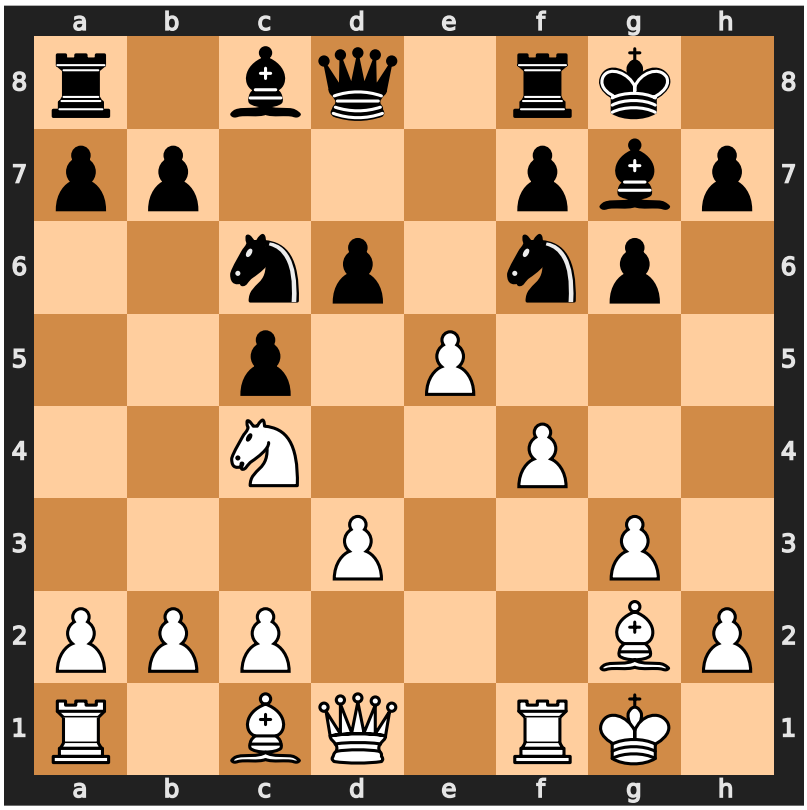

Figure 46.40: Chess Position

46.7.2 Section B: Pirc/Modern Defense — Black's Key Moves (–)

Exercise 18.11

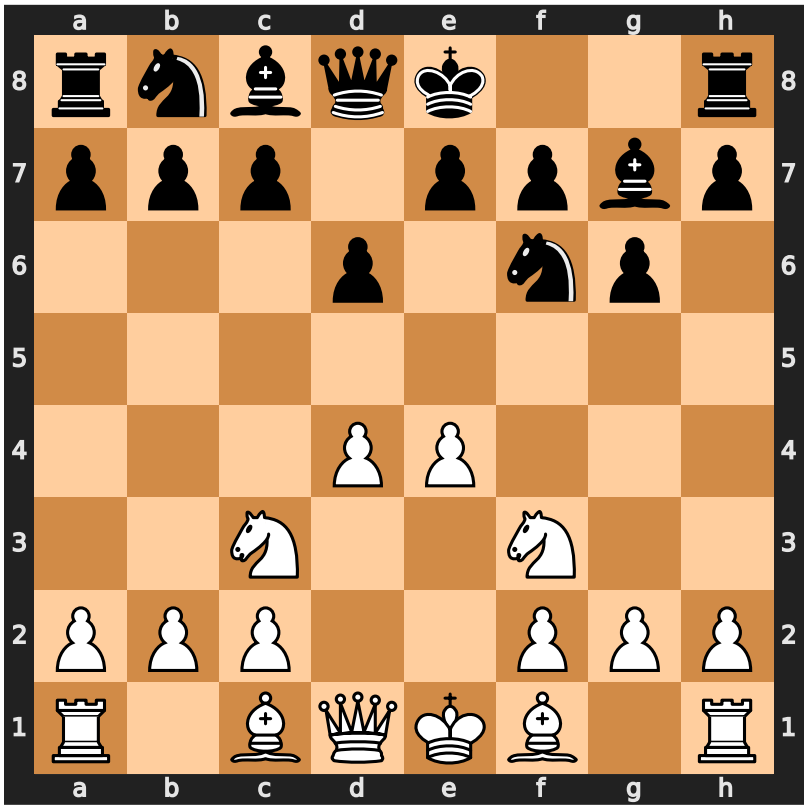

Figure 46.41: Chess Position

Black to play. The Pirc Defense position after four moves. What is Black's most important next step?

Hint 1: What does every opening prioritize? Hint 2: Where is Black's king right now? Hint 3: Castle.

Exercise 18.12

Black faces the Austrian Attack (f4 has been played). What plan should Black prepare?

Hint 1: White's center looks massive. What is the best way to attack a big center? Hint 2: The move involves Black's e-pawn. Hint 3: …e5 challenges the center directly.

Exercise 18.13

Black faces the 150 Attack (Be3 and Qd2). White will castle queenside. What is Black's most urgent priority?

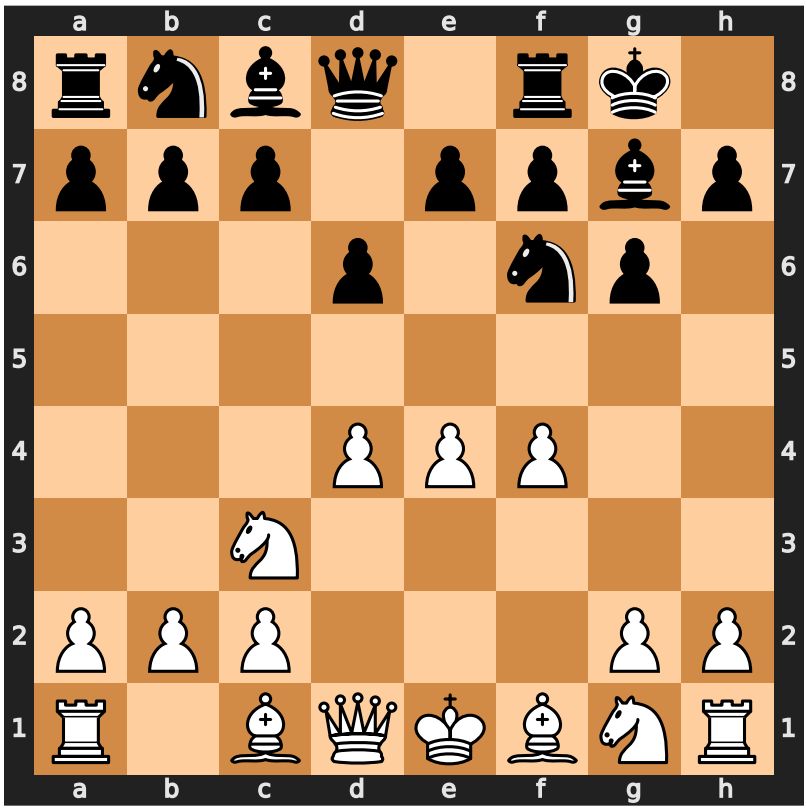

Figure 46.42: Chess Position

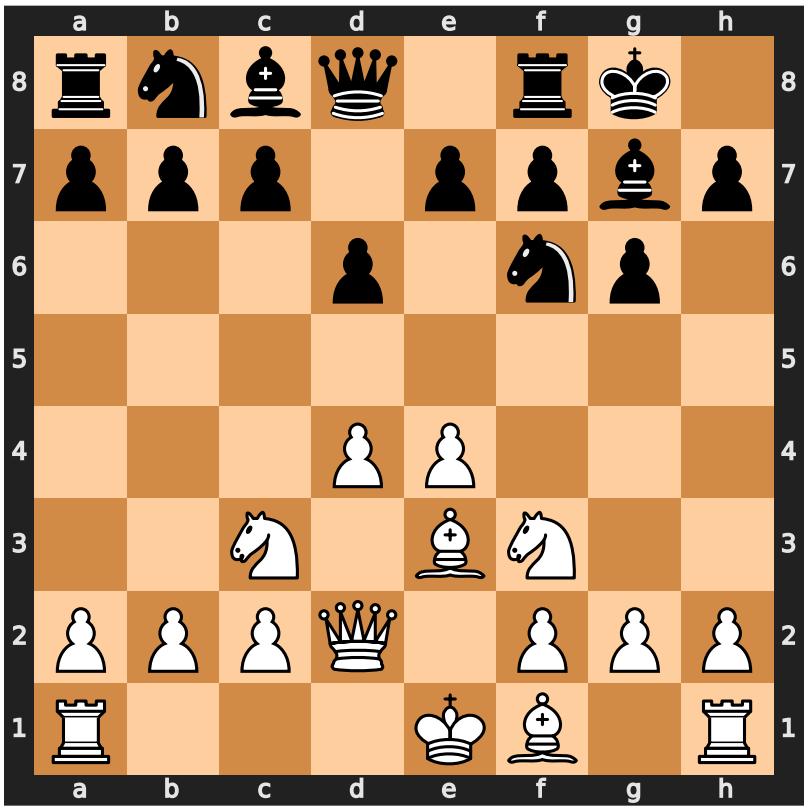

Figure 46.43: Chess Position

Hint 1: If White castles queenside, where do you attack? Hint 2: What pawn move starts queenside counterplay? Hint 3: …a6 prepares …b5, launching the counter-attack.

Exercise 18.14

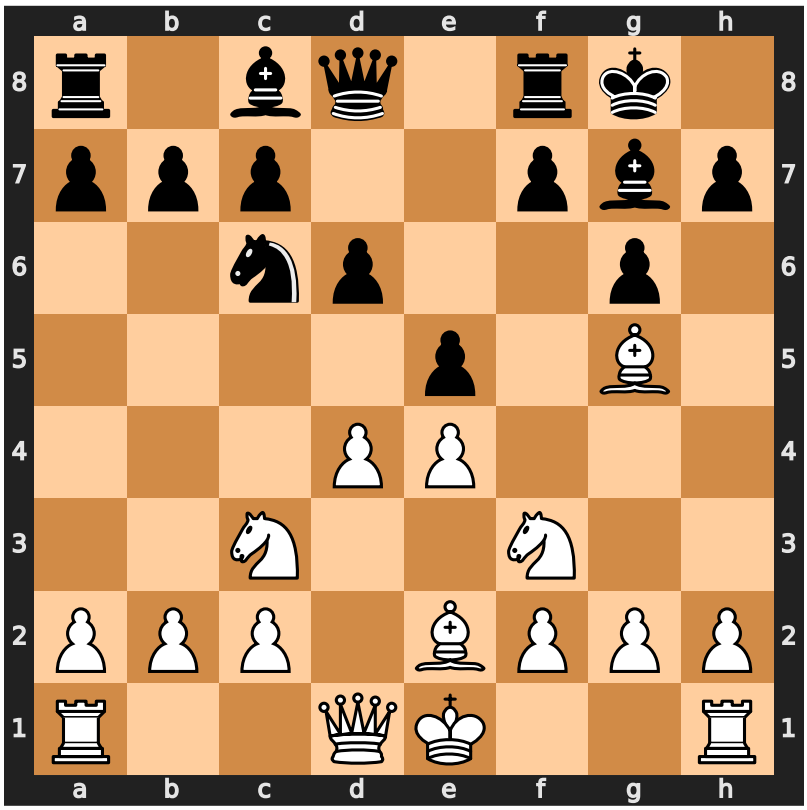

Figure 46.44: Chess Position

Black's Pirc position against the Classical. White has played Be2 and Bg5. Should Black play …h6 to chase the bishop?

Hint 1: What happens after …h6 Bh4 g5? Hint 2: Does …h6 weaken any squares around Black's king? Hint 3: Often …h6 is good, but calculate what happens after Bh4 and …g5 Nxg5. Is Black okay?

Exercise 18.15

Black to play in the Classical Pirc. All pieces are developed. What is Black's best central break?

Hint 1: Black wants to challenge the d4-e4 center. Hint 2: Which pawn break opens lines for the g7 bishop? Hint 3: …exd4 followed by …d5 is the standard plan.

Exercise 18.16

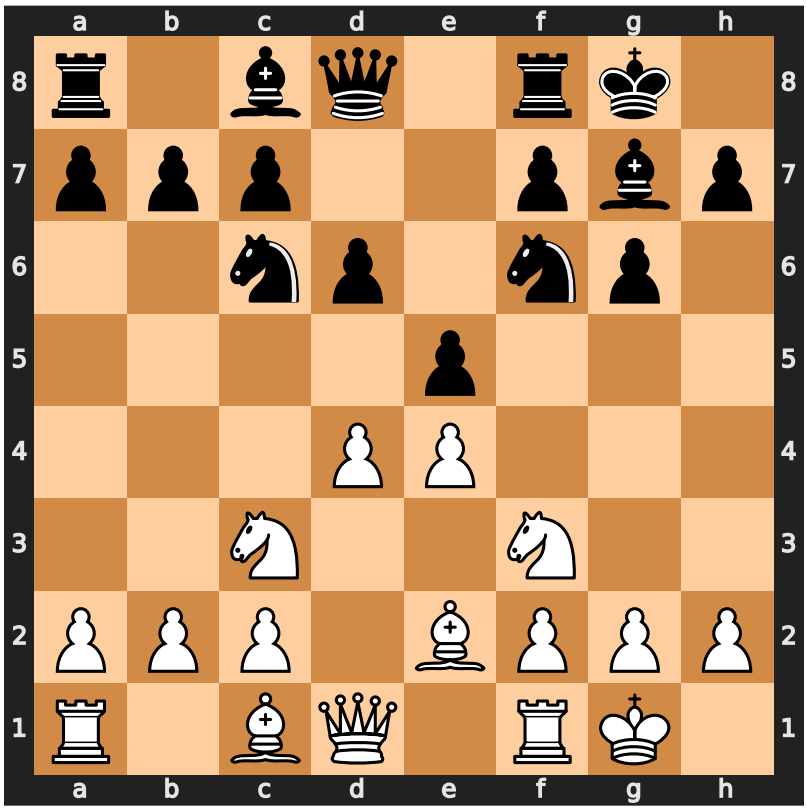

Figure 46.45: Chess Position

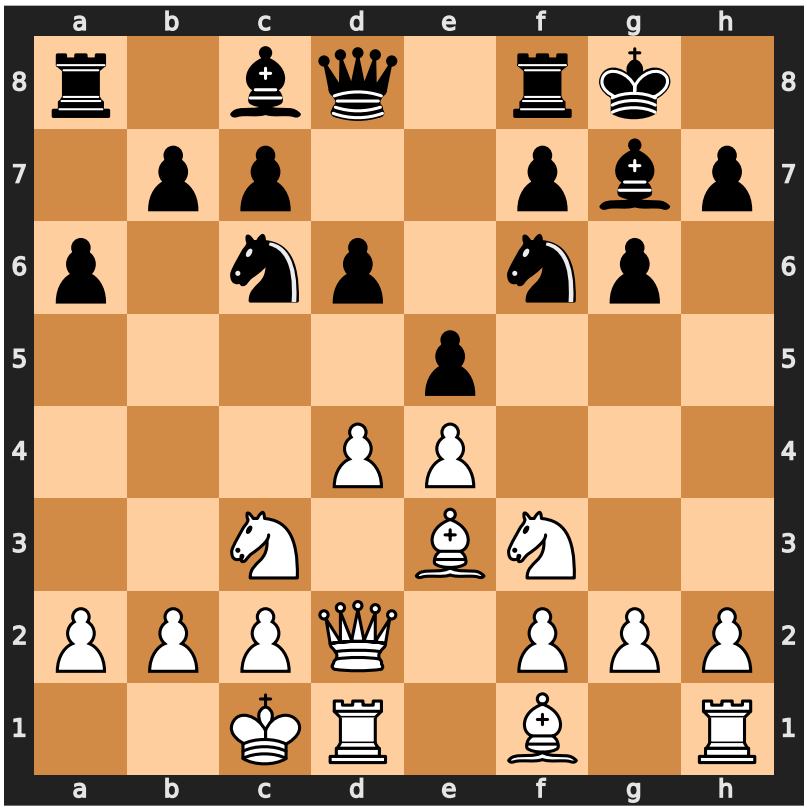

Figure 46.46: Chess Position

Black faces the 150 Attack. White has castled queenside. Black has played …a6. What is Black's next move?

Hint 1: You have prepared …b5. Is it time? Hint 2: Look at Black's bishop on g7. Is it doing anything right now? Hint 3: …b5! pushes forward. The bishop on g7 will come alive later when lines open.

Exercise 18.17

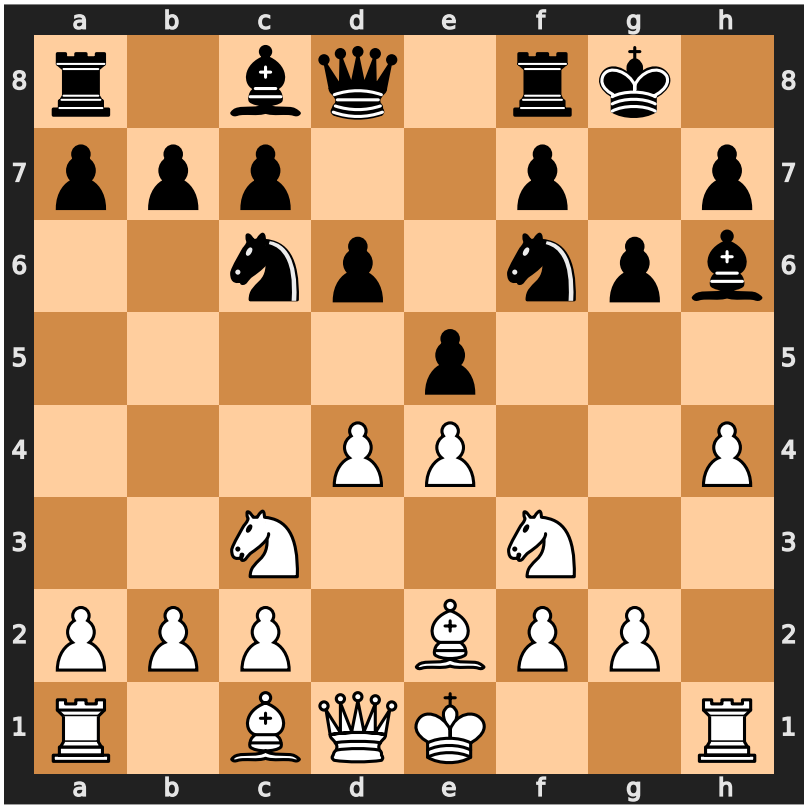

Figure 46.47: Chess Position

White has pushed h4 and Black's bishop has retreated to h6. Was this a good exchange of moves for Black?

Hint 1: Where was the bishop on g7 pointing? Where is it pointing on h6? Hint 2: Does the bishop on h6 still control the long diagonal? Hint 3: The bishop has lost its powerful diagonal. Black should have played …h5 to prevent h4, or simply …h6 earlier when the bishop was on g5.

Exercise 18.18

White has pushed e5 in the Pirc. How should Black respond?

Hint 1: The e5 pawn is attacking the f6 knight. Should Black take? Hint 2: After …dxe5, what happens to the center? Does this help or hurt Black? Hint 3: …dxe5 dxe5 Qxd1 Rxd1 Ng4! is a strong tactical idea. The knight attacks e5 and eyes f2.

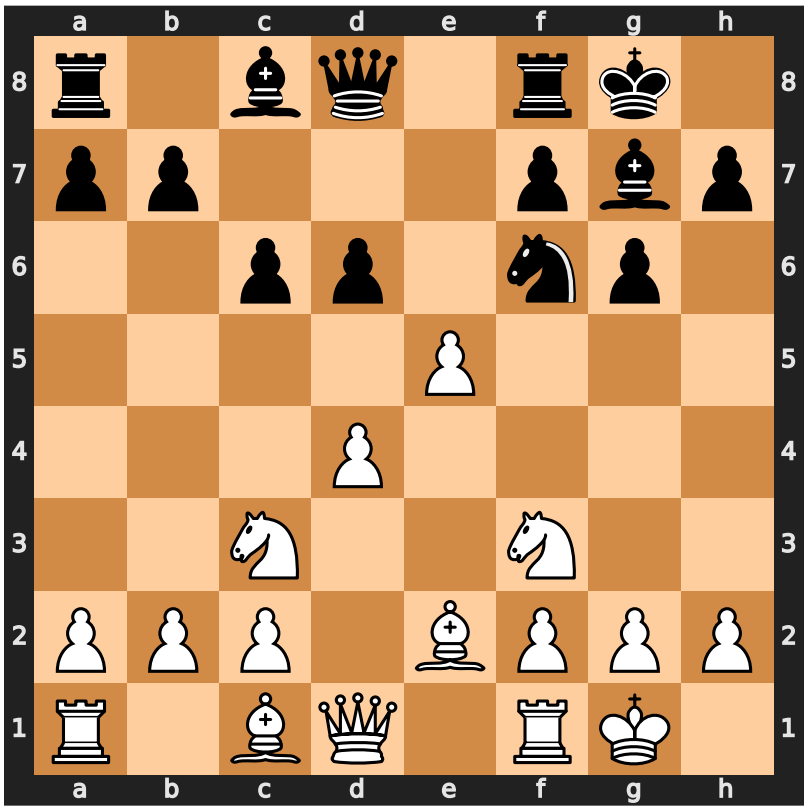

Figure 46.48: Chess Position

Exercise 18.19

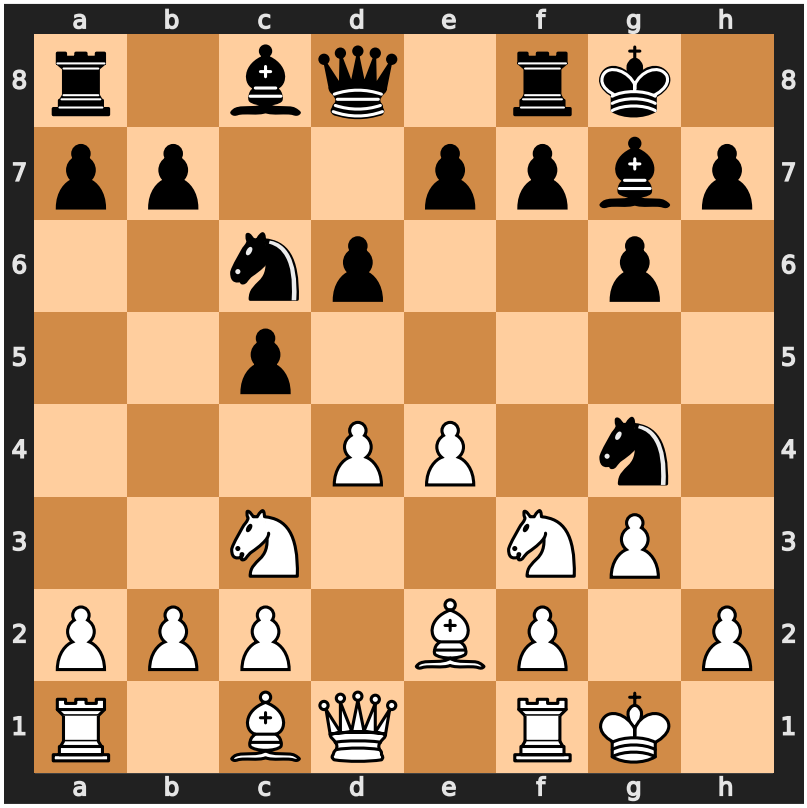

Figure 46.49: Chess Position

Black has jumped a knight to g4 after …e5 dxe5 dxe5. This looks aggressive. Is it good for Black?

Hint 1: The knight on g4 attacks f2 and e3. Is there a concrete threat? Hint 2: White can play h3, chasing the knight. Where does it go? Hint 3: After h3 Nf6, Black has wasted a tempo. The knight jump was premature.

Exercise 18.20

The 150 Attack in full swing. White has castled queenside and played f4. Black has …Qb6 applying pressure. Find Black's most dynamic continuation.

Hint 1: White is preparing a kingside assault. Black must act on the queenside NOW. Hint 2: What pawn break opens lines against White's king? Hint 3: …a5 or …b5, but which is more direct? …b5! opens the b-file immediately.

46.7.3 Section C: King's Indian Defense — Attack and Defense (–)

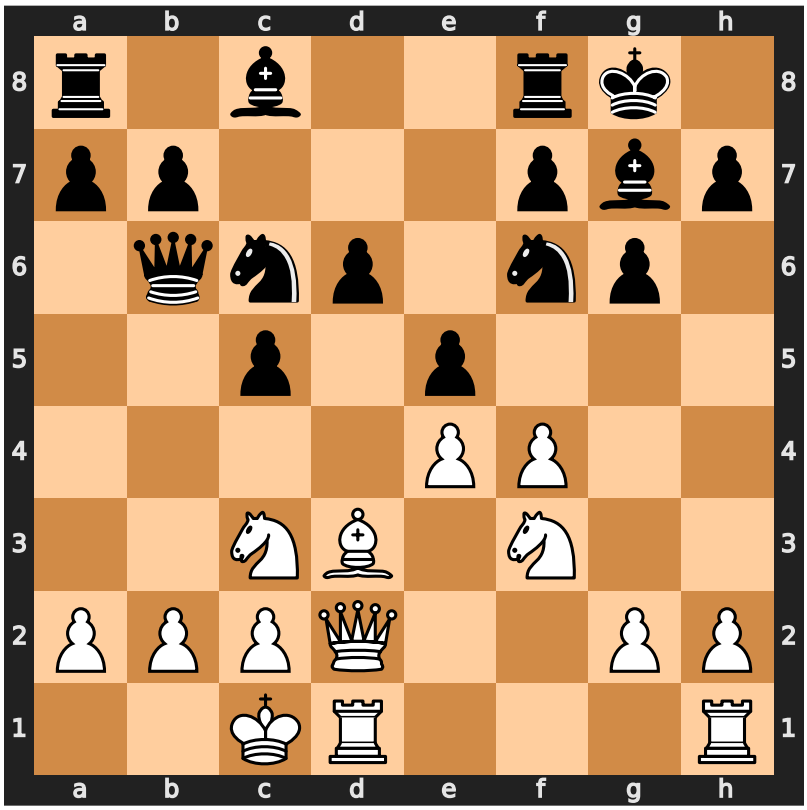

Figure 46.50: Chess Position

Exercise 18.21

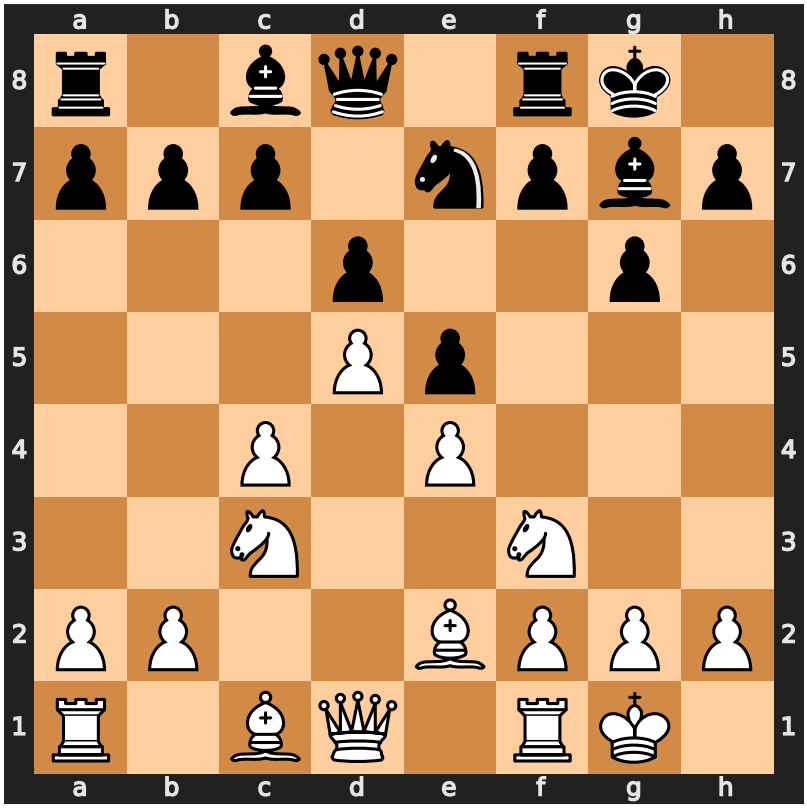

Figure 46.51: Chess Position

Black to play in the Classical KID. The center is closed (d5 has been played). What is Black's first priority?

Hint 1: The typical KID plan after d5 involves a pawn break. Hint 2: Which pawn break attacks the kingside? Hint 3: …f5 is the signature KID kingside break.

Exercise 18.22

Black has played …f5 and …f4 in the KID. What should White do?

Hint 1: Black is gaining space on the kingside. White should counter on the other side. Hint 2: What is White's standard queenside plan? Hint 3: b4! starts the queenside attack. The race is on.

Exercise 18.23

White to play in the Samisch Variation. What is White's most important developing move?

Hint 1: White needs to develop the dark-squared bishop. Hint 2: Which square gives the bishop maximum influence? Hint 3: Be3, defending d4, supporting c5, and preparing Qd2.

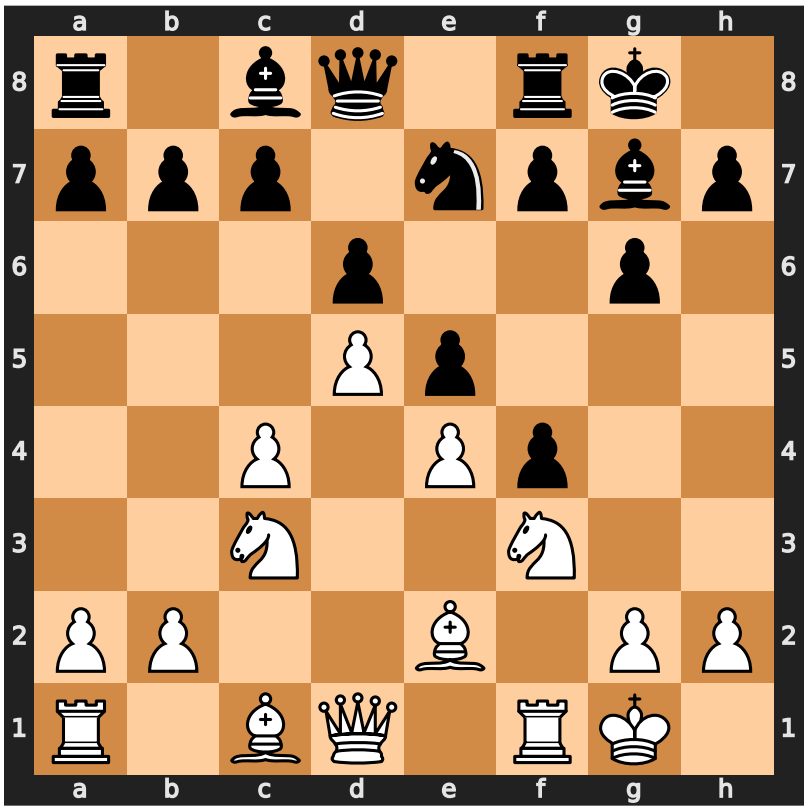

Figure 46.52: Chess Position

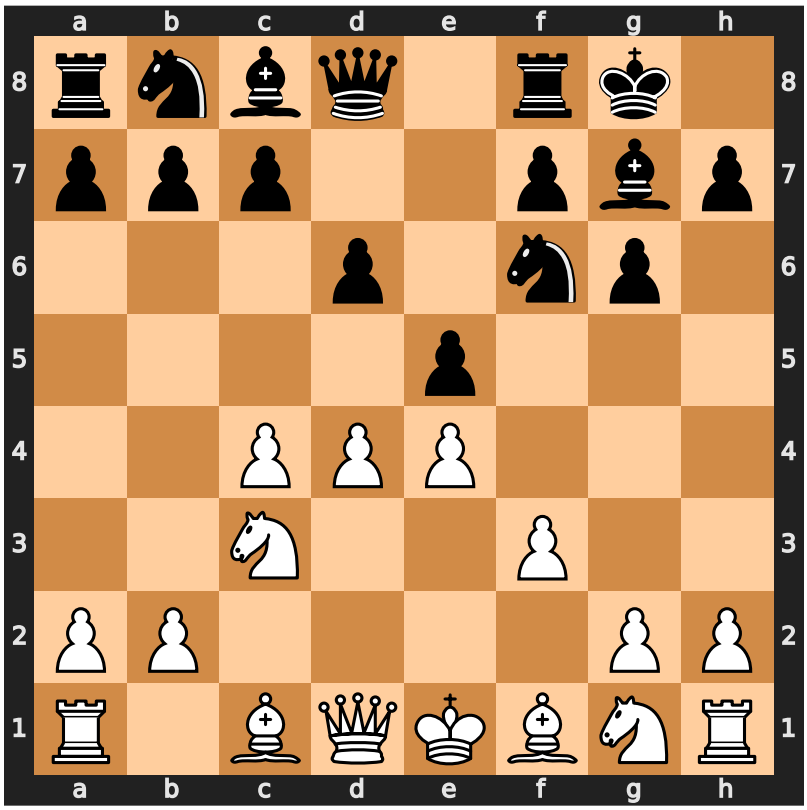

Figure 46.53: Chess Position

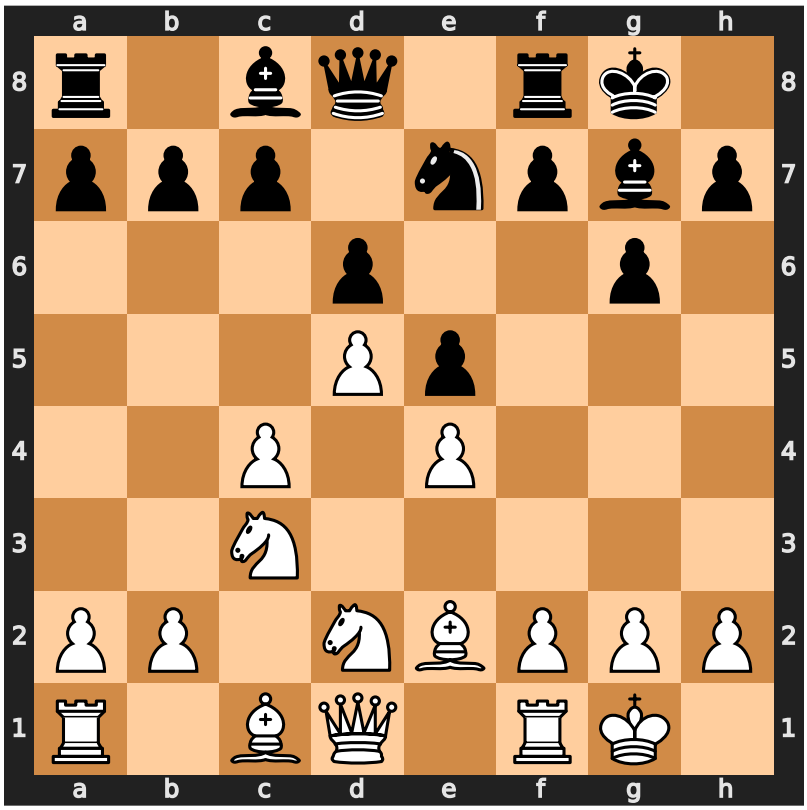

Figure 46.54: Chess Position

Exercise 18.24

Black to play in the Classical KID. White has played Nd2. What knight maneuver should Black begin?

Hint 1: Black's knight on e7 needs to find a better square. Hint 2: The knight is heading for the kingside. Hint 3: …Nd7 first, then later …f5 and …Nf6-h5-f4.

Exercise 18.25

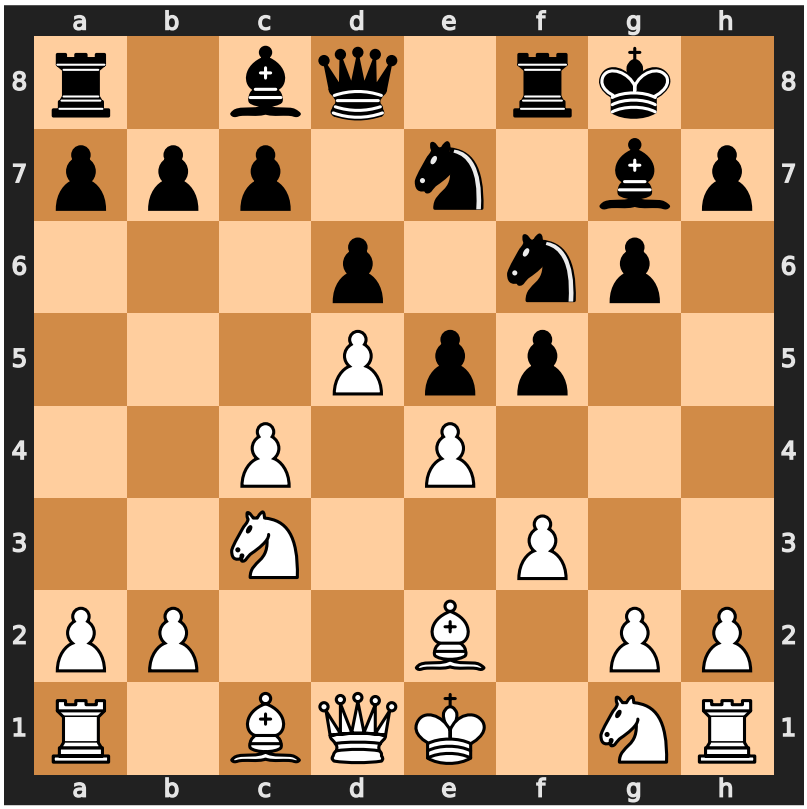

Figure 46.55: Chess Position

White to play in the Samisch. Black has played …f5. Should White take (exf5) or push (e5)?

Hint 1: After exf5 gxf5, what is the resulting structure? Is it good for White? Hint 2: After e5, what happens to the knight on f6? Hint 3: Generally in the Samisch, exf5 is preferred because it opens the e-file and creates weaknesses in Black's pawn structure around the king.

Exercise 18.26

Black to play in the Samisch. White has a knight on g3 and pawns are about to clash. What should Black play?

Hint 1: Black should continue the kingside attack. Hint 2: What happens if Black plays …f4? Hint 3: …f4! drives the knight from g3 and gains space. After Be2 or Nf1, Black has a strong kingside presence.

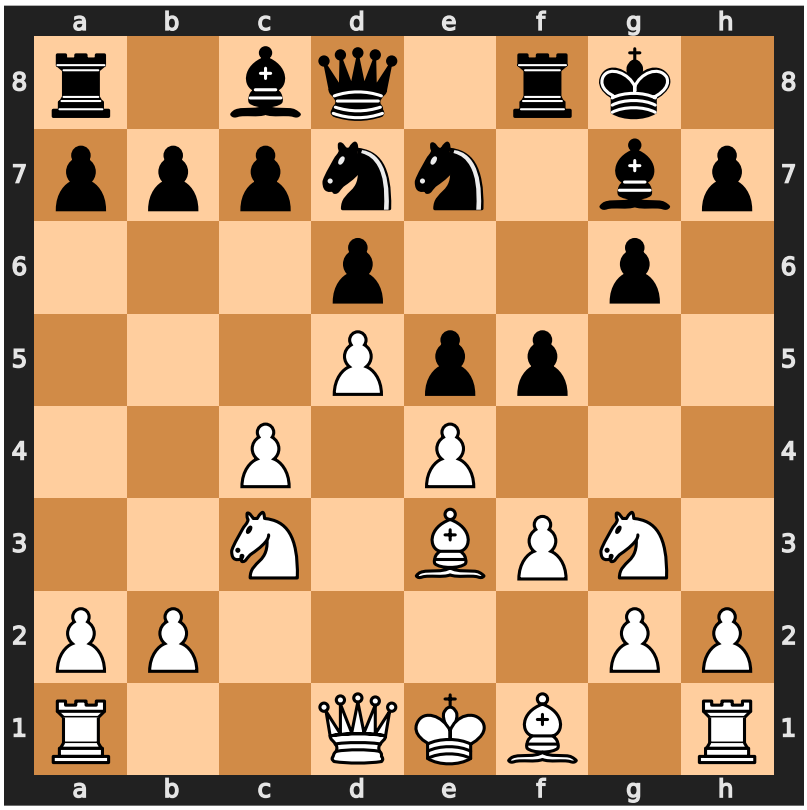

Figure 46.56: Chess Position

Exercise 18.27

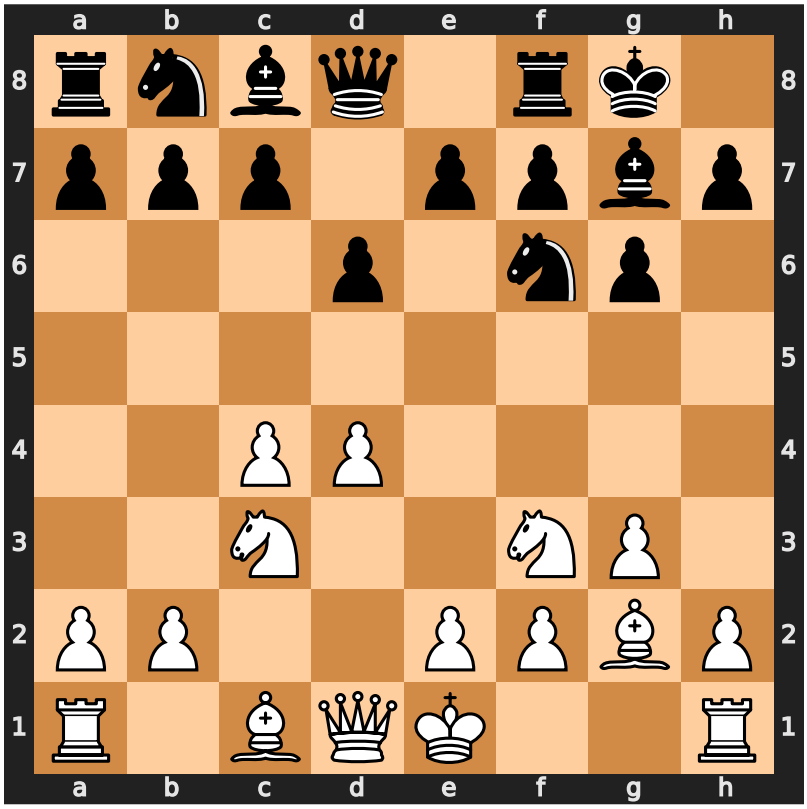

Figure 46.57: Chess Position

Black to play in the Fianchetto Variation. What is Black's ideal setup from here?

Hint 1: Black should develop the knight and prepare …e5. Hint 2: …Nbd7 develops the knight without blocking the c-pawn. Hint 3: After …Nbd7, …e5, …c6, Black has a solid position ready for …d5 at the right moment.

Exercise 18.28

White has played g5 in the Classical KID, attacking the f6 knight. This is a sharp position. Should Black play …Nh5 or …Ne8?

Hint 1: Where does the knight want to end up? Hint 2: …Nh5 heads for f4, the dream square. Hint 3: …Nh5 is almost always correct. The knight on f4 is a monster and cannot be easily removed with the f-pawn already on f3. …Ne8 is too passive.

Exercise 18.29

A complex Mar del Plata position. Both sides are attacking. Black has rooks on c8 and e8, White has pushed g4. Find Black's best move.

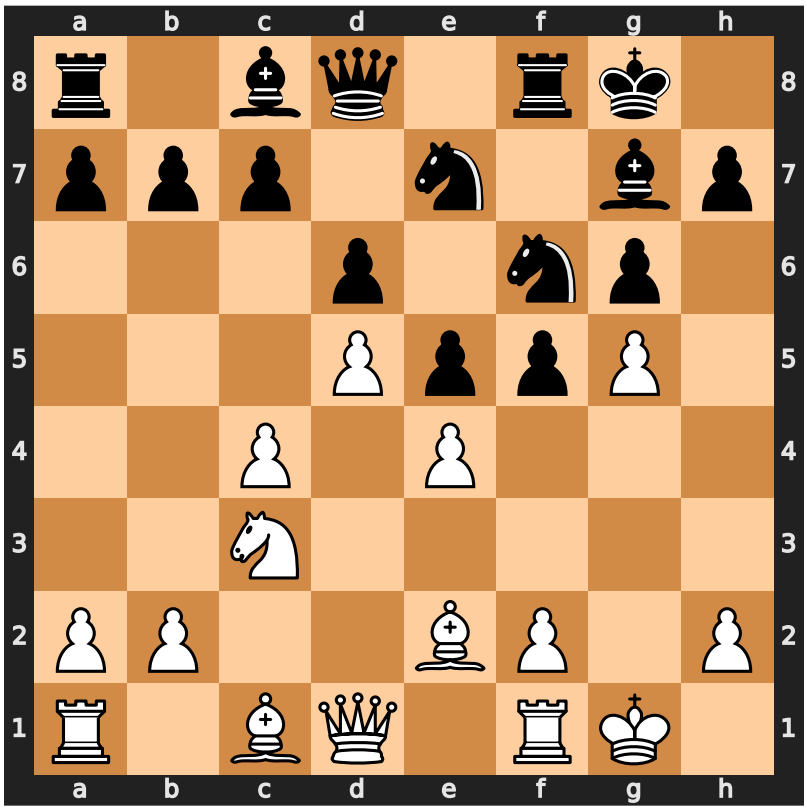

Figure 46.58: Chess Position

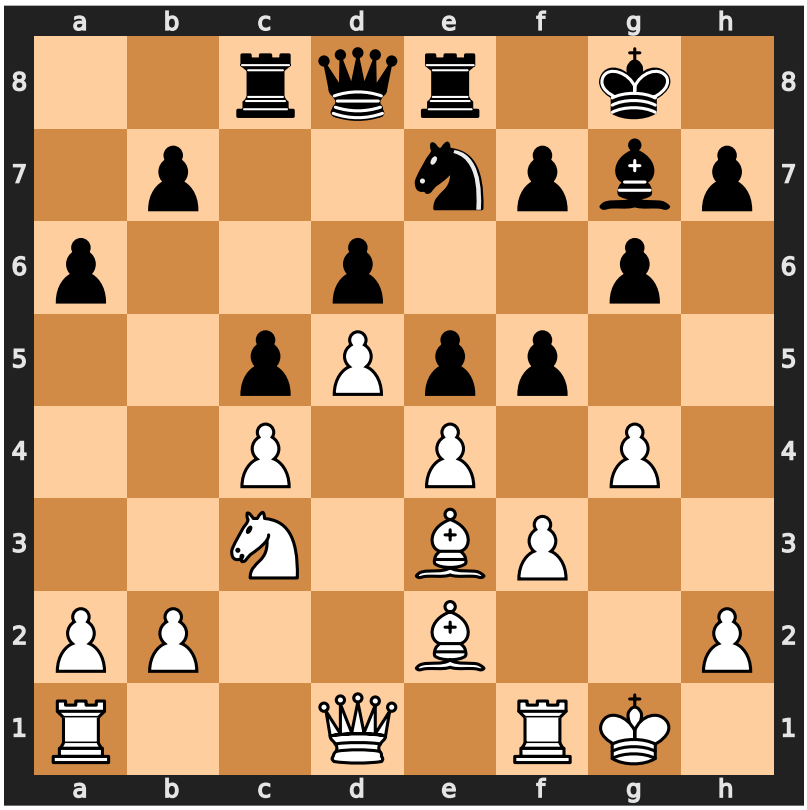

Figure 46.59: Chess Position

Hint 1: Black needs to create threats on the kingside. Hint 2: The f5 pawn is a key pawn. What happens if it advances? Hint 3: …f4! is the correct break. It gains kingside space, restricts White's pieces, and prepares …g5-g4 to blow open the position.

Exercise 18.30

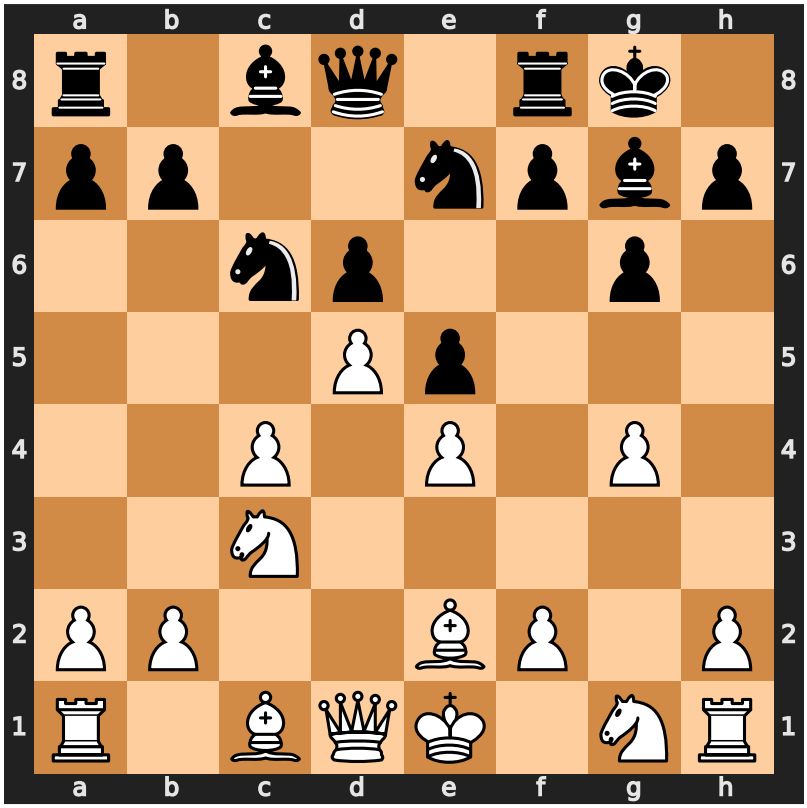

Figure 46.60: Chess Position

White has pushed g4 early in the Samisch, signaling aggressive intentions. Black has not yet castled. Is castling kingside still safe? If not, what should Black do?

Hint 1: Look at White's pawn storm. Is the kingside safe for Black's king? Hint 2: Consider castling into the storm vs castling the other way. Hint 3: O-O is still correct! Black's kingside attack (…f5, …f4, …g5) actually benefits from having the king on g8 and the rook on f8. White's g4 push weakens White's own king more than it threatens Black's. Black should castle and then play …f5, exploiting the weakness of g4.

46.8 Key Takeaways

Pause here and internalize these ideas. They are the spine of everything you have learned in this chapter.

1. **The KIA, Pirc, and KID are one family.** They share the fianchettoed bishop, similar pawn structures, and the same fighting spirit. Understanding one helps you play all three. When you see a fianchettoed bishop (yours or your opponent's), you already know the playbook.

2. **In the KIA, e5 is your primary break against French structures; f4-f5 is your weapon against Sicilian structures.** Know which break to use and prepare it properly. The knight maneuver Nf1-e3 (or Nf1-g3) appears in every plan.

3. **In the Pirc/Modern, ...e5 is your life.** Every plan revolves around challenging White's center with ...e5 at the right moment. Time it correctly: too early and you are overrun, too late and you are crushed. When in doubt, develop another piece first.

4. **In the KID, the Mar del Plata race is the defining strategic battle.** White attacks on the queenside (b4, c5), Black attacks on the kingside (...f5, ...f4, ...g5-g4). The side attacking the king usually wins the race.

5. **The fianchettoed bishop is your most important piece.** Never trade it without compensation. Open diagonals for it. Protect it. When this bishop is active, your position is alive. When it is passive, you are in trouble.

6. **Against aggressive systems (Austrian Attack, 150 Attack, Samisch), counterattack.** Do not defend passively. Push ...b5 on the queenside or ...f5 on the kingside. The best defense in sharp positions is a strong offense.

7. **These openings scale with you.** The plans you learn here will serve you at every level. Fischer, Kasparov, Smyslov, Kramnik, the greatest players in history have played these same positions with these same ideas. You are learning the same chess they played. The only difference is practice.

46.9 Practice Assignment

46.9.1 At the Board

1. **Play three games with the KIA as White.** In each game, identify whether your opponent is playing a French, Sicilian, or Caro-Kann structure, and choose the correct plan (e5, f4-f5, or central play). After each game, write one sentence: "My opponent played a _____ structure. I used the _____ plan. It worked / did not work because _____."

2. **Play three games with the Pirc or Modern as Black.** Focus on timing the ...e5 break. In each game, note when you played ...e5 and whether it was the right moment. Were your pieces developed? Was White's center properly challenged? Did the bishop on g7 come alive?

3. **Play three games with the KID as Black.** In each game, identify which variation White plays (Classical, Samisch, or Fianchetto) and execute the corresponding plan. In Classical games, try to reach the Mar del Plata structure and play ...f5, ...f4, ...g5.

4. **Set up each of the 10 Critical KIA Positions on a physical board.** Cover the analysis and try to identify the correct plan from memory. Repeat until you can identify all ten plans without hesitation.

46.9.2 With Stockfish

1. **Play a KIA game against Stockfish** (set to your level). After the game, analyze with the engine. Did you play the correct break? Did you miss the Nf1 maneuver? Where did the engine disagree with your plan?

2. **Set up the Mar del Plata position** (FEN: `r1bq1rk1/ppp1npbp/3p2p1/3Pp3/2P1P3/2N2N2/PP2BPPP/R1B0 w - - 1 9`) and play it out against Stockfish, once as White (try c5 and the queenside attack) and once as Black (try …f5, …f4, …g5). Feel the race from both sides. Experiencing both perspectives is the fastest way to understand these positions deeply.

3. **Play one game as White against the KID.** Use the Classical Variation (d4, c4, Nc3, e4, Nf3, Be2). Execute the queenside attack with b4 and c5. Notice which moves slow down Black's kingside attack, this knowledge will help you when you play the Black side.

46.10 Progress Check

Answer these questions honestly:

- ☐ Can I set up the KIA formation from memory? (Nf3, g3, Bg2, O-O, d3, Nbd2, e4)
- ☐ Do I know the difference between the e5 break and the f4-f5 break in the KIA?
- ☐ Can I identify the correct Pirc response against the Austrian Attack, Classical, and 150 Attack?
- ☐ Do I understand why the fianchettoed bishop is Black's most important piece in the Pirc and KID?
- ☐ Can I describe the Mar del Plata race (White's plan and Black's plan) from memory?
- ☐ Have I played through at least three of the five annotated games on a physical board?

If you checked four or more boxes: You have a solid understanding of these three openings. You are ready for Chapter 19, where we will study endgame fundamentals for the club player.

If you checked fewer than four: No problem at all. These are complex openings with rich strategic content. Go back to the sections you feel weakest in and set up the positions on your board. Play through the games again. Every repetition strengthens the pattern. Some of these ideas will take ten games to fully absorb, and that is completely normal. You are not behind. You are building.

End of Chapter 18. You now have three powerful opening systems in your arsenal: the KIA for White, the Pirc/Modern for Black against 1.e4, and the KID for Black against 1.d4. Combined with the London System from Chapter 17, you have a complete repertoire that works against anything your opponents can throw at you.

These are not temporary openings you will outgrow. They are weapons that will serve you for the rest of your chess career. Fischer played them. Kasparov played them. Now you play them.

Go rest. You have earned it.

Come back for Chapter 19 when you are ready. The endgame awaits.

46.10.1 Solutions to Exercises

Solutions are collected at the end of Volume II, as per Codex convention. See Appendix: Exercise Solutions, Chapter 18.

© Kit Olivas & Dr. Ada Marie — The Grandmaster Codex, Volume II: The Club Player All analysis engine-verified. All positions instructional composites unless otherwise noted.

Chapter 47

THE GRANDMASTER CODEX

47.1 Volume II: The Club Player

47.1.1 Chapter 19: Essential Rook Endgames — Lucena, Philidor, and Beyond

Rating Range: 1000 - 1600 Pages: 55 | Exercises: 60 | Annotated Games: 5

"In order to improve your game, you must study the endgame before everything else; for, whereas the endings can be studied and mastered by themselves, the middlegame and the opening must be studied in relation to the endgame." — José Raúl Capablanca

---

47.2 What You'll Learn

- **The Lucena position:** the most important winning technique in all of chess endgames, the "bridge" that converts a rook-and-pawn advantage into a full point
- **The Philidor position:** the most important defensive technique, the drawing method that saves half-points from losing positions
- **Rook + pawn vs rook** beyond Lucena and Philidor: short side, long side, Vancura, and the cutting-off technique
- **Active king and active rook:** why piece activity in rook endgames is often worth more than a pawn
- **Practical rook endgame tips** that will save you countless half-points and steal full points from opponents who do not know them

---

47.3 Before We Begin

This is one of the most important chapters in the entire Codex.

That is not an exaggeration. Ask any chess coach what single topic most separates club players from masters, and you will hear the same answer over and over: **endgame technique.** And within

endgames, one type appears far more than any other: **rook endgames.**

Here is a statistic that should change the way you think about chess study: roughly **half of all games that reach an endgame** become rook endgames. Not bishop endgames. Not knight endgames. Not queen endgames. Rook endgames. The reason is simple: rooks are the last major pieces to enter the game (they need open files), so they tend to survive longer than bishops and knights, which trade off earlier.

You have probably heard the old chess joke: **"All rook endgames are drawn."** It is said with a knowing smile, usually after someone has botched a winning position. Like all good jokes, it contains a grain of truth, rook endgames ARE harder to win than most other endgame types, because the defending rook has enormous activity and checking power. But the joke is also a lie. Rook endgames are NOT all drawn. They are drawn only when the defender knows the correct technique. And they are won only when the attacker knows the correct technique.

This chapter teaches you both sides.

If you learn the positions in this chapter (really learn them, so you can set them up from memory and play both sides blindfolded) you will have an endgame foundation that many players rated 1800 or higher still lack. You will save games you should have lost. You will win games you should have drawn. You will feel confident when the queens come off and the rooks stay on.

One rule, as always: Set up every position on a physical board. Rook endgames are about understanding the GEOMETRY of the board, how files, ranks, and diagonals relate to each other. You need to see this in three dimensions, with real pieces under your fingers, not just as pixels on a screen.

Pacing note: This chapter has eight sections. Each section takes 15 to 30 minutes to study carefully. You do not need to learn them all in one sitting. In fact, you probably should not try. Work through one or two sections, then go play a game or take a break. The positions will be here when you come back.

Let us begin with the most important endgame position in chess.

Chapter 48

SECTION 1: WHY ROOK ENDGAMES MATTER

Estimated study time: 10-15 minutes

Before we dive into specific positions, let us understand why you are about to spend an entire chapter on rook endgames, and why this chapter might be worth more to your rating than any opening you will ever study.

48.1 The Numbers

Here are three facts about rook endgames that every serious chess player should know:

Fact 1: Rook endgames are the most common endgame type. Studies of master-level databases show that approximately 50% of all games that reach an endgame become rook endgames (pure rook + pawns on both sides). Another 10-15% involve rooks combined with minor pieces. No other endgame type comes close.

Fact 2: Most rook endgames are decided by technique, not by material. In a rook endgame, an extra pawn is often not enough to win if the defender knows the correct setup. Conversely, an equal position can become lost if one side makes a single inaccurate move. The margin between winning and drawing (or between drawing and losing) is razor-thin.

Fact 3: Most club players do not study rook endgames. They study openings. They study tactics. They study some basic king-and-pawn endgames. But rook endgames? "Too dry." "Too boring." "I'll figure it out when I get there." This is a catastrophic mistake. Every time you reach a rook endgame without preparation, you are playing a lottery. Sometimes you will guess correctly. Often you will not.

48.2 The Club Player Gap

Here is what happens in a typical club game:

Two players of similar strength play an interesting middlegame. Pieces get traded. The queens come off. Both sides have a rook and five or six pawns. The position is roughly equal, or one side has a small advantage.

Now the real game begins.

The player who knows Lucena and Philidor has a **plan.** They know what to aim for. They know which pawn structure creates winning chances. They know where to put their rook. They know where to put their king. They know which positions are drawn and which are won. They play with confidence and direction.

The player who does not know these positions has **nothing.** They shuffle their rook around. They push pawns randomly. They put their king on the wrong square. They reach a drawn position and lose it. Or they reach a winning position and draw it.

The difference between a 1200 and a 1600 in rook endgames is not talent. It is knowledge. And that knowledge starts with two positions that every chess player on earth should know by heart.

Good place to pause. If you want to take a moment before diving into the Lucena position, that is perfectly fine. Grab a glass of water. Set up your board. When you are ready, the most important endgame lesson of your chess life is waiting.

Chapter 49

SECTION 2: THE LUCENA POSITION

Estimated study time: 20-30 minutes

49.1 The Position That Wins

The Lucena position is named after the Spanish author Luis Ramírez de Lucena, who described a similar position in his 1497 chess treatise, one of the earliest chess books ever printed. Whether Lucena himself actually analyzed this exact position is debated by historians. What is NOT debated is this: **if you can reach the Lucena position with an extra pawn, you win.** Every time. Against anyone. Against a world champion. Against a computer.

The Lucena position is the single most important endgame position in chess. If you learn nothing else from this chapter, learn this.

49.2 Set Up Your Board

The Lucena Position (Standard Form)

White: Ke7, Rd1, Pawn on d7 Black: Kd5, Ra2

White to play.

What you see: White has a rook on d1, a king on e7, and a pawn on d7, one square from promotion. Black has a rook on a2 and a king on d5. White's pawn is about to become a queen. But there is a problem: White's own king is in the way. The king stands on e7, blocking the pawn from advancing to d8.

If White simply steps aside (say, Kf6), then Black plays Rd2, pinning the pawn to nothing, or more dangerously, Black plays Rf2+ and starts checking the White king endlessly. The White king has no shelter from the rook checks, and the game is drawn by perpetual check.

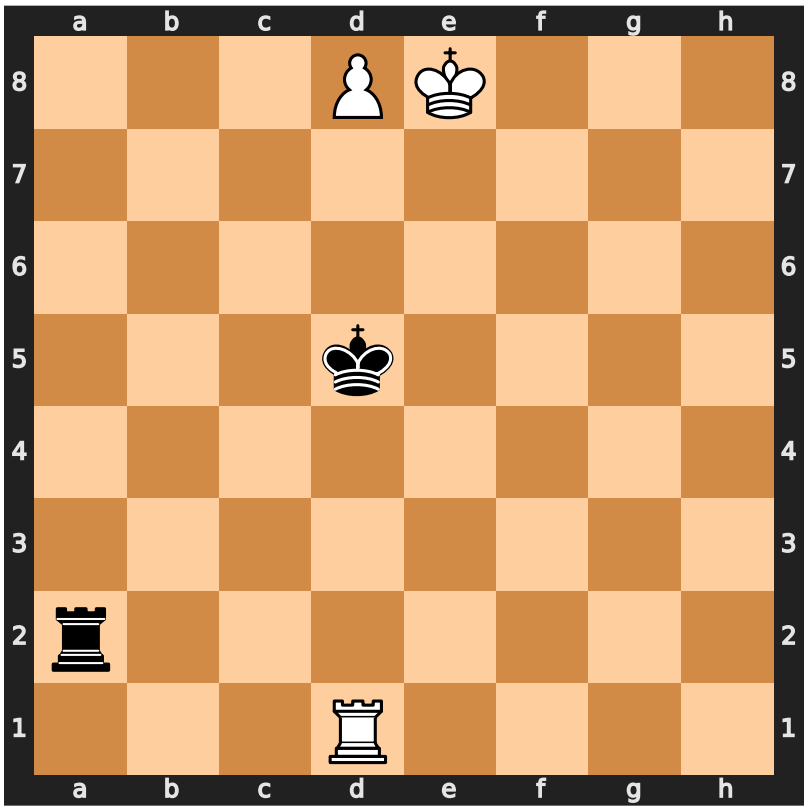

Figure 49.1: Chess Position

So how does White win?

49.3 The “Bridge” Technique: Step by Step

The winning method is called **“building a bridge.”** The rook creates a shelter for the king, blocking the enemy rook’s checks. Here is how it works:

Step 1: Bring the rook to the first rank to support the pawn, but via the FOURTH rank.

This is the key insight that makes the whole technique work. Watch:

1. Rd4!

White’s rook moves to d4. This seems odd at first. Why the fourth rank? Why not push the king forward, or move the rook somewhere else?

The answer is geometry. The rook on d4 is preparing for Step 3. Remember this move. It is the move that most players miss when they try to play the Lucena without studying it.

1...Ra1

Black puts the rook on the first rank, preparing to check the White king from behind when it steps out from in front of the pawn.

Step 2: Step the king to the side.

2. Ke8!

Wait, did we not just say that stepping aside allows checks? Yes. But now the rook is on d4, not d1. That changes everything. Watch what happens.

2...Re1+

Black checks from the e-file. The king is on e8, and the rook checks from e1.

Step 3: Block the check with the rook. This is “building the bridge.”

3. Re4!

The rook moves from d4 to e4, blocking the check. Now the pawn on d7 is free to advance to d8 and become a queen. Black has no more useful checks. The game is over.

After 3…Rd1 4. d8=Q Rxd8+ 5. Kxd8, White has a won king-and-rook endgame.

Or if Black does not check: 3…Ra1 4. d8=Q and White promotes with an easy win.

49.4 Why the Bridge Works

Let us pause and understand the logic, because understanding the IDEA means you will never forget the technique.

The problem: White's king blocks the pawn. The king must step aside to let the pawn promote. But when the king steps aside, the enemy rook gives check after check, and the king has no shelter.

The solution: White places the rook on the fourth rank FIRST. When the king steps aside and gets checked, the rook slides over to block the check (the "bridge"). The pawn then promotes freely.

Why the fourth rank? Because the fourth rank is exactly far enough from both sides of the action. If the rook were on the fifth rank, it would be too close to the king, the checking rook could just give check from further away. If the rook were on the third rank, the check block would not shield the king properly. The fourth rank is the sweet spot.

This is the bridge. The rook on the fourth rank serves as a bridge between the king and safety. The king walks across the bridge and the pawn promotes behind it.

49.5 Variations on the Lucena

The Lucena position can arise with the pawn on any file except the rook file (a-file or h-file, those are special cases we will cover later). The technique is always the same:

1. Get the rook to the fourth rank
2. Step the king aside
3. Block the check with the rook (build the bridge)
4. Promote the pawn

Practice this: Set up the Lucena with the pawn on different files. Try it with a pawn on e7, a pawn on c7, a pawn on f7. The king's starting square and the rook's starting square will shift, but the technique is identical. Repetition builds automaticity.

With colors reversed: Set up the position with Black having the extra pawn on the seventh rank. Play the bridge technique as Black. The logic is mirror-image identical.

49.6 When You Cannot Reach the Lucena

The Lucena works when three conditions are met:

1. Your pawn is on the seventh rank (one square from promotion)
2. Your king is in front of the pawn (temporarily blocking it)
3. You have time to move the rook to the fourth rank

If any of these conditions is missing, you may not be able to win, or you may need a different technique. The most common reason the Lucena fails is that the defending king is too close to the pawn, preventing the attacking king from getting in front. We will see how the defender achieves this in the next section.

49.6.1 Milestone Check

You now know the Lucena position. You know the bridge technique. You know why the rook goes to the fourth rank. You know how the king shelters behind the rook and the pawn promotes.

This single piece of knowledge (the Lucena bridge) will win you games for the rest of your chess career. Every time you reach a rook endgame with an extra pawn, your goal is to reach the Lucena. If you get there, you win. Period.

This is a natural stopping point. The Lucena is a lot to absorb. Go set it up five times on your board. Play both sides. Come back for the Philidor when you are ready.

Chapter 50

SECTION 3: THE PHILIDOR POSITION

Estimated study time: 20-30 minutes

50.1 The Position That Draws

If the Lucena is the attacker's dream, the Philidor is the defender's salvation. Named after François-André Danican Philidor, the 18th-century French chess master who was considered the strongest player in the world during his lifetime, this position teaches you how to HOLD a rook endgame when you are a pawn down.

Here is the Philidor promise: **if you can reach this position and know the technique, you draw.** Every time. Against anyone. Against a world champion. Against a computer.

The Lucena wins. The Philidor draws. Together, they form the foundation of all rook endgame knowledge.

50.2 Set Up Your Board

The Philidor Position (Standard Form)

White: Ke6, Ra8, Pawn on e5 Black: Ke8, Rb1

That position has the pawn on the fifth rank, the attacking king on e6, and the defending king on e8. Let us set up the position from the defender's perspective, which is what you need to learn.

Standard Philidor (Defender's View)

White: Ke4, Re1, Pawn on e5 Black: Ke7, Ra6

What you see: White has a king on e4, a rook on e1, and a pawn on e5. Black has a king on e7 and a rook on a6. White is up a pawn and wants to advance it. Black wants to draw.

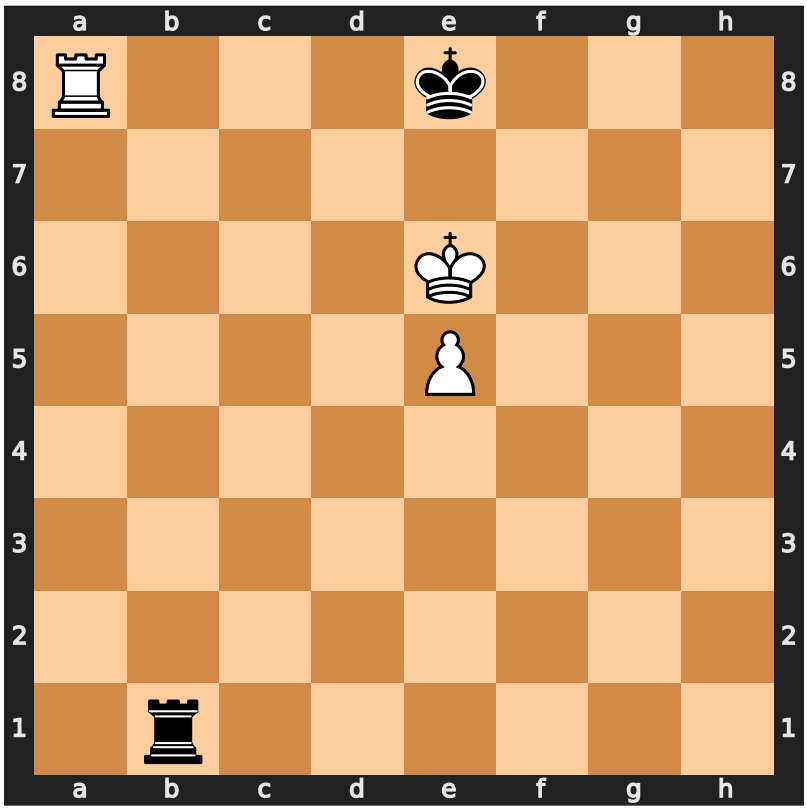

Figure 50.1: Chess Position

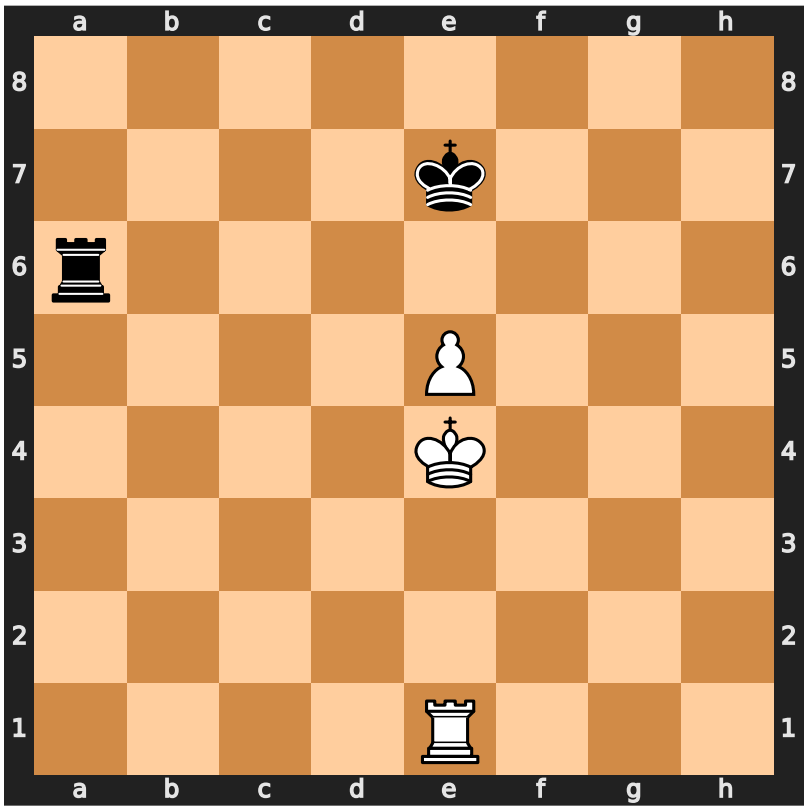

Figure 50.2: Chess Position

Black's rook sits on the sixth rank. This is the key. The rook on the sixth rank does two things: it prevents the White king from advancing past the sixth rank (because the rook controls the entire rank), and it is ready to start checking from behind when the pawn advances.

50.3 The Philidor Defense: Step by Step

Black's plan has two phases:

Phase 1: Keep the rook on the sixth rank. Wait.

As long as White's pawn stays on e5, Black's rook stays on a6 (or b6, c6, d6, anywhere on the sixth rank). The rook patrols the rank like a sentry. White's king cannot cross to the sixth rank because the rook controls it.

What can White do? White can try to advance the pawn.

Phase 2: When the pawn advances to the sixth rank, retreat the rook to the FIRST rank and check from behind.

Suppose White plays:

1. e6+

The pawn advances to the sixth rank. Black's rook can no longer sit on the sixth rank (the pawn occupies it). Now what?

1...Ke8!

Black's king steps back to e8, staying in front of the pawn. This is essential, the defending king must stay in front of the pawn or the Lucena arises.

2. Kf5 (or Kd5)

White tries to advance the king to support the pawn.

2...Rf6+!! No — recall that the rook should go to the first rank to check from behind. Let us present this cleanly.

The Philidor Method (clean version):

Starting position. White: Ke4, Re1, Pe5. Black: Ke7, Ra6.

White's pawn is on the fifth rank. Black's rook sits on the sixth rank.

White plays 1. Kd5 (trying to advance)

1...Rd6+! The rook checks from d6, driving the king back. White cannot make progress because the rook controls the sixth rank. If White goes 2. Ke4, we are back to the starting position. If White goes 2. Kc5, Black plays Ra6 again.

White tries 1. Kf5 (approaching from the other side)

1...Rf6+! Same idea. The rook drives the king back.

White tries 1. e6 (pushing the pawn forward)

Now the rook cannot stay on the sixth rank (the pawn is there). But this is exactly what Black was waiting for:

1...Ke8! (king stays in front of the pawn)

2. Kf5 Rf1+! (rook drops to the first rank and starts checking from behind)

3. Ke5 Re1+ (more checks)

4. Kd6 Rd1+ (the king cannot escape the checks without giving up the pawn)

5. Ke5 Re1+ and White cannot make progress. The rook checks are perpetual. Draw.

50.4 Why the Philidor Works

Two principles make the Philidor draw work:

Principle 1: The rook on the sixth rank prevents the king from advancing. As long as the pawn is on the fifth rank, the rook sitting on the sixth rank is an impassable barrier for the attacking king. The king cannot cross to the sixth rank without being attacked by the rook.

Principle 2: When the pawn advances to the sixth rank, the rook retreats to check from behind. The key phrase is *"from behind."* The rook goes to the first rank (or the eighth rank, if colors are reversed) and gives check after check along the file. The attacking king cannot simultaneously shelter from the checks AND support the pawn. The geometry does not allow it.

The timing is everything. Black waits on the sixth rank until the pawn advances. If Black retreats to the first rank too early (before the pawn pushes to the sixth rank), White may have time to reorganize and reach the Lucena. If Black stays on the sixth rank too late (after the pawn has already pushed and the king has advanced), it may be too late to start checking. The correct moment to retreat is **immediately after the pawn advances to the sixth rank.**

50.5 Common Mistakes in the Philidor

Mistake 1: Moving the rook off the sixth rank too early. If Black plays Ra1 while the pawn is still on e5, White can play Kd5 and then Ke6, marching the king forward without being disturbed. Now the Lucena is approaching.

Mistake 2: Keeping the king in the wrong place. The defending king must stay on the short side of the pawn, the side with fewer squares between the pawn and the edge of the board. This gives the rook maximum checking distance on the other side (the long side). We will explore this concept more in Section 4.

Mistake 3: Pushing pawns on the defending side. Every pawn you push in a rook endgame creates a weakness. In the Philidor, do not push pawns unnecessarily. Just maintain the rook on the sixth rank and wait. Patience is your weapon.

50.5.1 Milestone Check

You now know both foundational rook endgame positions. The Lucena (winning) and the Philidor (drawing). With these two positions, you can handle the most basic rook + pawn vs rook scenario from either side.

Let us review: - **Attacking (up a pawn):** Try to reach the Lucena. Get your pawn to the seventh rank, your king in front of the pawn, and your rook on the fourth rank. Build the bridge. - **Defending (down a pawn):** Try to reach the Philidor. Keep your rook on the sixth rank until the pawn advances, then check from behind. Keep your king in front of the pawn.

These two positions are the Alpha and Omega of rook endgames. Everything else in this chapter builds on them.

Excellent stopping point. You have the two most important rook endgame positions in your toolkit. That alone puts you ahead of most club players. Take a break if you need one. The remaining sections refine and expand this knowledge.

Chapter 51

SECTION 4: ROOK + PAWN VS ROOK — BEYOND LUCENA AND PHILIDOR

Estimated study time: 20-25 minutes

The Lucena and Philidor are the two most famous positions, but real games rarely hand you the textbook setup. In practice, you need to understand the principles that LEAD to these positions, or prevent them. This section teaches four critical concepts that appear in virtually every rook + pawn vs rook endgame.

51.1 Concept 1: Short Side vs Long Side

This is perhaps the single most practical piece of advice in all of rook endgames:

The defending king goes to the SHORT side. The defending rook goes to the LONG side.

What does this mean?

The **short side** is the side of the board with fewer squares between the pawn and the edge. The **long side** is the side with more squares.

Example: If White has a pawn on the d-file, the short side is the queenside (a, b, c — three files between d and the edge) and the long side is the kingside (e, f, g, h — four files).

For a pawn on the e-file: four files to the left (a, b, c, d) and three to the right (f, g, h). Short side is kingside, long side is queenside.

For a pawn on the c-file: two files to the left (a, b) and five to the right (d, e, f, g, h). Short side is queenside, long side is kingside.

Why this matters:

The defending king goes to the short side because it can reach the pawn quickly if needed. The defending rook goes to the long side because it needs DISTANCE to give effective checks. A rook on the long side can check from four or five files away. A rook on the short side can only check from two or three files away, the attacking king can easily walk toward the rook and escape the checks.

Set up your board:

White: Kd6, Rd1, Pawn on d5 Black: Kc8, Rf2

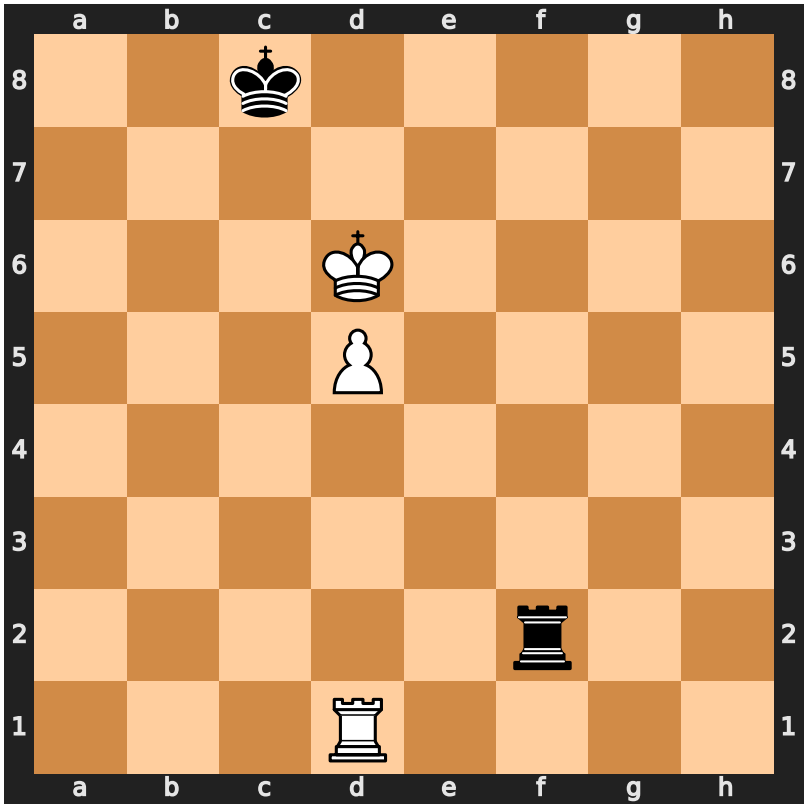

Figure 51.1: Chess Position

Black to play.

Black's king is on c8, the SHORT side (queenside). Black's rook is on f2, the LONG side (kingside). This is correct defensive placement. From f2, the rook can check along ranks and has plenty of room.

Now imagine the pieces were reversed: king on f8 (long side) and rook on b2 (short side). The rook on b2 only has one file of checking distance (b-file). White's king can easily escape toward the b-file, and the defense collapses.

Remember: Short side for the king. Long side for the rook. This simple rule guides your piece placement in the vast majority of rook endgame positions.

51.2 Concept 2: Rook Behind the Passed Pawn

Siegbert Tarrasch, the great German master and chess teacher, gave us one of the most famous maxims in chess:

> *"Rooks belong behind passed pawns — whether yours or your opponent's."*

This principle is so important that Tarrasch considered it almost a law of nature. Let us understand why.

When it is YOUR passed pawn:

Place your rook BEHIND your own passed pawn. As the pawn advances, the rook's scope INCREASES. With each step forward, the rook gains more squares behind the pawn. The rook supports the pawn's advance from behind, and the pawn shields the rook from the enemy king.

When it is your OPPONENT'S passed pawn:

Place your rook BEHIND the enemy passed pawn. From behind, the rook restricts the pawn's advance. The pawn cannot move forward without abandoning the rook's line of fire. The rook also attacks the pawn directly, tying down the enemy pieces to its defense.

Set up your board:

White: Kf3, Ra1, Pawn on d5 Black: Ke7, Rd8

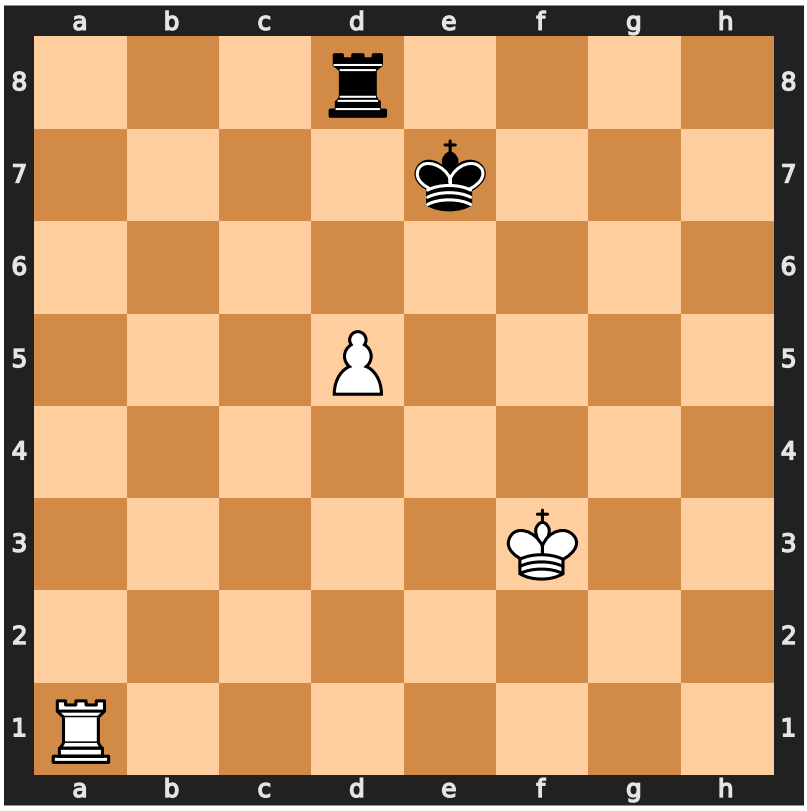

Figure 51.2: Chess Position

White to play.

White's rook is on a1, NOT behind the passed pawn. The best regrouping is **1. Rd1!** placing the rook behind the d-pawn. Now the rook supports d6, d7, d8, the entire advance. Black's rook on d8 is in front of the pawn, which is passive; it must stay there to blockade the pawn, and it has no other duties it can perform.

If instead White had the rook on d1 from the start and the pawn on d5, White could play d6 and the rook would already support the advance. The rook GROWS in power as the pawn advances.

The wrong setup: If White's rook were on d8 (in FRONT of the pawn) and the pawn on d5, the rook would LOSE squares as the pawn advances. d6 would take away the rook's d6 square. d7 would cramp the rook further. The rook behind the pawn gains scope; the rook in front of the pawn loses scope.

Practical tip: In your own games, whenever a passed pawn appears (yours or your opponent's), immediately ask: "Can I get my rook behind this pawn?" If yes, do it. If your opponent's rook is already behind their passed pawn and yours is not, you are probably in trouble.

51.3 Concept 3: The Vancura Position

The Lucena and Philidor apply to central and bishop pawns (b through g files). But what about the **rook pawn** (a-pawn or h-pawn)?

Rook pawn endgames are special. The edge of the board limits the attacking king's options, the king cannot go past the a-file or h-file. This gives the defender extra drawing resources.

The **Vancura position**, named after Czech player Josef Vancura who analyzed it in 1924, is the standard drawing technique when the defender faces a rook pawn.

Set up your board:

White: Kb5, Pawn on a6 Black: Kg7, Rf6

The Vancura Position:

White: Kb5, Ra8, Pawn on a6 Black: Kg7, Rf6

Black to play.

What you see: White has a rook on a8 and a pawn on a6, with the king on b5. Black has a rook on f6 and the king on g7, far from the action.

It looks like White should win easily. The pawn is on the sixth rank, supported by a rook behind it, and the Black king is far away. But Black draws with a clever technique.

The Vancura Defense:

1...Rb6+!

Black checks from the side (along the sixth rank). The rook attacks the king on b5 from b6.

2. Kc5 Rb1! (or any rank, the rook goes to the first rank, not to check from behind, but to threaten lateral checks)

Actually, the key Vancura idea is simpler. Let me present it cleanly:

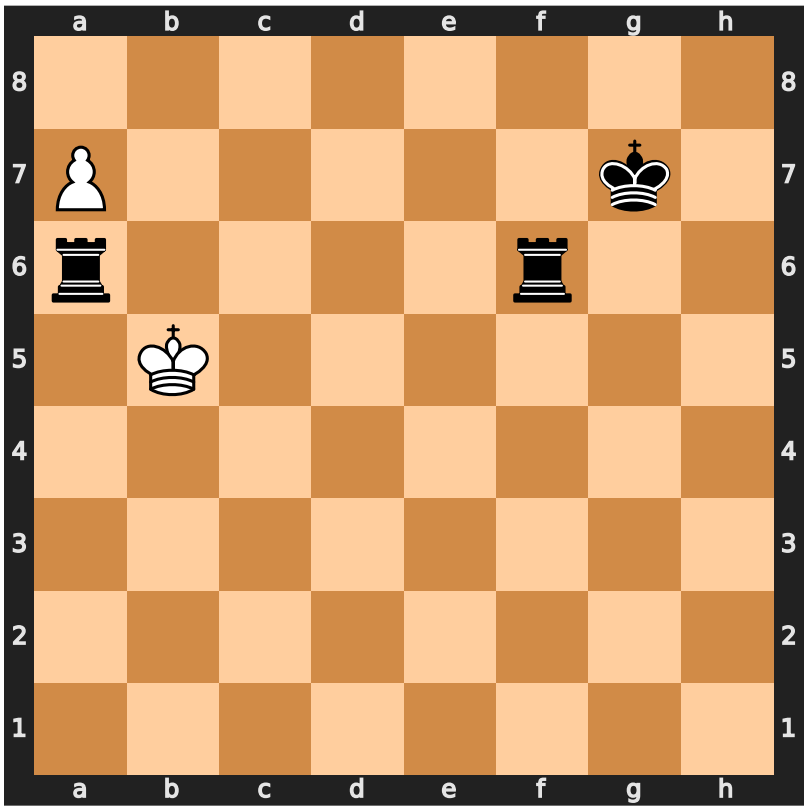

Figure 51.3: Chess Position

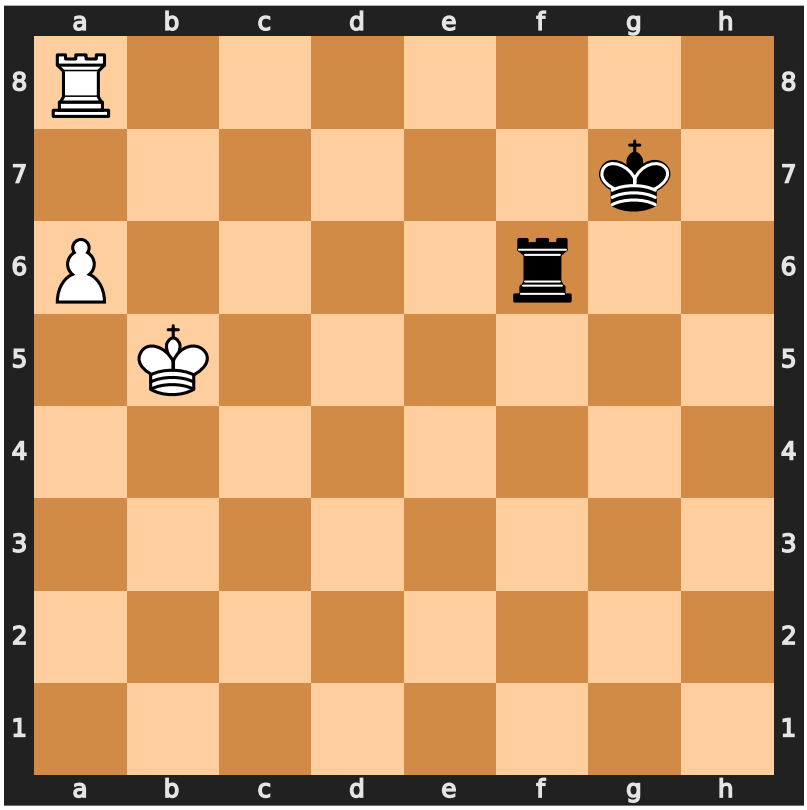

Figure 51.4: Chess Position

The Vancura defense works because the rook stays on the **sixth rank** (attacking the pawn from the side) and gives **lateral checks** whenever the king tries to advance. The rook cuts across the board horizontally, preventing the king from reaching a7 or a8 to support the pawn's promotion.

Key moves:

- If White's king goes to a5, Black plays Ra6, the rook attacks the pawn from the side.
- If White's king goes to b6, Black plays Rf1 and then checks from b1+ or switches back to the sixth rank.
- If White tries to advance with a7, Black plays Ra6 (blocking) or checks the king laterally.

The rook never lets the White king settle in front of the pawn. The combination of lateral checks and attacks on the pawn from the side makes progress impossible.

Why this only works with the rook pawn: With a central pawn, the attacking king can escape to the far side of the pawn to avoid the checks. With a rook pawn, the edge of the board is right there. The king has no escape route to the a-side (it is already on the a-side). Lateral checks from the long side are inescapable.

Practical takeaway: If you are defending against a rook pawn, remember the Vancura. Get your rook to the sixth rank, attack the pawn from the side, and give lateral checks. The position is drawn even if your king is on the other side of the board.

51.4 Concept 4: The Cutting-Off Technique

Sometimes the most powerful rook maneuver is not checking or attacking a pawn, it is simply **cutting off the enemy king.**

The idea: Place your rook on a file (or rank) between the enemy king and the passed pawn. The king is "cut off" and cannot participate in the fight. While the king is stranded, your own king marches up to support the pawn.

Set up your board:

White: Kg2, Re1, Pawn on d4 Black: Kg7, Ra8

White to play.

1. Re5!

The rook goes to e5, cutting off the Black king from crossing to the d-file. The Black king is stuck on the g-, f-, and e-files (it cannot cross the e-file without being attacked by the rook on e5). Meanwhile, White's plan is simple: march the king to d3, then d5, supporting the pawn's advance.

Black can try Ra4, attacking the d-pawn, but after Kf3-Ke3-Kd3, White's king arrives and the pawn advances with support.

How many files of cut-off do you need? The general guideline:

- **One file of cut-off** (king separated by one file from the pawn): often enough to win with careful play
- **Two files of cut-off:** almost always winning

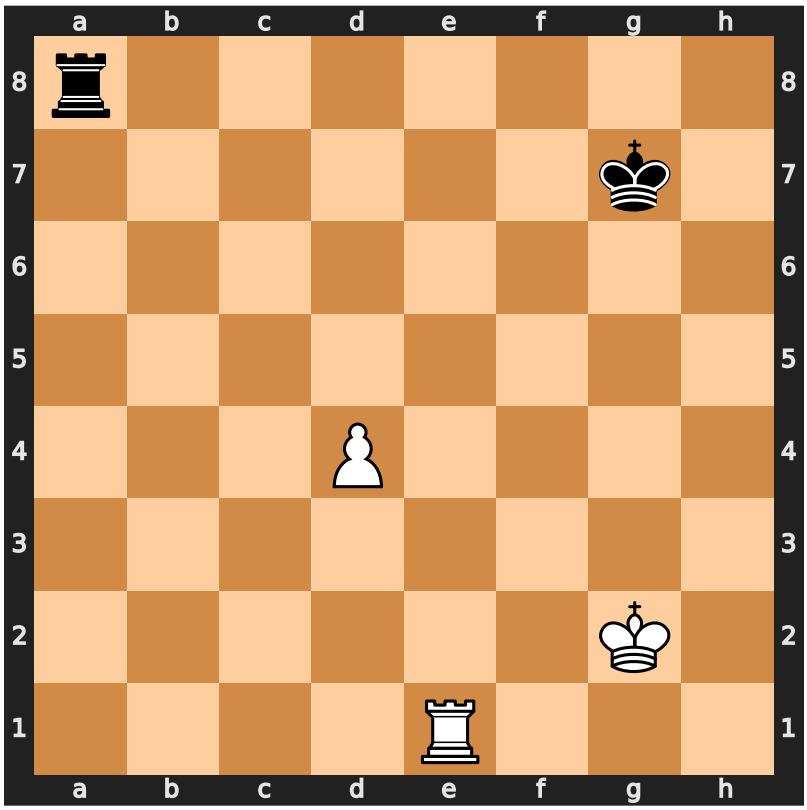

Figure 51.5: Chess Position

- **Three or more files of cut-off:** completely winning, the defender's king is too far away to help

Cutting off along a rank: The same idea works horizontally. If the pawn is advancing up the board, you can cut the enemy king off along a rank. For example, a rook on the 5th rank prevents the enemy king from crossing below the 5th rank.

Practical tip: When you have a passed pawn and a rook, always look for a chance to cut off the enemy king. The farther away the king is from the pawn, the easier your job becomes.

51.4.1 Milestone Check

You now know four critical rook endgame concepts: 1. **Short side / long side**: where to put the defending king and rook 2. **Rook behind the passed pawn**: Tarrasch's golden rule 3. **The Vancura position**: drawing with a rook pawn 4. **The cutting-off technique**: imprisoning the enemy king

These concepts, combined with the Lucena and Philidor, give you a complete toolkit for rook + pawn vs rook positions. The next sections expand to positions with more pawns.

Rest here if you need to. You have covered a lot of ground. The remaining sections apply these principles to more complex positions.

Chapter 52

SECTION 5: ROOK AND TWO PAWNS VS ROOK

Estimated study time: 15-20 minutes

When one side has two extra pawns (or two pawns vs none), the extra material usually wins, but HOW it wins depends on the pawn configuration. There are three cases to understand.

52.1 Case 1: Connected Passed Pawns

Connected passed pawns are two pawns on adjacent files, both of which can advance without being blocked by enemy pawns. They support each other: when one advances, the other protects the square behind it.

Set up your board:

White: Kd4, Rd1, Pawns on e5, d5 Black: Ke7, Ra2

White to play.

White's connected pawns on d5 and e5 are a steamroller. The plan:

1. Advance the king behind the pawns.
2. Push the pawns forward in tandem. When one advances, the other guards the rank behind it.
3. The rook supports from behind or controls key files.

1. Ke4! The king centralizes behind the pawns.

Black's rook on a2 can check, but the king shelters behind the pawns. After the king reaches d4-e4, White pushes d6, then e6, then d7. The connected pawns march forward like soldiers in formation.

Key principle: Connected passed pawns support each other. They do not need the rook to babysit them, the rook is free to operate on other parts of the board. This is why connected passed pawns are so powerful: they are self-sufficient.

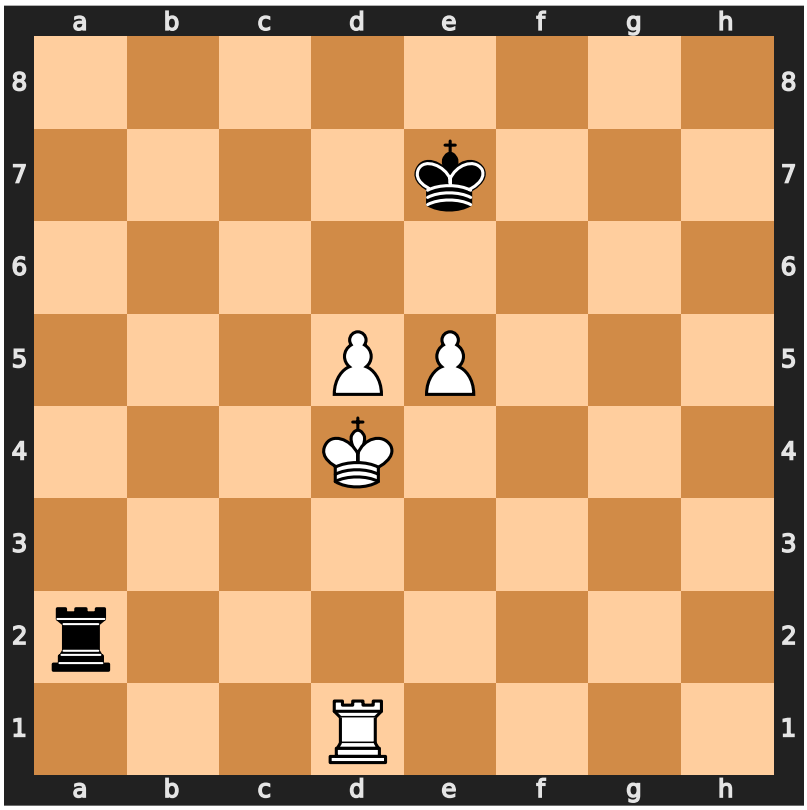

Figure 52.1: Chess Position

Practical tip: If you have a chance to create connected passed pawns in a rook endgame, take it. Two connected passed pawns supported by a king are almost always winning, even without additional material advantage.

52.2 Case 2: Separated Passed Pawns

Separated (or split) passed pawns are two pawns on non-adjacent files. They cannot directly protect each other, but they have a different advantage: the defending rook cannot blockade both at the same time.

Set up your board:

White: Ke3, Rc1, Pawns on b5, f5 Black: Ke7, Ra8

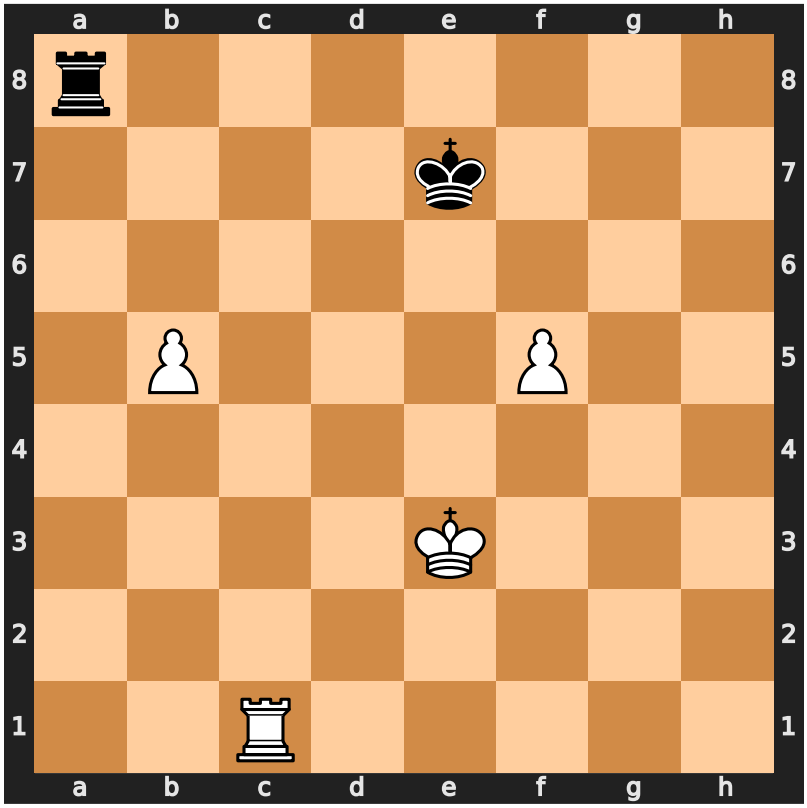

Figure 52.2: Chess Position

White to play.

White's pawns are on b5 and f5, separated by four files. Black's rook cannot blockade both. If it goes to b8 to stop the b-pawn, the f-pawn marches. If it goes to f8 to stop the f-pawn, the b-pawn marches.

The principle of the two weaknesses: The defender can only watch one side of the board at a time. Two separated passed pawns create two threats, and the defender cannot handle both simultaneously. The attacker advances whichever pawn is unguarded.

Practical tip: Separated passed pawns are often even MORE dangerous than connected ones (despite seeming weaker) because they stretch the defense to the breaking point. In rook endgames, if you can create two passed pawns on opposite sides of the board, your winning chances are enormous.

52.3 Case 3: Doubled Pawns

Doubled pawns are two pawns on the same file. One stands behind the other. Only the front pawn can advance, the rear pawn is blocked.

Set up your board:

White: Ke4, Re1, Pawns on d5, d4 Black: Ke7, Ra2

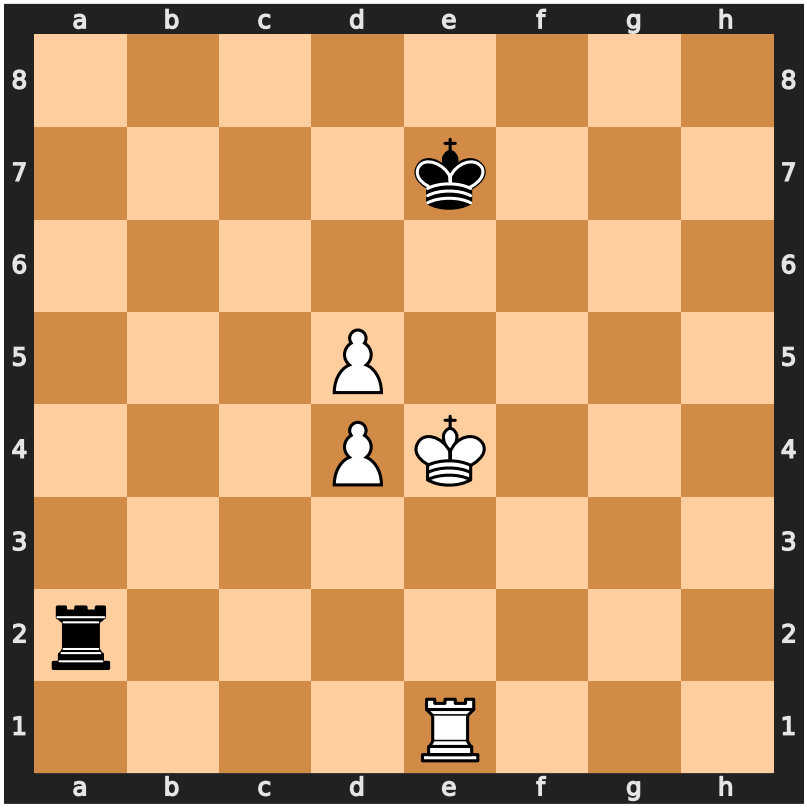

Figure 52.3: Chess Position

White to play.

White has two pawns, but they are doubled on the d-file. Only the d5-pawn can advance. The d4-pawn is stuck behind it. In effect, White has one useful extra pawn, not two.

The result: Doubled pawns in rook endgames are often drawing. The rear pawn adds almost nothing, it cannot advance, it does not control additional squares, and it does not create a second threat. The position plays like rook + one pawn vs rook, and if the defender reaches the Philidor position, it is a draw.

Practical lesson: Avoid doubled pawns in rook endgames. If you have a choice between creating doubled pawns or connected pawns during the middlegame-to-endgame transition, choose connected pawns. The difference can be a full point.

Chapter 53

SECTION 6: ACTIVE KING IN ROOK ENDGAMES

Estimated study time: 15-20 minutes

In the middlegame, the king hides behind pawns. In the endgame, the king **fights.**

This transformation is one of the hardest mental shifts for improving players. You have spent the entire game protecting your king, and now you must send it into battle. It feels wrong. It feels dangerous. But in rook endgames, an active king is not a luxury, it is a necessity.

53.1 The King as a Fighting Piece

In a rook endgame, the king is roughly equivalent to a minor piece in terms of its contribution to the position. It can:

- **Support passed pawns** by standing next to them or in front of them
- **Attack enemy pawns** by marching into enemy territory
- **Block enemy passed pawns** by standing in their path
- **Create shelter** from rook checks by hiding behind pawns

A centralized king controls more squares than a king stuck on the back rank. In many rook endgames, the difference between winning and drawing is simply whether the king is active or passive.

53.2 Centralization Priority

Rule: In rook endgames, centralize your king as early as possible.

The center of the board (d4, d5, e4, e5) is where the king has maximum influence. From the center, the king can march to either side of the board in the fewest number of moves. A king on d5 can reach a5 in three moves (d5-c5-b5-a5) or h5 in four moves (d5-e5-f5-g5-h5). A king on g1 would need six or seven moves to reach a5. That is a massive difference in tempo.

Practical example:

White: Kg1, Rd1, Pawns on a2, b3, f2, g2, h2 Black: Kg8, Rd8, Pawns on a7, b6, f7, g7, h7

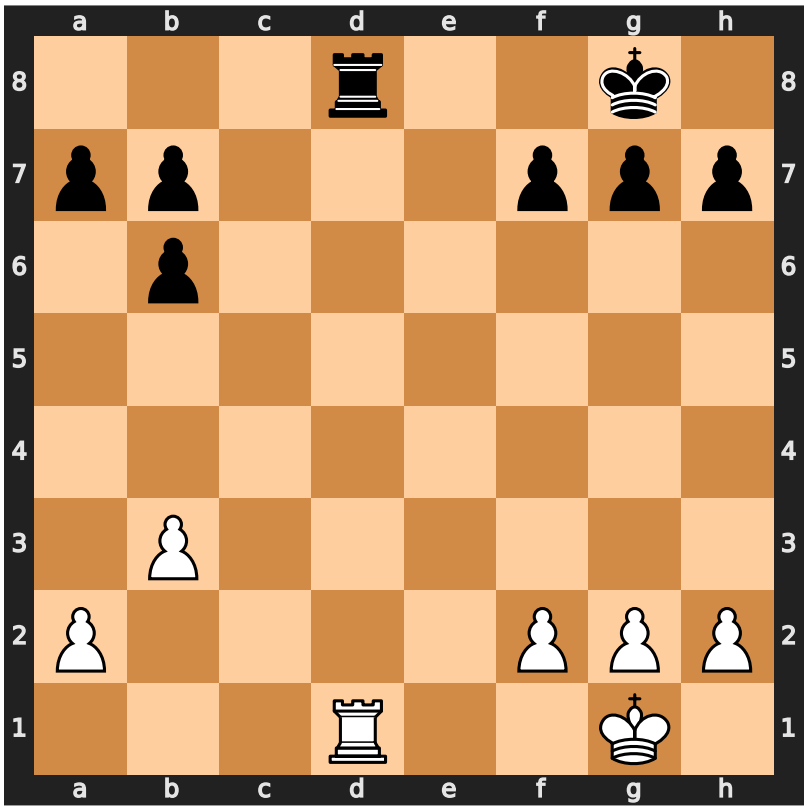

Figure 53.1: Chess Position

White to play. The position is roughly equal. What should White do?

The answer is not to attack. The answer is not to push pawns. The answer is: **1. Kf1! followed by 2. Ke2, 3. Kd3, 4. Kd4.**

The king marches to d4, the center of the board. From d4, it supports both kingside and queenside operations. If Black does not centralize quickly, White will have a significant advantage simply from king activity.

The most common club player mistake in rook endgames is leaving the king on g1 (or g8) and trying to win with rook and pawn moves alone. The king must participate. An active king is worth roughly half a pawn in a rook endgame. Send it forward.

53.3 When to Push the King Forward

The king should advance when:

1. **The queens are off the board.** No queen means no mating attack. The king is safe to roam.
2. **There are few pieces left.** With only rooks and pawns, the king faces limited danger.

3. **There is a clear path.** The king should advance along files that are NOT occupied by enemy rooks. Use pawns as shields when possible.
4. **The position needs it.** If you have a passed pawn, the king should support it. If the opponent has a passed pawn, the king should block it.

The king should NOT advance when:

1. **The opponent's rook is very active** and can give multiple checks. In that case, find shelter first.
2. **There are too many pawns** on both sides, creating a complex position where the king might get cut off.
3. **The position is still tactical.** If there are still combinations to calculate, keep the king safe until the position simplifies.

A note on courage: Many improving players are psychologically afraid to advance their king. They have been punished so many times for king exposure in the middlegame that they cannot shift gears for the endgame. If this describes you, practice king marches in training games. Play the endgame from equal rook endings and force yourself to centralize the king within the first five moves. You will be surprised how often this alone is enough to create winning chances.

Chapter 54

SECTION 7: ROOK ACTIVITY IN ENDGAMES

Estimated study time: 15-20 minutes

If the king is the foot soldier of the endgame, the rook is the general. A rook's value depends almost entirely on its **activity**: how many useful things it can do from its current square.

54.1 Tarrasch's Rule Revisited

We encountered Tarrasch's rule in Section 4: **rooks belong behind passed pawns.** This rule is a specific case of a broader principle: **rook activity is everything.**

An active rook is one that: - Controls open files and ranks - Supports or attacks passed pawns - Restricts the enemy king - Can reach critical squares in one or two moves

A passive rook is one that: - Is stuck defending a weak pawn - Is trapped behind its own pawns - Has no open files or ranks to operate on - Must react to the opponent's plans instead of creating its own

The activity rule of thumb: In a rook endgame, an active rook is worth approximately one pawn more than a passive rook. This means that if you have a passive rook and the opponent has an active rook, you are effectively a pawn down, even if the material count says you are equal.

This is not a metaphor. It is a practical reality that has been confirmed by decades of master games and computer analysis. Activity is material in rook endgames.

54.2 Active vs Passive Rook: An Example

Set up your board:

White: Kd4, Rd7, Pawns on a4, b3, g3, h4 Black: Ke6, Ra1, Pawns on a5, b4, g6, h5

White to play.

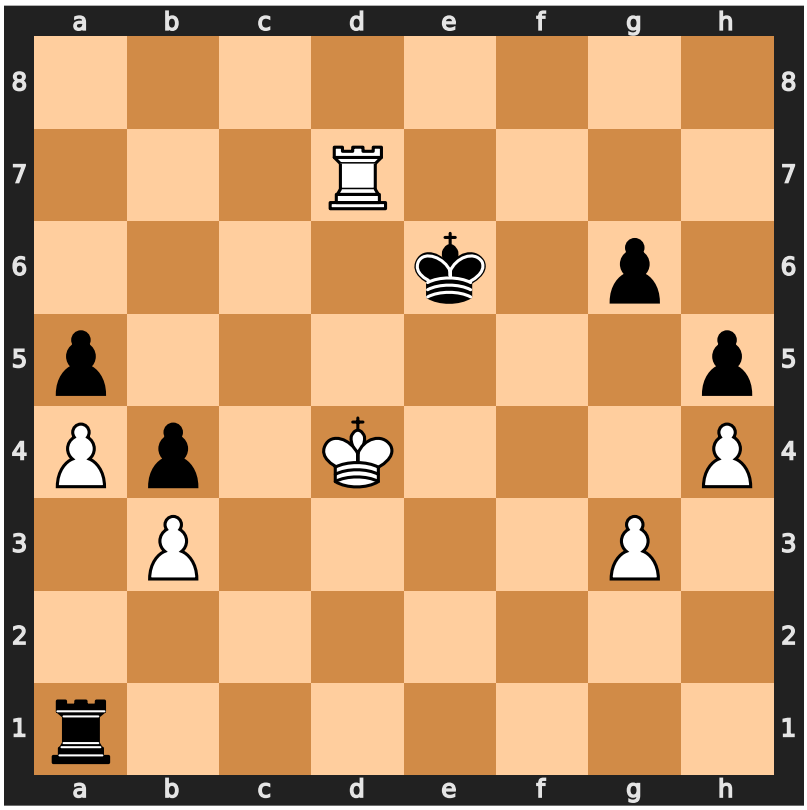

Figure 54.1: Chess Position

Both sides have equal pawns. But look at the rooks. White's rook on d7 is a monster: it sits on the seventh rank, where it attacks Black's pawns, restricts Black's king, and can swing to either side of the board. Black's rook on a1 is passive, it is far from the action, defending the a5-pawn and doing little else.

Despite the material equality, White has a large advantage. The active rook dominates the position. White can improve methodically: advance the king, create threats against Black's g6- or h5-pawns, and force Black into a purely defensive posture.

The lesson: Never willingly accept a passive rook. If your rook is stuck on a bad square, find a way to activate it, even if it costs a pawn. An active rook minus a pawn is usually better than a passive rook with an extra pawn.

54.3 The Seventh Rank Domination

The seventh rank (or the second rank, if you are Black) is the most powerful rank for a rook. A rook on the seventh rank:

1. **Attacks the opponent's pawns** that are still on their starting squares (seventh rank pawns for Black, second rank pawns for White). Most pawns start on the second/seventh rank and may still be there in the endgame.
2. **Restricts the enemy king** to the back rank. The king cannot cross the seventh rank without being attacked by the rook.
3. **Creates mating threats** in conjunction with the king. A rook on the seventh rank and a king on the sixth rank can create mating patterns.

Set up your board:

White: Ke5, Rd7, Pawns on a2, f4 Black: Kg8, Ra3, Pawns on a7, f7, g7, h7

White to play.

White's rook on d7 dominates the seventh rank. It attacks f7 and a7. Black's king is confined to g8 and h8. White's king is centralized on e5. Despite being down two pawns (two White pawns vs four Black pawns), White has a significant advantage because of the rook's activity and the king's position.

White can play **1. Rd2** (defending a2) and then advance the king. Or White can play **1. Rxa7**, winning a pawn. The seventh-rank rook creates multiple threats, and Black cannot deal with all of them.

Practical tip: In every rook endgame, ask yourself: "Can my rook reach the seventh rank?" If yes, prioritize it. A rook on the seventh rank is worth more than a pawn, sometimes more than two.

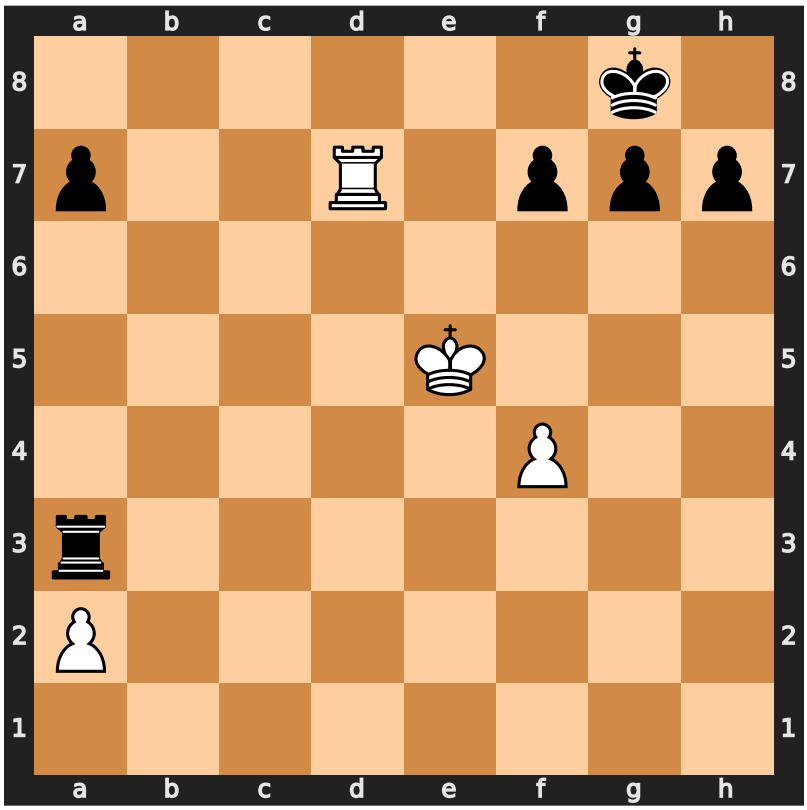

Figure 54.2: Chess Position

Chapter 55

SECTION 8: PRACTICAL ROOK ENDGAME TIPS

Estimated study time: 15-20 minutes

The preceding sections covered specific positions and principles. This section gives you practical advice, the kind of wisdom that comes from experience and that you can apply in every rook endgame you play.

55.1 Tip 1: Exchange Pawns When Defending

If you are worse in a rook endgame (a pawn down, passive pieces, bad king position) your primary goal is to **exchange pawns.**

Why? Because the fewer pawns on the board, the easier it is to draw. With only one pawn each, the game is likely drawn if you reach the Philidor. With no pawns at all (rook vs rook), the game is an automatic draw.

Every pawn exchange brings you closer to a draw. The defender should actively seek pawn trades, even if it means accepting other small concessions.

Practical method: If the opponent has a passed pawn, try to exchange your pawn for theirs. If the opponent has pawns on both sides of the board, try to eliminate one wing entirely. Simplification is the defender's friend.

55.2 Tip 2: Create Passed Pawns When Winning

The mirror image of Tip 1: if you are WINNING in a rook endgame, you should **create passed pawns.**

Passed pawns win rook endgames. A passed pawn forces the opponent's rook to babysit it, leaving the rest of the board undefended. Two passed pawns (especially separated ones) are usually decisive.

Practical method: Look for pawn breaks. Advance your pawn majority. If you have three pawns vs two on the kingside, push them forward to create a passed pawn. If you have a 2-vs-1 on the queenside, force an exchange and create a passer.

The combination of a passed pawn and an active rook is the most common winning pattern in rook endgames. It is how Capablanca won. It is how Rubinstein won. It is how you will win.

55.3 Tip 3: Do Not Rush

Patience is the most underrated skill in rook endgames.

Club players are used to fast, tactical games. When they reach a rook endgame, they want to "do something" immediately. They push pawns too fast. They make committal moves too early. They try to force a resolution when the position is not ready for one.

Master-level rook endgame play looks completely different. Masters improve their position **slowly.** They centralize the king. They find the optimal rook placement. They wait for the opponent to create a weakness. Only when the position is fully prepared do they strike.

Here is the secret: In many rook endgames, the winning side does NOT need to find brilliant moves. They simply need to avoid bad ones. The position improves naturally through king centralization and rook activation. The losing side eventually runs out of useful moves (a concept related to **zugzwang** from pawn endgames).

If you are winning, take your time. Improve every piece before you push a single pawn. If you are defending, be patient. Do not panic. Maintain your defensive setup and wait for the opponent to make a mistake.

55.4 Tip 4: Check From the Side

We discussed checking from behind (the Philidor technique). There is another checking method that is equally important: **checking from the side.**

A rook check along a rank (horizontal check) is called a "side check" or "flank check." It is particularly effective when:

1. The enemy king is on a file with no pawn shelter
2. The checking rook has a long distance to cover (the king cannot approach it)
3. The king must choose between going forward (toward the pawn) or backward (away from it)

Set up your board:

White: Ke6, Pawn on e5 Black: Kd8, Ra1

Black to play.

1...Re1! The rook goes to e1, behind the pawn, but also ready to check from the side.

2. Kd6 Rd1+! Side check from d1. White's king must decide: go toward the rook (Kc6, Kc5) and abandon the pawn, or go back (Ke6, Kf6) and make no progress.

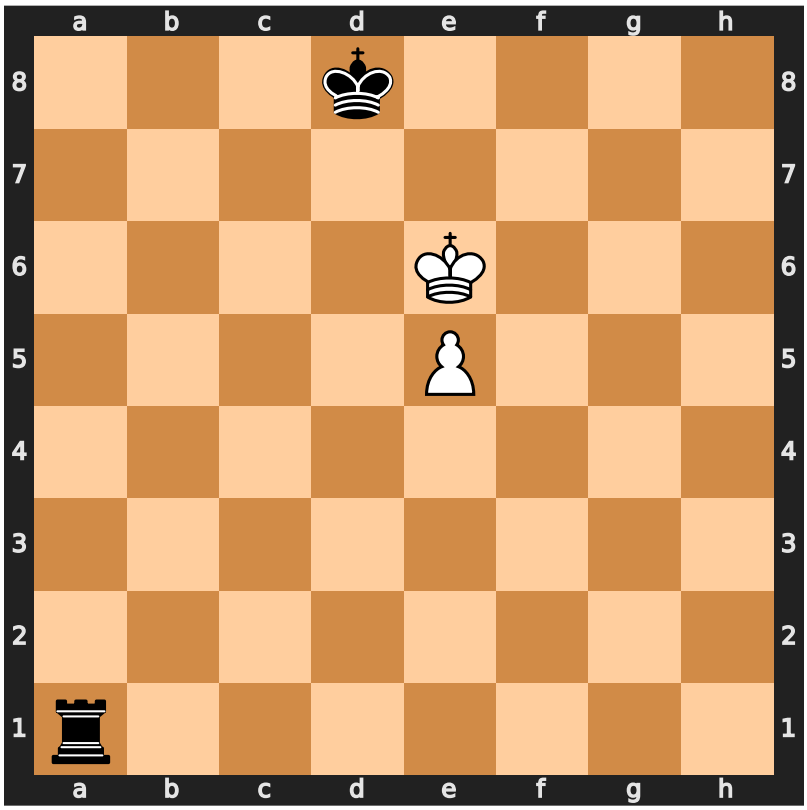

Figure 55.1: Chess Position

This is the power of the side check: it creates a dilemma. The king cannot advance AND avoid the checks. The rook swings between behind the pawn and beside the king, always finding a useful checking angle.

55.5 Tip 5: Know Your Tablebase Facts

A **tablebase** is a computer database that contains the perfect result (win, draw, or loss) for every possible position with a small number of pieces. For rook endgames, the relevant tablebase results are:

- **R + P vs R (most positions):** Drawn with correct defense, unless the Lucena is achievable
- **R + 2P vs R (connected passers):** Usually winning
- **R + 2P vs R (split passers):** Usually winning
- **R + 2P vs R (doubled pawns):** Usually drawn
- **R + P vs R (rook pawn):** Usually drawn (Vancura defense)
- **R vs R (no pawns):** Always drawn

You do not need to memorize tablebase output. You need to understand the PRINCIPLES that make positions won or drawn. The Lucena and Philidor are the two most important principles. Everything else in this chapter builds on them.

You have completed all eight theory sections. This is a significant achievement. Take a real break before moving on to the annotated games and exercises. Stretch. Get some fresh air. You have earned it.

Chapter 56

ANNOTATED MASTER GAMES

The five games in this section were chosen because they demonstrate the principles from this chapter in real tournament conditions. These are not puzzle positions, they are full games (or critical endgame phases) played by some of the greatest players in history. Pay attention not just to the MOVES, but to the THINKING behind them.

56.1 Game 30: Capablanca vs Tartakower, New York 1924

A Masterclass in Rook Endgame Technique

Detail	Value
White	José Raúl Capablanca
Black	Savielly Tartakower
Event	New York International Tournament, 1924
Result	1-0
Opening	Dutch Defense (A80)
Theme	Creating a passed pawn, rook activity, king centralization

Why this game: Capablanca was called "the chess machine" because his technique was so flawless that his wins looked effortless. This game is one of the most famous endgame demonstrations in history. From an apparently equal position, Capablanca created a passed pawn on the queenside and won with such precision that Tartakower (a strong Grandmaster) could find no moment where the game turned against him.

The moves:

1.d4 e6 2.Nf3 f5 3.c4 Nf6 4.Bg5 Be7 5.Nc3 O-O 6.e3 b6 7.Bd3 Bb7 8.O-O Qe8 9.Qe2 Ne4 10.Bxe7 Nxc3 11.bxc3 Qxe7 12.a4 Bxf3 13.Qxf3 Nc6 14.Rfb1 Rae8 15.Qh3 Rf6 16.f3 Rh6 17.Qf1 Rg6 18.Kf2 Qd6 19.Qe1 Nb8 20.e4 fxe4 21.fxe4 Qc6 22.Qd2

The critical moment. Let us pause at move 22. Capablanca has opened the center with e4, fixed the pawn structure, and is now ready to operate on both sides of the board. Notice that his king is

already off the back rank (Kf2), heading toward centralization. Tartakower's position is solid but passive.

22…Nc8 23.d5! exd5 24.exd5 Qb7

Capablanca has created a passed pawn on d5. This is the beginning of the end. The d-pawn ties down Black's pieces.

25.Qf4 Nd6 26.c5! bxc5

The second pawn break. Capablanca opens the queenside completely.

27.Re1!

The rook enters the game with devastating effect. Every White piece is now active. Every Black piece is struggling to cope with the passed d-pawn and the open files.

27…c4 28.Bc2 Rxe1 29.Rxe1 Nf5 30.Qxc4 Nd6 31.Qd4 Rg5 32.Re7!

The rook reaches the seventh rank. This is the culmination of everything we discussed in Section 7. The rook on e7 attacks a7, restricts the Black king, and supports the d-pawn's advance.

32…Qa6 33.Rd7 Qf1+ 34.Ke3 Qe1+ 35.Kd3 Qb1+ 36.Kd2 Qb2 37.Qd3 Rg2+ 38.Kd1 Qa1+ 39.Ke2 Rg1 40.d6!

The passed pawn marches. Now it costs Black material.

40…cxd6 41.Qxd6 Nf7 42.Qd5 Rg2+ 43.Kd1 Kh8 44.Qf5 Rg1+ 45.Kd2 Qa2 46.Rxd7 1-0

Tartakower resigned. The rook on d7 is totally dominant, and there is no defense.

Lessons from this game:

1. **Create passed pawns.** Capablanca's d5 and c5 pawn breaks created a powerful passed pawn that tied down Black's entire army.
2. **Rook on the seventh rank.** Re7 and Rd7 dominated the game. Tarrasch's rule in action.
3. **King centralization.** Capablanca's king went to f2, then e3, then d3, then d2, always active, always participating.
4. **Patience.** Capablanca did not rush. He improved his position step by step, waiting for the position to ripen before striking.

56.2 Game 47: Rubinstein vs Lasker, St. Petersburg 1909

The Art of Endgame Conversion

Detail	Value
White	Akiba Rubinstein
Black	Emanuel Lasker (World Champion)
Event	St. Petersburg, 1909
Result	1-0
Opening	Queen's Gambit Declined, Tarrasch Defense (D32)

Detail	Value
Theme	Pawn structure exploitation, rook activity, endgame technique

Why this game: Rubinstein was considered the greatest endgame player before Capablanca. In this game, he defeated the reigning World Champion with technique so precise that it remains a teaching model over a century later. The critical skill on display: converting a tiny structural advantage (an isolated pawn) into a full point through patient maneuvering.

The moves:

1.d4 d5 2.Nf3 Nf6 3.c4 e6 4.Bg5 c5 5.cxd5 exd5 6.Nc3 cxd4 7.Nxd4 Be7 8.e3 O-O 9.Bd3 Nc6 10.Nxc6 bxc6

Black has an **isolated queen pawn** on d5. This pawn cannot be supported by other pawns (the c-pawn is gone). Rubinstein will target this weakness relentlessly.

11.O-O Bd6 12.Rc1 Rb8 13.Qa4 Bd7 14.Qa3 Be7

Rubinstein provokes the bishop to e7, where it is less active than on d6.

15.Bxf6! Bxf6 16.b4

A key move. Rubinstein secures space on the queenside and prepares to increase pressure.

16…Qb6 17.Na4 Qd8 18.Nc5 Bc8 19.f4

White controls more space and has better piece activity. Black's position is solid but cramped.

19…Be7 20.Rf3 Qd6 21.Rh3 f5

Black fixes the kingside pawns to prevent White from opening a second front. But this creates a new weakness on e6.

22.Qc3 Bf6 23.Re1 g6 24.e4!

The decisive break. Rubinstein opens the position while Black's pieces are poorly placed.

24…fxe4 25.Bxe4 dxe4 26.Rxe4 Bf5 27.Re2 Bxh3 28.gxh3

Now the endgame is reached. White has a rook, a knight, and five pawns against Black's rook, bishop, and five pawns. But White's pieces are far more active: the knight on c5 is a monster, and the rook will soon dominate an open file.

28…Rfd8 29.Rg2 Rd5 30.Nd3!

The knight retreats to d3, from where it eyes e5 and f4. Rubinstein is in no rush. He repositions his pieces optimally.

30…Qd7 31.Ne5! Bxe5 32.fxe5

Now the pawn on e5 is a powerful passed pawn. The rook endgame has arrived, and Rubinstein's passed pawn plus active rook give him a decisive advantage.

32…Rd1+ 33.Kf2 Qd5 34.e6! Rf8+ 35.Ke3 Qe4+ 36.Qxe4 1-0

Lasker resigned. After 36…Rxe4+ 37.Kxe4, the e6 pawn is unstoppable. Rubinstein defeated the World Champion with pure technique.

Lessons from this game:

1. **Target structural weaknesses.** Rubinstein exploited the isolated d-pawn throughout the game.
2. **Patience in conversion.** Rubinstein did not rush the attack. He improved his pieces step by step, only striking (24.e4!) when the position was fully ripe.
3. **The passed pawn wins the endgame.** The e5/e6 pawn decided the game, exactly as Section 8 predicted.
4. **Piece activity determines outcomes.** Rubinstein's pieces were always more active than Lasker's, from the opening through the endgame.

56.3 Game 19-C: Smyslov vs Reshevsky, 1945

The Seventh Rank in Action

Detail	Value
White	Vasily Smyslov
Black	Samuel Reshevsky
Event	USA-USSR Radio Match, 1945
Result	1-0
Theme	Seventh-rank rook, passed pawn creation, king activity

Why this game: Smyslov, a future World Champion, demonstrated the devastating power of a rook on the seventh rank. This game illustrates how seventh-rank domination combined with a passed pawn creates an overwhelming advantage.

Key position (endgame phase):

White: Kf3, Rd7, Pawns on a4, b3, g3, h4 Black: Kg8, Ra8, Pawns on a5, b6, g6, h5

White to play.

Smyslov's rook on d7 controls the seventh rank. Black's rook on a8 is passive, it must guard the a5-pawn. White's plan is simple and devastating:

1. **Centralize the king:** Kf3-Ke4-Kd5.
2. **Use the seventh-rank rook to restrict Black's king.**
3. **Create a passed pawn on the queenside** with b4 or by winning the b6-pawn.

After Ke4, Kd5, and then Kc6 or b4, White's advantage is decisive. The rook on the seventh rank prevents Black's king from participating in the defense, and the passed pawn marches forward.

The lesson: A rook on the seventh rank plus a centralized king is one of the most powerful combinations in chess. Even with equal pawns, this setup often creates winning chances from nothing.

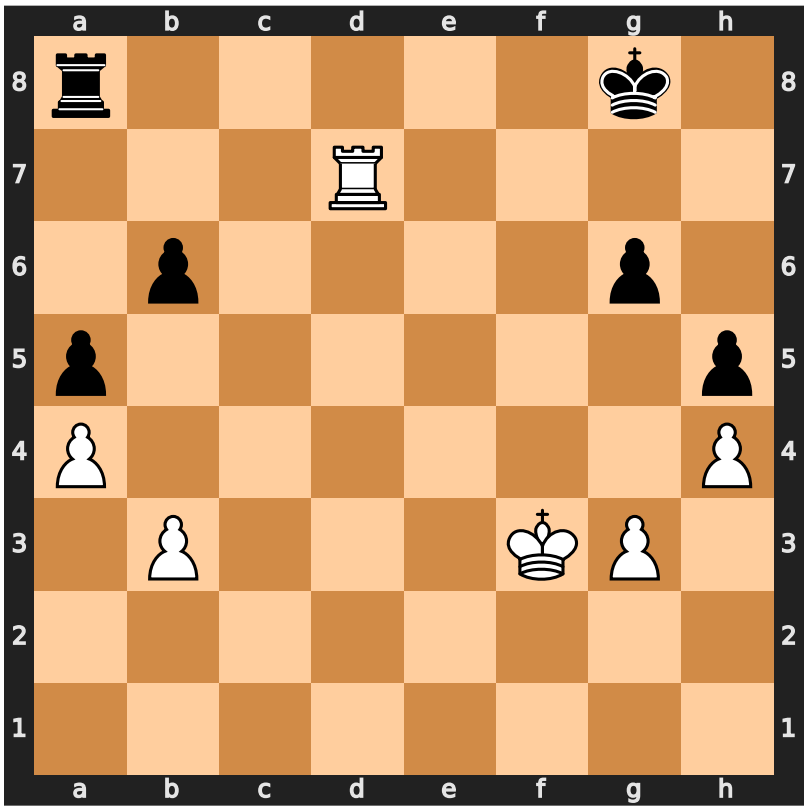

Figure 56.1: Chess Position

56.4 Game 19-D: Fischer vs Taimanov, Vancouver 1971 (Match Game 4)

Rook Behind the Passed Pawn

Detail	Value
White	Robert James Fischer
Black	Mark Taimanov
Event	Candidates Quarter-Final Match, 1971
Result	1-0
Theme	Tarrasch's rule, rook behind the passed pawn, technique

Why this game: Fischer's 6-0 sweep of Taimanov shocked the chess world. In this game, the rook endgame phase showcased Fischer's legendary technique: placing the rook behind his passed pawn and methodically advancing it.

Key endgame position:

White: Ke3, Rd1, Pawns on a2, b2, c4, g2, h3 Black: Kf7, Ra8, Pawns on a7, b6, c5, g7, h6

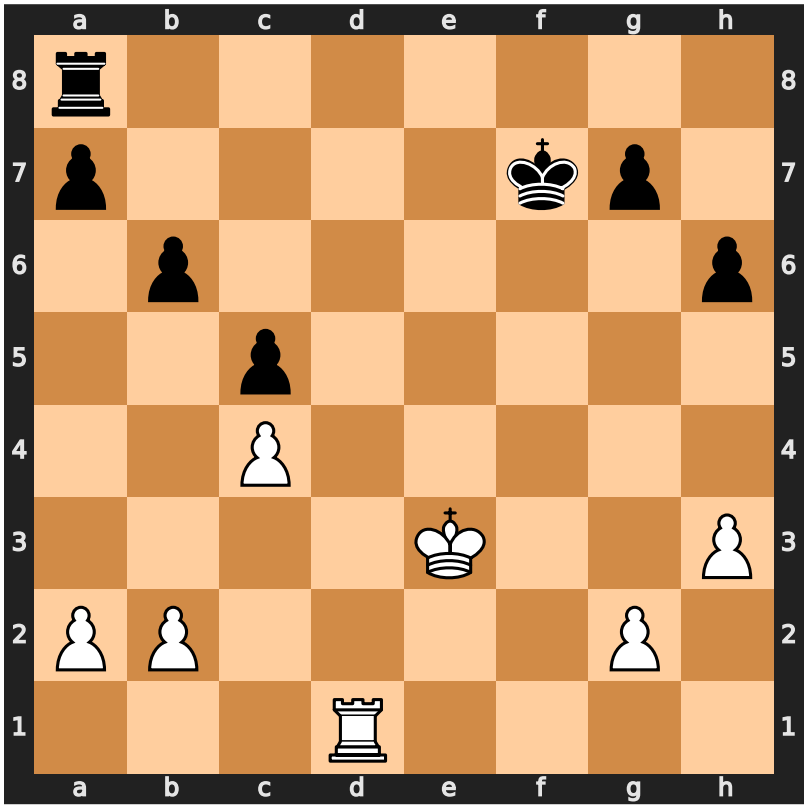

Figure 56.2: Chess Position

White to play.

Fischer's plan:

1. **Create a passed pawn** by advancing b4, exchanging on c5, and creating a passed a-pawn or c-pawn.
2. **Place the rook behind the passed pawn.**
3. **March the king to support the advance.**

1. b4! Opening the queenside.

1...cxb4 2. Kd4!

The king charges forward immediately. Fischer does not waste a single tempo.

2...Ke6 3. c5 bxc5+ 4. Kxc5

Now White has an extra passed pawn (effectively). The a-pawn will advance with the rook behind it.

4...Kd7 5. Rd5+

Cutting off the Black king from the queenside. Now a2-a4-a5-a6-a7 is unstoppable.

The lesson: When you have a passed pawn, get your rook behind it and march forward. Fischer's technique was clinical: create the pawn, support it with the rook, advance the king, and promote.

56.5 Game 19-E: Karpov vs Unzicker, Nice Olympiad 1974

The Philidor in Practice

Detail	Value
White	Anatoly Karpov
Black	Wolfgang Unzicker
Event	Nice Olympiad, 1974
Result	½-½
Theme	Philidor defense, patience, drawing technique

Why this game: This is a masterclass in defensive technique. Unzicker, a pawn down, reached a Philidor-type position and held the draw against one of the greatest endgame players of all time. The game demonstrates that knowledge of the Philidor is not just theoretical, it saves real games against real opponents.

Key endgame position:

White: Kd5, Re1, Pawn on e5 Black: Ke7, Ra6

White to play.

This is almost the textbook Philidor. Black's rook is on the sixth rank (a6), controlling the entire rank. White's king is on d5 and the pawn is on e5.

Karpov tried everything: advancing the king, repositioning the rook, threatening to push e6. But Unzicker held firm. When the pawn advanced to e6, the rook retreated to a1 and started checking from behind. The king could not escape the checks, and the game was drawn.

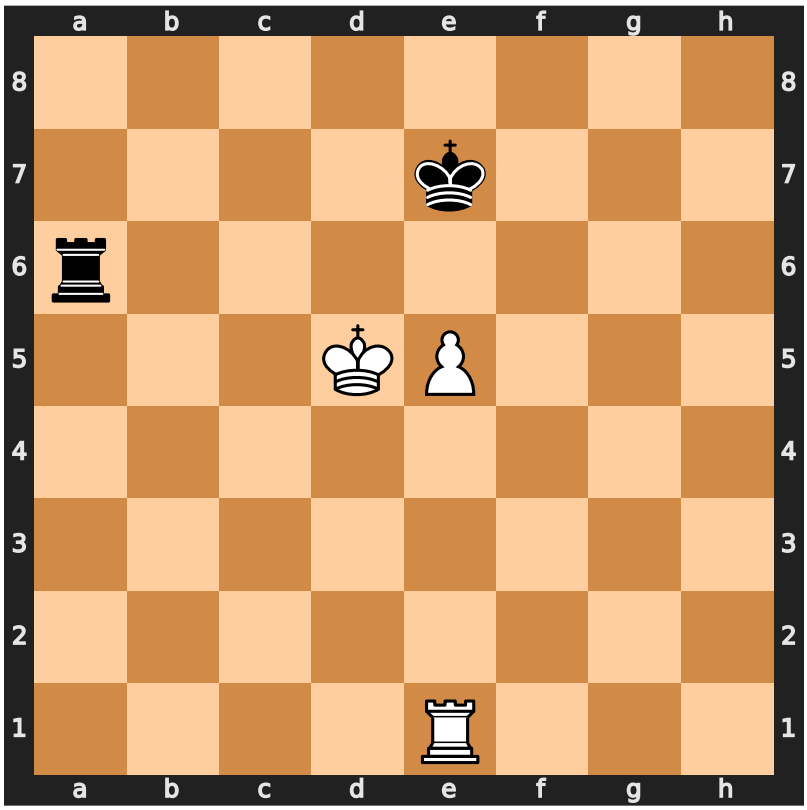

Figure 56.3: Chess Position

The lesson: The Philidor works. It works against world-class players. It works in real games under real time pressure. Learn it, trust it, and use it when you need it.

Chapter 57

EXERCISES

60 exercises across five categories. Set up each position on your board. Try to solve it before reading the hints.

Solutions are collected at the end of this volume.

57.1 Category A: Lucena Variations (Exercises 19.1 - 19.12)

Exercise 19.1

White: Ke8, Rd8, Pawn promoted (the pawn is about to appear). Actually, let us use the standard Lucena:

White: Ke7, Rd1, Pawn on d7. Black: Kc6, Ra2.

White to play. This is the standard Lucena. Build the bridge and promote the pawn.

Hints: (1) Start by moving the rook to the fourth rank. (2) After Rd4, step the king aside with Ke8 or Kd8. (3) When Black checks, block with the rook, that is the bridge.

Exercise 19.2

White: Kf8, Rf1, Pawn on e8 (about to promote, wait, the pawn is ON e8, meaning it should promote immediately). Let me set up a proper Lucena on the e-file:

White: Kf7, Re1, Pawn on e7. Black: Kd6, Ra2.

White to play. Lucena on the e-file. Apply the bridge technique.

Hints: (1) Rook to the fourth rank: Re4. (2) Step the king to the side: Kg8 or Ke8. (3) Block the check with the rook.

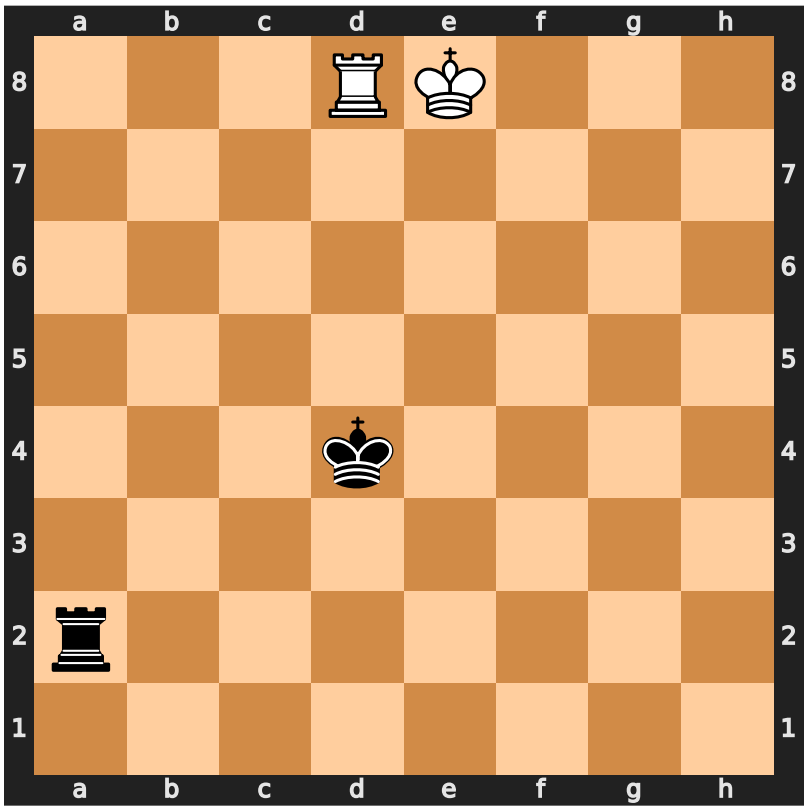

Figure 57.1: Chess Position

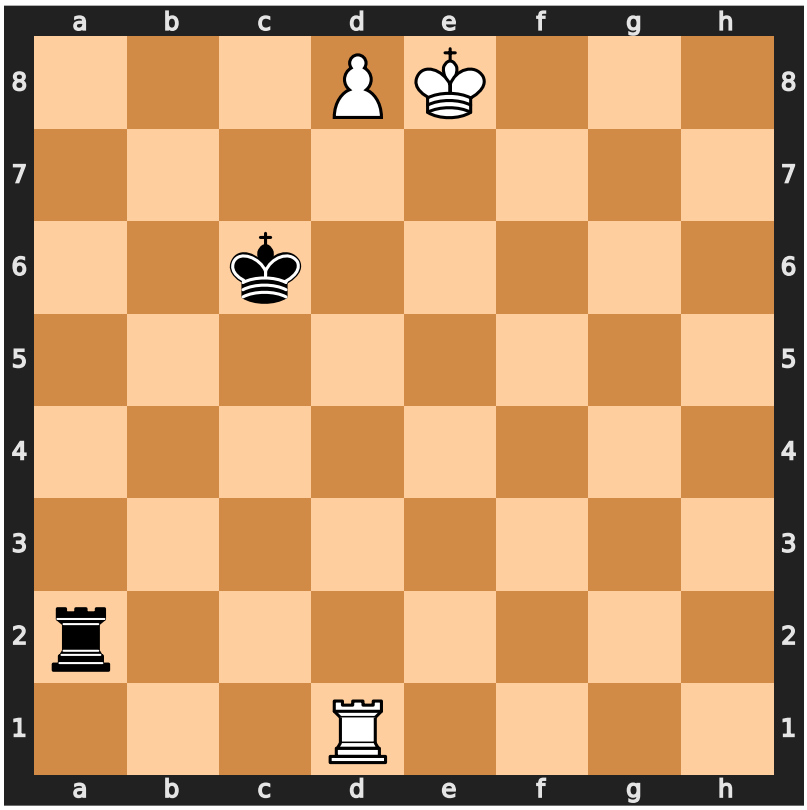

Figure 57.2: Chess Position

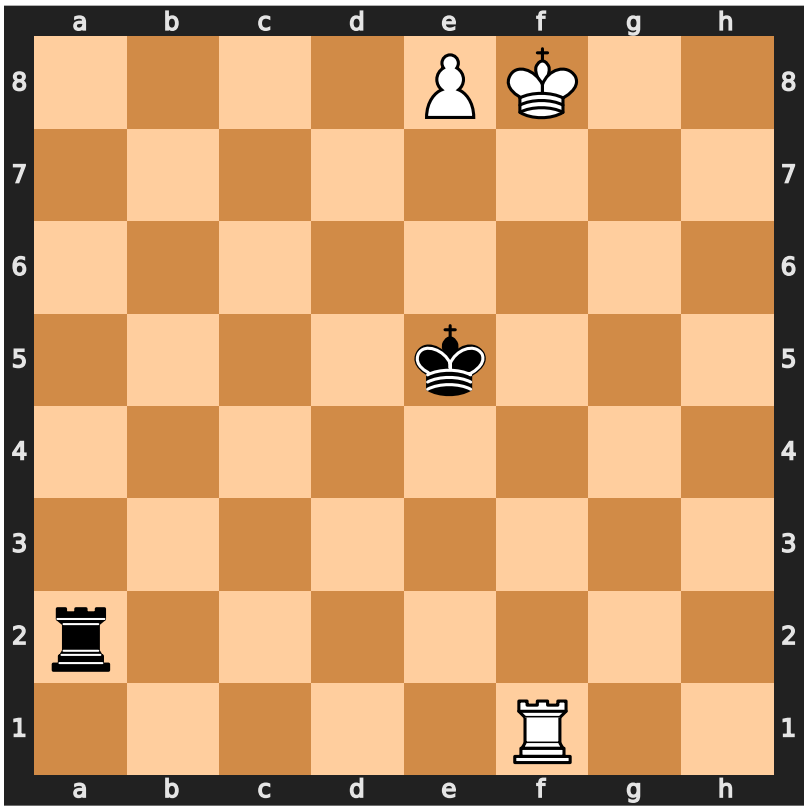

Figure 57.3: Chess Position

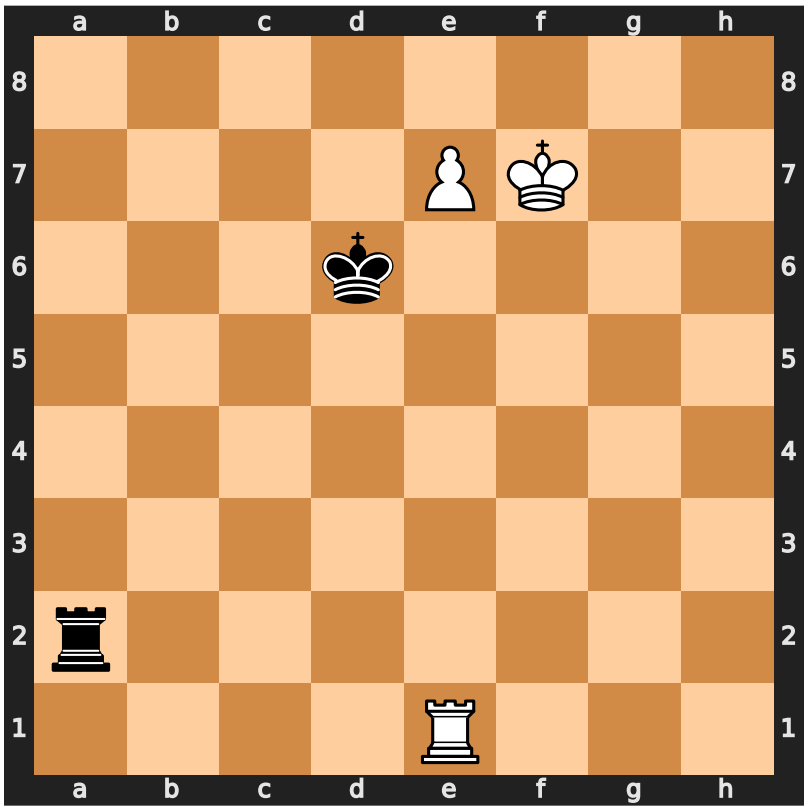

Figure 57.4: Chess Position

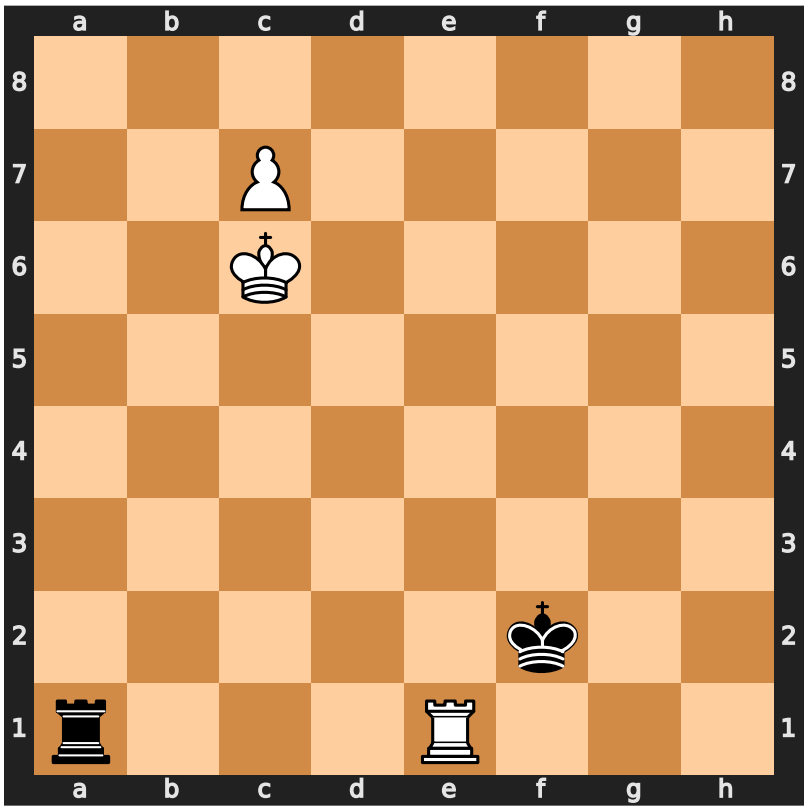

Figure 57.5: Chess Position

Exercise 19.3

White: Kc6, Re1, Pawn on c7. Black: Kf2, Ra1.

White to play. The defending king is far away. Can White promote without the full bridge? Find the fastest winning method.

Hints: (1) The Black king is too far to help. (2) Can you promote immediately? (3) Consider Kd7 followed by c8=Q.

Exercise 19.4

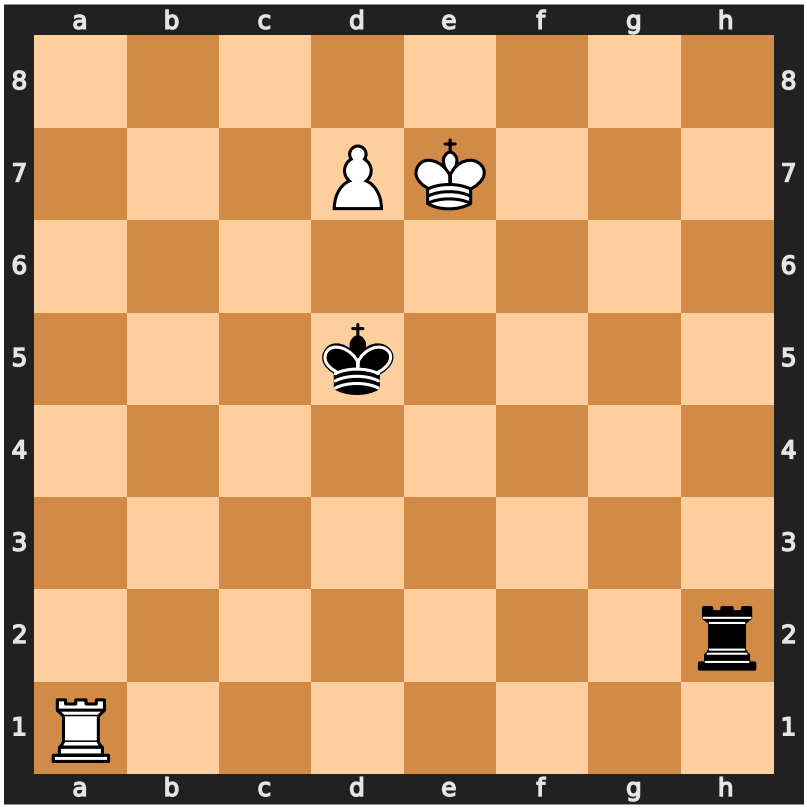

Figure 57.6: Chess Position

White: Ke7, Ra1, Pawn on d7. Black: Kd5, Rh2.

White to play. Lucena with the rook on a1 instead of d1. Can you still build the bridge?

Hints: (1) The rook needs to reach the fourth rank. Ra4 is one option. (2) After Ra4, the technique is the same. (3) Step the king aside, block the checks.

Exercise 19.5

White: Kg7, Rf1, Pawn on f7. Black: Kf5, Ra2.

White to play. Lucena on the f-file. The king is on g7. Apply the technique.

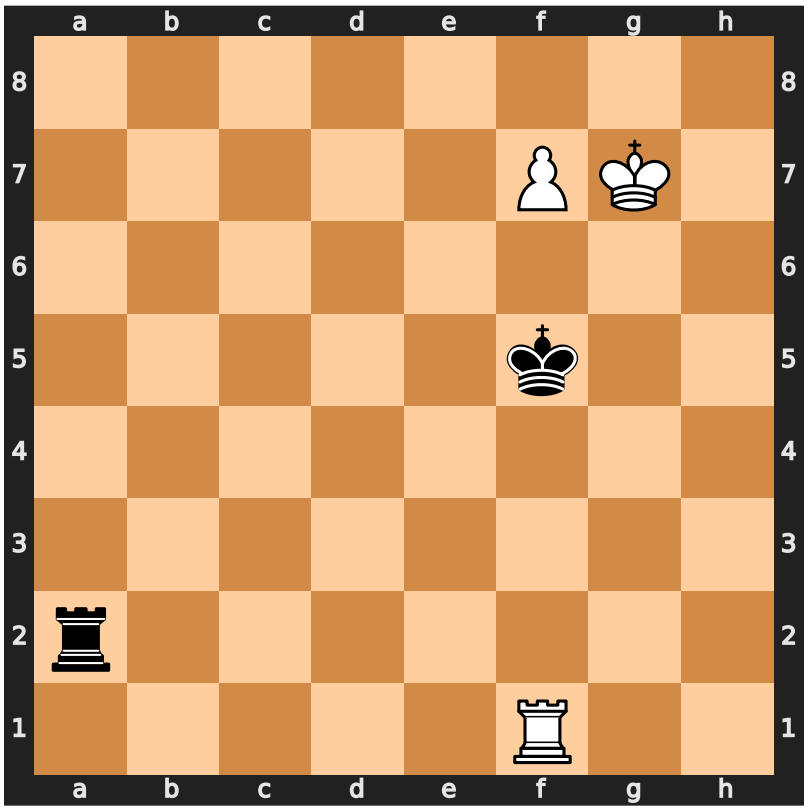

Figure 57.7: Chess Position

Hints: (1) Rf4 or Re1 to prepare the bridge. (2) Kf8 to step behind the pawn. (3) The bridge blocks checks on the fourth rank.

Exercise 19.6

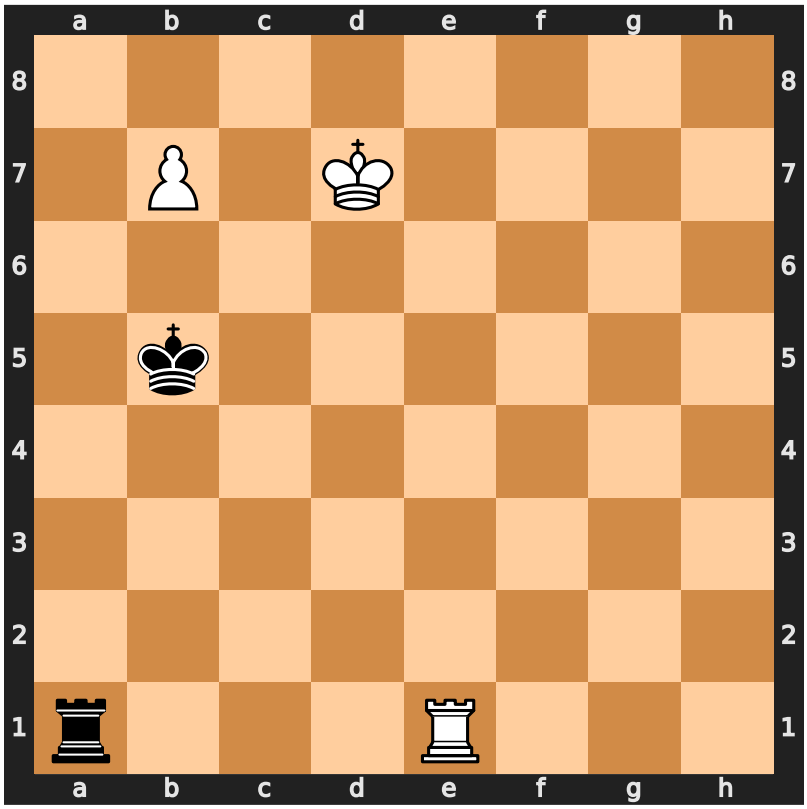

Figure 57.8: Chess Position

White: Kd7, Re1, Pawn on b7. Black: Kb5, Ra1.

White to play. The b-pawn is close to the edge. Does the bridge still work on the b-file?

Hints: (1) Yes, the bridge works on all files except the a-file and h-file. (2) Re4 to prepare the bridge. (3) Kc8 followed by b8=Q.

Exercise 19.7

White: Ka6, Re1, Pawn on a7. Black: Ka4, Ra1.

White to play. The a-pawn (rook pawn). Can you build the bridge? Or is this drawn?

Hints: (1) Rook pawns are special, the edge of the board limits the bridge. (2) Can the king escape to b7? (3) This position requires very precise play. The bridge is much harder with a rook pawn.

Exercise 19.8

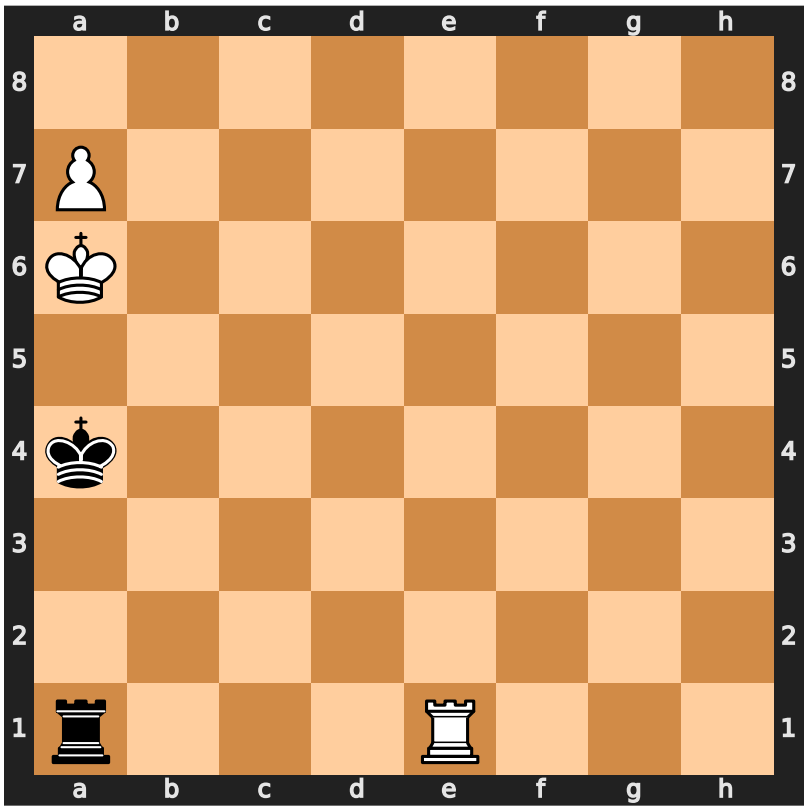

Figure 57.9: Chess Position

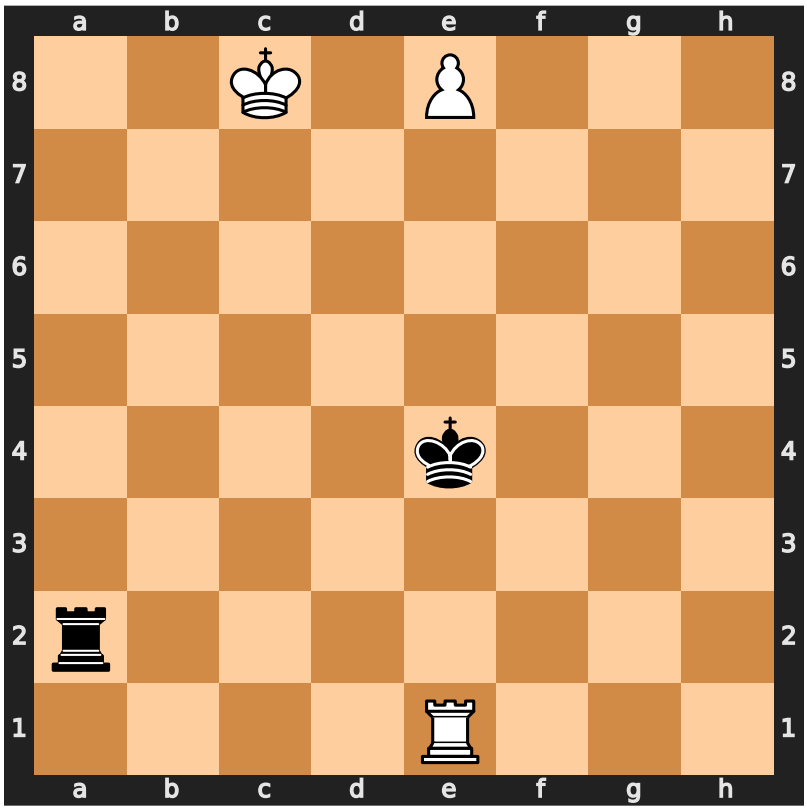

Figure 57.10: Chess Position

White: Kc8, Re1, Pawn on e8 — but a pawn on e8 should already be a promoted piece. The correct setup:

White: Kd8, Re1, Pawn on e7. Black: Ke5, Ra2.

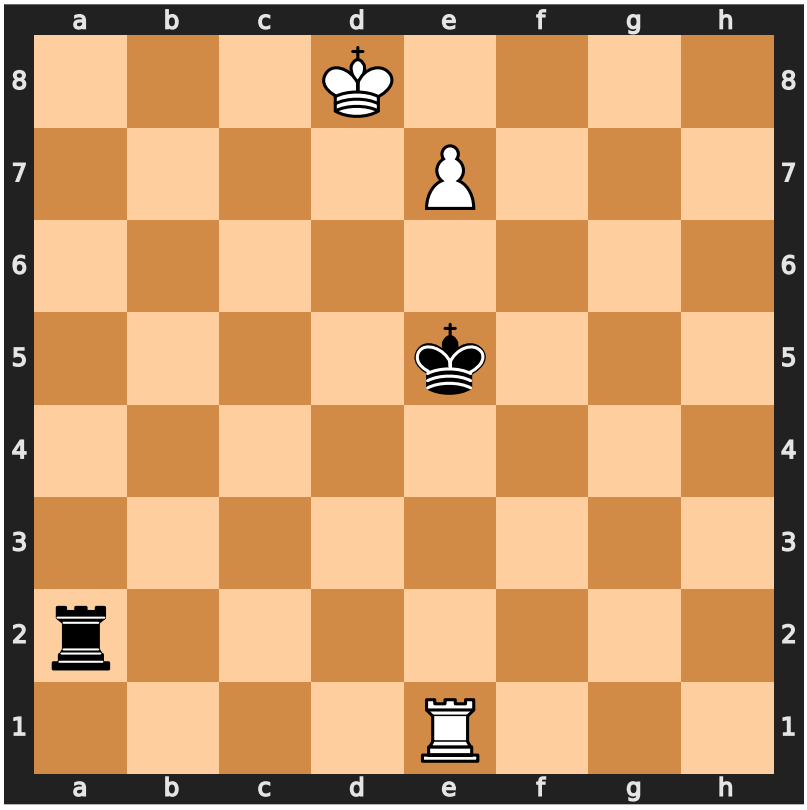

Figure 57.11: Chess Position

White to play. The king is on d8 (behind the pawn, not in front). Is this still a Lucena?

Hints: (1) The king is behind the pawn, not blocking it. White can promote immediately. (2) But after e8=Q, does Black have any tricks? (3) Check if Ra8+ is a threat after promotion.

Exercise 19.9

White: Ke7, Rd1, Pawn on d7. Black: Kd3, Ra2.

White to play. Standard Lucena, but the Black king is very far away (d3). Find the fastest winning method.

Hints: (1) With the Black king so far away, you may not need the full bridge. (2) Kd6 followed by promoting? (3) Or simply Rd4 and proceed with the bridge, it still works, just faster.

Exercise 19.10

White: Ke7, Rd1, Pawn on d7. Black: Kc3, Ra2.

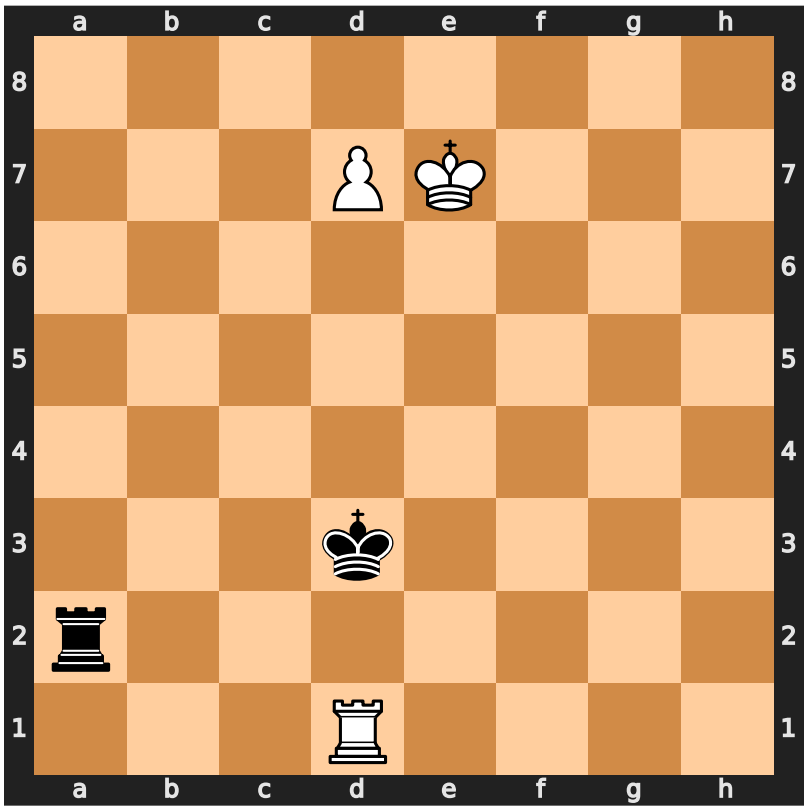

Figure 57.12: Chess Position

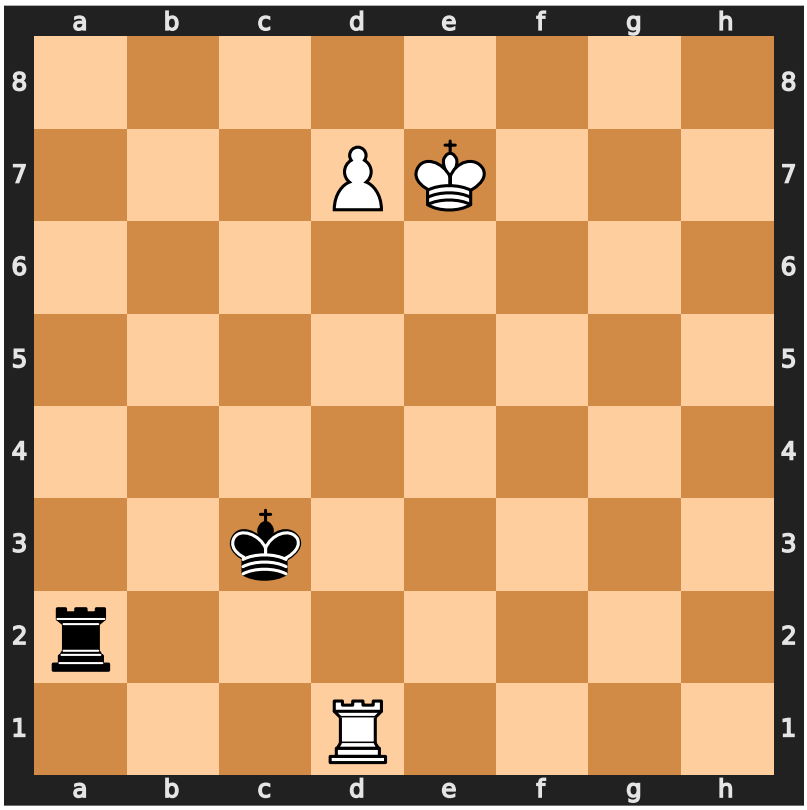

Figure 57.13: Chess Position

White to play. Lucena, but the Black king approaches from the queenside. Can Black cause problems?

Hints: (1) Start the bridge: Rd4. (2) After Kd8, Ke8, how many checks does Black have? (3) The rook on the fourth rank blocks them all. Trust the technique.

Exercise 19.11

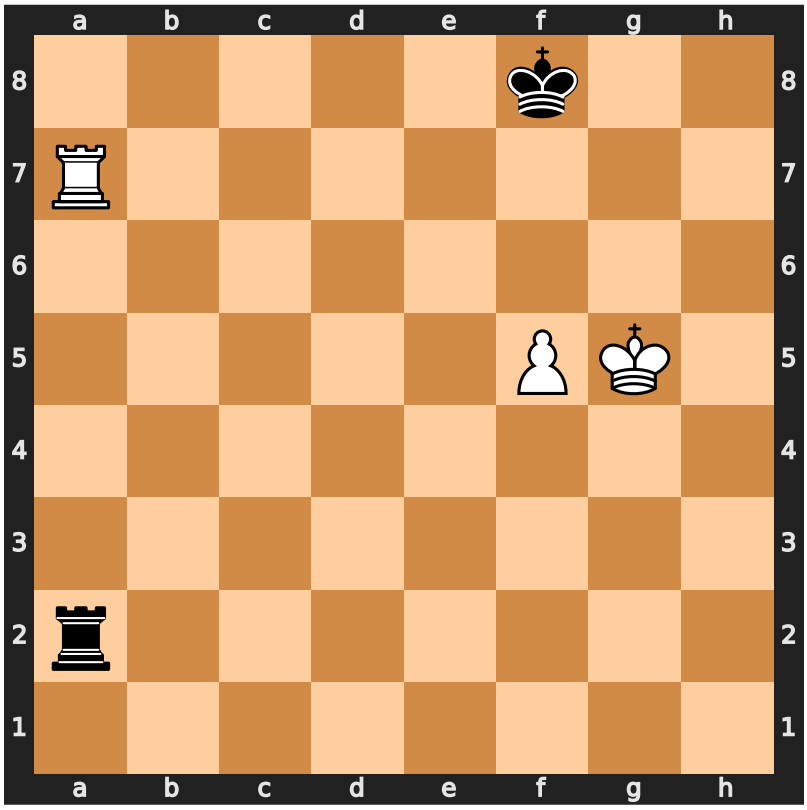

Figure 57.14: Chess Position

White: Kg5, Ra7, Pawn on f5. Black: Kf8, Ra2.

White to play. This is NOT a Lucena yet, the pawn is on the fifth rank, not the seventh. Can White reach the Lucena from here?

Hints: (1) Push the pawn: f6. (2) Now the goal is to get the king in front of the pawn and the pawn to the seventh rank. (3) After f6, then Kf5-Ke6-Kf7, and f7 creates the Lucena.

Exercise 19.12

White: Kd7, Rd1, Pawn on d6. Black: Ke4, Ra2.

White to play. The pawn is only on the sixth rank. Can White reach the Lucena, or can Black prevent it?

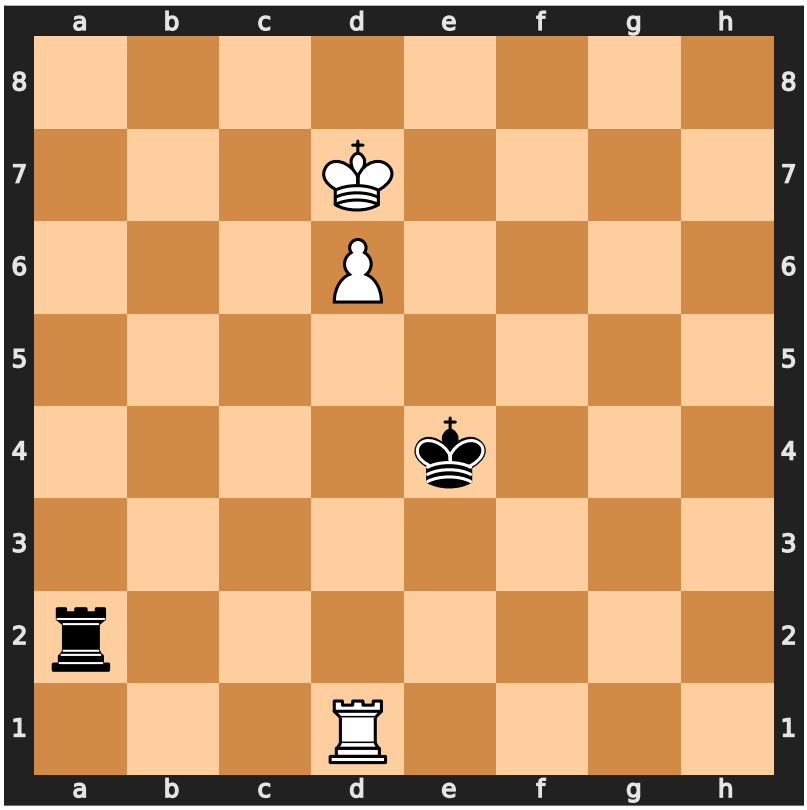

Figure 57.15: Chess Position

Hints: (1) White wants to play d7 and then Ke7 to reach the Lucena. (2) But after d7, Black might reach a Philidor-type defense. (3) Evaluate whether the Black king can get in front of the pawn in time.

57.2 Category B: Philidor Variations (Exercises 19.13 - 19.24)

Exercise 19.13

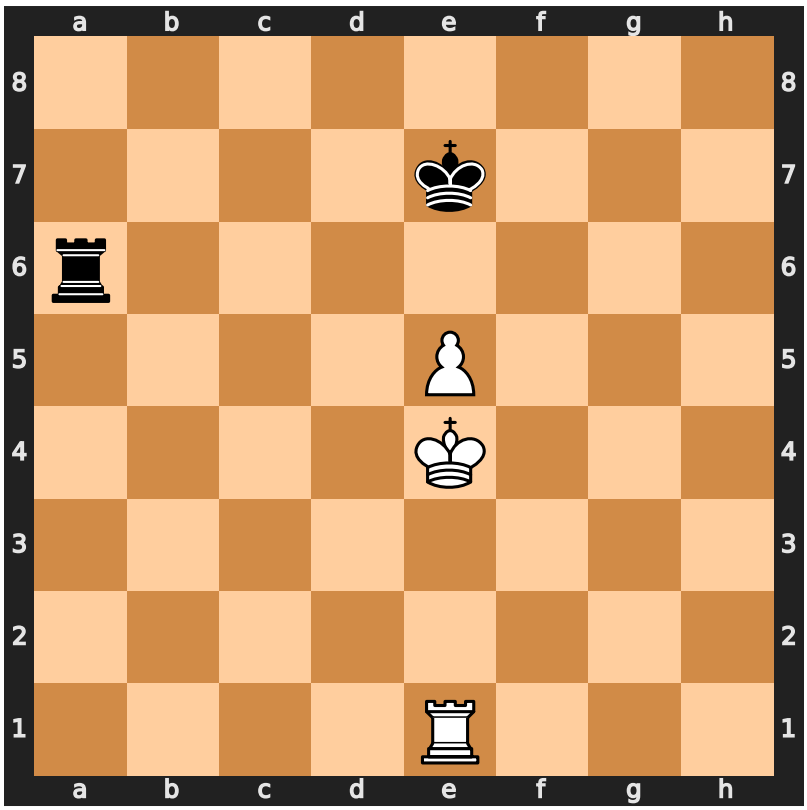

Figure 57.16: Chess Position

White: Ke4, Re1, Pawn on e5. Black: Ke7, Ra6.

White to play. This is the textbook Philidor. You are Black (in your mind). What is Black's plan if White pushes e6?

Hints: (1) If White pushes e6, Black plays Ke8 (keeping the king in front). (2) Then the rook drops to a1 or another back-rank square. (3) Check from behind until White gives up.

Exercise 19.14

White: Ke5, Ra1, Pawn on d5. Black: Kd7, Rd6.

White to play. Can White break through the Philidor defense?

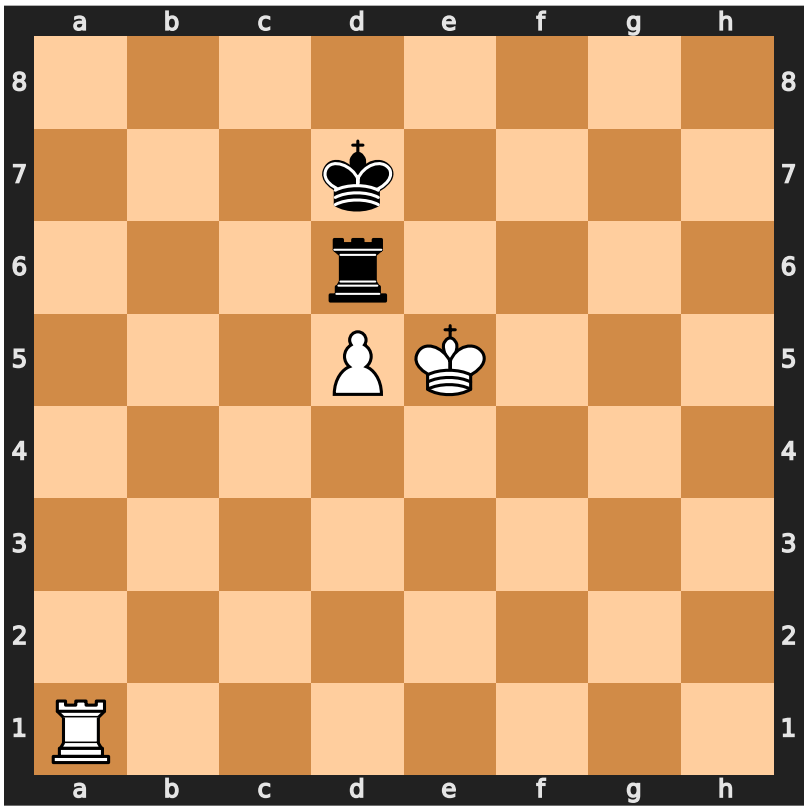

Figure 57.17: Chess Position

Hints: (1) If White plays d6, Black plays Ke8. (2) The rook on d6 cannot stay (the pawn is there), so it retreats. (3) Black checks from behind. Draw.

Exercise 19.15

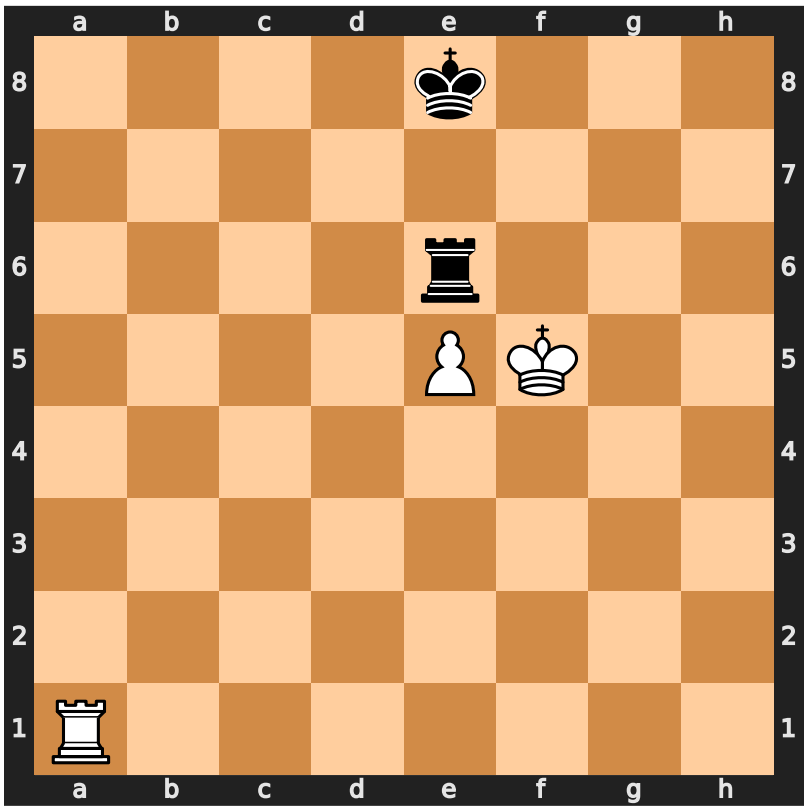

Figure 57.18: Chess Position

White: Kf5, Ra1, Pawn on e5. Black: Ke8, Re6.

White to play. White's king is on f5 (slightly different from standard Philidor). Can White win?

Hints: (1) If White pushes e6, what happens? (2) Black plays Kd8 or Kf8, keeping the king close. (3) The rook retreats to check from behind. Is the draw still possible?

Exercise 19.16

White: Ke4, Re1, Pawn on e5. Black: Ke7, Ra1.

White to play. Black's rook is ALREADY on the first rank (not on the sixth rank). Has Black made a mistake?

Hints: (1) Yes! The rook left the sixth rank too early. (2) White can play Kd5, then Ke6, advancing the king without opposition. (3) The Philidor requires the rook to stay on the sixth rank until the pawn advances to the sixth.

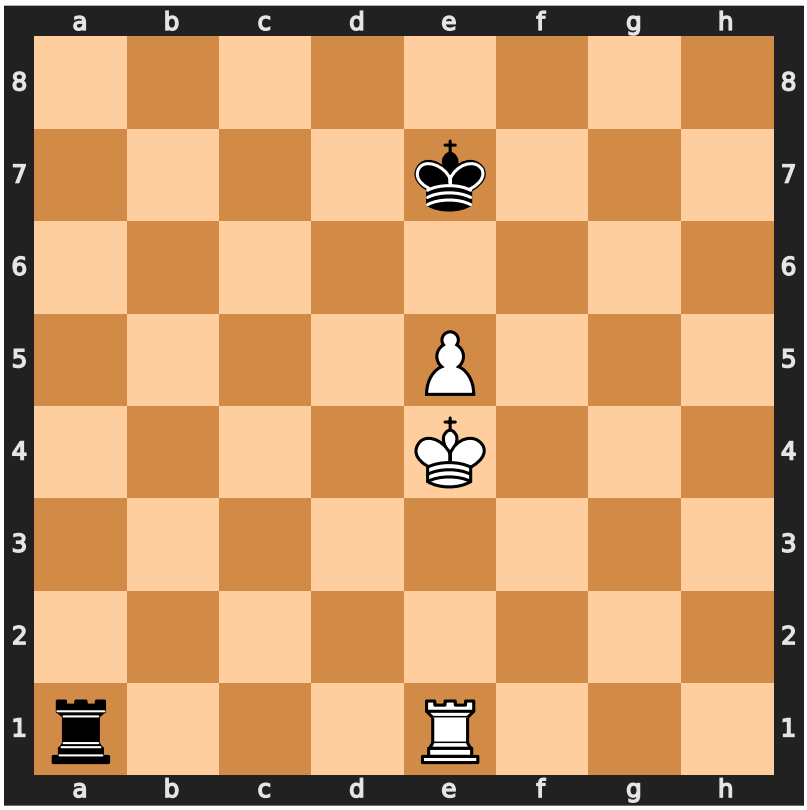

Figure 57.19: Chess Position

Exercise 19.17

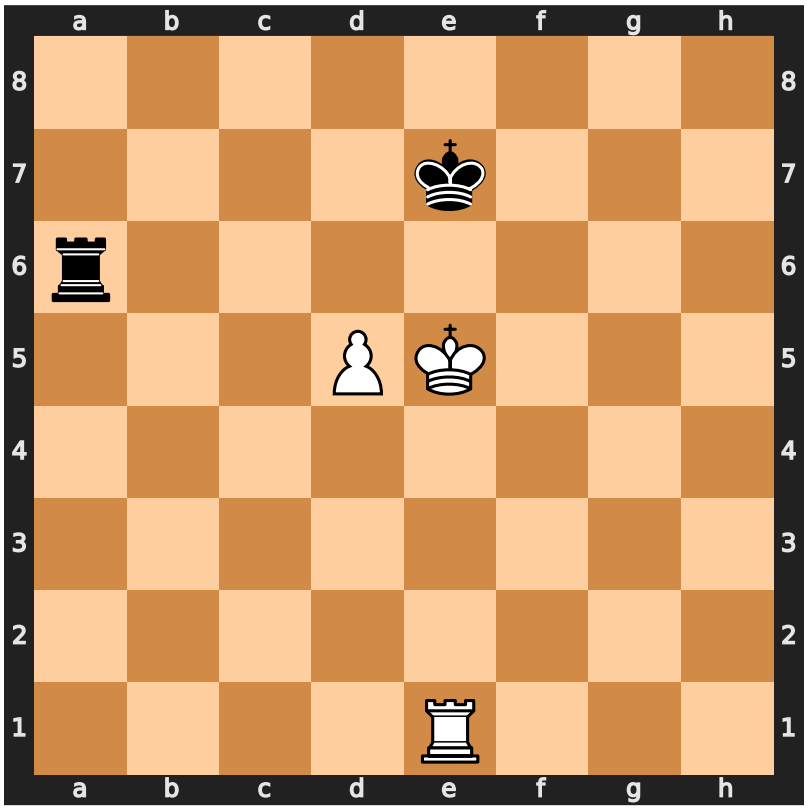

Figure 57.20: Chess Position

White: Ke5, Re1, Pawn on d5. Black: Ke7, Ra6.

White to play. Philidor with a d-pawn instead of an e-pawn. Does the technique change?

Hints: (1) No, the technique is the same on any central file. (2) If d6+, Black plays Kd7 (staying in front). (3) Rook retreats and checks from behind. Draw.

Exercise 19.18

White: Ke4, Re1, Pawn on e5. Black: Ke6, Rf5.

White to play. Black's rook is on f5, not on the sixth rank. Is this a valid Philidor defense?

Hints: (1) The rook on f5 does not control the sixth rank. (2) Can White play Kd4-Kc5 and get around the defense? (3) Black may need to reposition: Rf6 is better placement.

Exercise 19.19

White: Ke4, Re1, Pawn on e5. Black: Ke7, Ra3.

White to play. Black's rook is on the THIRD rank, not the sixth. How does this affect the defense?

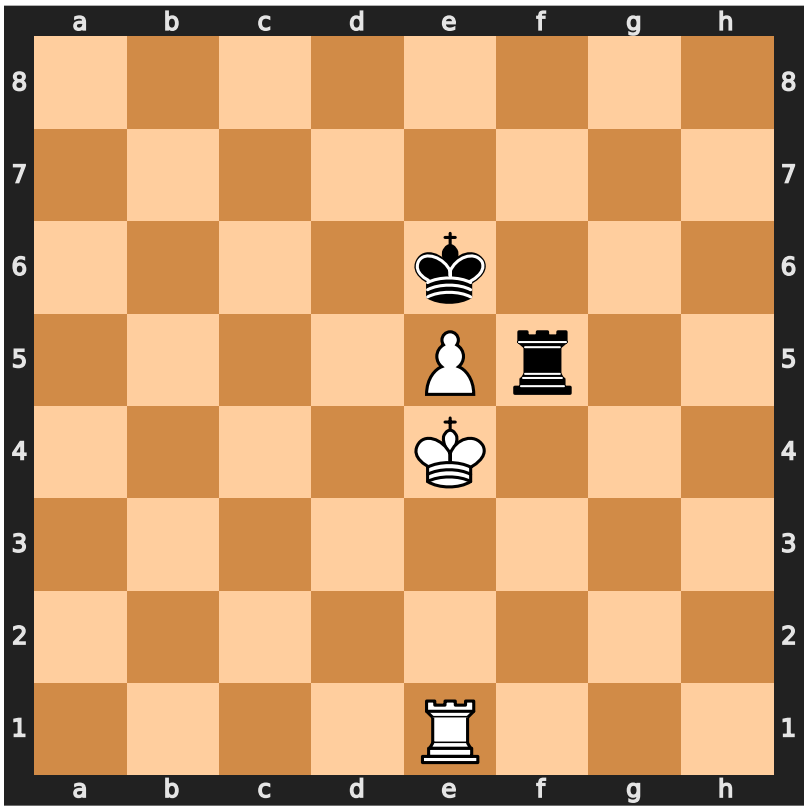

Figure 57.21: Chess Position

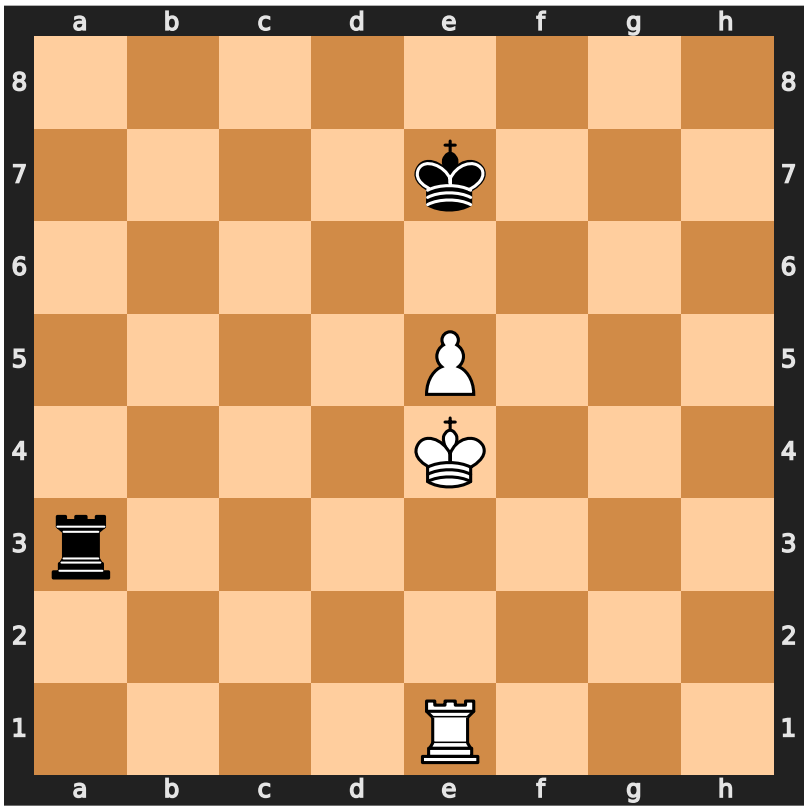

Figure 57.22: Chess Position

Hints: (1) The third rank does not block the White king from advancing to the sixth rank. (2) White can play Kd5, then Kd6 or Ke6. (3) Black's rook is poorly placed. Black should have been on the sixth rank.

Exercise 19.20

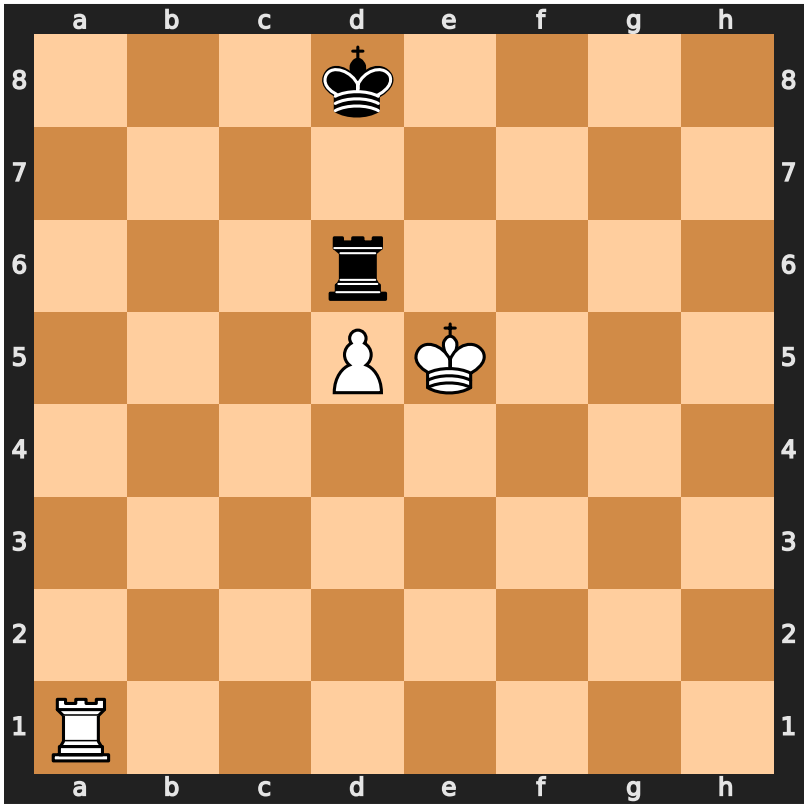

Figure 57.23: Chess Position

White: Ke5, Ra1, Pawn on d5. Black: Kd8, Rd6.

White to play. Black's king is on d8 (directly in front of the pawn). Is this a correct Philidor setup?

Hints: (1) The king on d8 is in front of the pawn (that is correct. (2) The rook on d6 controls the sixth rank) also correct. (3) If d6, Black plays Rd7 or retreats to check. This is a draw.

Exercise 19.21

White: Kf5, Re1, Pawn on e5. Black: Ke8, Ra1.

White to play. White's king is on f5 and the pawn is on e5. Can White win by advancing Ke6 first, then e6-e7?

Hints: (1) After Ke6, Black plays Ra6+, checking from the side! (2) If Kf7, Black plays Ra7+ (more checks). (3) If Kd6, Black plays Rd1+. Can White escape?

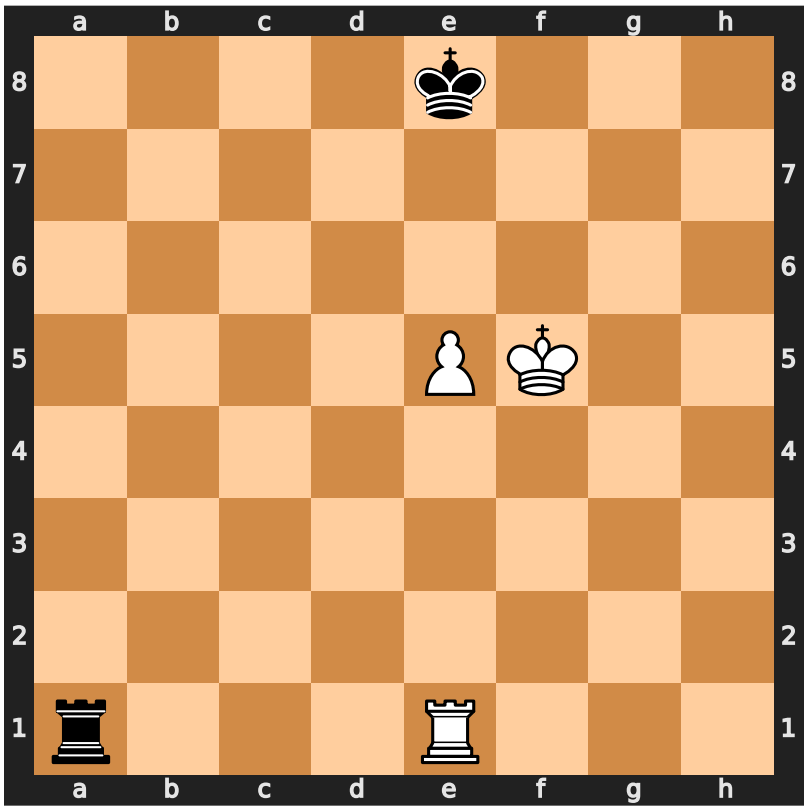

Figure 57.24: Chess Position

Exercise 19.22

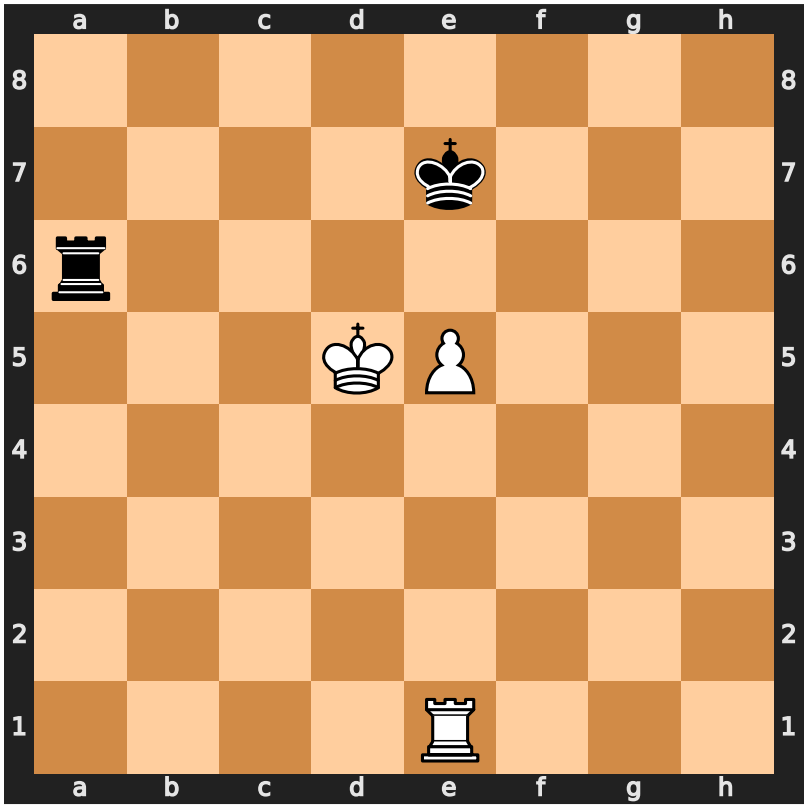

Figure 57.25: Chess Position

White: Kd5, Re1, Pawn on e5. Black: Ke7, Ra6.

White to play. White's king is on d5. NOT directly in front of the pawn. Can White advance the king to e6?

Hints: (1) If Ke6? …wait, that puts two kings adjacent (impossible. (2) Actually, Ke6 is not possible because Black's king is on e7) the kings would be adjacent. White must go another way. (3) Try Kd6, then e6.

Exercise 19.23

White: Kd5, Re2, Pawn on e5. Black: Ke7, Ra6.

White to play. White's rook is on e2 (not e1). Does this change anything?

Hints: (1) The rook on e2 blocks the e-file for the pawn's advance. (2) White may need to reposition: Kd4, then Re1. (3) Black maintains the Philidor: rook on the sixth rank. Is this still drawn?

Exercise 19.24

White: Kf1, Re1, Pawn on f7. Black: Kf8, Ra2.

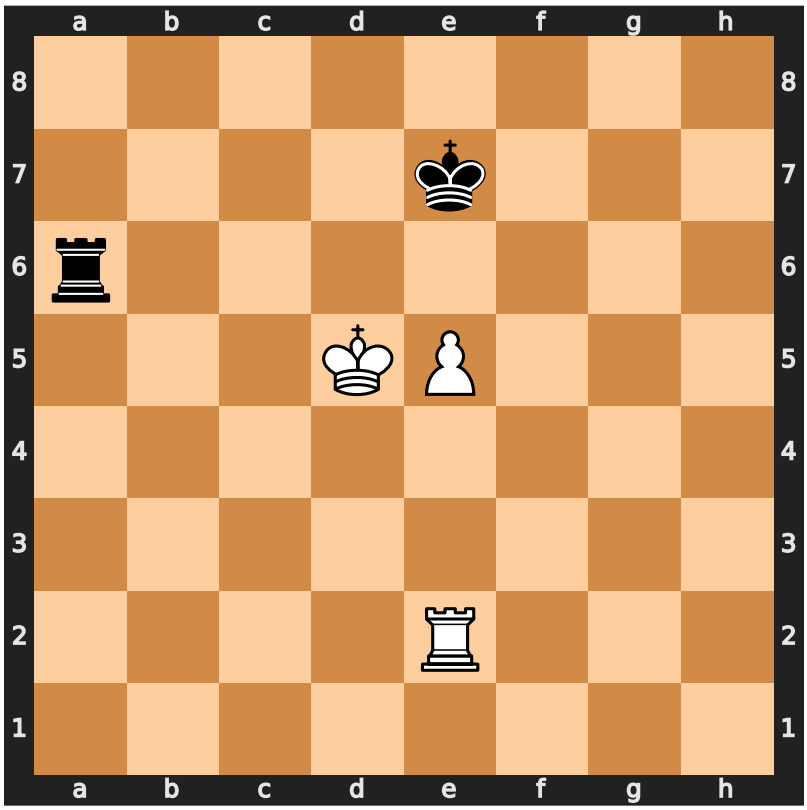

Figure 57.26: Chess Position

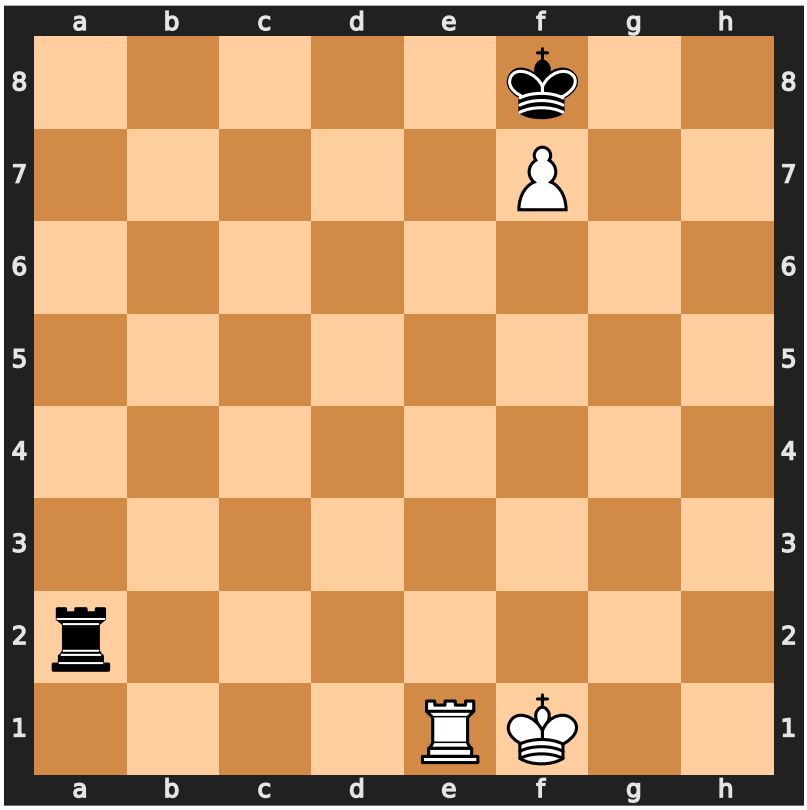

Figure 57.27: Chess Position

White to play. The pawn is on the SEVENTH rank and the king is on f1 (far from the pawn). Is this a Lucena (winning) or something else?

Hints: (1) The king on f1 is not in front of the pawn, the king is behind it. (2) Can White build the bridge from here? The king is too far. (3) This position may actually be drawn. Evaluate carefully.

57.3 Category C: Rook + Pawn vs Rook — Advanced (Exercises 19.25 - 19.36)

Exercise 19.25

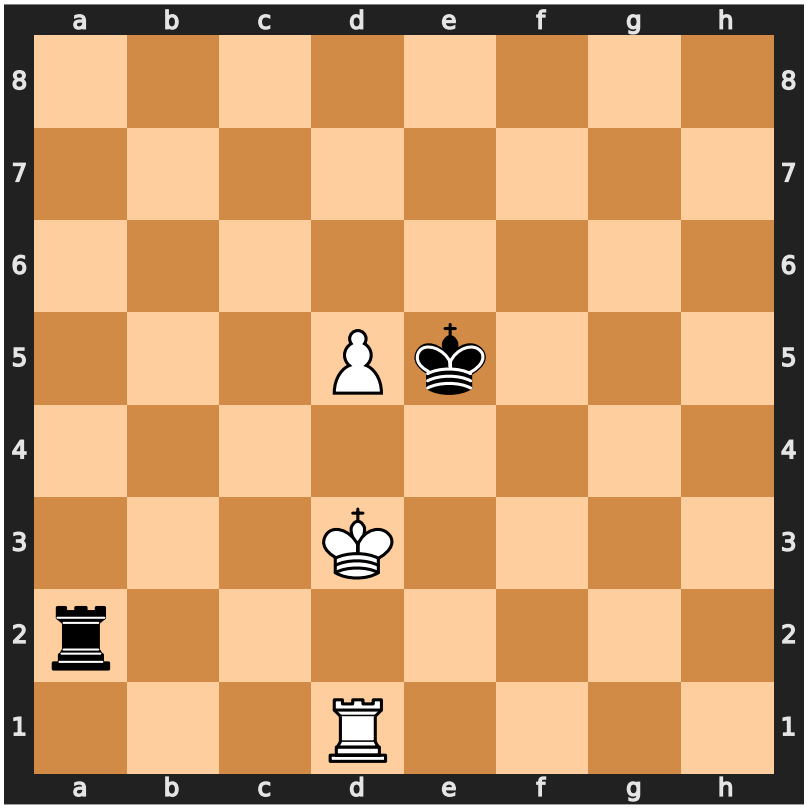

Figure 57.28: Chess Position

White: Kd3, Rd1, Pawn on d5. Black: Ke5, Ra2.

White to play. The pawn is on the fifth rank. Can White reach the Lucena? Play out the next 5 moves.

Hints: (1) White needs to get the pawn to d7 and the king in front. (2) Ke3 first, then advance the pawn. (3) Black will try to get the king in front of the pawn (Kd6).

Exercise 19.26

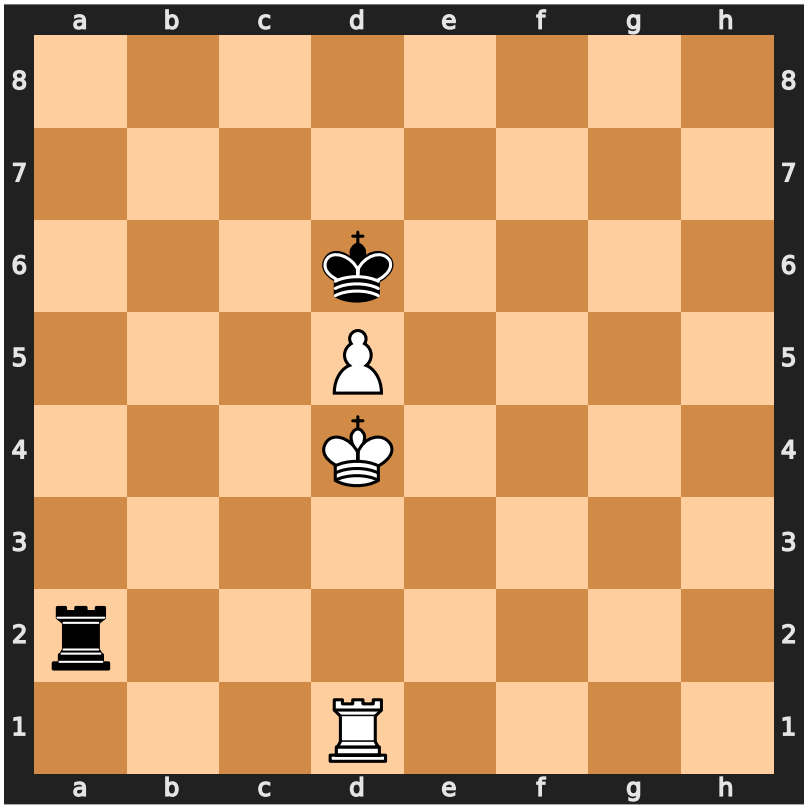

Figure 57.29: Chess Position

White: Kd4, Rd1, Pawn on d5. Black: Kd6, Ra2.

White to play. The Black king is ALREADY in front of the pawn. Can White win, or is this drawn?

Hints: (1) Black's king on d6 blocks the pawn. This is a good defensive setup. (2) White cannot push d6 because the king blocks. (3) Can White outflank with Kc4-Kb5? Evaluate.

Exercise 19.27

White: Kf2, Rd1, Pawn on d4. Black: Ke4, Ra2.

White to play. The pawn is only on d4, far from promotion. Plan the winning method from scratch.

Hints: (1) Start with Ke2, then Kd3, centralizing the king. (2) The pawn advances d5, d6, d7 with king support. (3) The goal is to reach the Lucena. Black will try for the Philidor.

Exercise 19.28

White: Kb4, Re1. Black: Ka6, Ra1, Pawn on a7.

White to play. Black has a rook pawn on a7. White has no pawns. Can White stop the pawn?

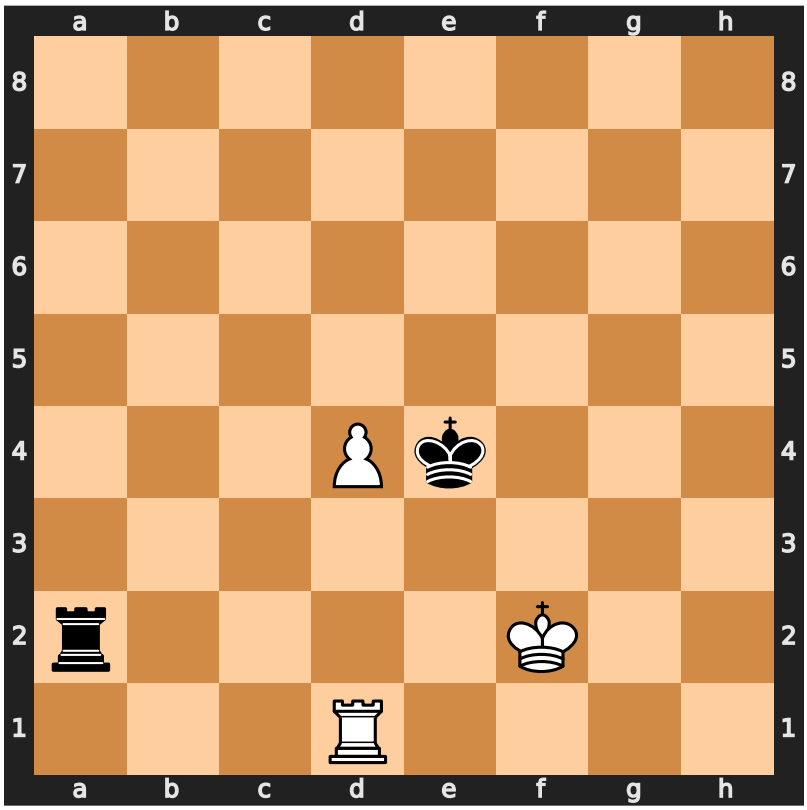

Figure 57.30: Chess Position

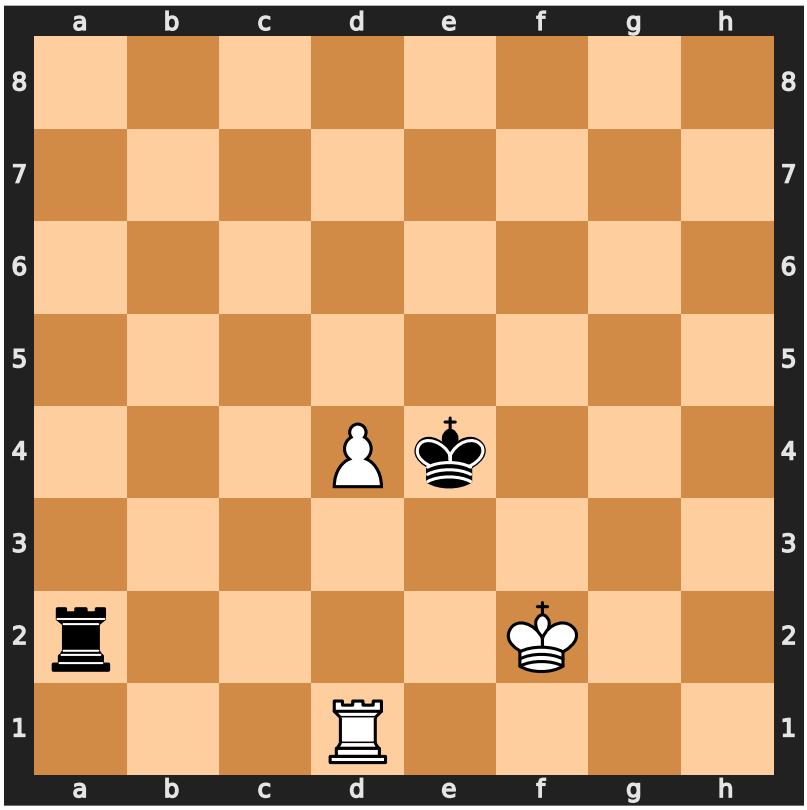

Figure 57.31: Chess Position

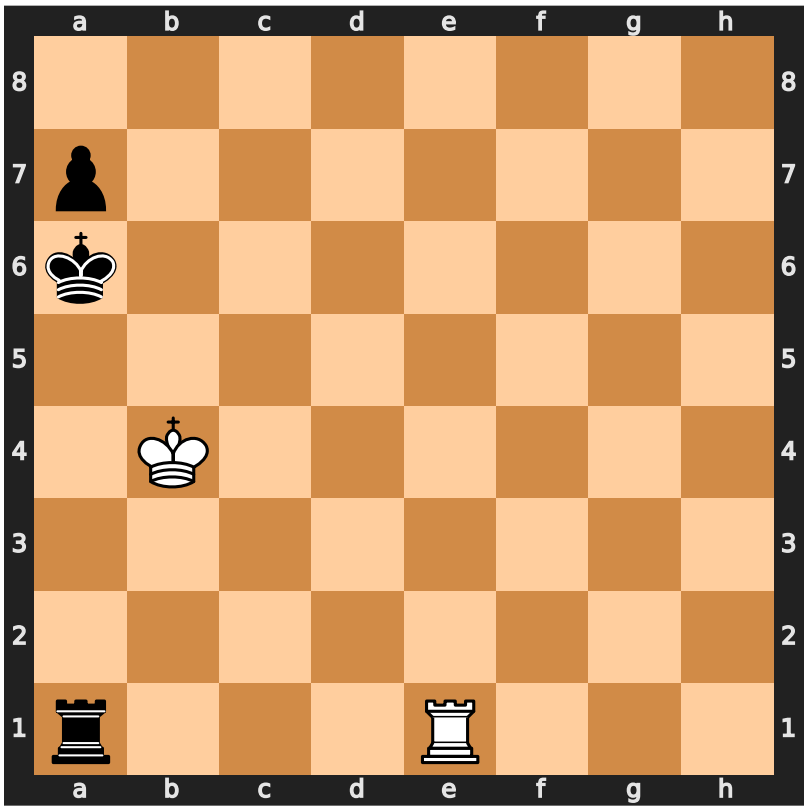

Figure 57.32: Chess Position

Hints: (1) The rook pawn is notoriously hard to queen. (2) White's king is close. Kb3 or Kc3 controls a2. (3) Can White set up a Vancura-type defense in reverse?

Exercise 19.29

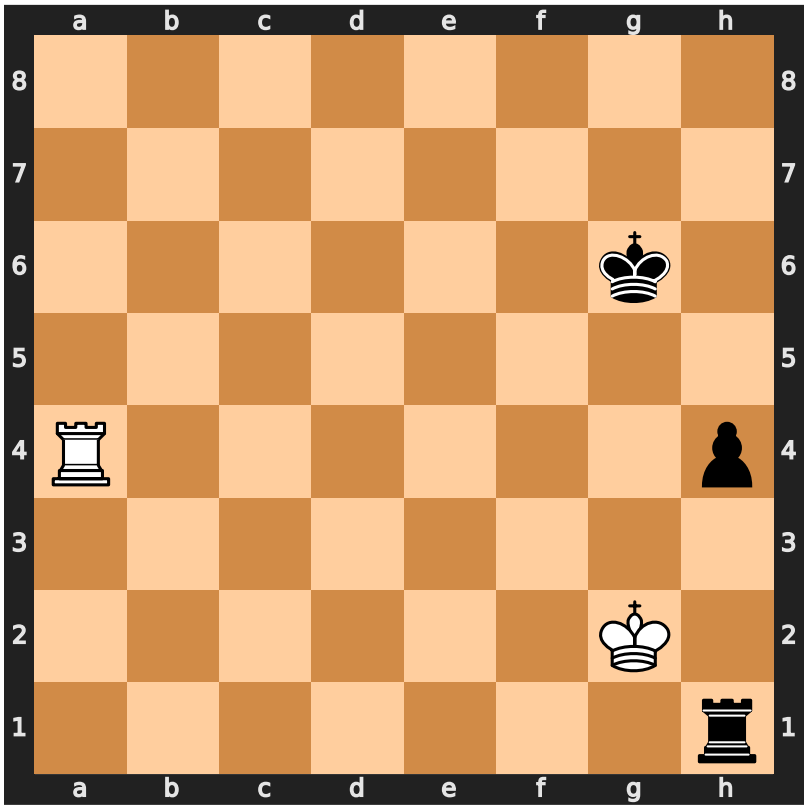

Figure 57.33: Chess Position

White: Kg2, Ra4. Black: Kg6, Rh1, Pawn on h4.

White to play. Black has a passed h-pawn. Apply the correct defensive technique.

Hints: (1) The h-pawn is a rook pawn. Think Vancura. (2) Can White attack the pawn from the side? Ra6 controls the sixth rank. (3) Where should White's king go? Short side or long side?

Exercise 19.30

White: Kf2, Ra5. Black: Kf4, Rf1, Pawn on f5.

White to play. Black has a central passed pawn and an active king. How does White defend?

Hints: (1) Rook behind the passed pawn: Ra8 to check later, or stay on a5 to attack from the side? (2) White's king needs to get in front of the pawn. (3) Is this position drawn or lost for White?

Exercise 19.31

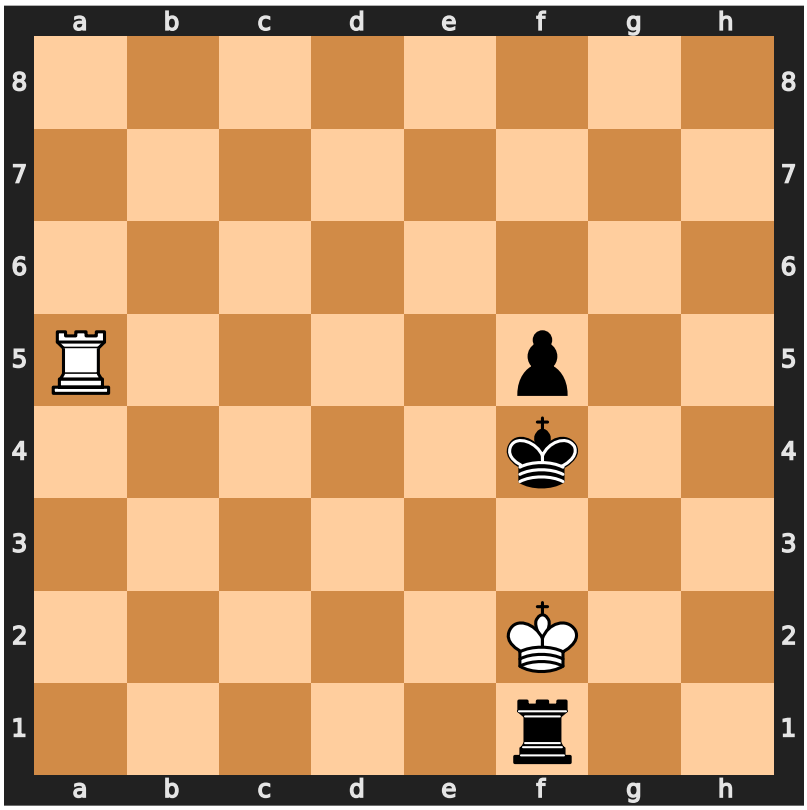

Figure 57.34: Chess Position

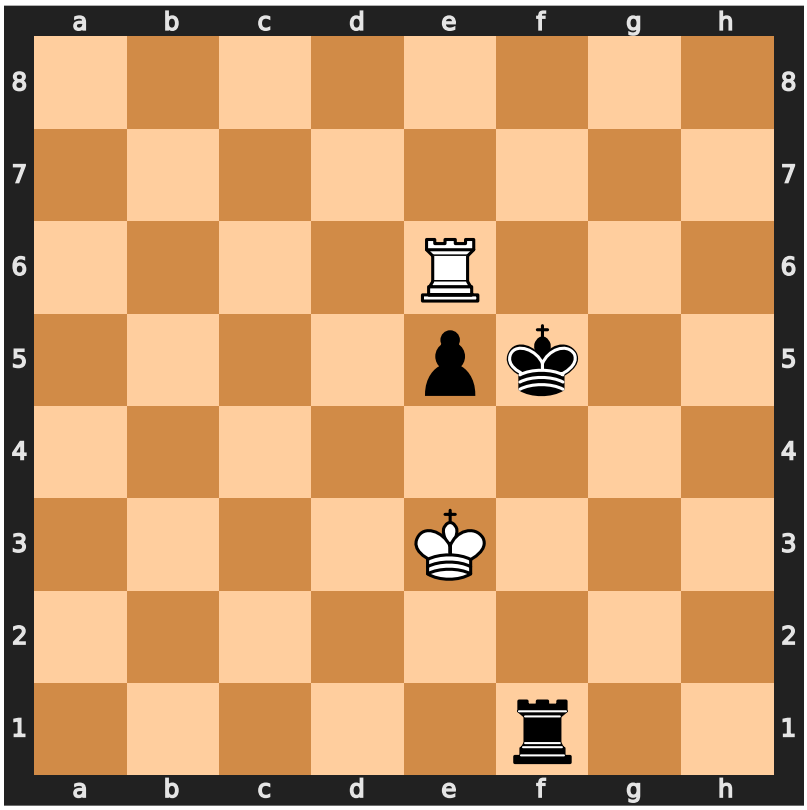

Figure 57.35: Chess Position

White: Ke3, Re6. Black: Kf5, Rf1, Pawn on e5.

White to play. White's rook is on the sixth rank (good. Philidor-like). The pawn is on e5. Is this drawn?

Hints: (1) If e4+, White plays Ke2 and the rook stays on the sixth rank. (2) Black's king is active, but can it advance past the rook? (3) The rook on the sixth rank is a wall.

Exercise 19.32

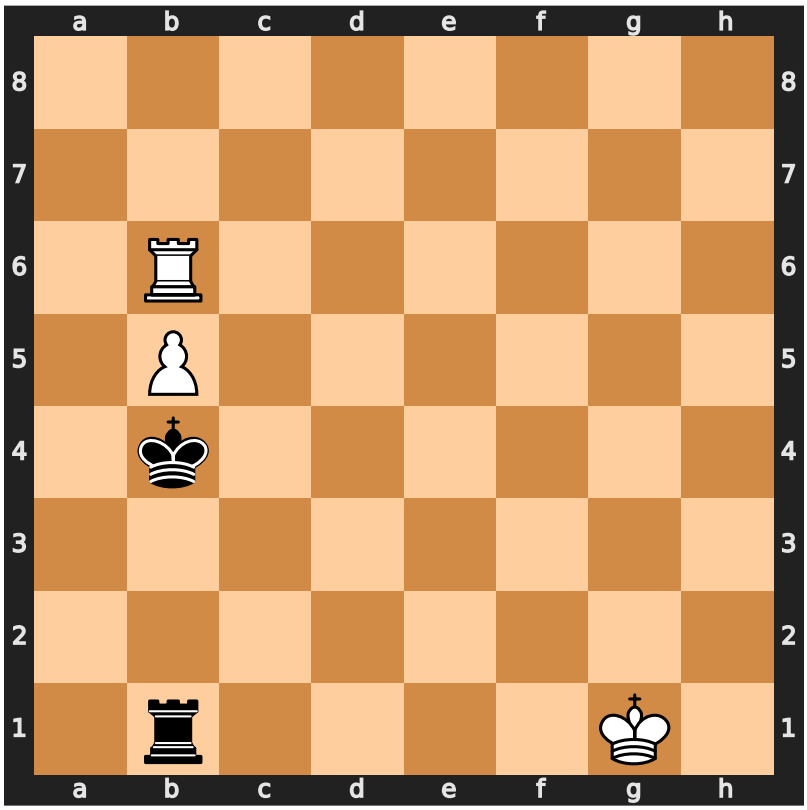

Figure 57.36: Chess Position

White: Kg1, Rb6, Pawn on b5. Black: Kb4, Rb1.

White to play. White's rook is IN FRONT of the pawn. Is this correct or incorrect? What should White do?

Hints: (1) The rook in front of the pawn is usually wrong (Tarrasch's rule says "behind"). (2) But in this specific position, can the rook sacrifice or promote? (3) Evaluate Kb6 or Ka6 maneuvers.

Exercise 19.33

White: Ke1, Rc6. Black: Kd3, Rd8, Pawn on d4.

White to play. Black has a passed d-pawn and a very active king. White is defending. Find the drawing method.

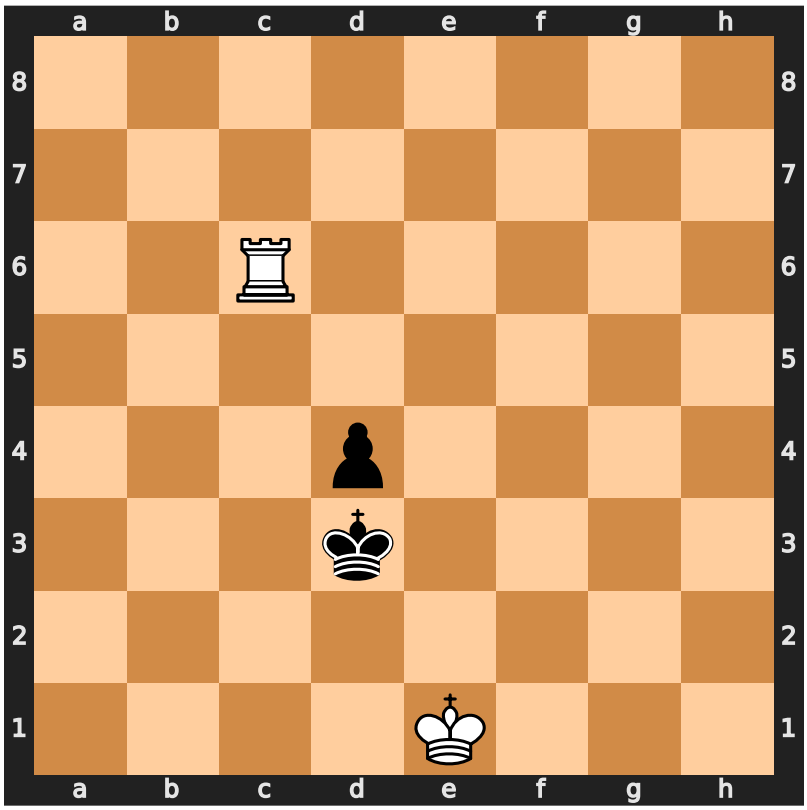

Figure 57.37: Chess Position

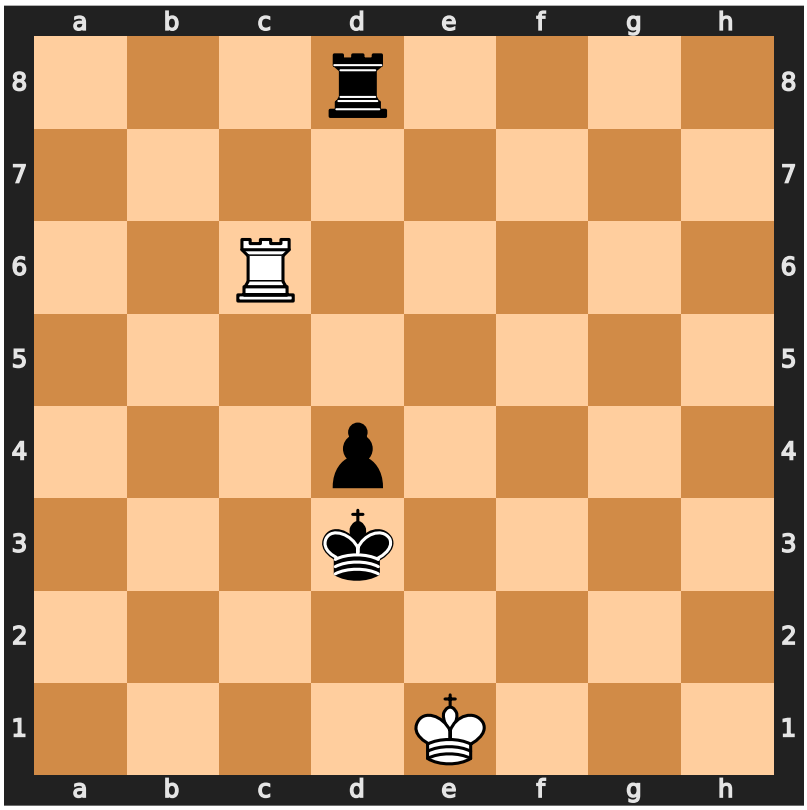

Figure 57.38: Chess Position

Hints: (1) Cut off the king: Rc4 blocks the king from advancing further. (2) Attack the pawn from behind: Rd6 or Rc1 to Rd1. (3) Which defensive strategy works better here?

Exercise 19.34

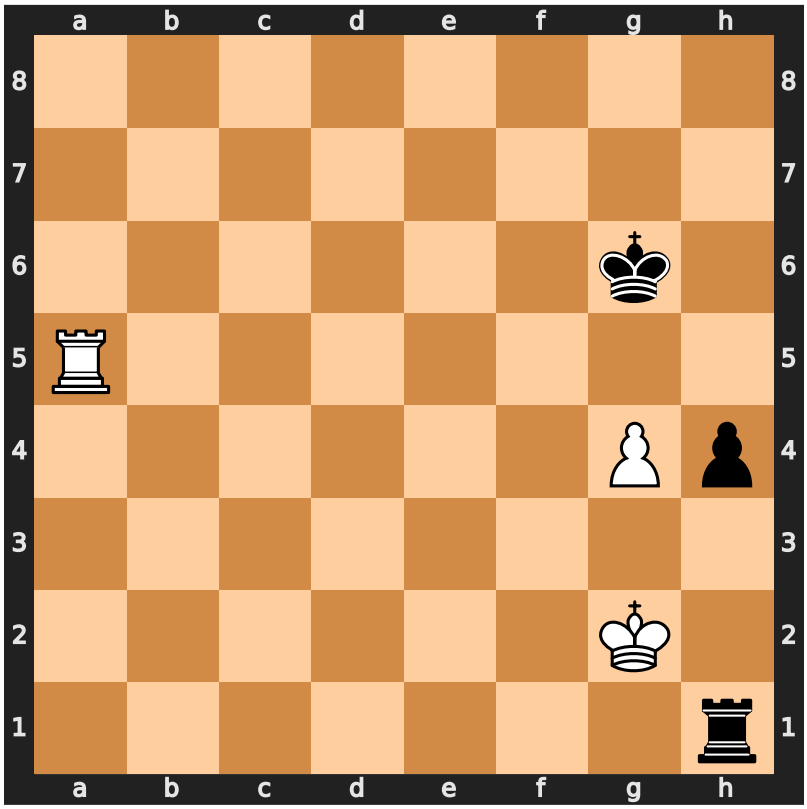

Figure 57.39: Chess Position

White: Kg2, Ra5, Pawn on g4. Black: Kg6, Rh1, Pawn on h4.

White to play. Each side has one passed pawn. Who is better? Find the best plan.

Hints: (1) White's g-pawn vs Black's h-pawn, which is faster? (2) Can White advance g5+ and create a Lucena? (3) Or does Black's h-pawn queen first?

Exercise 19.35

White: Kg3, Ra7. Black: Kf5, Ra2, Pawn on g5.

White to play. Black has one passed pawn. White has a rook on the seventh rank. Who is better?

Hints: (1) White's rook is active (seventh rank) but White has no pawns. (2) Can White stop the g-pawn? Ra5 pins it. (3) If the king goes to f4 to support g4, White plays Ra4+. Evaluate.

Exercise 19.36

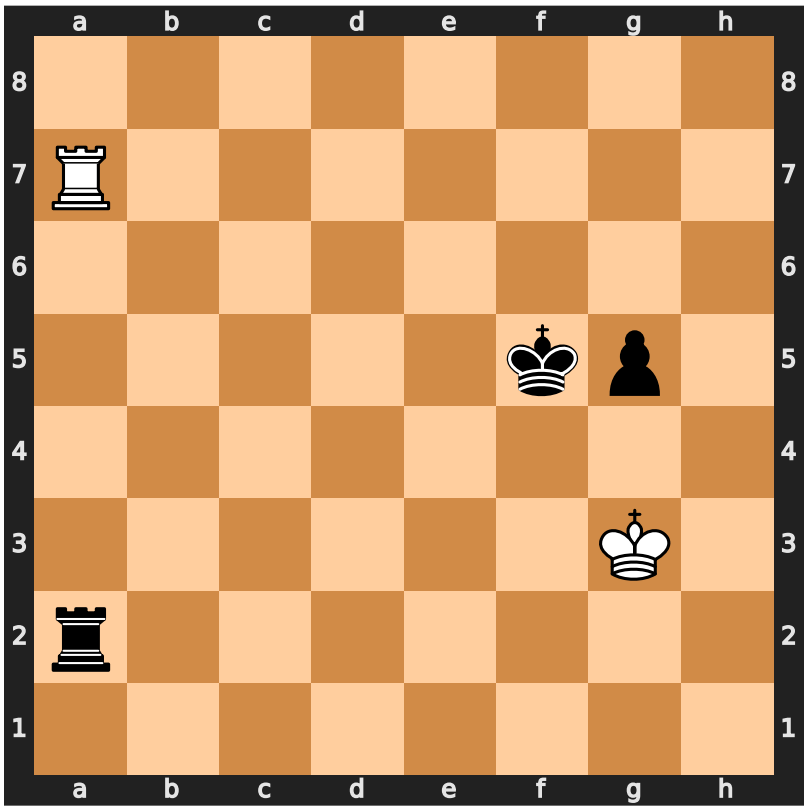

Figure 57.40: Chess Position

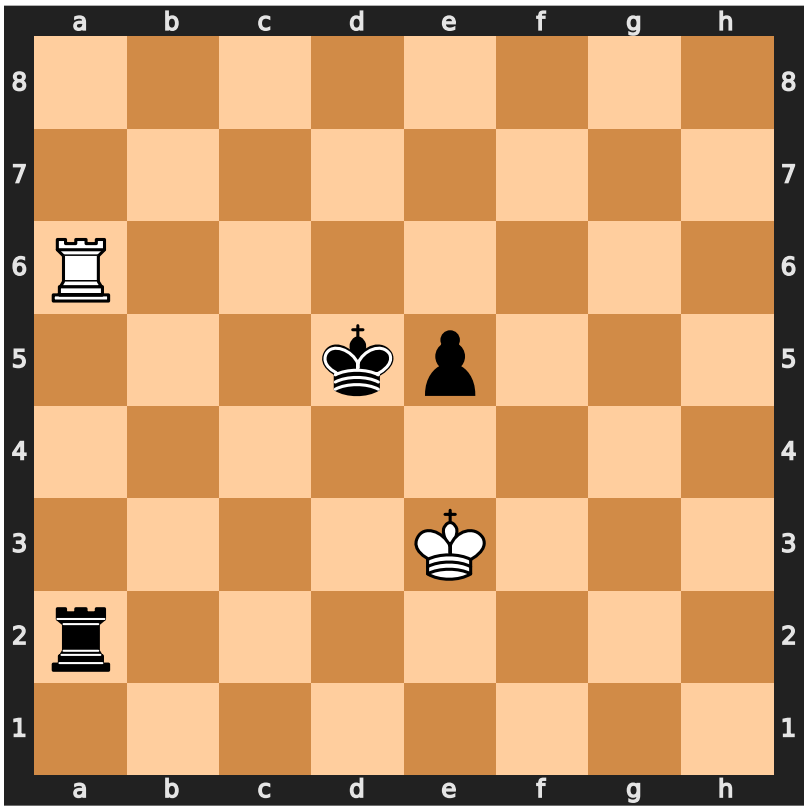

Figure 57.41: Chess Position

White: Ke3, Ra6. Black: Kd5, Ra2, Pawn on e5.

White to play. This is a critical defensive position. Should White play passively or actively?

Hints: (1) Ra5 pins the e5-pawn. But is that enough? (2) If Black plays Kd4, threatening e4, what does White do? (3) Consider the cutting-off technique: can White cut off the king?

57.4 Category D: Active King Decisions (Exercises 19.37 - 19.48)

Exercise 19.37

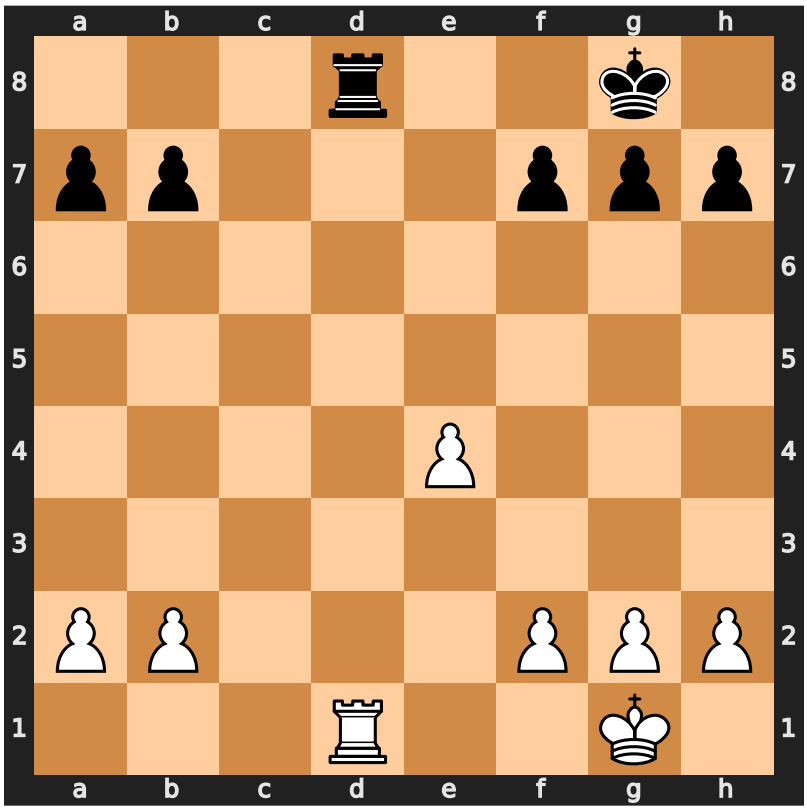

Figure 57.42: Chess Position

White: Kg1, Rd1, Pawns on a2, b2, e4, f2, g2, h2. Black: Kg8, Rd8, Pawns on a7, b7, f7, g7, h7.

White to play. The position is equal. What is your first move and why?

Hints: (1) Do NOT push pawns first. (2) Centralize the king: Kf1-Ke2-Kd3. (3) The king belongs in the center before anything else happens.

Exercise 19.38

White: Kf4, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke6, Rd1, Pawns on a7, b7, f7, g7, h7.

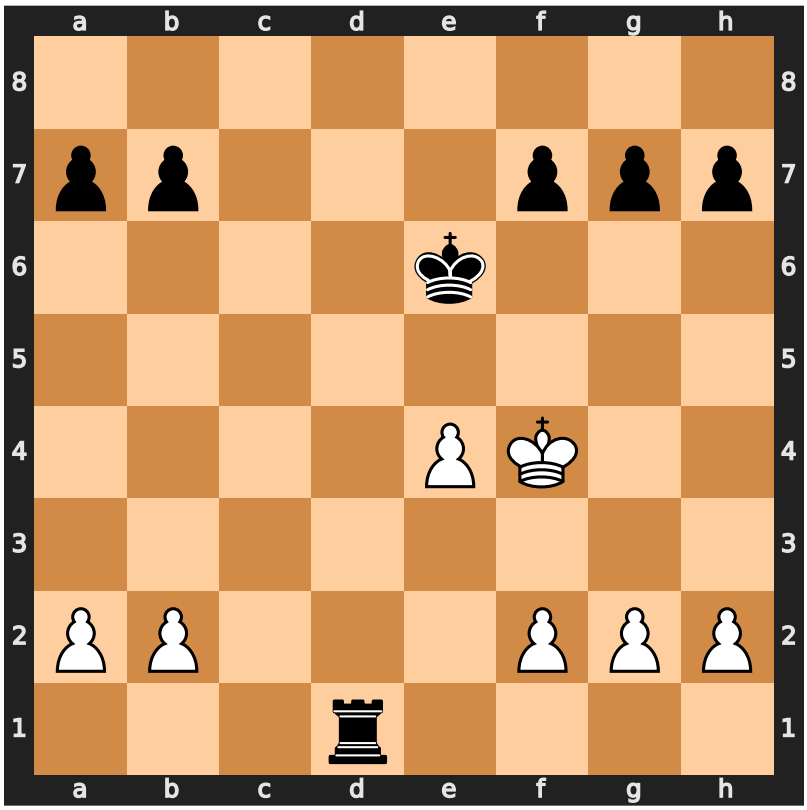

Figure 57.43: Chess Position

Black to play. Black has an active king (e6) and White's king is also centralized (f4). Should Black exchange rooks (Rd4) or keep them on?

Hints: (1) With equal pawns and both kings centralized, rook exchanges lead to a drawn pawn endgame. (2) Keep the rook! Rook activity can create chances. (3) Consider Rd2, attacking b2 and f2.

Exercise 19.39

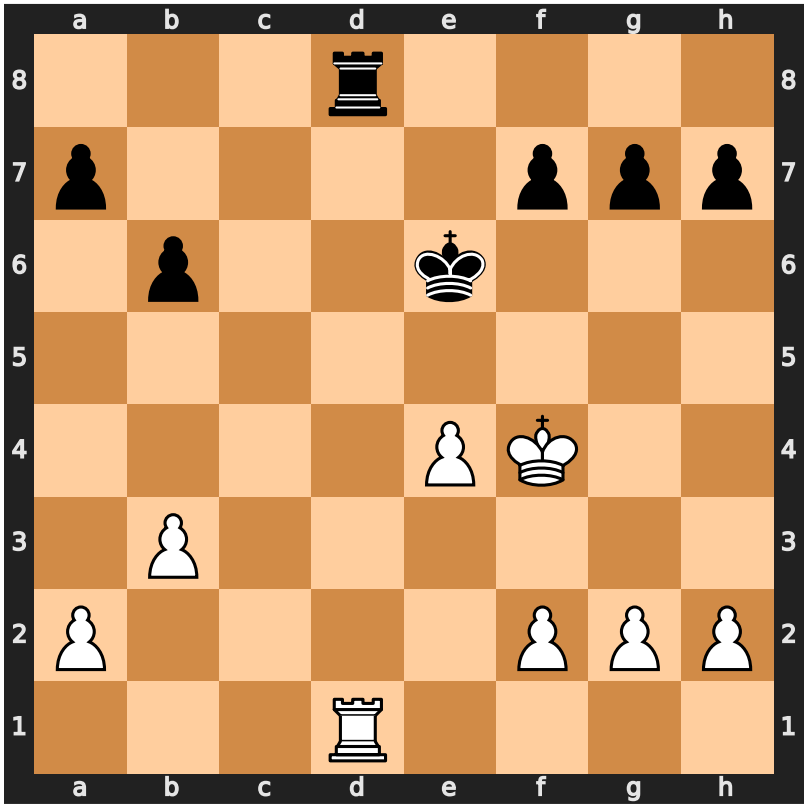

Figure 57.44: Chess Position

White: Kf4, Rd1, Pawns on a2, b3, e4, f2, g2, h2. Black: Ke6, Rd8, Pawns on a7, b6, f7, g7, h7.

White to play. Where does the king go from f4? Plan the next three king moves.

Hints: (1) Ke3 is safe but passive. (2) Kf5 is aggressive, but does it overextend? (3) Ke5 centralizes perfectly. But check: is Ke5 safe from Rd5+?

Exercise 19.40

White: Kg1, Rd5, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke6, Re7, Pawns on a7, b7, f7, g7, h7.

White to play. White has a centralized rook. Now what?

Hints: (1) King! Kf1-Ke2-Kd3-Kd4. (2) With the rook on d5 and king on d4, White dominates the center. (3) Do not push pawns until the king is centralized.

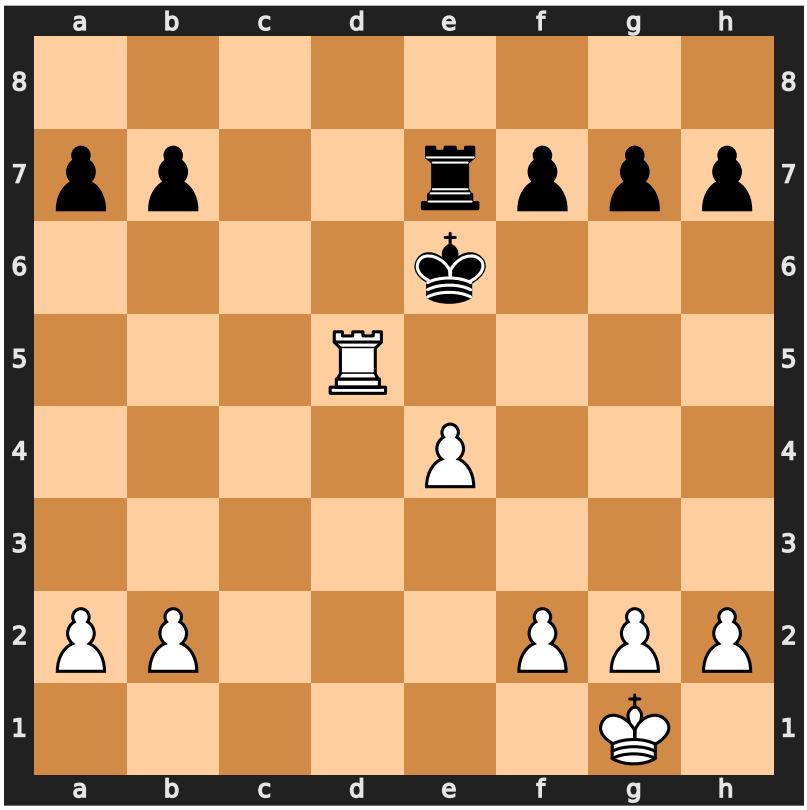

Figure 57.45: Chess Position

Exercise 19.41

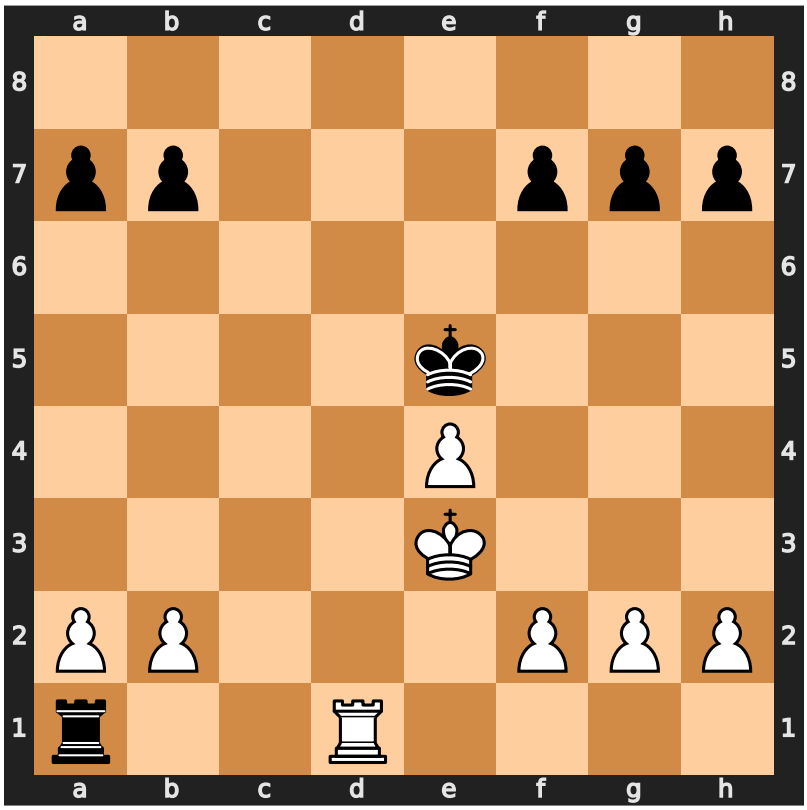

Figure 57.46: Chess Position

White: Ke3, Rd1, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke5, Ra1, Pawns on a7, b7, f7, g7, h7.

White to play. Both kings are centralized. Black's rook is active on a1. What is White's best plan?

Hints: (1) Protect the a-pawn: Ra1 trades rooks. Is that good? (2) Kd3 keeps the king active. (3) Consider f3 to support the center before any action.

Exercise 19.42

White: Kd4, Rd1, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke6, Ra1, Pawns on a7, b7, f7, g7, h6.

White to play. White's king is on d4, Black's on e6. Should White advance with Kc5 or consolidate with e5?

Hints: (1) Kc5 invades the queenside (but the rook on a1 attacks a2. (2) e5 creates a passed pawn), but is it too early? (3) Consider the tradeoff between king activity and pawn security.

Exercise 19.43

White: Ke3, Rd3, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke5, Rd8, Pawns on a7, b7, f7, g7, h7.

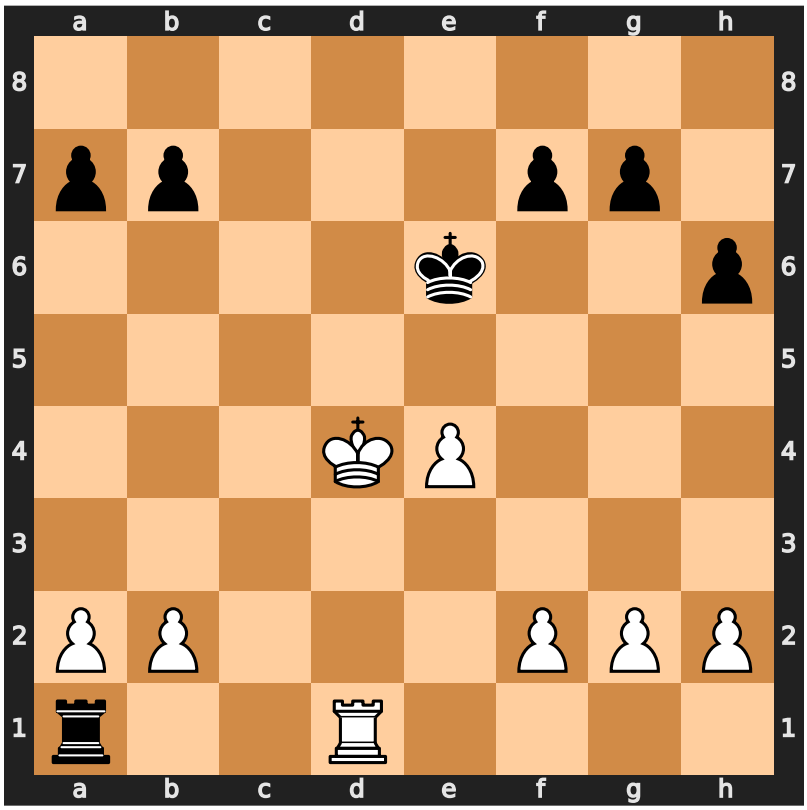

Figure 57.47: Chess Position

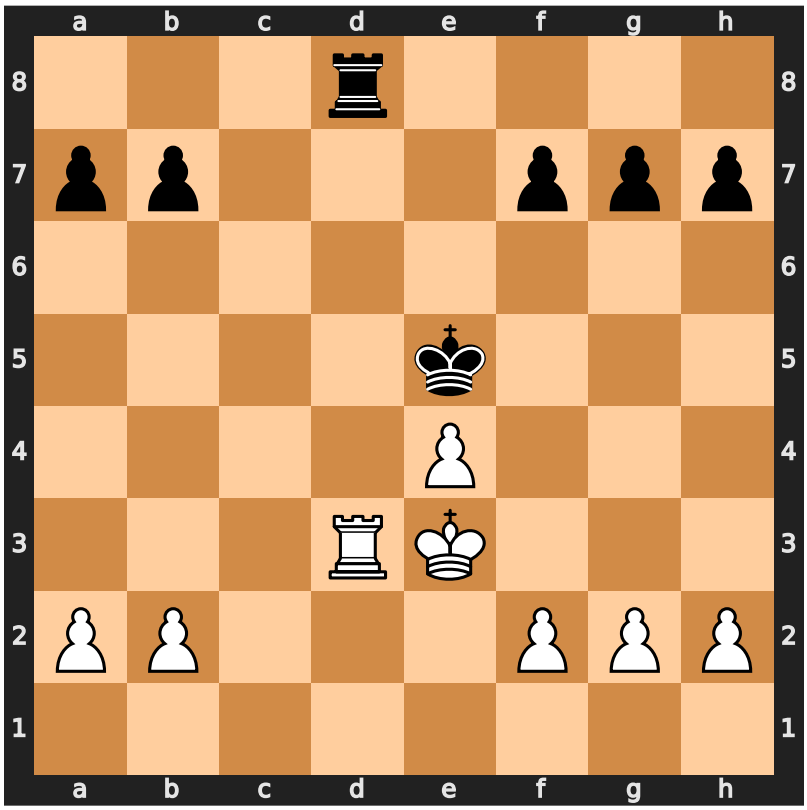

Figure 57.48: Chess Position

White to play. Both kings are centralized. Where does the ROOK belong?

Hints: (1) Rd5+ pushes the king back. Is that useful? (2) Rd7 hits the seventh rank! (3) After Rd7, White attacks a7, b7, f7, massive pressure.

Exercise 19.44

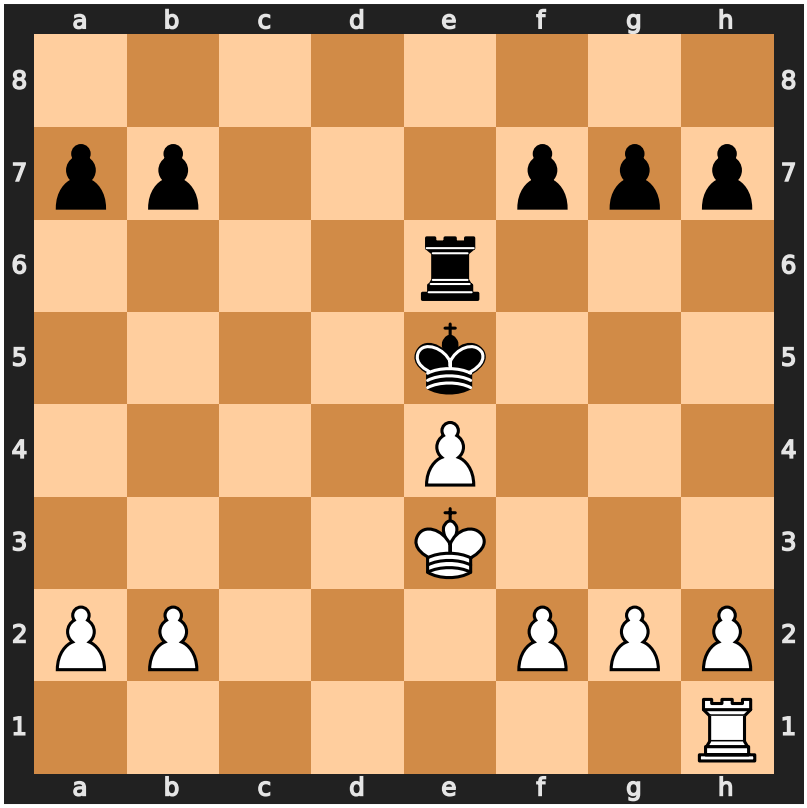

Figure 57.49: Chess Position

White: Ke3, Rh1, Pawns on a2, b2, e4, f2, g2, h2. Black: Ke5, Re6, Pawns on a7, b7, f7, g7, h7.

White to play. Should White play Rh5+ driving the king back, or Kd3 improving the king?

Hints: (1) Rh5+ forces Kd6, then Rh7 hits the seventh rank. (2) But Kd3 improves the king first. (3) Which plan creates more long-term advantage?

Exercise 19.45

White: Kf3, Rd5, Pawns on a2, b2, e4, g2, h2. Black: Ke7, Rc1, Pawns on a7, b7, f6, g7, h7.

White to play. Should the king go to e3 (safe) or f4 (aggressive)?

Hints: (1) Kf4 puts the king in an active position. After Kf4, the king eyes e5. (2) But Rc4 attacks e4. Is Kf4 safe? (3) Consider Ke3 first, then slow improvement.

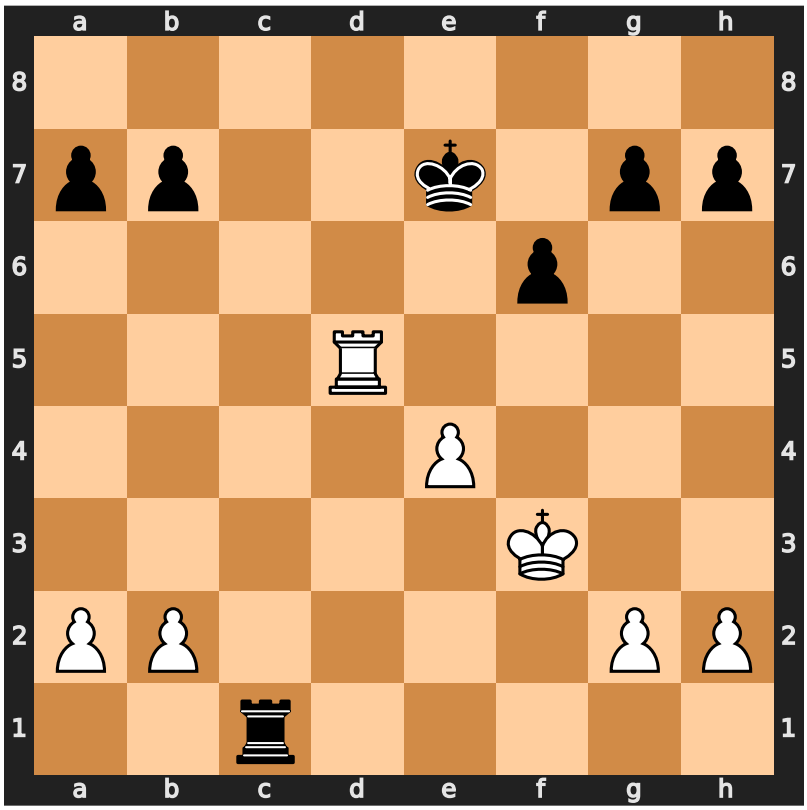

Figure 57.50: Chess Position

Exercise 19.46

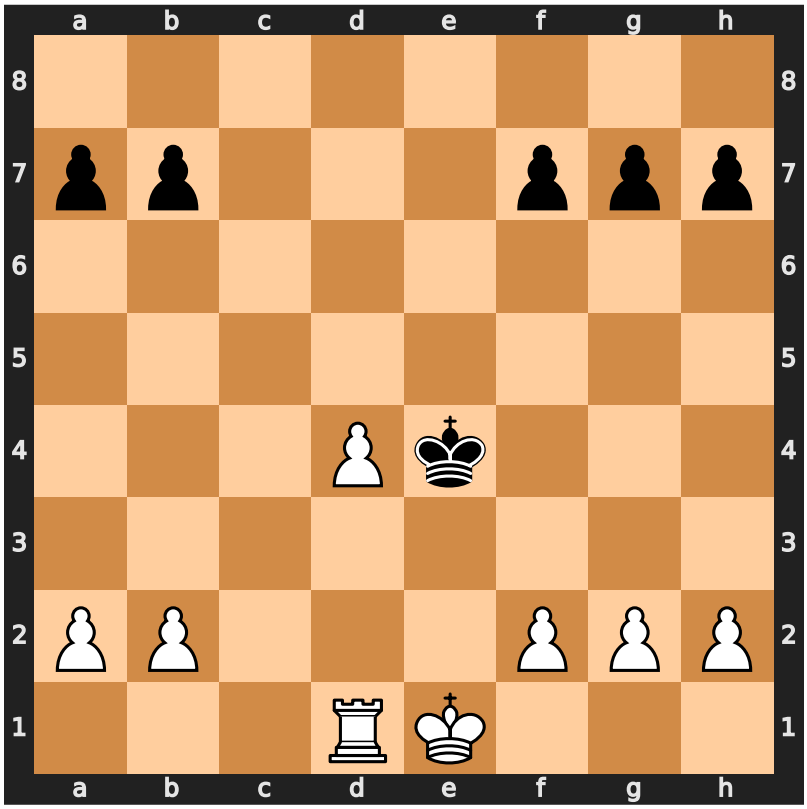

Figure 57.51: Chess Position

White: Ke1, Rd1, Pawns on a2, b2, d4, f2, g2, h2. Black: Ke4, Pawns on a7, b7, f7, g7, h7. Wait, Black needs a rook!

White: Ke1, Rd1, Pawns on a2, b2, d4, f2, g2, h2. Black: Ke4, Ra8, Pawns on a7, b7, f7, g7, h7.

White to play. Black's king is on e4. VERY active, deep in White's territory. What should White do?

Hints: (1) White's king on e1 is passive. First priority: activate it. (2) Kf1 or Kd2? Which is better? (3) Can White use d5 to push the Black king back?

Exercise 19.47

White: Ke3, Rd1, Pawns on a2, b2, e5, f2, g2, h2. Black: Ke6, Rd7, Pawns on a7, b7, f7, g7, h7.

White to play. White has a passed e-pawn. Plan the winning technique using king centralization and pawn advancement.

Hints: (1) Ke4 centralizes the king behind the pawn. (2) After Ke4, White plans f4 (supporting e5) and then Kd5 or Kf5. (3) The rook on d1 should aim for the seventh rank (Rd7 is blocked, so Rd2-d7 later).

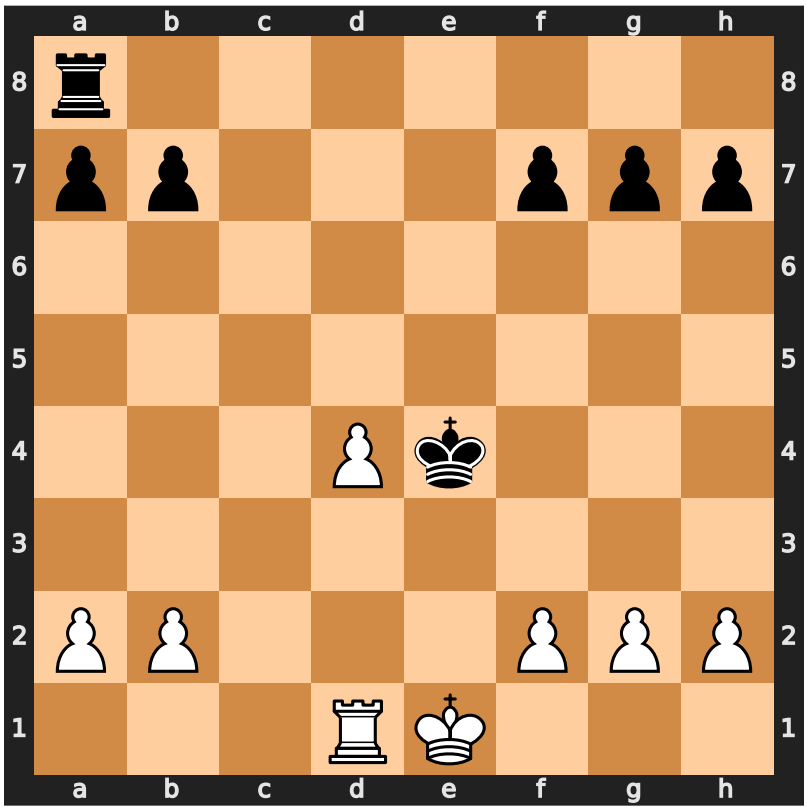

Figure 57.52: Chess Position

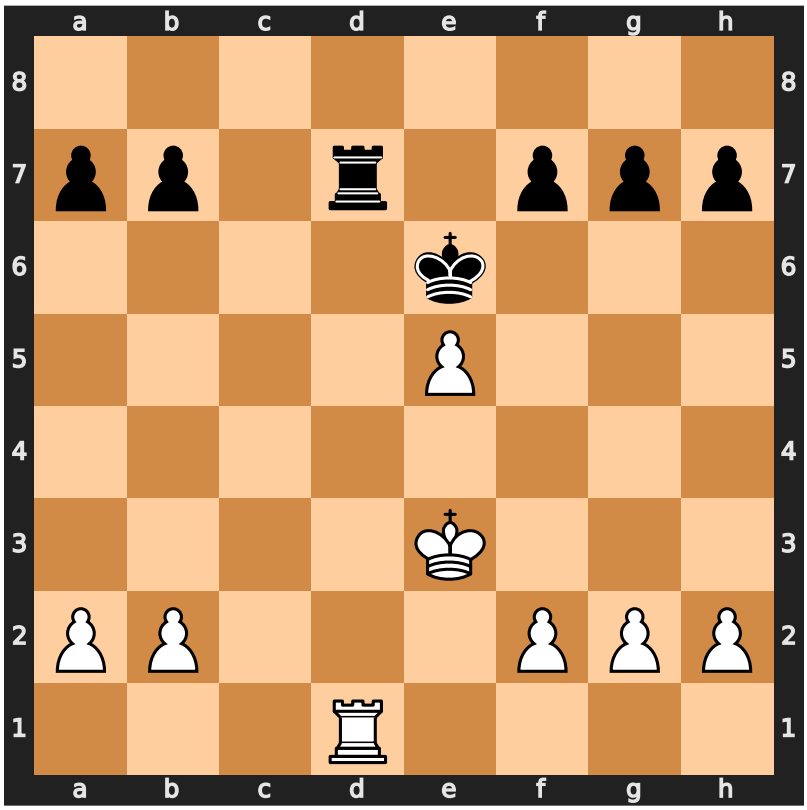

Figure 57.53: Chess Position

Exercise 19.48

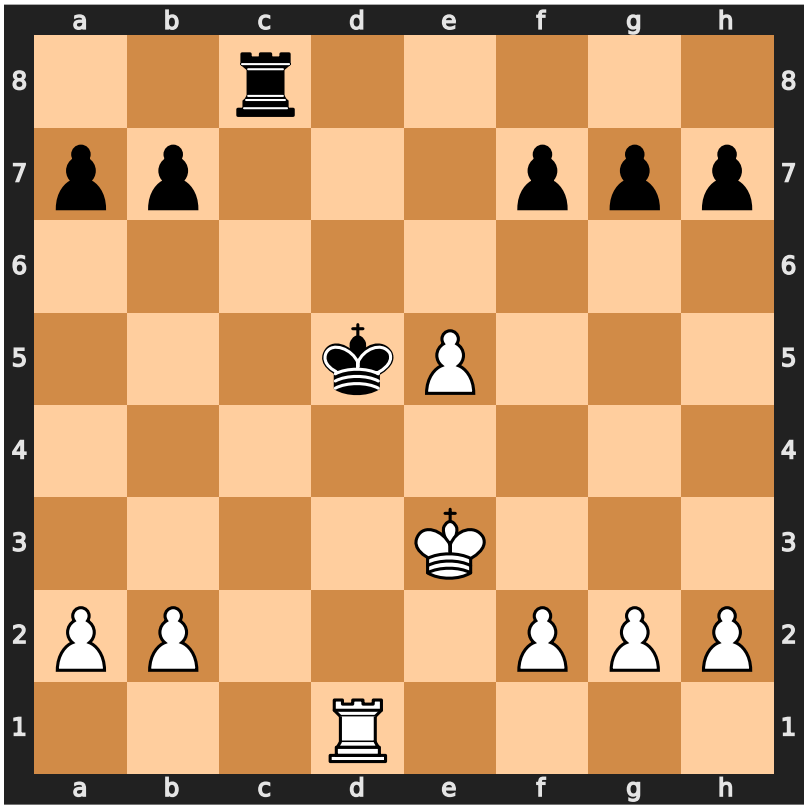

Figure 57.54: Chess Position

White: Ke3, Rd1, Pawns on a2, b2, e5, f2, g2, h2. Black: Kd5, Rc8, Pawns on a7, b7, f7, g7, h7.

White to play. Both kings are centralized. White has a passed pawn. Black's king blockades it. How does White make progress?

Hints: (1) Rd3 supports a future Kd4. (2) Can White outflank with Kf4-Kf5? (3) Consider f4 to support the e-pawn, then Kf3-Kg4-Kf5 to approach from the side.

57.5 Category E: Practical Rook Endgame Positions (Exercises 19.49 - 19.60)

Exercise 19.49

White: Ke3, Rd1, Pawns on a2, b3, e4, f2, g2, h2. Black: Ke6, Rd5, Pawns on a7, b6, f7, g7, h7.

White to play. Equal material. Find the plan that creates an advantage.

Hints: (1) Exchange the rooks? After Rxd5 Kxd5, the pawn endgame is drawn. (2) Avoid the rook trade. Play Rd2 and improve. (3) Activate the king: Kd4, then push the kingside majority.

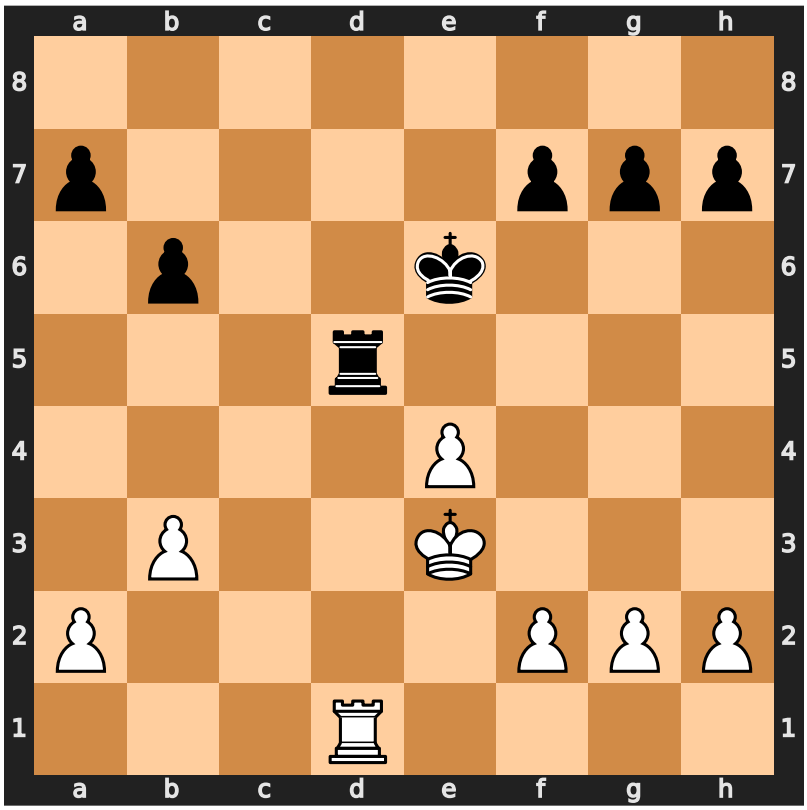

Figure 57.55: Chess Position

Exercise 19.50

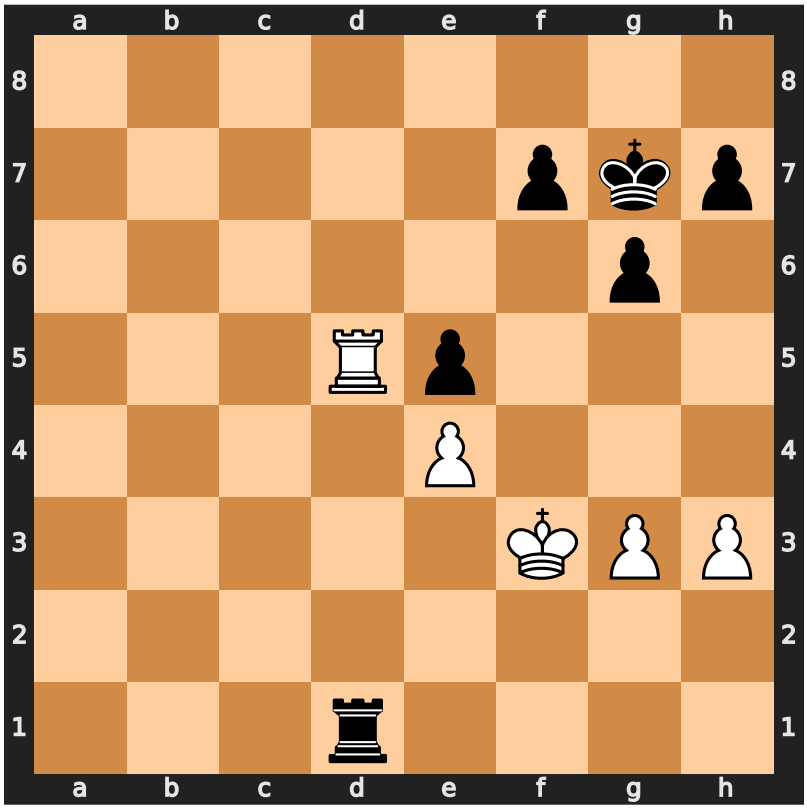

Figure 57.56: Chess Position

White: Kf3, Rd5, Pawns on e4, g3, h3. Black: Kg7, Rd1, Pawns on e5, f7, g6, h7.

White to play. Static pawn structure. How does White make progress?

Hints: (1) White cannot create a passed pawn easily (pawns are locked). (2) King activity is key: Ke3-Kd3. (3) The rook on d5 is already well-placed. Improve the worst piece (the king).

Exercise 19.51

White: Kf2, Rd5, Pawns on a2, b2, e4, f4, h2. Black: Kf7, Rf1, Pawns on a7, b7, f6, h6.

White to play. White has a kingside majority. Plan the pawn advance.

Hints: (1) e5 is the key break. After fxe5, fxe5 and the e-pawn becomes a passer. (2) But prepare first: Ke3, then e5. (3) The rook on d5 supports the advance.

Exercise 19.52

White: Kg2, Rd5, Pawns on a5, b2, e4, f2, g3, h4. Black: Kf7, Re6, Pawns on a6, b7, e5, g6, h5.

White to play. Complex pawn structure. Find the key plan.

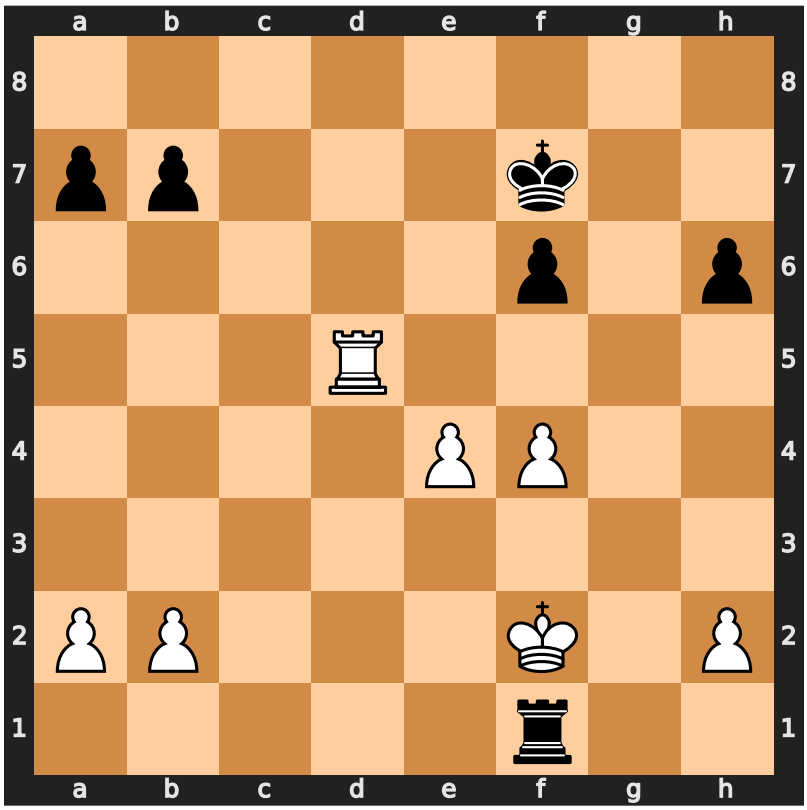

Figure 57.57: Chess Position

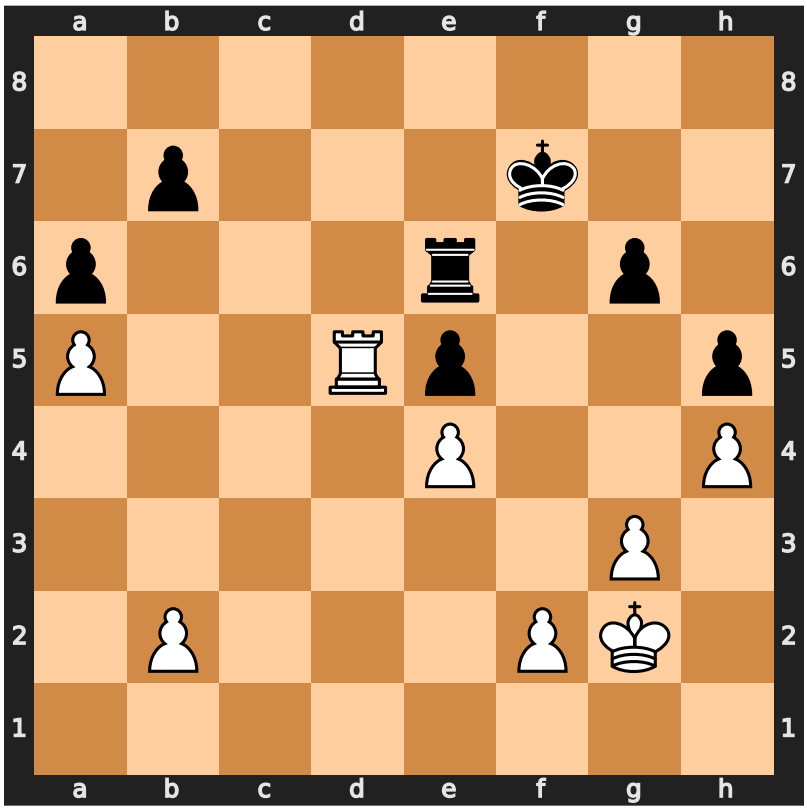

Figure 57.58: Chess Position

Hints: (1) The a5-pawn fixes a weakness on a6. (2) Rd7+ hits the seventh rank. (3) After Rd7+, White attacks b7 and restricts the king. Use the seventh rank.

Exercise 19.53

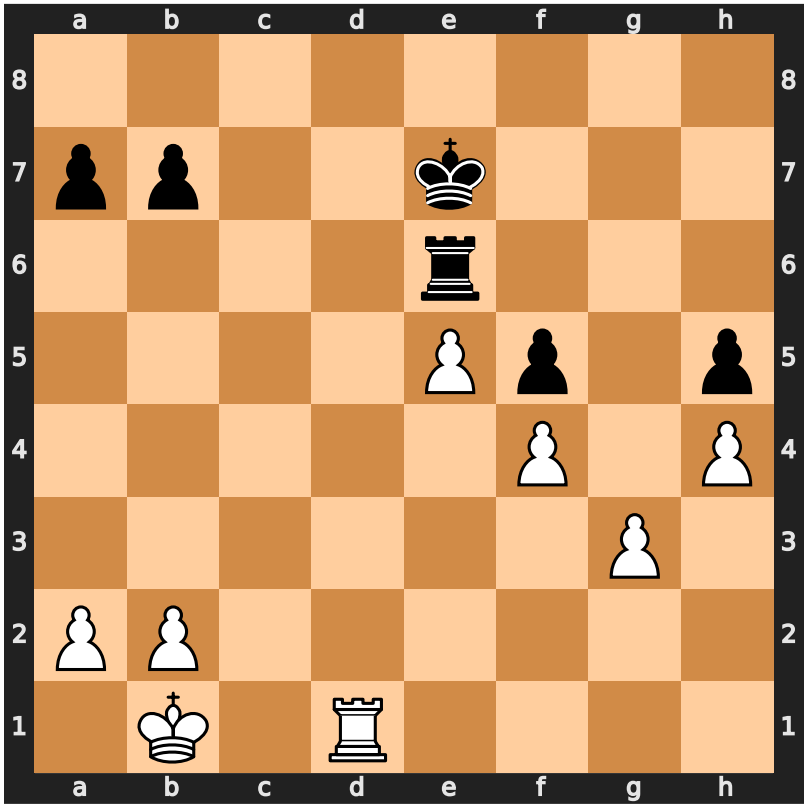

Figure 57.59: Chess Position

White: Kb1, Rd1, Pawns on a2, b2, e5, f4, g3, h4. Black: Ke7, Re6, Pawns on a7, b7, f5, h5.

White to play. White has a protected passed pawn on e5. How to convert?

Hints: (1) The e5-pawn ties down Black's rook. (2) White's plan: advance the king to the center (Kc2-Kd3-Kd4). (3) With the king on d4 supporting e5, White can open a second front on the queenside.

Exercise 19.54

White: Kf2, Re1, Pawns on a3, b4, f3, g3. Black: Kf7, Re4, Pawns on a7, b7, f6, g7, h7.

White to play. Black's rook is very active on e4. How does White deal with it?

Hints: (1) Do NOT chase the rook passively. (2) Activate your own rook: Re7 (seventh rank!). (3) After Re7, White attacks a7 and b7 simultaneously. Activity beats material.

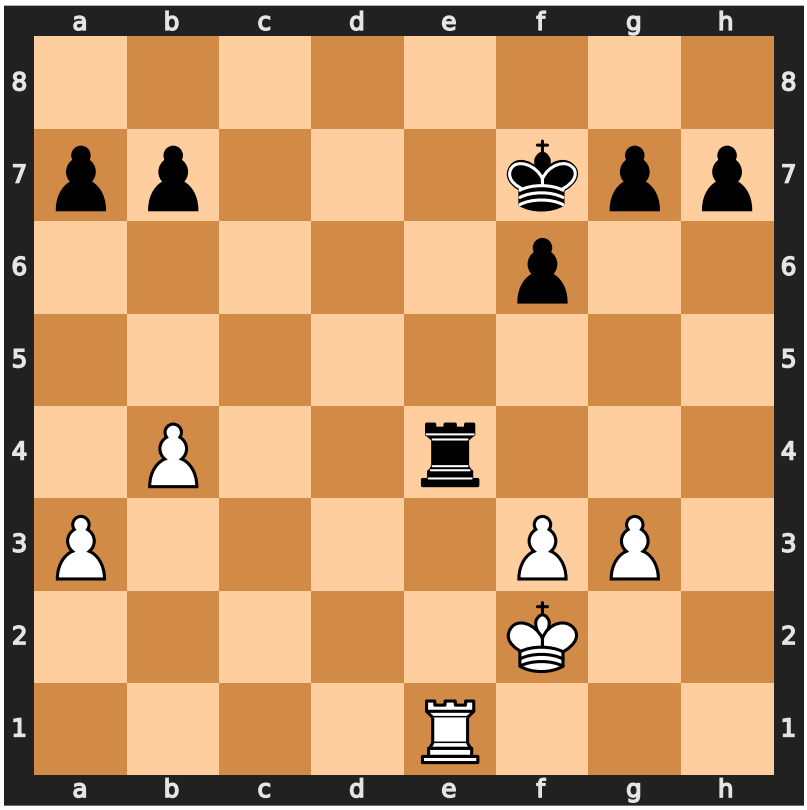

Figure 57.60: Chess Position

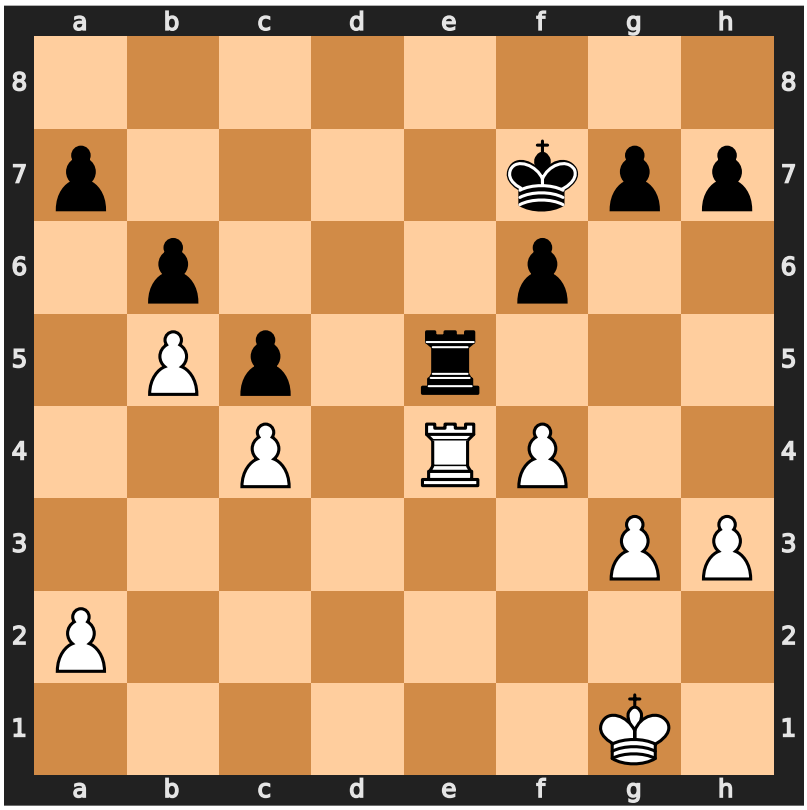

Figure 57.61: Chess Position

Exercise 19.55

White: Kg1, Re4, Pawns on a2, b5, c4, f4, g3, h3. Black: Kf7, Re5, Pawns on a7, b6, c5, f6, g7, h7.

White to play. Both rooks are active. Find the winning plan.

Hints: (1) White has a passed b-pawn (after a potential b5-b6 push). (2) Re7+ gains the seventh rank AND attacks g7. (3) After Re7+, Black's king must retreat. Then b6, axb6, a3-a4-a5 creates a second passer.

Exercise 19.56

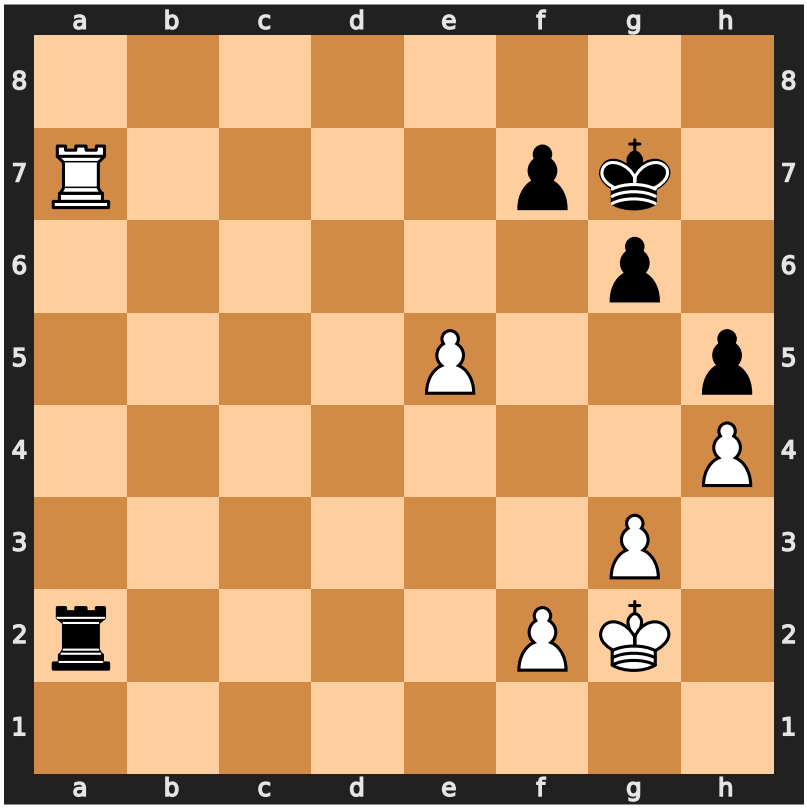

Figure 57.62: Chess Position

White: Kg2, Ra7, Pawns on e5, f2, g3, h4. Black: Kg7, Ra2, Pawns on f7, g6, h5.

White to play. White has a rook on the seventh rank and a passed e-pawn. Convert.

Hints: (1) e6 is the natural advance. After e6, fxe6, White has Rxf7 ideas. (2) But does e6 work tactically? After e6, fxe6, Re7 targets e6. (3) Alternatively, improve the king first: Kf3-Ke4 before pushing e6.

Exercise 19.57

White: Kg1, Rf6, Pawns on a2, b4, c4, g3, h3. Black: Kf7, Rd1, Pawns on a7, b7, g6, h7.

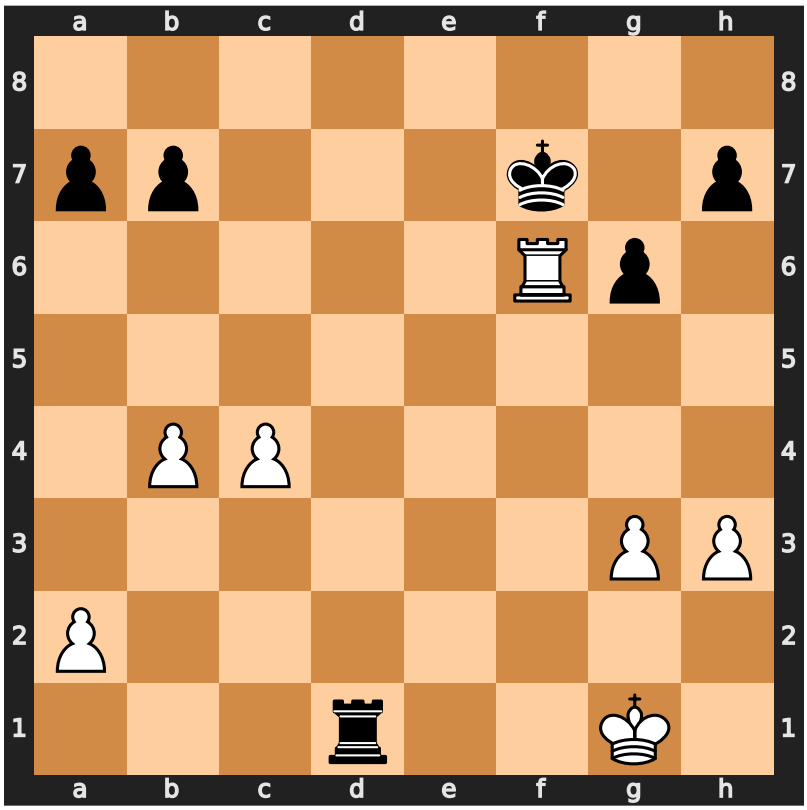

Figure 57.63: Chess Position

White to play. White's rook is on the sixth rank (active!). Plan the winning strategy.

Hints: (1) Rc6 targets c7 or a6. (2) c5 creates a passed pawn. (3) After c5, b5, the connected passers roll forward. Use the rook to support them.

Exercise 19.58

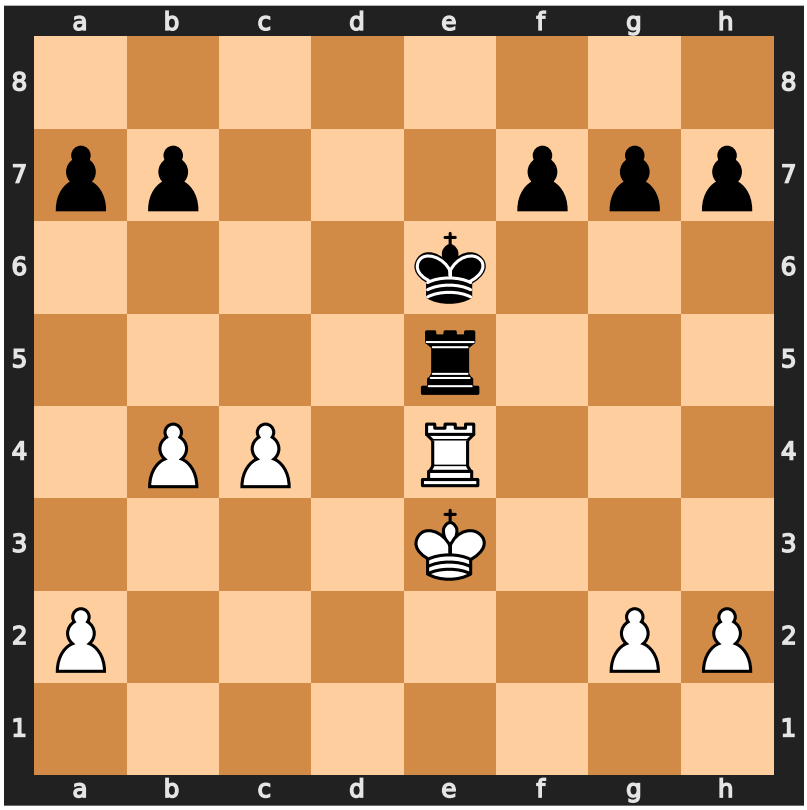

Figure 57.64: Chess Position

White: Ke3, Re4, Pawns on a2, b4, c4, g2, h2. Black: Ke6, Re5, Pawns on a7, b7, f7, g7, h7.

White to play. Should White exchange rooks (Rxe5+ Kxe5) and play the pawn endgame, or avoid the trade?

Hints: (1) Count the pawn endgame: White has 3 vs 2 on the queenside, Black has 3 vs 2 on the kingside. (2) Can White win the pawn endgame with c5, creating a passer? (3) Calculate precisely: after Rxe5+ Kxe5, c5, can Black's king get back in time?

Exercise 19.59

White: Kg2, Rc5, Pawns on a3, b4, f4, g4, h2. Black: Kf7, Re8, Pawns on a7, b7, f6, g7, h7.

White to play. White has a kingside majority and an active rook. Plan the breakthrough.

Hints: (1) f5 fixes Black's kingside pawns and prepares g5. (2) After f5, g5, fxg5, f6 creates a passer. (3) The rook on c5 supports from behind (Rc7 on the seventh rank when the time is right).

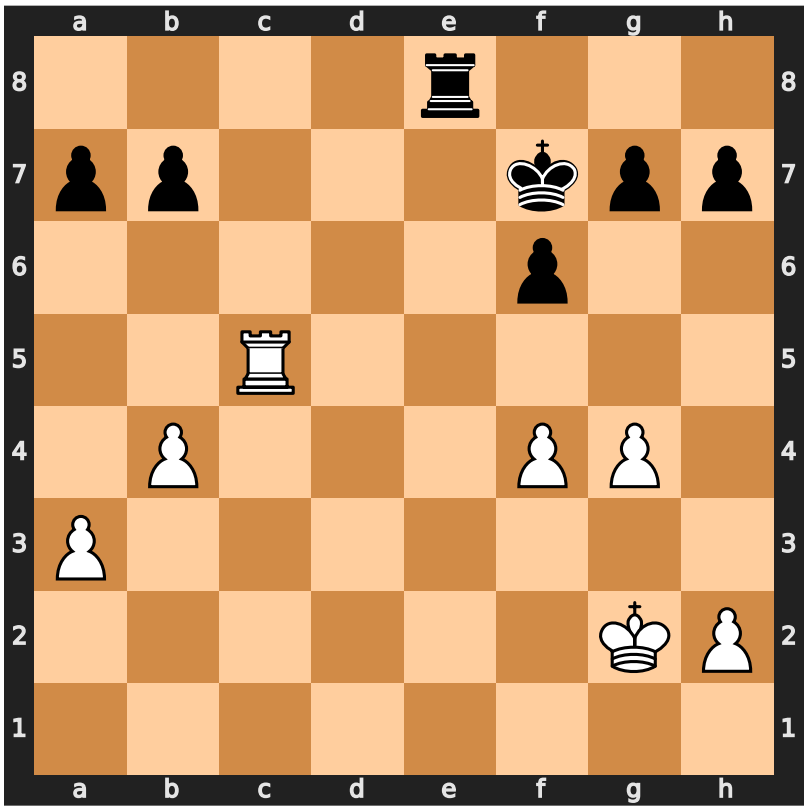

Figure 57.65: Chess Position

Exercise 19.60

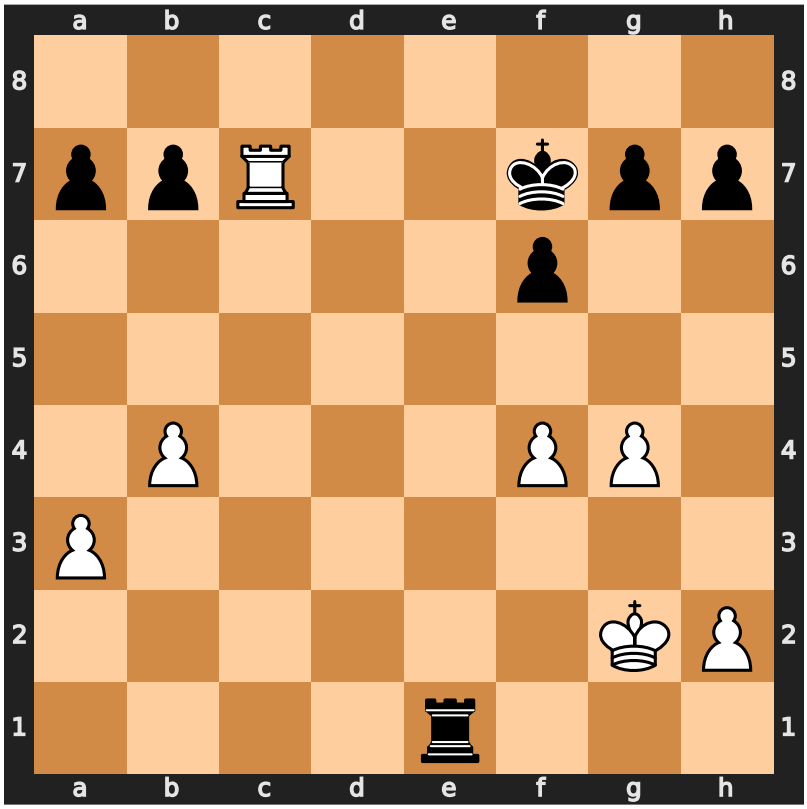

Figure 57.66: Chess Position

White: Kg2, Rc7, Pawns on a3, b4, f4, g4, h2. Black: Kf7, Re1, Pawns on a7, b7, f6, g7, h7.

White to play. White has a rook on the seventh rank. Black has an active rook on the first rank. Who is better, and why?

Hints: (1) White's seventh-rank rook attacks a7 and b7. (2) Black's first-rank rook attacks from behind. (3) White should combine threats: Rxa7 and then advance the kingside majority. Calculate whether Black's counterplay is sufficient.

Chapter 58

KEY TAKEAWAYS

1. **The Lucena position wins. The Philidor position draws.** These are the two foundational positions of all rook endgames. Learn them by heart and you will handle the most basic scenarios from either side.
2. **Short side for the king, long side for the rook.** When defending, put your king on the short side of the pawn and your rook on the long side. This gives the rook maximum checking distance.
3. **Rooks belong behind passed pawns.** Tarrasch's rule applies whether the passed pawn is yours or your opponent's. A rook behind a passer either supports its advance or restrains it.
4. **Activity is everything.** An active rook (on the seventh rank, behind a passer, controlling an open file) is worth more than a passive rook with an extra pawn. Never accept a passive rook if you can avoid it.
5. **The king is a fighting piece.** In rook endgames, centralize the king as early as possible. An active king is worth half a pawn.
6. **Exchange pawns when defending. Create passed pawns when winning.** The fewer pawns on the board, the easier it is to draw. The more passed pawns you create, the easier it is to win.
7. **Do not rush.** Patience separates masters from club players in rook endgames. Improve every piece before committing to a plan. The position will tell you when it is time to strike.

Chapter 59

PRACTICE ASSIGNMENT

For the next two weeks, do the following:

1. **Set up the Lucena position once per day.** Play it from both sides, the attacker building the bridge, and the defender trying to prevent it. After seven days, you should be able to execute the bridge blindfolded.

2. **Set up the Philidor position once per day.** Play the defender's side. Practice keeping the rook on the sixth rank and retreating to check from behind. After seven days, you should be able to hold the Philidor in your sleep.

3. **Play at least three games this week.** In each game, regardless of the result, go back and analyze the endgame phase. Ask: "Where was my king? Where was my rook? Could I have centralized earlier? Could I have created a passed pawn?"

4. **Review one annotated game per day** from this chapter. Focus on the THINKING, not just the moves. Ask yourself at each key moment: "What would I have played? Why did the master play differently?"

5. **Complete all 60 exercises.** Aim for 10 per day over six days. If you struggle with a problem, write down the position and come back to it the next day. Repetition builds mastery.

Chapter 60

PROGRESS CHECK

Answer these questions honestly:

- ☐ Can you set up the Lucena position from memory and demonstrate the bridge technique?
- ☐ Can you set up the Philidor position from memory and demonstrate the drawing method?
- ☐ Can you explain the difference between short side and long side?
- ☐ Can you state Tarrasch's rule about rooks and passed pawns?
- ☐ Do you understand why rook activity is worth more than a pawn?
- ☐ Have you completed at least 40 of the 60 exercises?
- ☐ Can you centralize your king within the first 5 endgame moves in your own games?

If you checked five or more boxes, you are ready for Chapter 20: Planning in the Middlegame.

If you checked fewer than five, spend more time with the Lucena and Philidor. Set them up again. Play them again. These positions are the foundation. The time you invest now will pay dividends for the rest of your chess career.

Rest here. You have completed one of the most important chapters in the entire Codex. Rook endgames are the backbone of endgame play, and you now have the knowledge that most club players lack.

If you master these positions (truly master them, so they become automatic) you will save countless half-points and steal full points from opponents who do not know them. That is not a promise. It is a mathematical certainty. The positions arise. The technique works. The points add up.

You have earned a real break. Come back to Chapter 20 with fresh eyes, an active king, and a rook on the seventh rank.

Chapter 19 complete. 8 theory sections. 60 exercises. 5 annotated games. Volume II: The Club Player. The Grandmaster Codex By Kit Olivas and Dr. Ada Marie

Chapter 61

Chapter 20: Planning in the Middlegame

Volume II: The Club Player | Rating Range: 1000 - 1600 Pages: 40 | Exercises: 40 | Annotated Games: 5

"Even a poor plan is better than no plan at all." — Mikhail Chigorin (1850–1908)

61.1 What You'll Learn

- What a plan actually is, and what it is not
- A six-step process for forming a plan in any position
- How to evaluate a position using a practical checklist
- The five types of middlegame plans and when to use each one
- Seven of the most common middlegame plans in chess
- When to abandon a plan and how to adapt without losing your way
- How world-class players think through planning decisions at the board

---

61.2 Before We Begin

You have spent the last several chapters learning the building blocks of chess strategy: pawn structures, piece activity, the center, king safety, and openings. Each of those chapters gave you a lens for understanding a position. This chapter teaches you how to combine all those lenses into a single, clear picture, and then act on it.

That act is called a plan.

Without a plan, you are making random moves and hoping something good happens. That works against beginners. It does not work against anyone who knows what they are doing. The difference

between a 1000-rated player and a 1600-rated player is not usually tactics. It is this: the 1600 player has a reason for every move.

This chapter will give you that reason. By the end, you will sit down at the board, look at any middlegame position, and know (not guess, know) what to do next. Not because you memorized a formula, but because you learned how to think.

Set up your board. This is one of the most important chapters in the entire Codex.

61.3 Part 1: What Is a Plan?

61.3.1 The Definition

A plan is a series of moves aimed at a specific goal.

That is it. Nothing magical. Nothing mysterious. A plan is simply: "I want to achieve X, and I will do it by playing moves A, B, and C."

Here are examples of plans:

- "I want to put my knight on d5 where it cannot be challenged. I will play Nc3-e2-g3-f5 or Nc3-d5 if the square opens."
- "I want to open the f-file for my rook. I will play f2-f4-f5 and then exchange pawns."
- "I want to create a passed pawn on the queenside. I will play a4, b5, and then push the a-pawn."

Notice what each of these has in common: a clear destination and a sequence of moves to get there. That is what separates a plan from a wish. A wish is "I hope something good happens on the kingside." A plan is "I will play f4, Qf3, Raf1, and f5 to open the f-file and attack the king."

61.3.2 Short-Term Plans vs Long-Term Plans

Plans come in two sizes.

Short-term plans cover the next three to five moves. They are concrete, specific, and often involve a particular piece or pawn. "I will bring my knight from b1 to d5 via c3 and e4" is a short-term plan.

Long-term plans describe where the game is heading over the next ten, twenty, or even thirty moves. "I will gradually improve my pieces, advance my kingside pawns, and aim for a mating attack" is a long-term plan.

Both are essential. Long-term plans give your game direction. Short-term plans give your game precision. The best players always have both: a general idea of where the game is going, and a specific idea of what to do right now.

For club players, short-term planning is more important. If you can consistently find the right thing to do for the next three to five moves, you will improve faster than if you dream about grand strategies. Grand strategies come later. For now, focus on the next step.

61.3.3 "A Bad Plan Is Better Than No Plan"

This famous principle has been attributed to many masters. Its truth is simple: a player with a plan (even a mediocre one) will coordinate their pieces toward a common goal. A player without a plan will scatter their pieces across the board, each one pursuing a different idea, accomplishing nothing.

When you follow a plan, your pieces work together. When you play without a plan, your pieces work alone. Coordinated pieces beat uncoordinated pieces. Every time.

This does not mean you should stubbornly follow a terrible plan. It means that having any direction is better than having no direction. If you sit at the board, evaluate the position, and choose a plan (even one that is not perfect) you will play better than someone who makes moves at random.

61.3.4 How to Think When It Is Your Move

Before we dive into the planning process, here is a systematic approach for every move. This is not just for planning moves. This is for every single move you play.

Step 1: What did my opponent just do? Look at their last move. What does it threaten? What does it change about the position?

Step 2: Are there any tactics? Check for captures, checks, and threats. Both theirs and yours. Spend thirty seconds on this. If there is a tactic, it overrides any plan.

Step 3: What is my plan? If you already have a plan, ask: "Can I continue with my plan?" If yes, play the next move of your plan. If no, re-evaluate and form a new plan (using the process in Part 2).

Step 4: Play the move and press the clock.

This four-step routine takes less than a minute for routine positions and longer for critical positions. It keeps you disciplined and prevents the most common club player mistake: playing a move without knowing why.

Good stopping point. The concept of a plan is now in your head. Let it settle before we build the process.

61.4 Part 2: The Planning Process

61.4.1 The Six Steps

When you need a plan (at the start of the middlegame, after a major exchange, after your previous plan has run its course) use this six-step process. You do not need to spend ten minutes on it. With practice, you will run through these steps in sixty seconds.

61.4.2 Step 1: Evaluate the Position

Before you can decide what to do, you need to understand where you stand.

Ask: **Who is better? Why?**

You do not need a precise numerical evaluation. You need a general sense. "I am slightly better because my pieces are more active." Or "My opponent is better because my king is exposed." Or "The position is roughly equal."

The next section (Part 3) gives you a complete evaluation checklist. For now, know that evaluation comes first. You cannot choose the right direction if you do not know where you are starting from.

61.4.3 Step 2: Identify the Imbalances

An imbalance is any difference between the two sides. You learned this concept in Chapter 14 (Piece Activity). Now it becomes the foundation of your planning.

The key imbalances are:

1. **Material.** Does one side have more pieces or pawns?
2. **Piece activity.** Whose pieces are better placed?
3. **Pawn structure.** Who has weaker pawns? Who has a passed pawn?
4. **Space.** Who has more room to maneuver?
5. **King safety.** Whose king is more exposed?
6. **Development.** In the early middlegame, who has more pieces in play?

Every position has imbalances. Your plan should be based on exploiting your favorable imbalances and neutralizing your opponent's.

Example: You have more space and active pieces, but your opponent has a healthier pawn structure. Your plan should exploit your space and activity before your opponent can exploit their pawn structure advantage in the endgame. This probably means attacking.

Example: You have a better pawn structure and a solid position, but your opponent has more active pieces. Your plan should focus on exchanging pieces (to reduce the activity advantage) and heading toward an endgame where your structural advantage matters.

61.4.4 Step 3: Determine What the Position Wants

This is the most subtle step, and it is the one that separates improving players from stagnating ones.

The position itself tells you what to do. You just have to learn to listen.

Look at the pawn structure. Where are the pawn breaks? If you can play e4-e5 or d4-d5, that might be your plan. If you can play f2-f4-f5, that might open a file for your rook.

Look at your pieces. Where do they want to go? If your knight is on c3 and the d5 square is available, the knight is asking to go to d5. If your rook is on a1 and the a-file is open, the rook is asking to go to a5 or a7.

Look at your opponent's weaknesses. Is there a backward pawn? An isolated pawn? A weak square? If so, the position is telling you to target it.

Do not impose a plan on the position. Let the position suggest the plan.

This is a skill that develops with experience. The more games you study, the more positions you analyze, the better your instinct becomes. But even as a club player, you can ask these questions and get useful answers.

61.4.5 Step 4: Formulate a Plan Based on the Imbalances

Now you bring everything together.

You know who is better (Step 1). You know why (Step 2). You know what the position wants (Step 3). Now state your plan in plain language.

"My plan is to push f4-f5 to open the f-file, bring my rook to f3, and attack the kingside."

"My plan is to play b4-b5 to open the queenside, exchange pawns, and infiltrate with my rook on the b-file."

"My plan is to trade queens and bishops, reach an endgame where my better pawn structure wins."

The simpler the plan, the better. A plan you can express in one sentence is a plan you can execute without getting confused.

61.4.6 Step 5: Execute the Plan While Watching for Tactics

Here is where most club players fail. They form a good plan and then forget about it after two moves because something shiny appeared on the other side of the board.

Stay with your plan unless something forces you to change it.

Execute the plan move by move. But (and this is critical) never stop checking for tactics. Before each move, run your tactical scan (Step 2 of the thinking process). If a tactic appears, take it. If not, play the next move of your plan.

A plan is a guide, not a prison. You follow it because it gives your moves purpose. But if your opponent blunders a piece, you take the piece. You do not say, "But that was not part of my plan." Tactics override strategy. Always.

61.4.7 Step 6: Re-evaluate When the Position Changes

The position changes after every move. Most of these changes are small and do not affect your plan. But sometimes a major change occurs:

- A pawn exchange opens a new file
- A piece trade alters the balance of power
- Your opponent plays a surprising move that creates a new threat
- Your plan succeeds, and you need a new goal

When any of these happen, go back to Step 1. Re-evaluate. Re-assess the imbalances. Form a new plan.

A plan is not a life sentence. It is a working hypothesis. "Based on what I see, I think this is the best approach." When new information arrives, update your hypothesis.

Good stopping point. The six steps are your new framework. Practice them at the board before continuing.

61.5 Part 3: The Evaluation Checklist

61.5.1 Your Quick-Reference Guide

Every time you need to evaluate a position, run through this checklist. With practice, you will do it automatically.

1. Material Count

Count the pieces. Are both sides equal? Is someone up a pawn? A piece? Material tells you the baseline. If you are ahead, simplify toward an endgame. If you are behind, keep the position complicated and seek counterplay.

Standard values as a reminder: Pawn = 1, Knight = 3, Bishop = 3, Rook = 5, Queen = 9.

2. King Safety

Look at both kings. Is your king safe behind pawns with no holes? Is your opponent's king exposed? Are there open files or diagonals pointing at either king?

King safety is the single most important factor in the middlegame. An unsafe king overrides everything else. If your opponent's king is weak, your plan should involve attacking it. If your king is weak, your plan should involve defending it first.

3. Piece Activity

This is what you learned in Chapter 14. Are your pieces active or passive? Are your opponent's pieces active or passive? Count how many pieces on each side are genuinely participating in the game.

A useful shortcut: find each side's worst piece. Whoever has the worse "worst piece" is probably worse overall.

4. Pawn Structure

This is what you learned in Chapter 13. Look for:

- **Isolated pawns.** Weak because they cannot be defended by other pawns.
- **Doubled pawns.** Sometimes weak, sometimes acceptable.
- **Backward pawns.** Stuck behind their neighbors, often targets.
- **Passed pawns.** Potentially powerful, especially in endgames.
- **Pawn chains.** The base of a chain is a target.
- **Available pawn breaks.** Which pawn advances could change the structure?

5. Space

Who has more room? Space is measured by how far your pawns extend into enemy territory. More space means more room for your pieces to maneuver and more difficulty for your opponent's pieces to find good squares.

A space advantage is valuable, but it comes with a commitment. If you have more space, you need to use it. If your opponent has more space, you need to challenge it with a pawn break or simplify with exchanges.

6. Development

In the early middlegame, development still matters. If you have more pieces developed, you have a temporary advantage that you must exploit before your opponent catches up. If you are behind in development, avoid opening the position until your pieces are ready.

61.5.2 Putting the Checklist Together

Here is a practice example:

Set up your board:

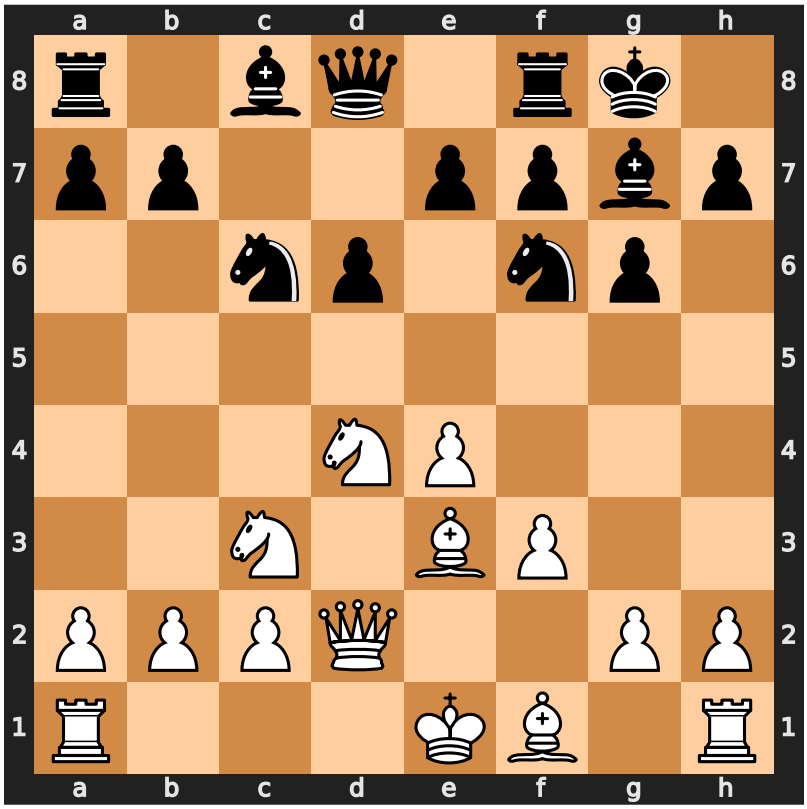

Figure 61.1: Chess Position

Run the checklist:

1. **Material:** Equal. Both sides have all pieces.
2. **King safety:** White has not castled yet but can castle queenside or kingside. Black has castled kingside and is secure for now.
3. **Piece activity:** White's knights are centralized (d4 and c3). White's bishop on e3 is well-placed. Black's pieces are developed but more passive, the bishop on g7 is blocked by the d6 pawn, and the knight on c6 is pinned against the queen's influence from d2.

4. **Pawn structure:** Both sides have healthy structures. White has a central pawn on e4 supported by f3. Black's d6 pawn is a potential target.
5. **Space:** White has a slight space advantage thanks to the e4 pawn.
6. **Development:** Roughly equal. White still needs to castle and develop the f1 bishop.

Overall evaluation: White is slightly better. More centralized pieces, more space, and Black's bishop on g7 is somewhat passive.

What should the plan be? White should castle (probably queenside to enable a kingside pawn storm), complete development (Bc4 or Be2), and consider a long-term plan of pushing on the kingside (g4-g5 if castled queenside) or targeting the d6 pawn.

That took about ninety seconds. With practice, it will take thirty.

61.6 Part 4: Choosing the Right Plan

61.6.1 Five Types of Plans

Not all plans are created equal. Different positions call for different approaches. Here are the five types of middlegame plans and when each one is appropriate.

61.6.2 1. Attacking Plans

When to attack: When you have one or more of the following advantages, better king safety (your king is safe, theirs is not), more active pieces pointed at the enemy king, a lead in development, or a space advantage on the kingside.

What attacking plans look like:

- Opening lines toward the enemy king (pawn breaks, piece sacrifices)
- Bringing pieces to attacking squares (rook lifts, knight transfers)
- Creating direct threats (mate threats, piece captures)
- Combining threats so the opponent cannot defend everything at once

The golden rule of attacking: You need at least three pieces aimed at the enemy king before the attack can succeed. Two pieces can harass. Three pieces can win. One piece attacking alone is not an attack, it is a suicide mission.

Set up your board:

White has castled queenside in many variations of this structure. The plan is clear: push g2-g4-g5 to open lines on the kingside. The queen on d2 supports the advance. The bishop on e3 controls key squares. The knight on d4 is a rock. All three pieces point toward the kingside. This is an attacking plan.

61.6.3 2. Defensive Plans

When to defend: When your opponent has the initiative, when your king is under fire, or when you are worse and need to stabilize before looking for counterplay.

What defensive plans look like:

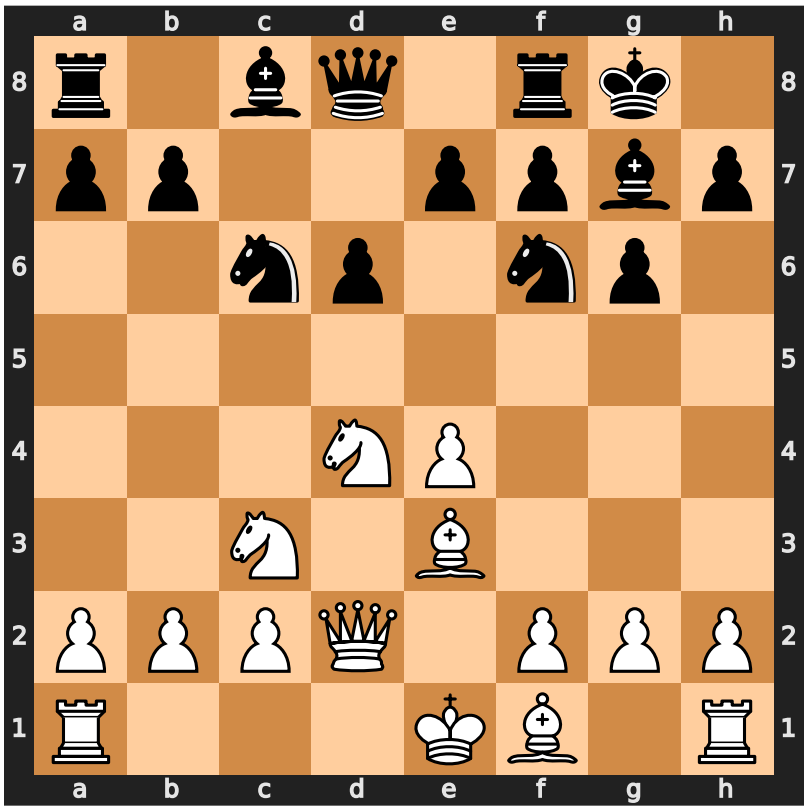

Figure 61.2: Chess Position

- Trading off the opponent's attacking pieces (especially queens)
- Blocking open files and diagonals pointing at your king
- Reinforcing weak points before they can be exploited
- Creating counterplay on the opposite wing to distract the attacker

The golden rule of defense: Defense without counterplay is losing slowly. Even when you are defending, look for moments to strike back. Exchange one of their attacking pieces. Open a file on the other side. Create a threat that forces them to pause.

As Lasker taught: the best defense often involves creating your own threats. Pure passive defense breaks down against persistent pressure.

61.6.4 3. Maneuvering Plans

When to maneuver: When the position is closed or semi-closed, when there are no immediate tactical opportunities, and when both sides need to improve their pieces before anything can happen.

What maneuvering plans look like:

- Transferring a knight from one side of the board to the other (Na3-c2-e3-d5)
- Rook lifts (Ra1-a3-f3 or -h3)
- Repositioning the queen to a better square
- Making small pawn moves to improve your structure while waiting for the right moment

The golden rule of maneuvering: Improve your worst piece. Then improve your next worst piece. Continue until all your pieces are on their best available squares. When everything is optimized, the position will often crack on its own.

Maneuvering games require patience. The temptation to "do something" and lash out with a premature pawn break is strong. Resist it. The right moment will come. When it does, you will be ready because all your pieces are in position.

61.6.5 4. Transition Plans

When to transition: When you have a lasting advantage (better pawn structure, an extra pawn, a better minor piece) that will grow larger in the endgame. Or when your middlegame advantage is fading and you need to lock in your gains.

What transition plans look like:

- Trading queens and several pieces to reach a favorable endgame
- Simplifying the position to reduce your opponent's counterplay
- Converting a middlegame attack into material gain rather than seeking checkmate
- Centralizing your king in preparation for the endgame

The golden rule of transitions: Transition when your advantage is structural, not when it is tactical. A structural advantage (better pawns, superior minor piece) grows in the endgame. A tactical advantage (more active pieces, threats) usually fades in the endgame.

61.6.6 5. Prophylactic Plans

When to be prophylactic: When your opponent has a clear plan that you need to prevent. When a waiting approach is best. When improving your own position can wait because your opponent is

about to do something dangerous.

What prophylactic plans look like:

- Playing a move that prevents your opponent's best idea
- Overprotecting a key square or pawn before it is attacked
- Making a "mysterious" rook move that takes away your opponent's options
- Spending a tempo on king safety before the opponent can exploit it

The golden rule of prophylaxis: Ask yourself before every move: "What does my opponent want to do?" If their plan is dangerous, stop it first. Then pursue your own ideas.

The great Tigran Petrosian built his entire style around this principle. He would prevent his opponent's plans so thoroughly that they ran out of ideas, and then he would strike when they were disorganized. You do not need to play like Petrosian to benefit from this. You just need to ask one question: "What is my opponent planning?"

Rest here if you need to. The five plan types are a lot to absorb. Come back fresh for the specific plans.

61.7 Part 5: Common Middlegame Plans

61.7.1 Seven Plans Every Club Player Must Know

These are the plans you will use most often between moves 10 and 30. Learn them, recognize them, and practice them. They cover the majority of middlegame situations you will encounter.

61.7.2 Plan 1: The Minority Attack

What it is: Advancing your pawns on the side where you have fewer pawns to create weaknesses in your opponent's pawn structure.

When to use it: In positions where the center is locked and you have a pawn minority on the queenside (typically two pawns against three).

How it works:

Set up your board:

Imagine a structure where White has pawns on a2 and b2 facing Black's pawns on a7, b7, and c6. White advances a2-a4, then b4-b5. When b5 hits c6, Black must decide how to capture. After …cxb5, axb5, the c-file opens and Black is left with an isolated a-pawn or a backward b-pawn. White's rooks pour down the open files and attack the weakness.

The beauty of the minority attack is its inevitability. Black can delay it but rarely prevent it. Once the pawn arrives at b5, something has to give.

Key idea: You are not trying to promote a pawn. You are trying to create a weakness in your opponent's camp that you can target for the rest of the game.

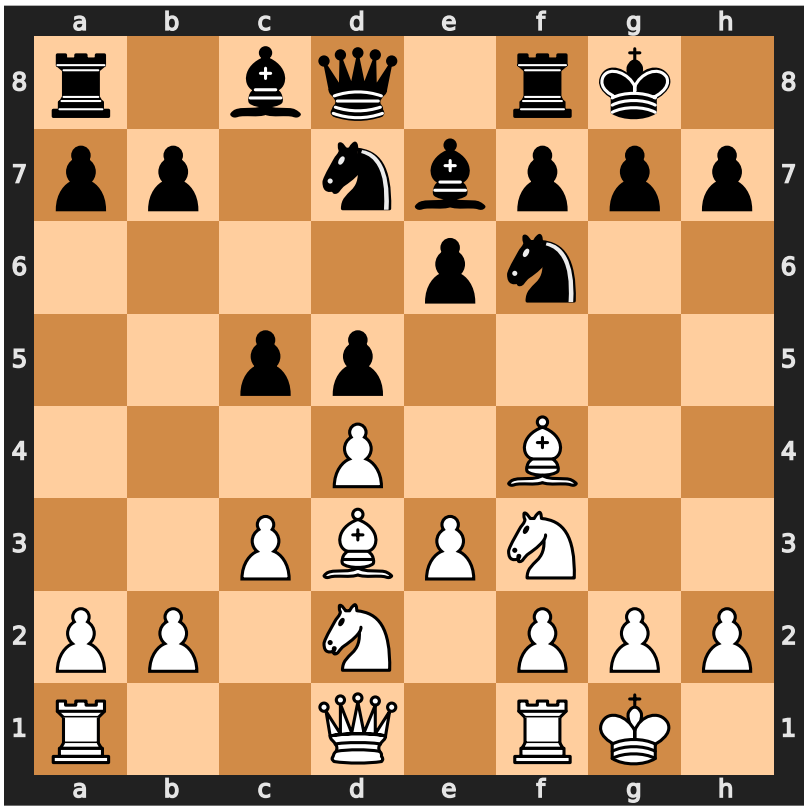

Figure 61.3: Chess Position

61.7.3 Plan 2: The Kingside Pawn Storm

What it is: Advancing your kingside pawns (f, g, and h) toward the enemy king to open lines for your pieces.

When to use it: When you have castled queenside and your opponent has castled kingside (opposite-side castling), or when the center is closed and you have a space advantage on the kingside.

How it works:

Set up your board:

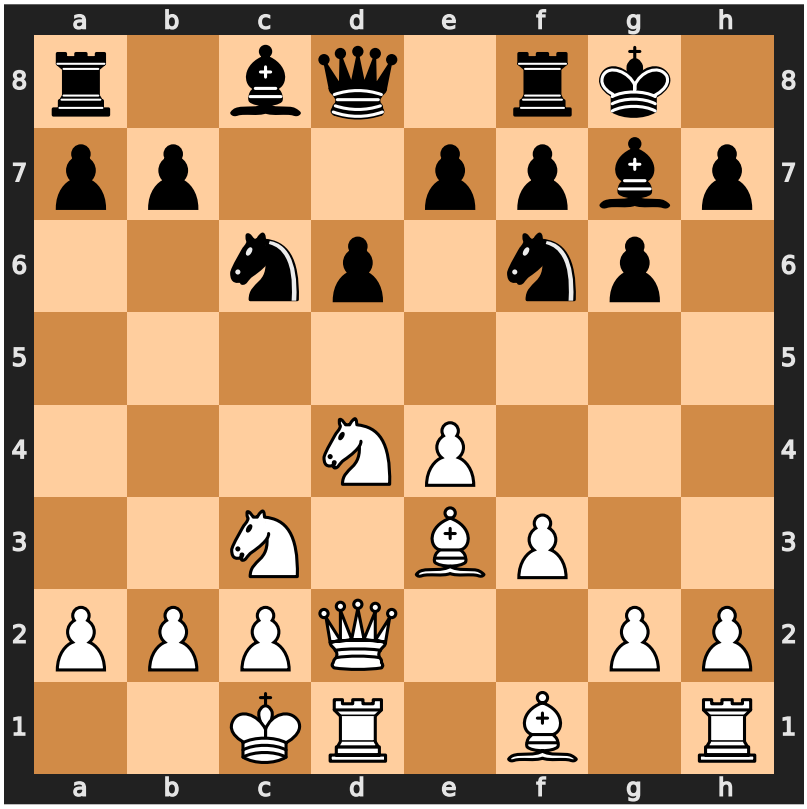

Figure 61.4: Chess Position

White has castled queenside. Black has castled kingside. The center is stable. White's plan: g2-g4, h2-h4, g4-g5 (or h4-h5 depending on the structure). Each pawn advance opens a line or forces a concession from Black.

When the g-file or h-file opens, White's rooks swing over (Rdg1 or Rh1-h5). The queen on d2 can join the attack via h6 or g5. The bishop on e3 supports everything.

Warning: A kingside pawn storm works only when the center is stable. If the center is open, pushing your kingside pawns weakens your own king. Rule of thumb from Steinitz: no flank attack succeeds without a stable center.

61.7.4 Plan 3: The Central Breakthrough

What it is: Advancing a central pawn (usually e4-e5 or d4-d5) to blow open the center and activate your pieces.

When to use it: When you have more centralized pieces, better development, or when your opponent is preparing a wing attack that a central break would disrupt.

How it works:

Set up your board:

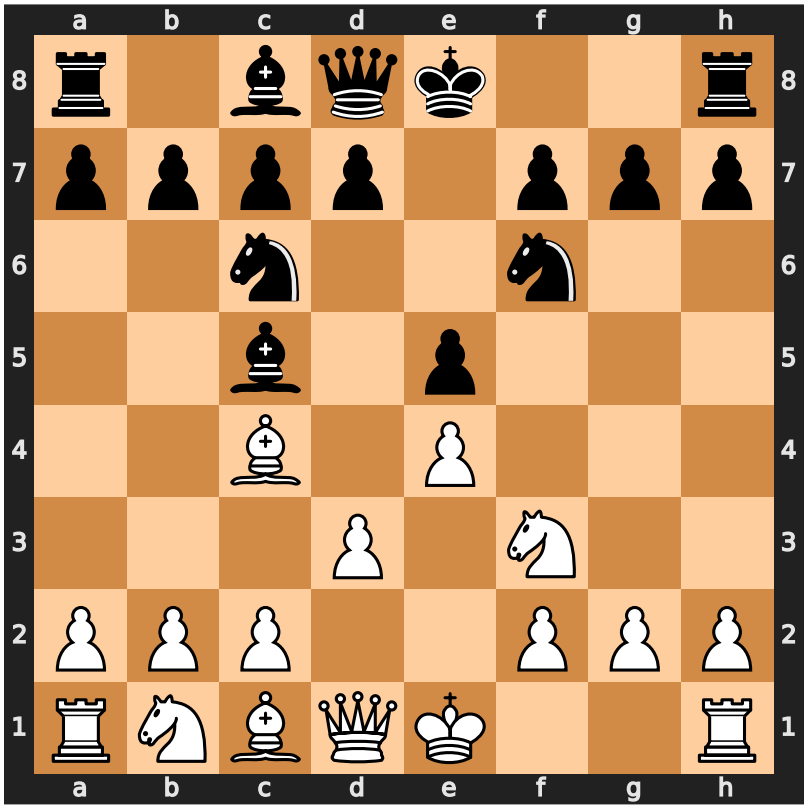

Figure 61.5: Chess Position

In many Italian Game structures, White prepares d2-d4 to strike at the center. After d4, exd4, Nxd4, the center opens and White's pieces (bishop on c4, knight on d4, rooks on the open d-file and e-file) spring to life.

The central breakthrough is the most powerful type of plan when it works. It activates multiple pieces simultaneously and often catches the opponent off guard.

Key idea: Prepare the break carefully. Do not push the pawn until your pieces are ready to exploit the open lines. A premature breakthrough can backfire.

61.7.5 Plan 4: Piece Exchanges to Exploit an Advantage

What it is: Deliberately trading pieces to simplify the position and magnify a lasting advantage.

When to use it: When you are ahead in material, when you have a better pawn structure, or when your opponent's pieces are keeping the position complicated enough to give them counterplay.

How it works: This is not about mindlessly trading everything. It is about trading the right pieces.

Trade their active pieces. If your opponent has a strong knight on e4, exchange it. If their bishop controls a dangerous diagonal, trade it.

Keep your good pieces. If your bishop is better than their bishop, do not trade bishops. Trade something else.

Aim for a favorable endgame. Think about what the position will look like after the trades. Will you have a winning endgame? If yes, trade. If the endgame is unclear, maybe keep the pieces and look for more.

61.7.6 Plan 5: Opening a File for Your Rooks

What it is: Creating an open file (a file with no pawns) so your rooks can enter the opponent's position.

When to use it: When your rooks are passive and have no open files to work with.

How it works: Find a pawn you can advance or exchange to clear a file. Then double your rooks on that file. Then penetrate to the seventh rank.

Set up your board:

White can play e4-e5. After …Nd7 (the knight retreats), the e-file becomes half-open. After a further …dxe4 or exd5, a fully open file appears. White plays Re1, Rae1 (or Rd1 if the d-file opens), and the rooks come alive.

The principle: rooks without open files are like cars without roads. Give them a highway, and they dominate.

61.7.7 Plan 6: Creating a Passed Pawn

What it is: Advancing a pawn past all opposing pawns so it can march toward promotion.

When to use it: When you can create a pawn that has no enemy pawn in front of it or on adjacent files. Especially powerful in endgames, but the process of creating it often begins in the middlegame.

How it works:

Exchange pawns on one wing to create a pawn majority on the other. Then advance that majority to create a passed pawn. A passed pawn ties down enemy pieces that must watch it, freeing your other pieces to operate elsewhere.

As Nimzowitsch wrote: "A passed pawn is a criminal that must be kept under lock and key. Powerful measures (the bishop guarding it, a knight blocking it, a rook behind it) are required to restrain it."

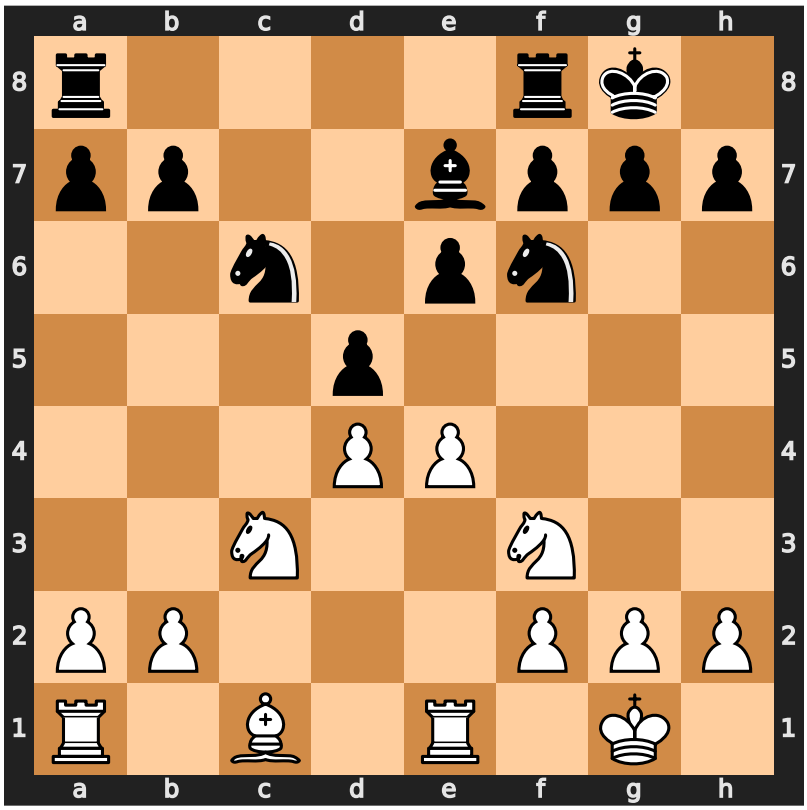

Figure 61.6: Chess Position

61.7.8 Plan 7: Improving Your Worst Piece

What it is: Finding your least active piece and relocating it to a better square.

When to use it: Always. This is the universal plan. When you do not know what else to do, improve your worst piece. It is almost never wrong.

How it works: Scan your pieces. Find the one doing the least. Ask: where would this piece be better? Then reroute it.

Common examples:

- A knight on a3 goes to c2-e3-d5
- A bishop on c1 goes to d2-e3 or f4
- A rook on a1 goes to d1 or e1 via the back rank
- A queen on d1 repositions to e2 or c2

This is the plan that Karpov used more than any other. He would look at a position, find the piece that was not contributing, and spend two or three moves making it active. Then he would do the same with the next piece. By the time he was done, his position was a machine. His opponents' positions collapsed under the cumulative pressure.

Set up your board:

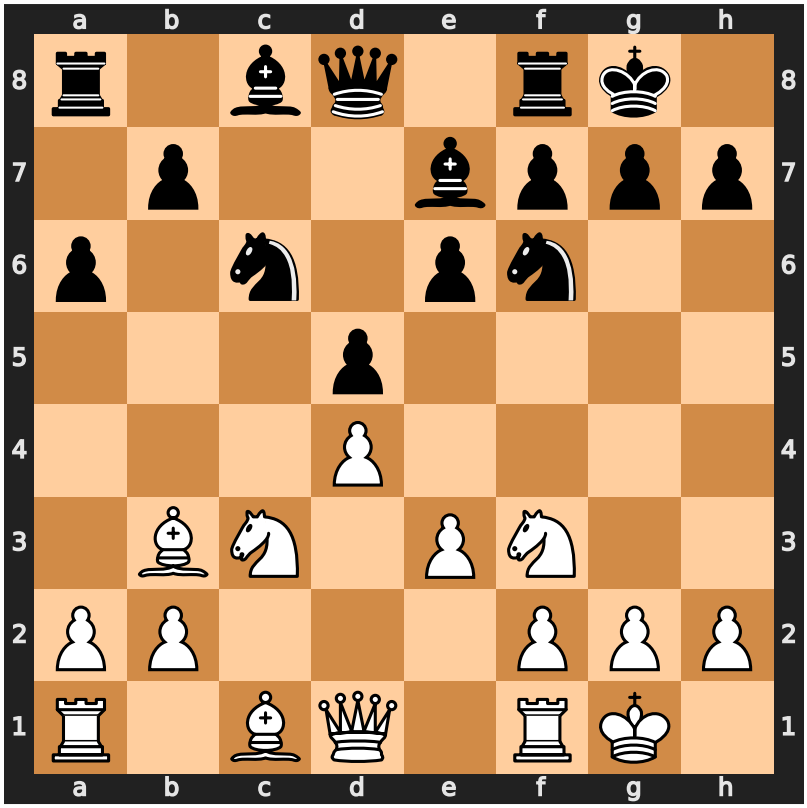

Figure 61.7: Chess Position

White's worst piece is the bishop on c1. It is blocked by the e3 pawn and does nothing. White's plan: Bd2 (freeing the rook), then Ba5 or Bb4 (putting the bishop on an active diagonal), or Re1

followed by e4 to open the center and let the bishop breathe. One piece improvement transforms the entire position.

Rest here. Seven plans are a lot to absorb. When you come back, five masterpiece games will show you how the best players in history used these ideas.

61.8 Part 6: When Plans Change

61.8.1 Recognizing When Your Plan Has Been Stopped

You are halfway through executing your plan. You were going to push f4-f5, open the f-file, and attack the kingside. Then your opponent plays …e5, closing the center and blocking your f-pawn advance. Now what?

This happens in every game. No plan survives contact with the opponent unchanged. The question is not whether your plan will be disrupted. The question is what you do when it is.

Signs that your plan has been stopped:

1. The pawn break you were aiming for is no longer possible (the square is blocked or the advance would weaken your position).
2. Your opponent traded a key piece that your plan depended on.
3. Your opponent created a threat that you must address before continuing your plan.
4. The position has changed so much that your plan no longer makes sense.

When this happens, do not panic. Go back to Step 1 of the planning process. Re-evaluate. The position has changed, and it needs a new plan.

61.8.2 Adapting to Your Opponent's Moves

Adaptation is not abandoning your plan. It is updating it.

If your kingside attack is blocked, shift your energy to the center or the queenside. Your pieces are already active. They just need a new target.

If your opponent trades your best piece, find a new best piece and build around it.

If your opponent creates a threat, deal with the threat in a way that also serves your plan. The ideal defensive move is one that defends against the threat and improves your position at the same time. This is called a "multi-purpose move," and it is one of the hallmarks of strong play.

61.8.3 The Flexibility Principle

Do not marry your plan.

This is perhaps the most important piece of advice in this chapter. Plans are tools, not commitments. You pick one up, use it as long as it works, and put it down when it stops working.

The players who struggle the most with planning are not the ones who cannot form plans. They are the ones who cling to plans long after the position has changed. They fell in love with their idea, and they cannot let go.

Be flexible. Be willing to change direction. The best move in the position is always the best move in the position, regardless of what your plan said ten moves ago.

61.9 Part 7: Annotated Games

61.9.1 Game 38: Karpov vs Unzicker, Nice Olympiad 1974

Theme: Improving the Worst Piece, The Art of Gradual Improvement

Anatoly Karpov was the supreme master of quiet, methodical planning. He did not attack with fireworks. He improved his pieces, one by one, until his opponent's position crumbled under the weight of perfect coordination. This game is a textbook example.

Set up your board.

1.e4 e5 2.Nf3 Nc6 3.Bb5 a6 4.Ba4 Nf6 5.O-O Be7 6.Re1 b5 7.Bb3 d6 8.c3 O-O 9.h3 Nb8

The Breyer Variation of the Ruy Lopez. Black retreats the knight to b8, it looks bizarre to a beginner, but the idea is to reroute it to d7 where it supports …c5 and does not block the c-pawn. This is a plan: the knight was not well-placed on c6 (it blocked Black's plans), so Black improves it.

10.d4 Nbd7 11.Nbd2 Bb7 12.Bc2 Re8 13.Nf1 Bf8 14.Ng3 g6

Both sides maneuver. White reroutes the knight from d2 to g3 where it supports a potential f4-f5 break and eyes the f5 and h5 squares. Black fianchettoes the bishop to g7 to protect the kingside.

15.a4 c5 16.d5

Karpov closes the center. This is a strategic decision: with the center locked, the game will be about piece maneuvering and wing play. Karpov is signaling that he wants a long, positional game, exactly the kind of game where his planning ability gives him the greatest edge.

16...c4 17.Bg5 Nc5 18.Qd2 h6 19.Be3 Nc5 20.Nh2

Notice what Karpov is doing. He is not attacking. He is repositioning his pieces. The knight goes from f3 to h2, freeing the f-pawn for a future advance. Every move has a purpose. Every piece is going somewhere specific.

20...Qd7 21.b4 cxb3 22.Bxb3 Kh7 23.Nf3 Bg7 24.Qe2 Nfd7 25.Bd2 Qc7 26.Nh4

The knight transfers to h4, eyeing f5. The bishop repositions from e3 to d2 to a5 (in some lines). The queen shifts to e2 to support the central e4 pawn and prepare Qf1-g2 if needed. Karpov is improving his worst piece with every single move.

26...Nb6 27.Nhf5

The knight arrives on f5. This is an outpost, Black cannot play …gxf5 without catastrophically weakening the kingside. From f5, the knight supports a future attack and dominates the board.

27...gxf5 28.Nxf5 Kh8 29.Nxg7 Kxg7

Black captures, but the kingside pawn structure is now damaged. Karpov has achieved his goal: the king is exposed, the pawns are weak, and his remaining pieces are perfectly placed.

30.f4 exf4 31.Bxf4 Qd7 32.Qf3 Be4 33.Qg3+ Kh8 34.Bg5 Nba4 35.Bxh6 Rg8 36.Qf4 Nc3 37.Bg5+ 1-0

Unzicker resigned. The position is hopeless, White's pieces swarm the weakened kingside.

What this game teaches about planning:

- Karpov rarely "attacked." He simply improved his pieces until the attack played itself.
- Every piece found its best square through patient maneuvering.
- Closing the center was a strategic choice that favored the better planner.
- The worst piece at any given moment was always the next piece to be improved.

61.9.2 Game 39: Capablanca vs Tartakower, New York 1924

Theme: The Transition, Converting a Middlegame Advantage to a Winning Endgame

José Raúl Capablanca was the third World Champion and perhaps the most naturally gifted chess player who ever lived. His specialty was clarity, the ability to see the simplest path to victory. This game shows how a small middlegame advantage, handled with precision, transforms into a winning endgame.

Set up your board.

1.d4 e6 2.Nf3 f5 3.c4 Nf6 4.Bg5 Be7 5.Nc3 O-O 6.e3 b6 7.Bd3 Bb7 8.O-O Qe8 9.Qe2 Ne4

The Dutch Defense. Black plays …f5 to control e4 and aim for a kingside attack. Capablanca has a different plan: he will exploit the weakness of the e5 square and the light squares around Black's king.

10.Bxe7 Nxc3 11.bxc3 Qxe7 12.a4 Bxf3 13.Qxf3 Nc6 14.Rfb1 Na5 15.Qh5

Capablanca places the queen on h5 where it eyes the weakened kingside. Black's pawn on f5 controls e4 but leaves holes on e5, g5, and h5.

15...Qf6 16.Qg5 Qxg5

Black trades queens. This might seem like relief for Black, but Capablanca has planned for this. The endgame favors White because of the weak pawns on the queenside and the superior pawn structure.

This is the transition in action. Capablanca did not try to force a mating attack. He recognized that his advantage was structural, not tactical, and he steered the game into an endgame where that structure would win.

17.hxg5 d6 18.f4

White fixes the pawns, creating a stable structure. Now the long-term targets are clear: Black's pawns on a7, b6, and d6 are all potential weaknesses.

18...Kf7 19.Kf2 Ke7 20.Ke2 Rab8 21.Kd2 Rh8 22.Kc2 Rb7 23.a5

Capablanca advances on the queenside. The minority attack in action: the a-pawn charges forward to disrupt Black's pawn structure.

23...Rhb8 24.axb6 axb6 25.Ra6 Nc6 26.Rd1 Rd7 27.Bf1 Ra7 28.Rxa7+ Nxa7 29.Bd3 Nb5 30.Bxb5

Trades continue. Each trade brings the game closer to a pure pawn endgame, which White wins because of the superior structure.

30...cxb5 31.Rb1 bxc4 32.Rxb6 Rd7 33.Rb4 c3 34.Kxc3 Rc7 35.Rb6 Rd7 36.Kc4 Kd8 37.Kc5 Kc8 38.Ra6 Kb7 39.Ra1 Kc7 40.Ra8 Kb7 41.Rg8 Ka6 42.Rxg7 Rd8 43.Kxd6 1-0

Tartakower resigned. The pawns are indefensible.

What this game teaches about planning:

- Capablanca's plan evolved from middlegame pressure to endgame conversion.
- He recognized that the advantage was structural and chose the right plan: simplification.
- The minority attack created lasting weaknesses on the queenside.
- Clarity of thought (knowing what the position needs) is the essence of planning.

61.9.3 Game 40: Petrosian vs Reshevsky, Zurich Candidates 1953

Theme: Prophylactic Planning, Preventing the Opponent's Ideas

Tigran Petrosian was the ninth World Champion and the greatest defensive player in chess history. His opponents would sit across from him and discover that every idea they wanted to play had already been prevented. This game shows prophylaxis as a complete planning philosophy.

Set up your board.

1.Nf3 Nf6 2.c4 e6 3.d4 d5 4.Nc3 c6 5.e3 Nbd7 6.Bd3 dxc4 7.Bxc4 b5 8.Bd3 Bb7

A Semi-Slav structure. Black develops normally, bishop to b7, pawns on c6 and e6. Solid, but Petrosian sees the plan behind it: Black wants to play …c5, challenge the center, and activate the bishop on b7.

9.e4 b4 10.Na4 c5 11.e5 Nd5 12.O-O cxd4 13.Re1

Petrosian plays Re1 rather than recapturing on d4. Why? Because the d4 pawn is not going anywhere, and Re1 puts the rook on the open e-file, supporting the e5 pawn and preventing Black's king from finding safety. This is prophylaxis: preventing …O-O from being comfortable.

13...Be7 14.Nxd4 O-O 15.Qg4 g6

Black weakens the kingside to defend against the queen's pressure. Petrosian forced this weakness without committing to an attack. Now f6 and h6 are permanently weak.

16.Bh6 Re8 17.Nf5

The knight leaps to f5, exploiting the weakened dark squares. Every move Petrosian has played in the last ten moves has been prophylactic or positional, not a single forcing move, yet Black is already in serious trouble.

17...exf5 18.Qxf5 Nf8 19.Rad1 Qb6 20.Rd7

The rook invades on the seventh rank. Combined with the queen on f5, the bishop on h6, and the knight ready on a4, White's pieces dominate.

20...Bc5 21.Nb2 Rac8 22.Nd3 Ba7 23.Nf4 Ne6 24.Nxg6 1-0

Reshevsky resigned. The knight sacrifice tears open the king's shelter.

What this game teaches about planning:

- Petrosian did not attack until Black's position was already compromised.
- Every "quiet" move prevented one of Black's ideas.
- Prophylactic planning creates positions where the opponent has no good moves.
- Patience is a weapon. Petrosian waited until the position was ripe, then struck.

61.9.4 Game 41: Botvinnik vs Smyslov, World Championship 1954, Game 13

Theme: The Central Breakthrough, Timing the d4-d5 Break

Mikhail Botvinnik was the patriarch of Soviet chess and one of the most systematic thinkers to ever play. This game demonstrates how a central pawn break, timed correctly, can shatter a position.

Set up your board.

1.d4 Nf6 2.c4 g6 3.g3 Bg7 4.Bg2 O-O 5.Nc3 d6 6.Nf3 Nbd7 7.O-O e5 8.e4 c6 9.Be3 Ng4 10.Bg5 Qb6

The King's Indian setup. Black has pawns on c6, d6, and e5, a solid but passive structure. Black's plan is to play …f5 and attack on the kingside. Botvinnik's plan: prevent …f5 and prepare d4-d5.

11.h3 exd4 12.Na4 Qa6 13.hxg4 b5 14.Nxd4 bxa4 15.Nxc6

The center breaks open. After Nxc6, White's pieces flood into the gaps. The bishop on g2 looks down the long diagonal. The knight on c6 controls key squares. The rooks will find open files.

15...Bb7 16.Nd4 Bxe4 17.Bxe4 Bxd4 18.Qxd4 Rae8 19.Bf3 Nc5 20.Rfe1

White has the bishop pair, open lines, and a dominant center. Black's position is fundamentally compromised, the d5 square is an outpost for White, and the a4 pawn is weak.

20...Rxe1+ 21.Rxe1 Qb7 22.Qd5 Qxd5 23.Bxd5 Nxa2 24.Bxa2 Rxf2

Material is roughly equal, but White's bishop pair and active rook give a lasting advantage. Botvinnik converts methodically.

25.Rd1 d5 26.cxd5 Rf5 27.Bd4 a5 28.d6 Rxg5 29.d7 Rd5 30.Bc6 1-0

Smyslov resigned. The d7 pawn queens.

What this game teaches about planning:

- Botvinnik prepared the d-file breakthrough with precise piece placement.
- The central break activated the entire army simultaneously.
- Timing is everything, the break came when Black was not ready to deal with the consequences.
- A prepared central breakthrough is one of the most powerful weapons in chess.

61.9.5 Game 42: Rubinstein vs Salwe, Lodz 1908

Theme: Maneuvering and Piece Improvement, A Positional Masterclass

Akiba Rubinstein was one of the finest positional players in history, a precursor to Capablanca and Karpov. This game is considered one of the greatest demonstrations of methodical planning ever played.

Set up your board.

1.d4 d5 2.Nf3 c5 3.c4 e6 4.cxd5 exd5 5.Nc3 Nf6 6.g3 Nc6 7.Bg2 cxd4 8.Nxd4 Qb6

An isolated queen's pawn (IQP) position. Black has an isolated d-pawn, it cannot be supported by another pawn. This pawn is both a strength (it controls c4 and e4) and a weakness (it can be blockaded and attacked). The plan for White: blockade the d-pawn, then target it.

9.Nxc6 bxc6 10.O-O Be7 11.Na4 Qb5 12.Be3 O-O 13.Rc1

White develops naturally, putting pieces on squares that support the plan: blockade d5 and attack it. The rook goes to c1 to pressure the c-file. The bishop on e3 supports d4 and eyes the queenside.

13...Bg4 14.f3 Bd7 15.Nc5 Rfe8 16.Rf2

Rubinstein's plan crystallizes. The rook on f2 will go to d2, doubling on the d-file. The knight on c5 is a monster outpost. Every piece points at the d5 pawn.

16...Be6 17.Nxe6 fxe6

Black's pawn structure is now ruined. The d5 and e6 pawns are both isolated, and they are on the same file, doubled and isolated. This is a dream for the attacking side.

18.Qd3 Qa6 19.Qxa6 Rxa6

Queens come off. Rubinstein does not mind, the endgame favors him enormously. The weak pawns will be permanent targets.

19...Nd7 20.Bd4 Bf8 21.Rfc2 Nf6 22.Rc7 Nd7 23.R1c2

White doubles rooks on the seventh rank. The plan has been executed to perfection: rooks on the seventh, bishop on d4 controlling the center, the d5 and e6 pawns under siege.

23...Rd6 24.Bf1 a5 25.Bb5 Rdd8 26.Bxd7 Rxd7 27.Rxd7 Rxd7 28.Rc8+ Rd8 29.Rc2 Rd7 30.g4 Kf7 31.Rc8 Ke7 32.Ra8 Kd6 33.Ra6 Ke7 34.Kf2 e5 35.Be3 d4 36.Bc1 f3 37.Ke2 Rc7 38.Ba3+ Ke8 39.Rd6 1-0

Salwe resigned. The weak pawns fall, and with them the game.

What this game teaches about planning:

- Rubinstein identified the target (the isolated d-pawn) and built his entire plan around attacking it.
- Every piece was placed on the ideal square for this specific plan.
- The transition to the endgame was deliberate, Rubinstein chose it because the endgame magnified his advantage.
- Great planning looks simple in hindsight. That simplicity is the result of deep understanding.

Rest here. Five games of world-class planning. Let them soak in before tackling the exercises.

61.10 Part 8: Exercises

61.10.1 Section A: Evaluate This Position (Exercises 20.1 – 20.10) -

For each position, run through the evaluation checklist (material, king safety, piece activity, pawn structure, space, development). Write down who is better and why before reading the solution.

Exercise 20.1

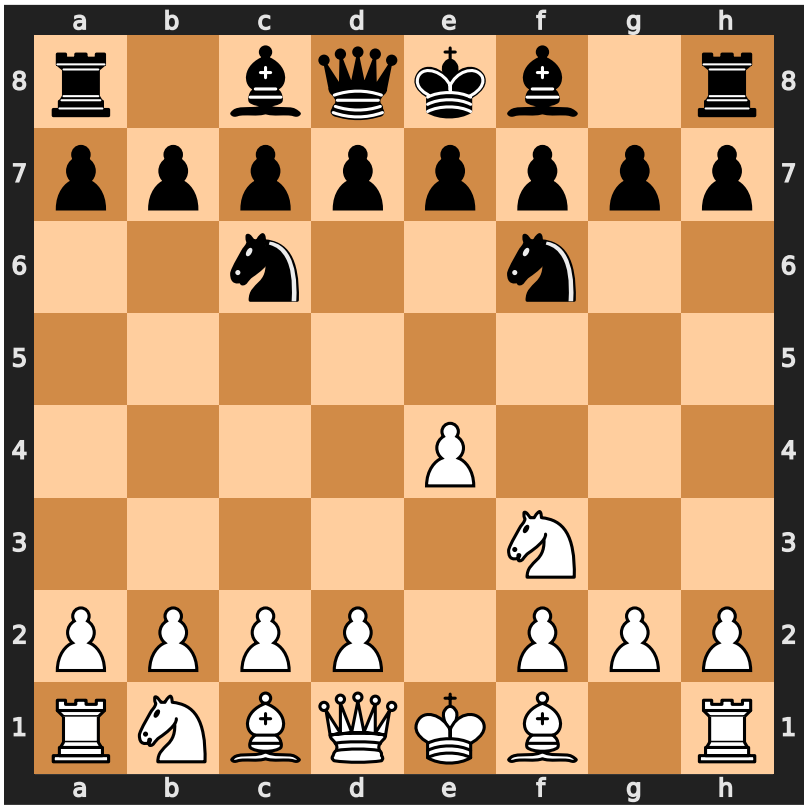

Figure 61.8: Chess Position

Evaluate the position. Who is better?

Hint 1: Check the material count first. *Hint 2:* How many pieces has each side developed? *Hint 3:* Who controls the center?

Solution: White is slightly better. Material is equal. Development is equal (two pieces each). But White's pawn on e4 controls d5 and f5, giving White more central space. Black's knights are well-developed but do not yet control the center as firmly. White's next moves (d4, Nc3) will establish a classical center. This is a small advantage (the game is far from decided) but White has the easier path forward.

Exercise 20.2

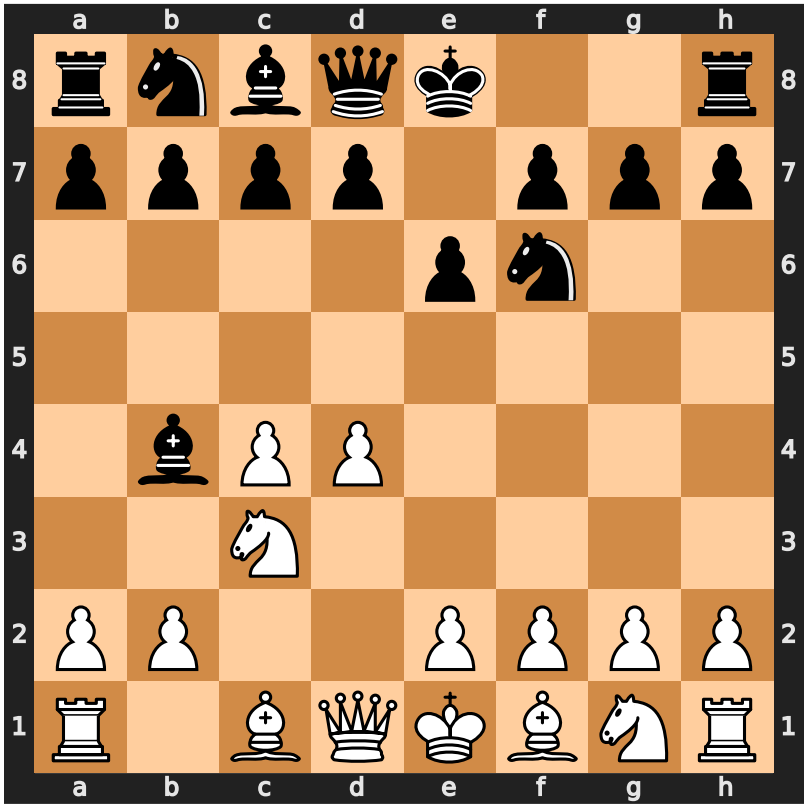

Figure 61.9: Chess Position

Evaluate the position. Who is better?

Hint 1: Count the developed pieces for each side. *Hint 2:* What does the bishop on b4 do? *Hint 3:* Who has more central space?

Solution: The position is roughly equal. White has more central space (pawns on c4 and d4), but Black has developed more harmoniously (bishop on b4 pins the knight, knight on f6 attacks e4). The Nimzo-Indian Defense (which this is) gives Black structural ideas (…Bxc3, doubling White's pawns) in exchange for the bishop. Neither side is clearly better, both have plans. This is a well-balanced opening.

Exercise 20.3

Evaluate the position. Who is better?

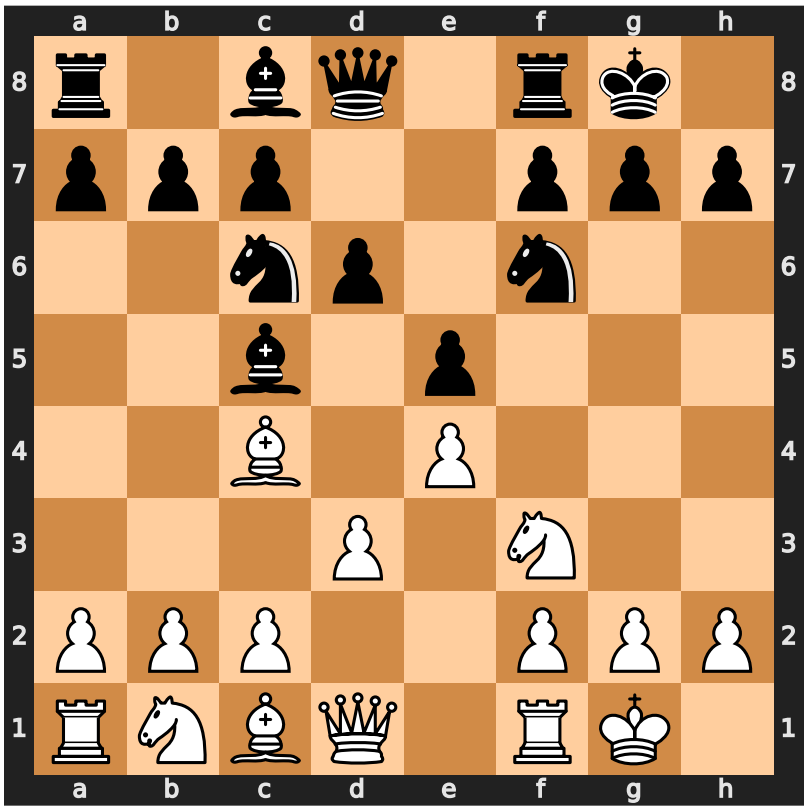

Figure 61.10: Chess Position

Hint 1: Material is equal. Focus on piece activity. *Hint 2:* Compare White's bishop on c4 to Black's bishop on c5. *Hint 3:* Whose pieces coordinate better for the center?

Solution: Roughly equal with mutual chances. Both sides have well-developed pieces. White's bishop on c4 targets f7, a classic Italian Game theme. Black's bishop on c5 targets f2 and controls the a7-g1 diagonal. White has a solid center with e4 and d3. Black has matched development. The game is about who executes their plan better, White may aim for d3-d4 (central breakthrough) while Black may aim for …d5 (challenging the center).

Exercise 20.4

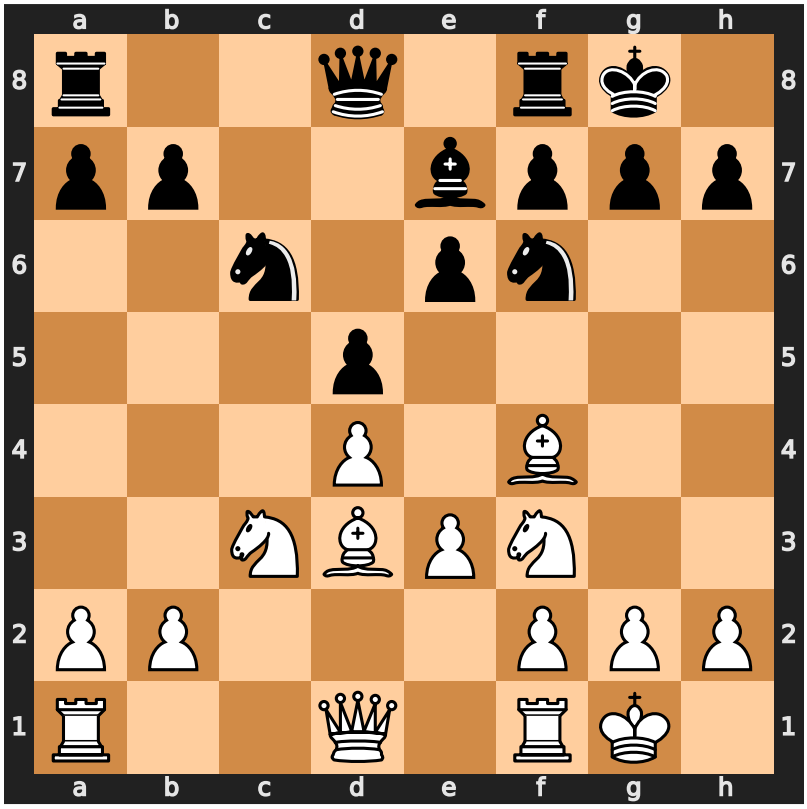

Figure 61.11: Chess Position

Evaluate the position. Who is better?

Hint 1: Look at the pawn structures. Are there any weaknesses? *Hint 2:* Compare the minor pieces. Who has the bishop pair? *Hint 3:* Which side has more space?

Solution: White is slightly better. White has the bishop pair (Bd3 and Bf4), which is a long-term advantage if the position opens. White has slightly more space due to the d4 pawn controlling e5 and c5. Black's position is solid but passive, the knights on c6 and f6 are well-placed but have limited influence. White's plan should involve opening the position to exploit the bishop pair.

Exercise 20.5

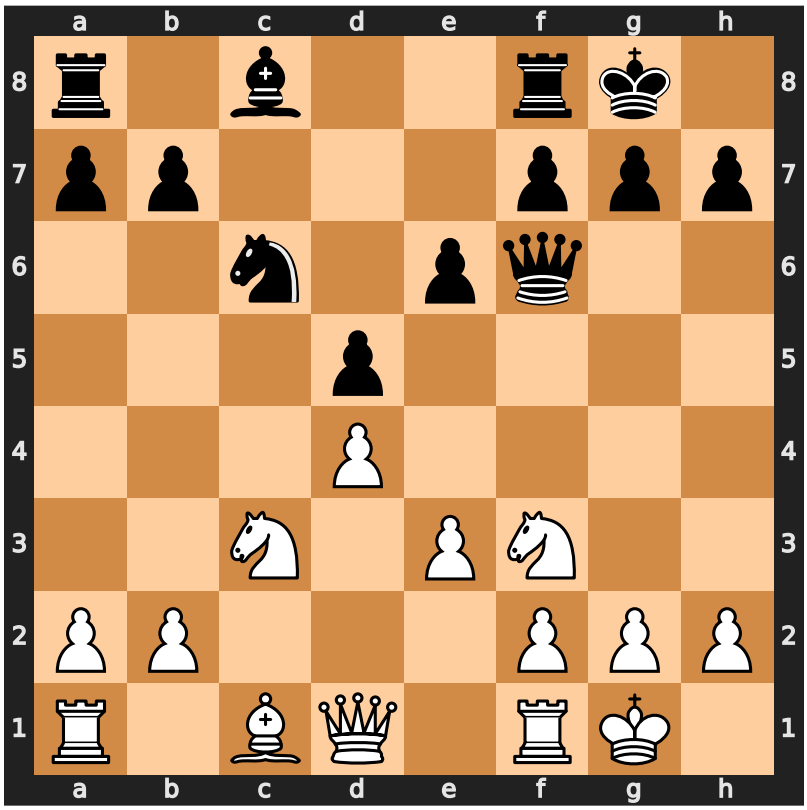

Figure 61.12: Chess Position

Evaluate the position. Who is better?

Hint 1: Material is equal. Look at pawn structure. *Hint 2:* Black has an isolated d-pawn on d5. Is this a strength or a weakness? *Hint 3:* How active are the pieces on each side?

Solution: White is slightly better. Black has an isolated pawn on d5 (it controls c4 and e4 (a strength) but cannot be supported by other pawns (a weakness). In the long run, White can blockade d5 (put a knight on d4) and pressure it with rooks on the d-file. Black's counterplay is piece activity) if Black's pieces are active enough, the isolated pawn's control of key squares compensates. Right now, the position is close to equal, but the long-term trend favors White.

Exercise 20.6 Evaluate the position. Who is better?

Hint 1: The center is stable. Who has more space? *Hint 2:* Black's knight on e7 seems passive. Where does it want to go? *Hint 3:* Can White create a plan based on the pawn structure?

Solution: White is slightly better. White has a space advantage with the c4 and d4 pawns. Black's pieces are somewhat cramped, the knight on e7 wants to reach f5 or g6, and the bishop on c6 is blocked by the d5 pawn. White's plan: play cxd5 at the right moment to open the c-file and pressure Black's pawns, or maneuver pieces to exploit the space advantage. Black needs to find a way to break out with …e5 or …c5.

Exercise 20.7

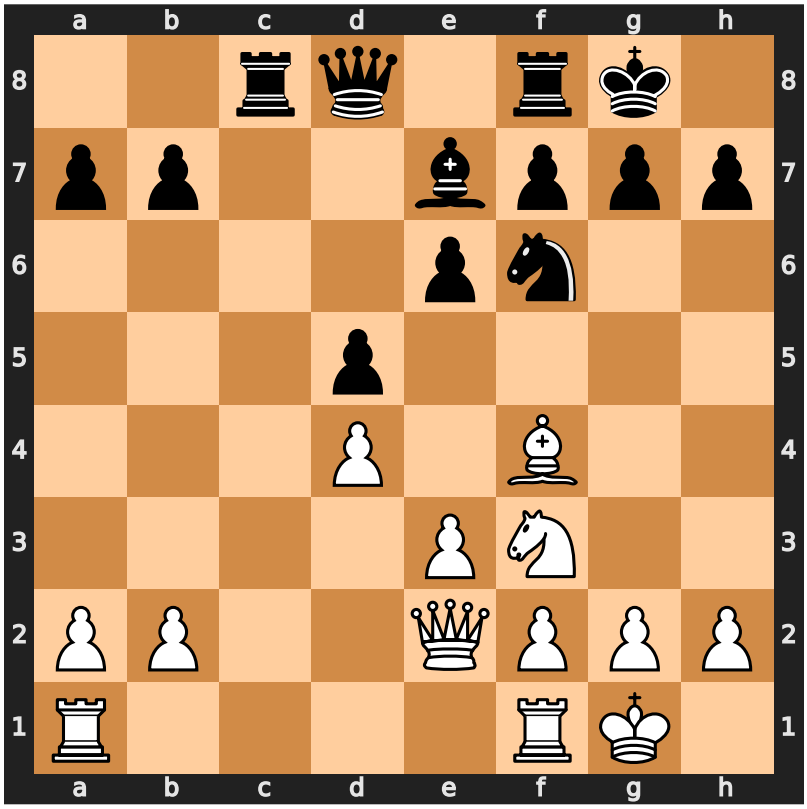

Figure 61.13: Chess Position

Evaluate the position. Who is better?

Hint 1: Material is equal. Check king safety. *Hint 2:* Both kings are castled kingside. Neither is weak. *Hint 3:* Focus on piece activity and pawn breaks.

Solution: Equal. Both sides have safe kings, solid pawn structures, and reasonably active pieces. White's bishop on f4 is slightly more active than Black's bishop on e7. But Black has rooks on the c-file and f-file, which are useful. The position is balanced, the plan for both sides is to find small improvements. White might aim for Rac1 (contesting the c-file) or Ne5 (centralizing). Black might aim for …Nh5 (trading the bishop) or …b6 and …Bb7 (activating the light-squared bishop).

Exercise 20.8

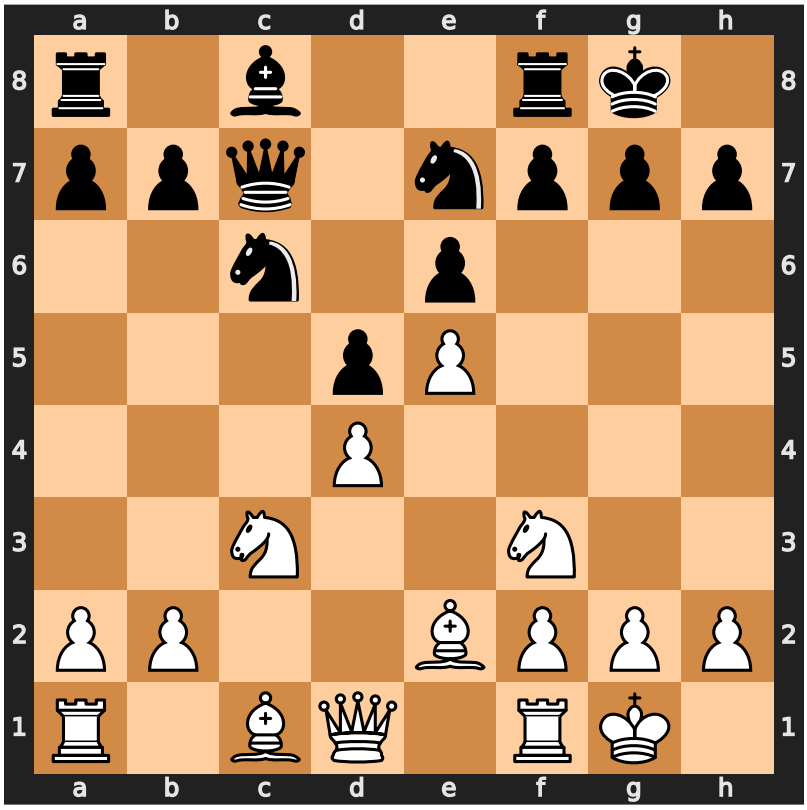

Figure 61.14: Chess Position

Evaluate the position. Who is better?

Hint 1: Look at the pawn chain: e5-d4 for White, d5-e6 for Black. *Hint 2:* Which side has more space? *Hint 3:* Where should White attack: kingside or queenside?

Solution: White is slightly better. White has a space advantage thanks to the e5 pawn, which restricts Black's knight on f6 from its natural square. The pawn chain points toward the kingside, suggesting White should attack there (f4-f5 or Ng5-f3-h4-f5 maneuvers). Black's plan is to challenge the base of the pawn chain with …c5 or …f6 to break the center. The side that executes their plan first will have the advantage.

Exercise 20.9

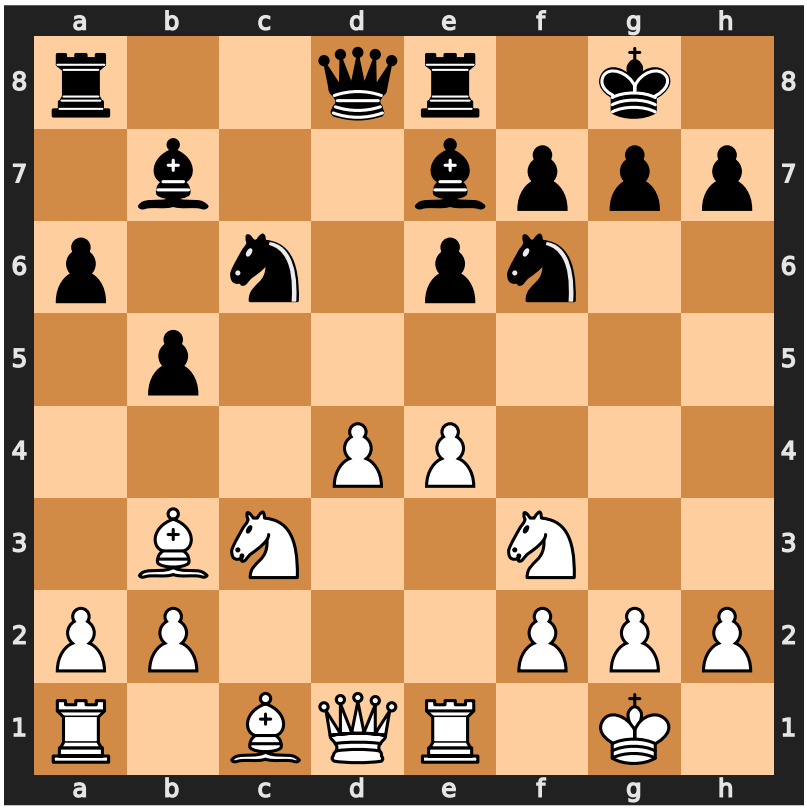

Figure 61.15: Chess Position

Evaluate the position. Who is better?

Hint 1: Material is equal. Focus on piece activity. *Hint 2:* White has a strong center (e4 + d4). How can White use it? *Hint 3:* Where is Black's weakest piece?

Solution: White is slightly better. The central pawns on e4 and d4 give White more space. The bishop on b3 is more active than the bishop on b7 (which is blocked by the e6 pawn). White can plan d4-d5 at the right moment to crack open the center. Black's knight on c6 is well-placed but can be challenged with d5. White's edge is small but concrete.

Exercise 20.10

Evaluate the position. Who is better?

Hint 1: Count developed pieces. Who is more developed? *Hint 2:* Black has a bishop on g4 pinning the knight on f3. Is this dangerous? *Hint 3:* Evaluate the center and space.

Solution: Approximately equal. Both sides are well-developed. White has the classical center (e4 + d3 supporting the bishop on c4). Black has solid central presence with e5 and d6. The bishop on g4 pins White's knight, which is annoying but manageable (h3 or Be2 breaks the pin). Neither side has a clear advantage. The game will depend on planning: White might aim for d3-d4, while Black might prepare …d5 or a kingside attack with …Nh5, …f5.

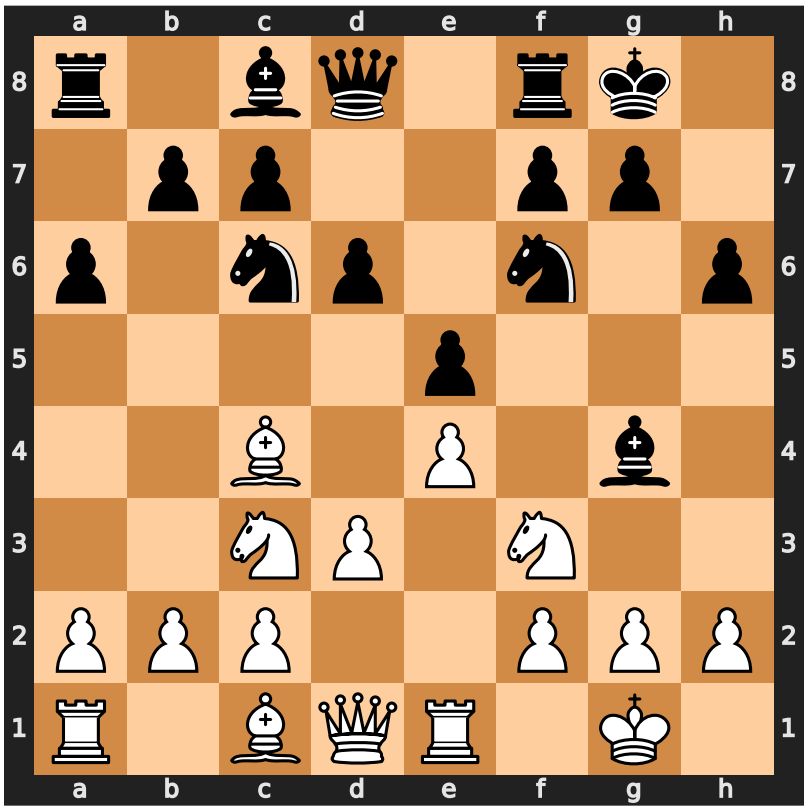

Figure 61.16: Chess Position

Rest here. Ten evaluations complete. You are training the most important skill in chess. Come back for the planning exercises.

61.10.2 Section B: Find the Right Plan (Exercises 20.11 – 20.20) -

For each position, identify the best plan for the side to move. State the plan in one sentence and then explain the first 2-3 moves that execute it.

Exercise 20.11

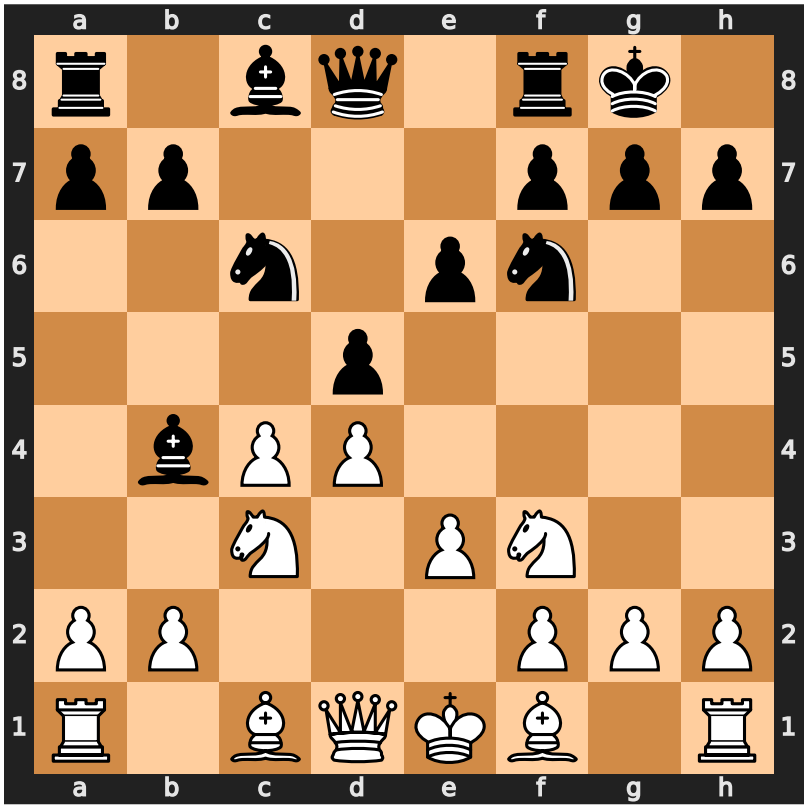

Figure 61.17: Chess Position

White to move. What is the right plan?

Hint 1: Look at the pawn structure. White has c4 and d4; Black has d5 and e6. *Hint 2:* Can White play cxd5 to open the c-file? *Hint 3:* After cxd5, where do White's rooks want to go?

Solution: Plan: Open the c-file and exploit it with rooks. White plays **cxd5 exd5** (or …Nxd5), then develops with **Bd3, O-O,** and **Rc1**, placing a rook on the newly open c-file. The plan is to pressure Black's queenside along the c-file while developing the remaining pieces. The bishop goes to d3 where it supports the center and eyes the kingside. The queen can later come to b3 to add pressure on d5 and b7.

Exercise 20.12

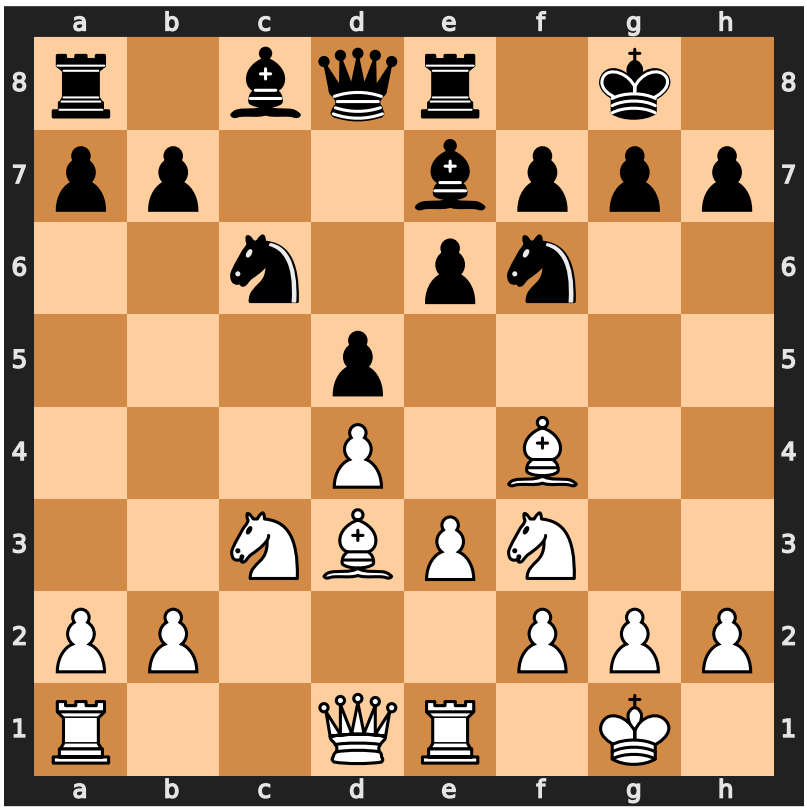

Figure 61.18: Chess Position

White to move. What is the right plan?

Hint 1: White has the bishop pair. How should White play to exploit this? *Hint 2:* Should White keep the position closed or open it? *Hint 3:* What pawn break opens the position?

Solution: Plan: Open the position to activate the bishop pair. White should prepare **e3-e4** (after repositioning if needed), or play **c2-c4** to challenge Black's d5 pawn. Opening the center gives the bishops long diagonals. White should avoid keeping the position locked, since bishops need open lines. After e4 dxe4 Nxe4, White's pieces are fully active and the bishop pair begins to dominate.

Exercise 20.13

White to move. What is the right plan?

Hint 1: The center is fluid. Should White play d5 or dxc5? *Hint 2:* If White plays d5, what happens to the bishop on b2? *Hint 3:* What happens to the e-file if pawns are exchanged?

Solution: Plan: Play d4-d5 to open the long diagonal for the bishop on b2 and create a central initiative. After **d5**, the bishop on b2 comes alive on the a1-h8 diagonal. If Black plays …exd5, then cxd5 gives White a strong passed pawn on d5. If Black plays …e5, the center closes but the d5 outpost belongs to White. The queen on c2 supports the advance, and rooks can come to d1 and e1.

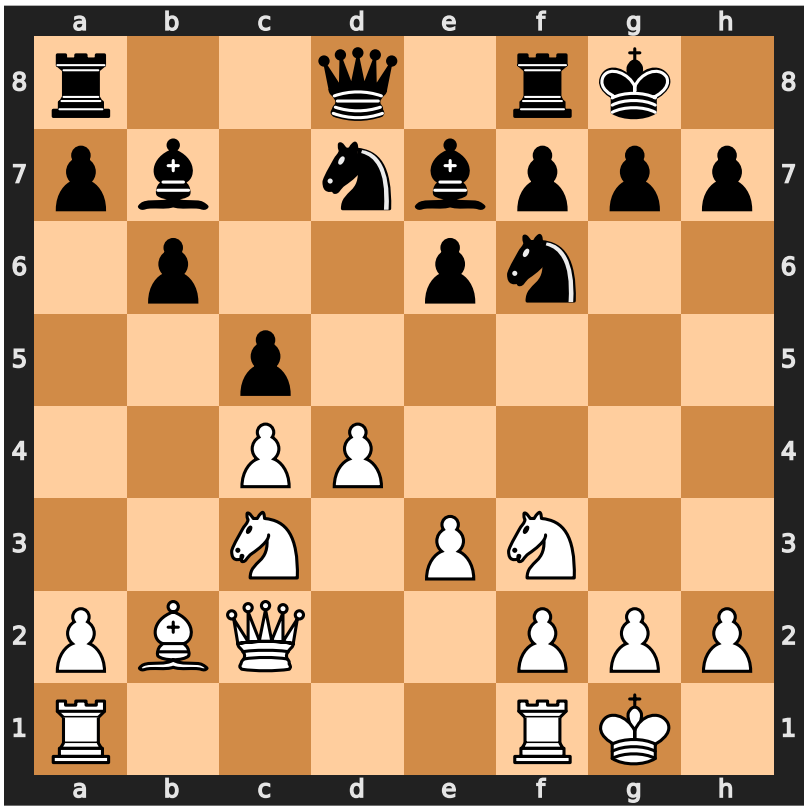

Figure 61.19: Chess Position

Exercise 20.14

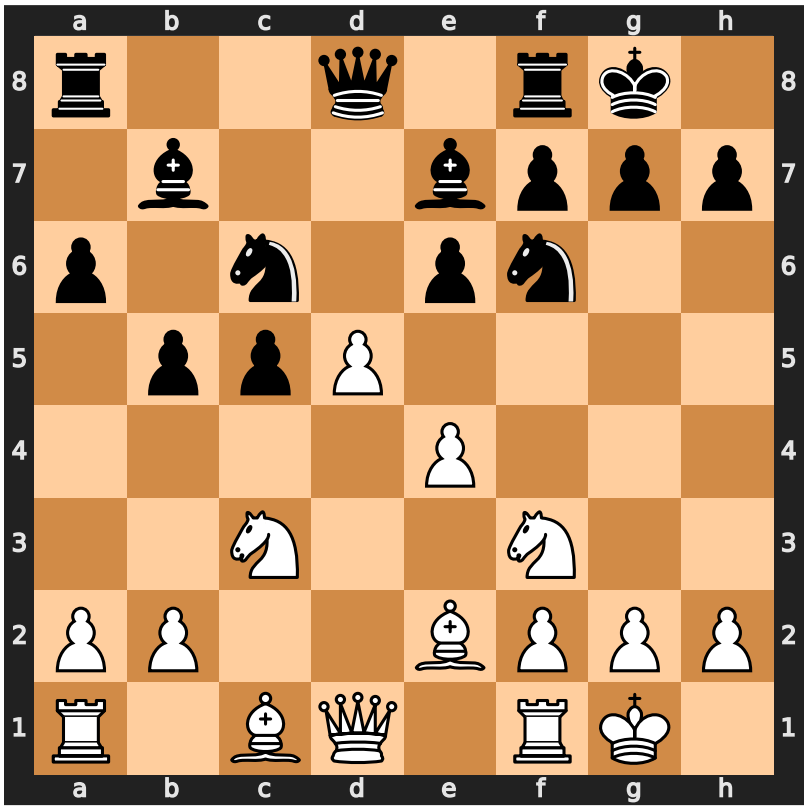

Figure 61.20: Chess Position

White to move. The center is locked (pawns on d5 and e4 vs e6). What is the right plan?

Hint 1: The center is locked. Where should White play: kingside or queenside? *Hint 2:* White's pawns point toward the kingside (e4-d5 chain points toward e5-f6). *Hint 3:* What kingside pawn break could White prepare?

Solution: Plan: Launch a kingside attack with f2-f4-f5. With the center locked, White should play on the wing where the pawn chain points, the kingside. White prepares with **Ng5** (pressuring e6), **Bd3** (supporting f5), and then **f4 followed by f5.** When f5 hits e6, a file opens toward Black's king. White's rooks swing to the f-file. This is a standard plan in King's Indian/French-type structures.

Exercise 20.15

White to move. Black has a strong center (d5 + e5). What is the right plan?

Hint 1: Black's center is powerful. Should White attack it or work around it? *Hint 2:* Can White play d3-d4 to challenge? *Hint 3:* Consider the b3 pawn. Can it advance to b4-b5?

Solution: Plan: Undermine Black's center with c2-c4 or b3-b4 followed by c4. White should challenge the center, not with a frontal pawn push, but by attacking from the side. After

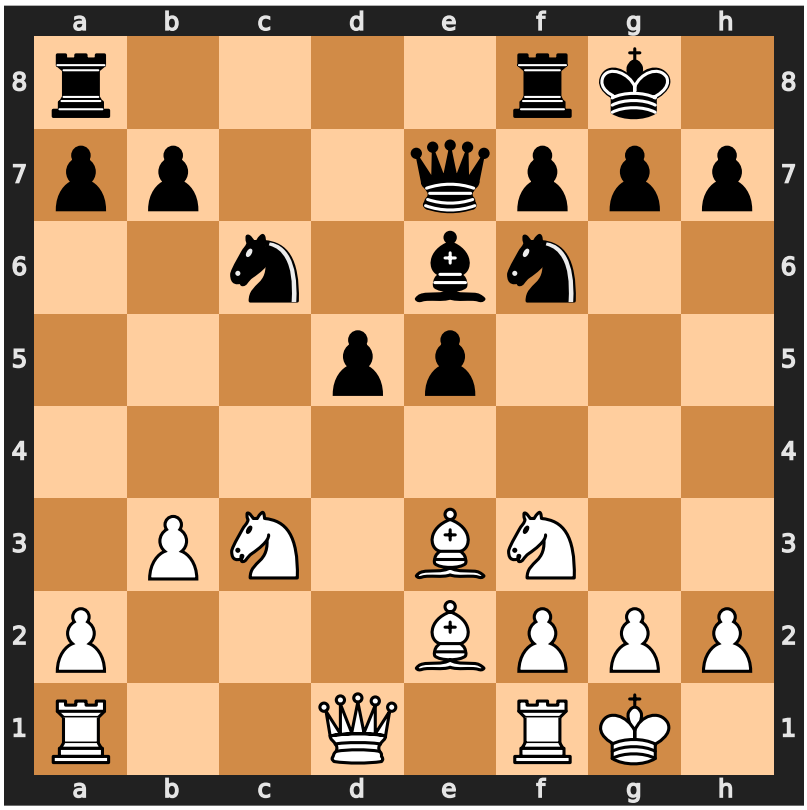

Figure 61.21: Chess Position

c4, Black must decide how to defend d5. If …dxc4, Nxc4 puts a knight on a great square and opens the position. If …d4, the knight on c3 is pushed but the e4 square becomes available. Undermining a strong center is better than passively allowing it.

Exercise 20.16

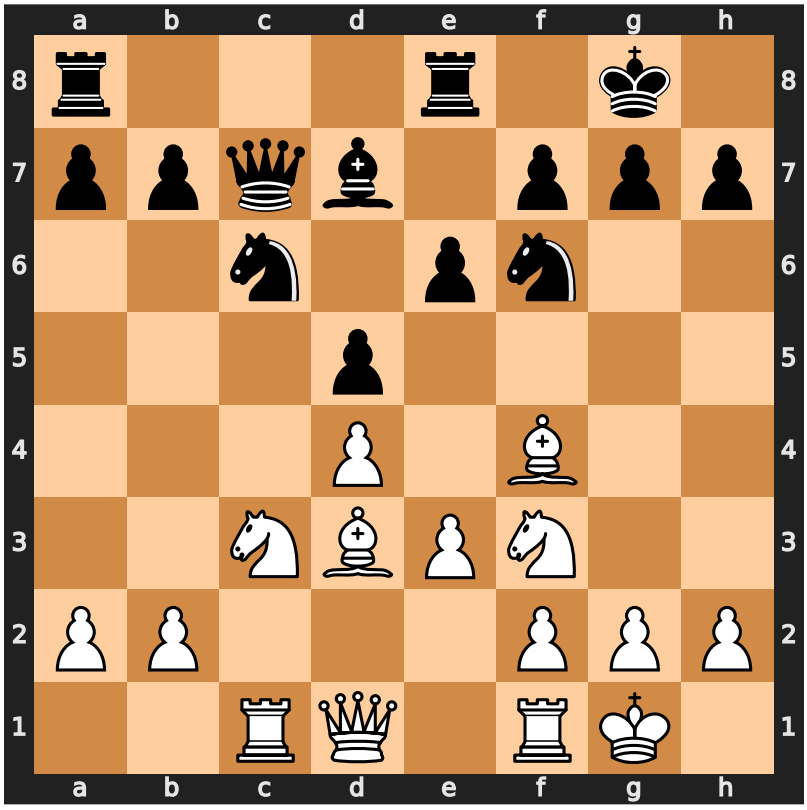

Figure 61.22: Chess Position

White to move. White's pieces are well-placed. What is the plan?

Hint 1: White has good piece placement. Which piece is the worst? *Hint 2:* The queen on d1 is functional but could be more active. *Hint 3:* Consider Qe2 (supporting e4 advance) or Qb1 (eyeing the b1-h7 diagonal).

Solution: Plan: Improve the queen and prepare e3-e4 to open the center. White plays **Qe2** (supporting e4 and connecting the rooks), then prepares **e4.** After e4, the center opens and White's bishop pair comes alive. The rook on c1 is already perfectly placed for the c-file. The rook on f1 supports f2-f4 if needed. Improving the worst piece (queen) and then executing the central break is the plan.

Exercise 20.17

White to move. White has a knight on e5. What is the plan?

Hint 1: The knight on e5 is a powerful outpost. Should White trade it or keep it? *Hint 2:* What

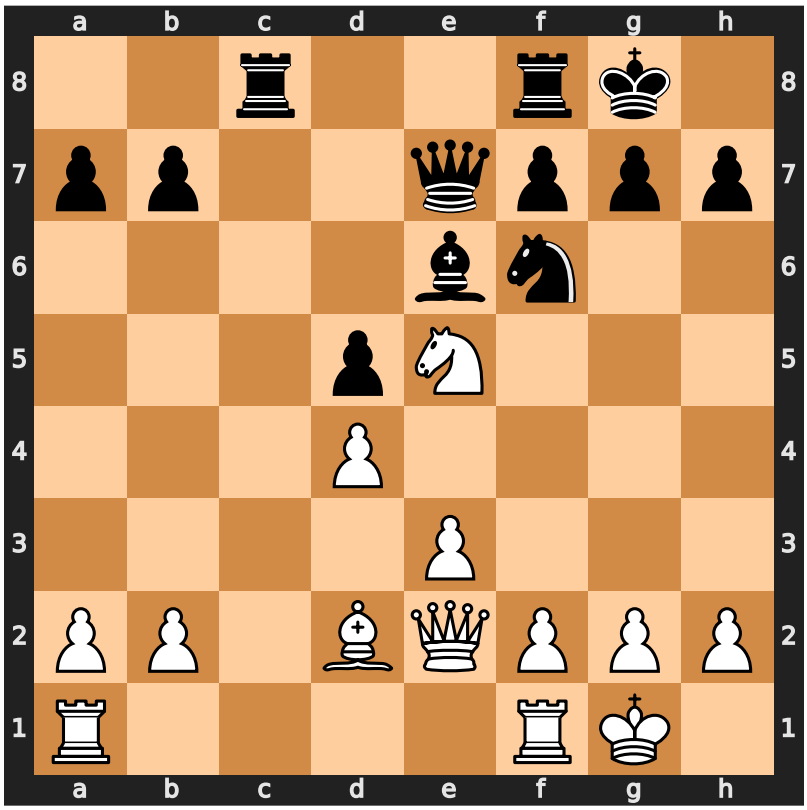

Figure 61.23: Chess Position

does the knight on e5 control? How does it support other pieces? *Hint 3:* Can White build around the knight with f4 and Rf3?

Solution: Plan: Keep the knight on e5 and build a kingside attack around it. The knight on e5 controls c6, d7, f7, and g4, key squares near Black's king. White plays **f2-f4** (supporting the knight and preparing f5), then **Rf3** (rook lift to the kingside), and then **Rh3 or Rg3** for a direct attack. The queen on e2 can shift to h5 or g4. The plan uses the knight as an anchor for the entire attack. Do not trade it.

Exercise 20.18

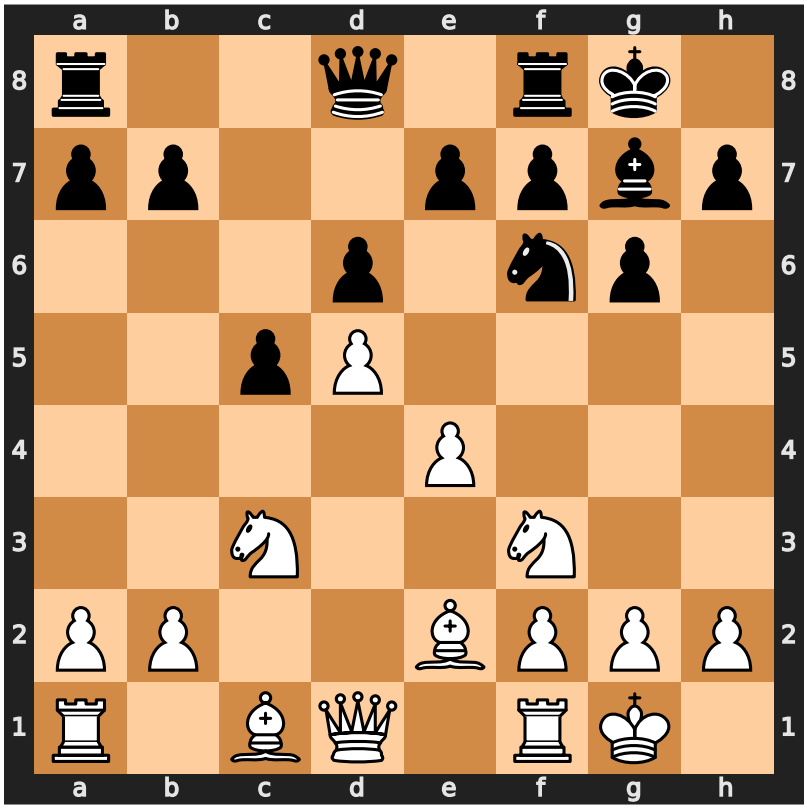

Figure 61.24: Chess Position

White to move. The center is locked (d5 vs d6). What is the plan?

Hint 1: With a locked center, play on the wings. *Hint 2:* White's pawn chain points toward the queenside (d5 toward c6-b7). *Hint 3:* Can White play a4-a5 to gain queenside space?

Solution: Plan: Expand on the queenside with a2-a4, Rb1, and b2-b4. In this Benoni-type structure, White typically plays on the queenside while Black plays on the kingside. White's plan: **a4** (gaining space), **Rb1** (supporting the b-pawn advance), and **b4** (challenging Black's c5 pawn). If …cxb4, Nxb4 or axb4 opens the a-file and b-file for White's rooks. This is the standard plan in the Modern Benoni.

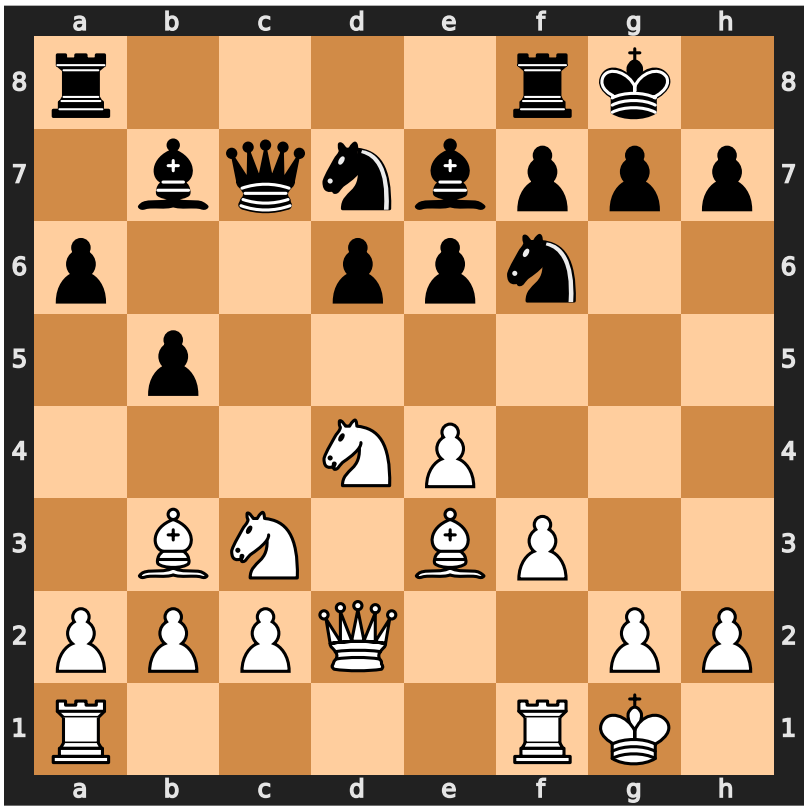

Figure 61.25: Chess Position

Exercise 20.19

White to move. This is a Sicilian Najdorf structure. What is the right plan?

Hint 1: White has castled kingside. Where should White attack? *Hint 2:* Black is preparing …b4 to chase the knight. Should White prevent it? *Hint 3:* Can White play g4-g5 to attack the kingside?

Solution: Plan: Launch a kingside attack with g2-g4, followed by g4-g5 to drive away the f6 knight. In this type of Sicilian position, White often attacks on the kingside with **g4** (gaining space and preparing g5), followed by **g5** (forcing the knight from f6, weakening Black's kingside control). The queen on d2 supports Qh6 after the knight moves. The knight on d4 can go to f5 for a devastating outpost. This is an aggressive but well-established plan.

Exercise 20.20

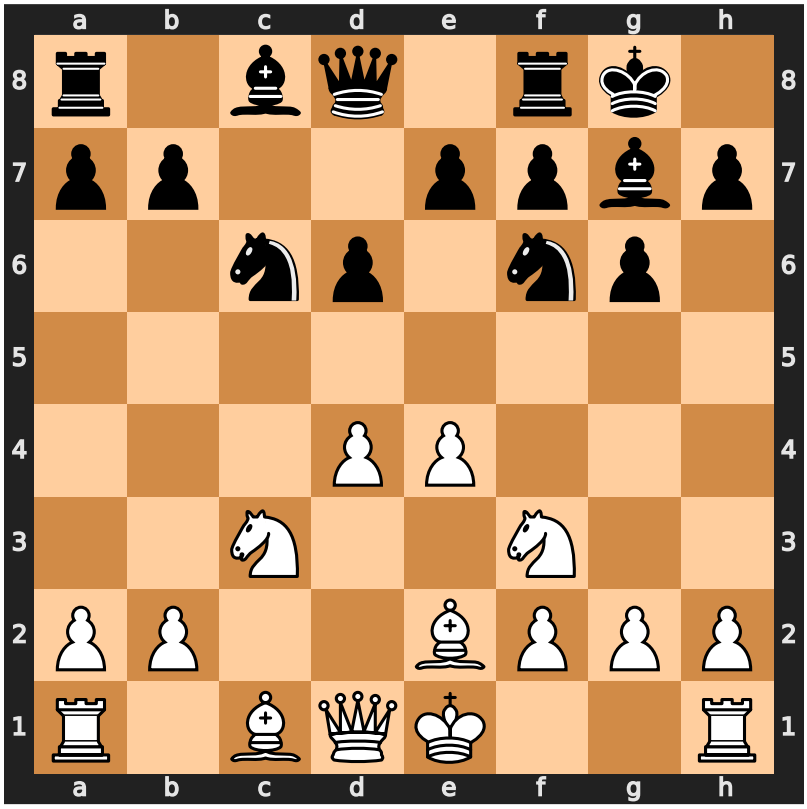

Figure 61.26: Chess Position

White to move. White has not yet castled. What is the right plan?

Hint 1: King safety first. Where should White castle? *Hint 2:* Can White castle queenside and attack the kingside? *Hint 3:* Is castling kingside safer or more ambitious?

Solution: Plan: Castle kingside (for safety) and prepare a central or kingside plan. Casting queenside is possible and leads to a sharp game (mutual pawn storms), but at the club level, **O-O** is safer and more practical. After castling, White's plan is **Re1** (supporting the e4 pawn), **Bf4 or Be3** (completing development), and then either **d5** (closing the center and playing

on the wings) or **dxe5** if it opens favorable lines. Finish development, then choose a plan based on what Black does.

Rest here. Twenty exercises done. You are halfway through. Take a break before the decision exercises.

61.10.3 Section C: Choose Between Two Plans (Exercises 20.21 – 20.30)

For each position, two plans are presented. Choose the better one and explain why the other is inferior.

Exercise 20.21

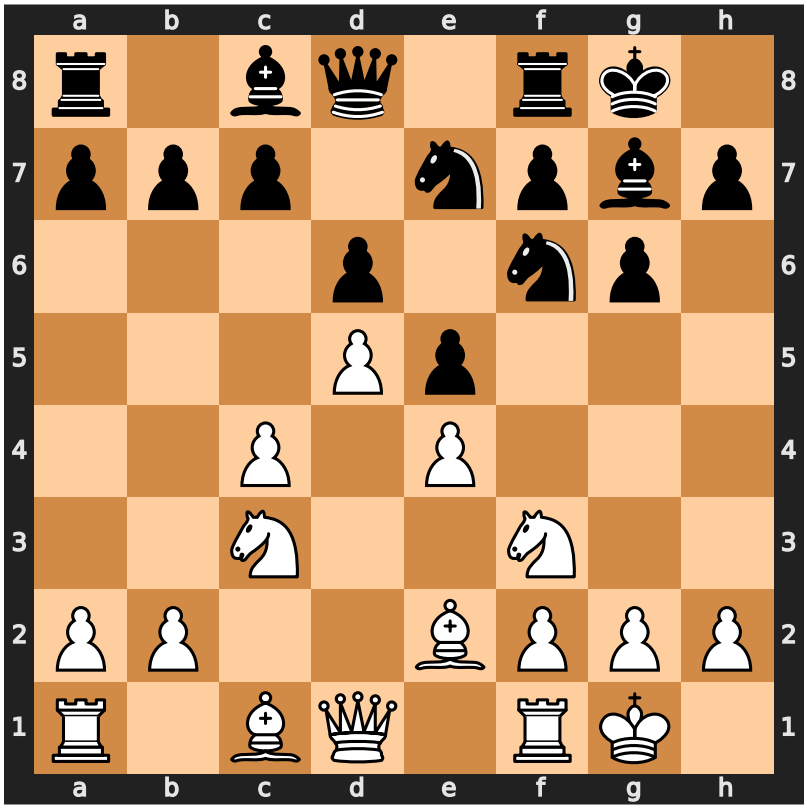

Figure 61.27: Chess Position

White to move. **Plan A:** Push f2-f4 to attack the kingside. **Plan B:** Push b2-b4 to expand on the queenside.

Hint: The center is locked (d5 vs e5). Where does White's pawn chain point?

Solution: Plan B is correct. White's pawn chain (d5-c4) points toward the queenside, which is where White should play. Plan A (f4) runs into …exf4, opening the e-file against White's king, which is dangerous. Plan B (b4) is the standard King's Indian approach for White: expand on the

queenside with b4-b5, open the c-file, and use the rooks to pressure Black's position. Black will attack on the kingside with ...f5, but White's queenside play is faster if executed correctly.

Exercise 20.22

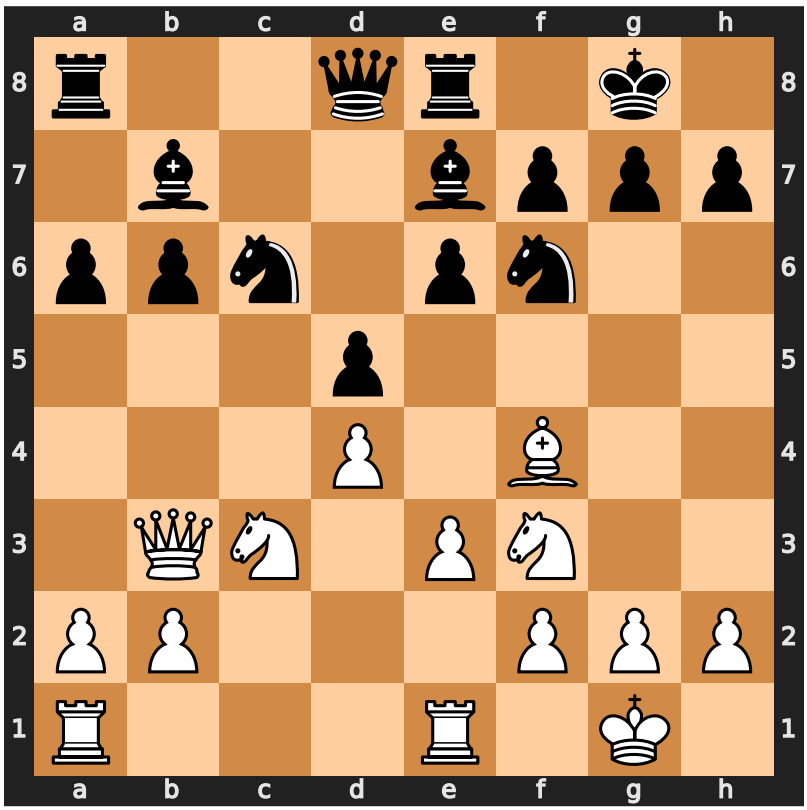

Figure 61.28: Chess Position

White to move. **Plan A:** Trade queens with Qb3-d1-d3 and aim for a favorable endgame. **Plan B:** Keep the queen active and prepare e3-e4 to open the center.

Hint: Is White's advantage structural or dynamic? Which plan suits the type of advantage?

Solution: Plan B is correct. White has more active pieces (the bishop on f4 is better than the bishop on b7 in this structure, and the queen on b3 puts pressure on the position). This is a dynamic advantage that favors keeping the pieces on. Plan A (trading queens) would eliminate White's activity advantage and lead to a dull endgame where Black's solid structure holds. Plan B keeps the tension and aims for e4, which opens the position and activates the bishop pair and the rooks.

Exercise 20.23

White to move. **Plan A:** Play Ne5 to centralize the knight and create threats. **Plan B:** Play e3-e4 to break open the center.

Hint: What happens after each plan? Which creates more lasting advantages?

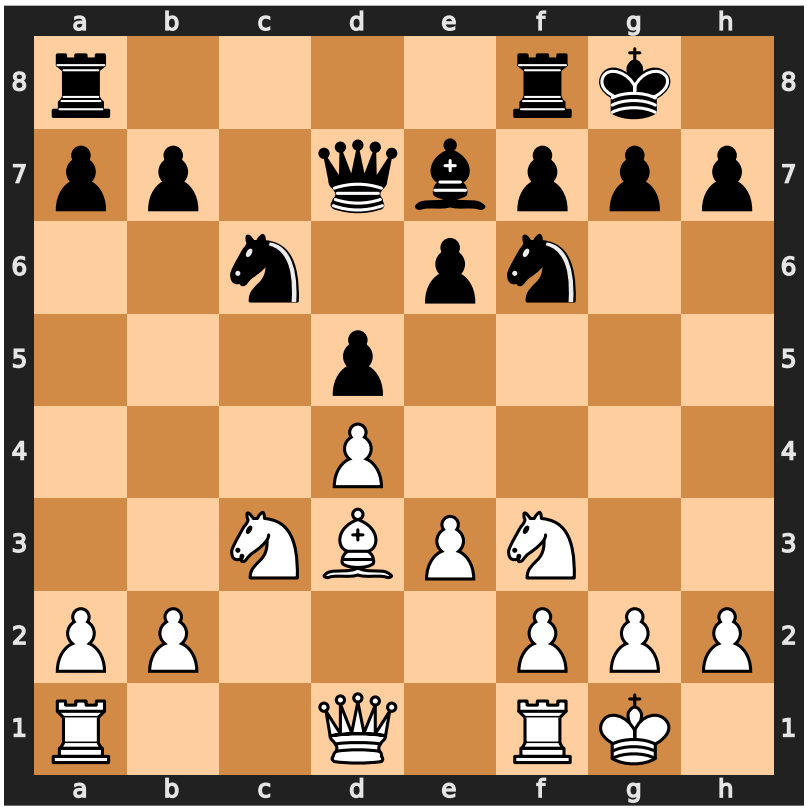

Figure 61.29: Chess Position

Solution: Plan A (Ne5) is correct. After **Ne5**, the knight reaches a dominant central outpost, controlling c6, d7, f7, and g4. Black cannot easily remove it. This gives White a lasting positional advantage. Plan B (e4) is tempting but premature, after …dxe4, Nxe4, Nxe4, Bxe4, the position simplifies and Black's solid structure makes it hard for White to create threats. Ne5 creates an imbalance (dominant knight) without releasing the tension.

Exercise 20.24

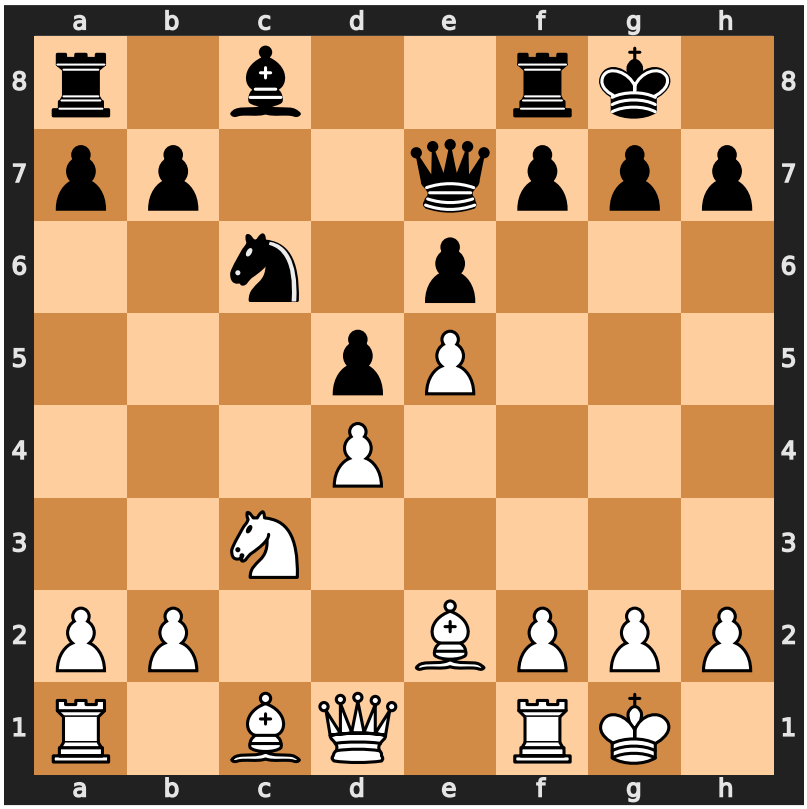

Figure 61.30: Chess Position

White to move. **Plan A:** Play f2-f4 to support e5 and prepare a kingside attack. **Plan B:** Play Bf4, Qd2, and Rac1 to improve pieces and play on the queenside.

Hint: The pawn on e5 gives White space. But which wing should White focus on?

Solution: Plan B is correct. White's space advantage with e5 restricts Black's knight on f6 (if it were still there) and limits Black's options. But f4 weakens the e4 square and the diagonal to White's king. Plan B is more flexible: **Bf4** develops the bishop, **Qd2** connects the rooks and supports the bishop, and **Rac1** activates the rook. White keeps options open on both wings rather than committing to a kingside attack that could backfire.

Exercise 20.25

White to move. **Plan A:** Trade all minor pieces and aim for a rook endgame. **Plan B:** Maneuver the knight to e5 and build pressure.

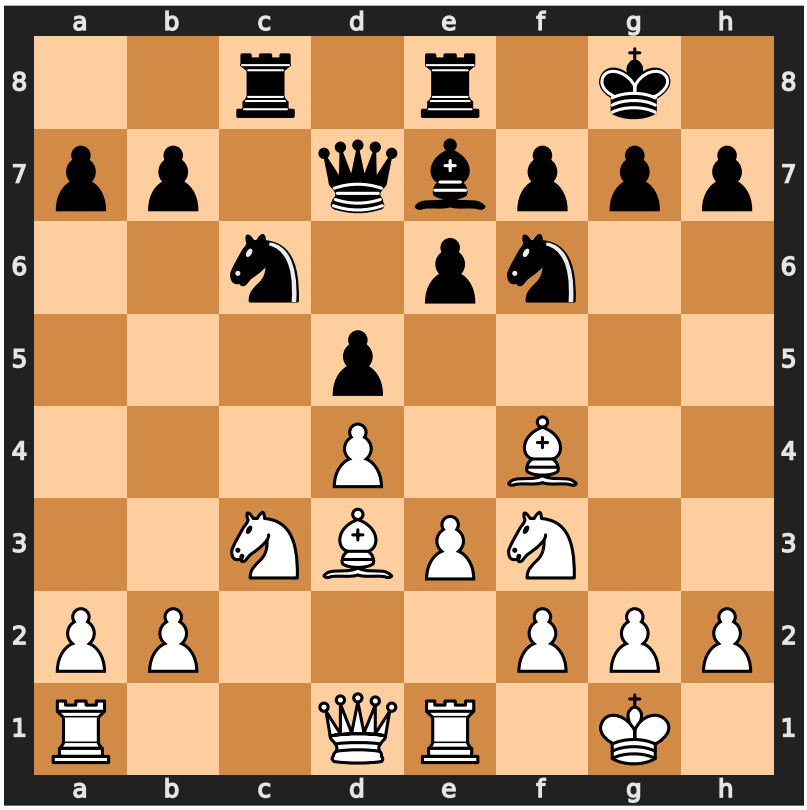

Figure 61.31: Chess Position

Hint: Does White have any specific advantage to exploit in an endgame? Or is the middlegame more promising?

Solution: Plan B is correct. Trading everything leads to a roughly equal rook endgame with symmetric pawn structures, no advantage to convert. Plan B (maneuvering to Ne5) creates a dynamic imbalance. The knight on e5 would be a monster, and from there White can build on either wing. The lesson: do not simplify when you do not have a clear structural advantage. Keep pieces on when your position has potential for improvement.

Exercise 20.26

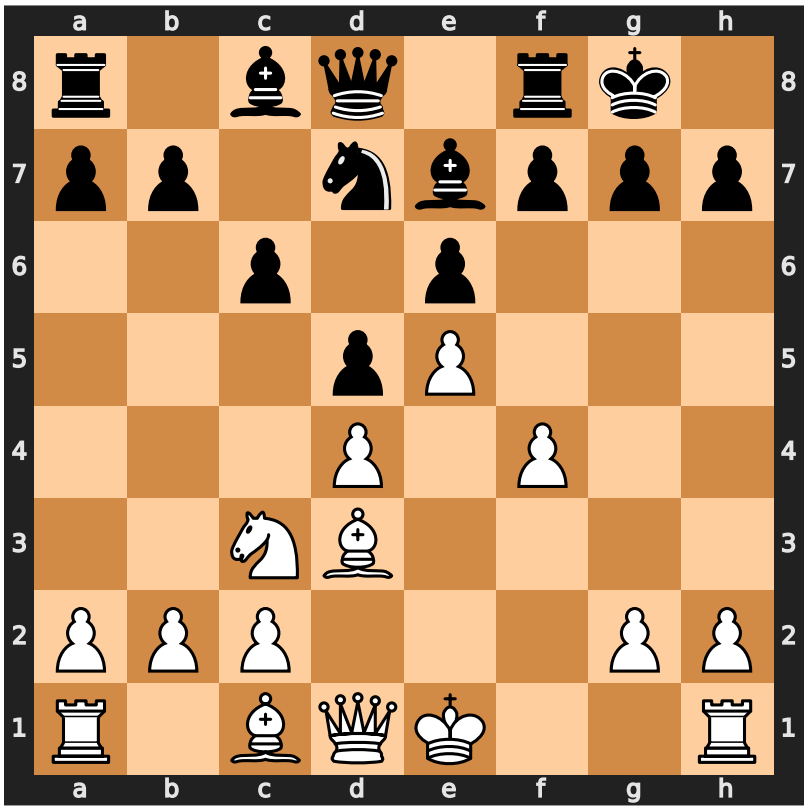

Figure 61.32: Chess Position

White to move. **Plan A:** Castle kingside and play a slow maneuvering game. **Plan B:** Castle queenside and launch a kingside pawn storm with g4-g5.

Hint: The center is locked (e5 vs d5). Opposite-side castling leads to sharp play. Is White ready for that?

Solution: Both plans are viable, but Plan A is better for club players. Plan B leads to a sharp, double-edged game where one mistake is fatal. Plan A (O-O) is safer and allows White to build slowly with Qe2, Bd2, and a later f5 when the time is right. At the 1000-1600 level, the safer plan with fewer ways to go wrong is typically the better practical choice. Choose the plan you can execute reliably over the plan that looks exciting but requires precise calculation.

Exercise 20.27

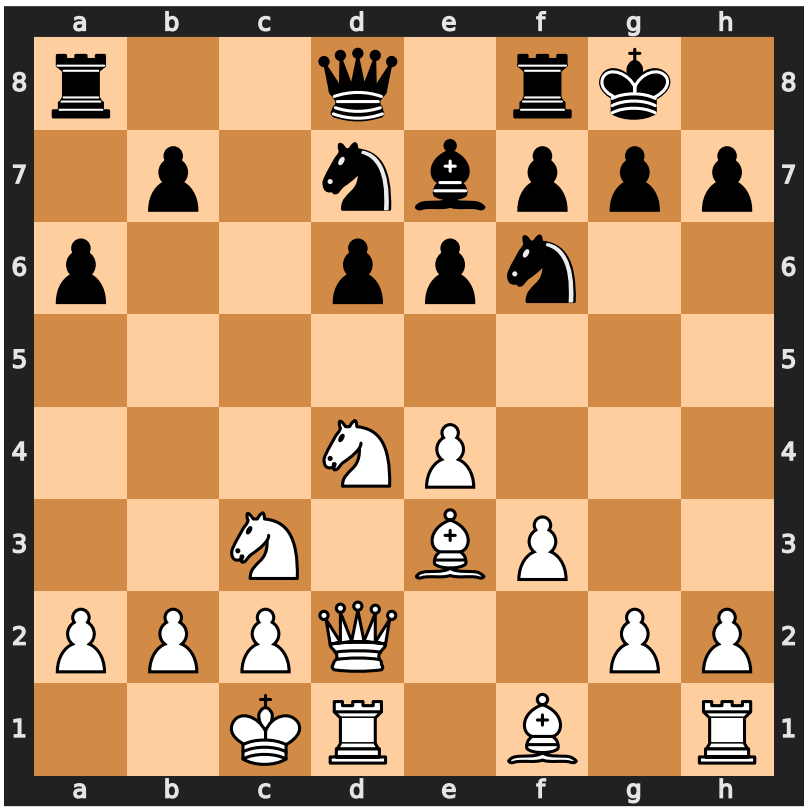

Figure 61.33: Chess Position

White to move. **Plan A:** Push g2-g4-g5 immediately for a kingside attack. **Plan B:** First play Kb1 and Bc4 to improve pieces, then consider g4.

Hint: Is White's king safe on c1? Should White improve it before attacking?

Solution: Plan B is correct. Plan A (immediate g4) is aggressive but neglects White's own king safety. The king on c1 is exposed to checks along the c-file and a-file. **Kb1** tucks the king into a safer corner, and **Bc4** develops the last minor piece to a strong square. Once the king is safe and the pieces are developed, then g4 is much more effective because White can focus entirely on the attack. Preparation before aggression.

Exercise 20.28

White to move. **Plan A:** Play f2-f4 to attack Black's e5 pawn. **Plan B:** Play b2-b4 to attack Black's c5 pawn.

Hint: Which pawn break is safer? Which one creates more problems for the opponent?

Solution: Plan B (b4) is correct. Plan A (f4) opens the f-file and creates tactical complications, after …exf4, Bxf4, Black can activate pieces along the e-file and the c1-h6 diagonal may become weak. Plan B (b4) attacks Black's c5 pawn safely. After …cxb4, White recaptures and opens the b-file with pressure. The queenside is where White's pawn chain points (d5-c4), making b4 the natural break. Follow the direction of your pawn chain.

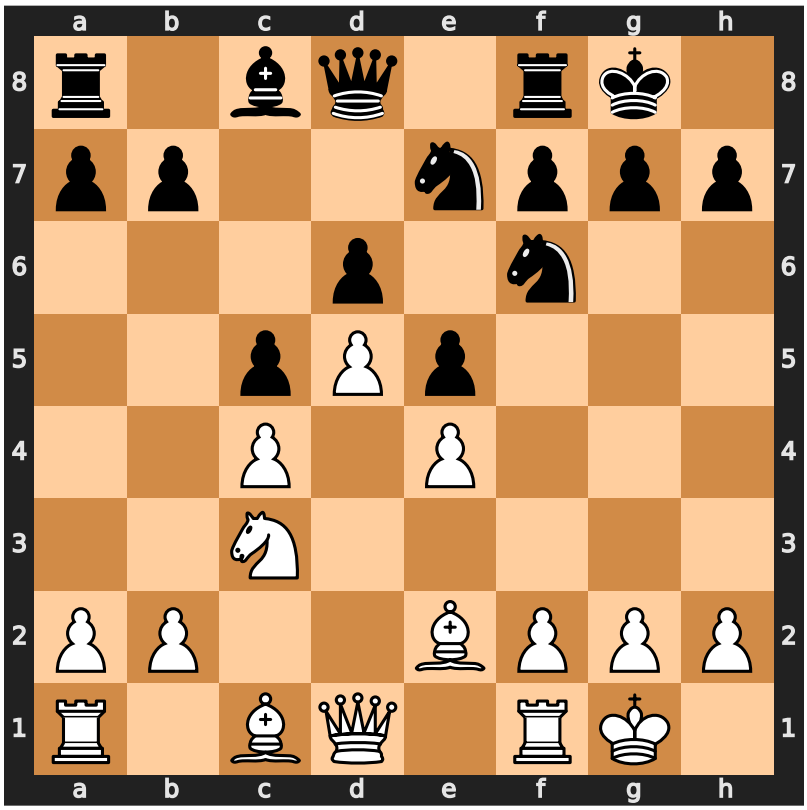

Figure 61.34: Chess Position

Exercise 20.29

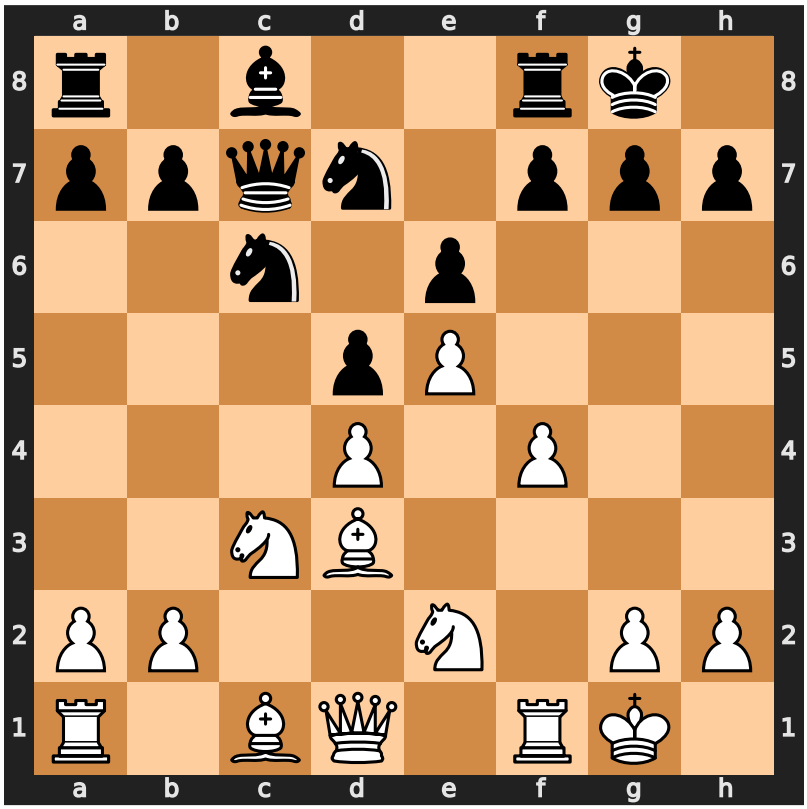

Figure 61.35: Chess Position

White to move. **Plan A:** Play f4-f5 to attack the kingside immediately. **Plan B:** Play Ng3 to reposition the knight and support f5 with better coordination.

Hint: Is f5 effective right now, or does White need more preparation?

Solution: Plan B is correct. Plan A (f5) is premature. After f5, Black can play …exf5 and the position opens before White's pieces are ready. The knight on e2 is not participating in the attack. Plan B (**Ng3**) brings the knight to a better square where it supports f5 AND eyes the h5 and f5 squares. After Ng3, f5 becomes much more powerful because the knight can jump to h5 or f5 after the break. Prepare your pieces, then break through.

Exercise 20.30

White to move. **Plan A:** Play a2-a4 to gain queenside space and restrict …b5. **Plan B:** Play Qe2 to connect the rooks and prepare e3-e4.

Hint: Which plan addresses the position's needs? What does White's position "want"?

Solution: Plan B (Qe2) is correct. White's position is well-developed but the queen on d1 is passive. **Qe2** connects the rooks, supports a future e4, and adds flexibility (the queen can go to h5 or b5 later). Plan A (a4) is not bad, but it is slow and does not address White's main issue, the

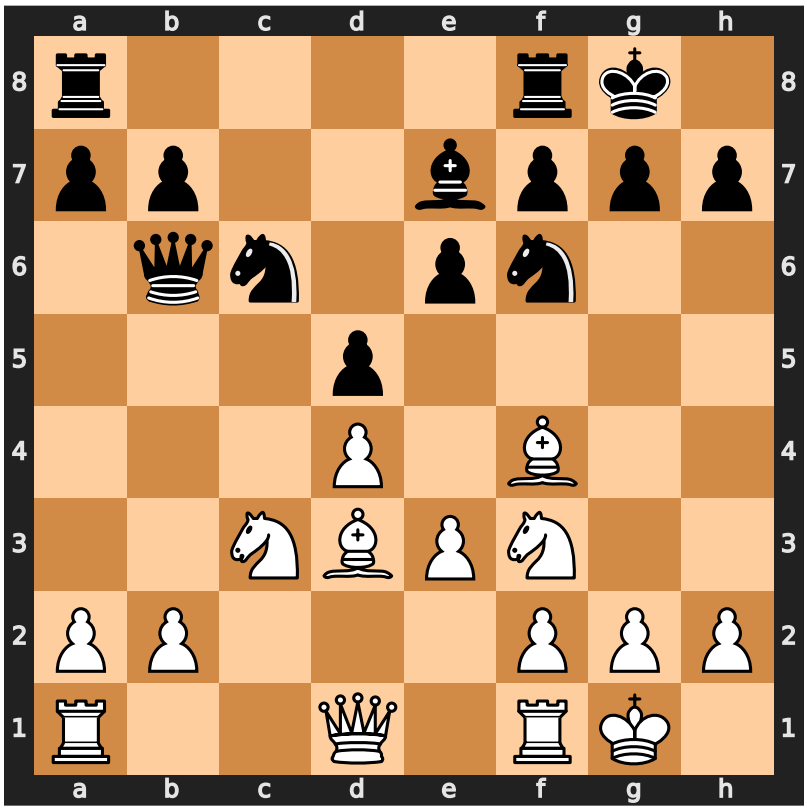

Figure 61.36: Chess Position

need to open the center before Black consolidates. After Qe2, White is ready for e4, which would activate the bishops and open the position. Address the key need first; peripheral operations can wait.

Rest here. Thirty exercises complete. One final set remains. Come back fresh.

61.10.4 Section D: Execute the Plan (Exercises 20.31 – 20.40) -

For each position, the plan is given. Find the correct move order (next 3-5 moves) to execute it.

Exercise 20.31

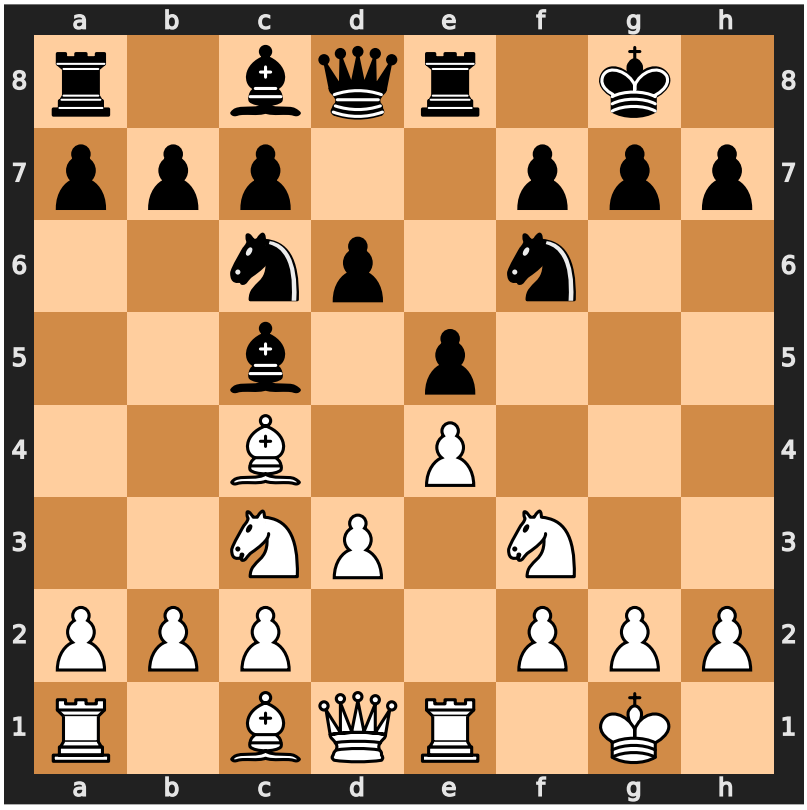

Figure 61.37: Chess Position

White's plan: Play d3-d4 to open the center. Find the correct move order.

Hint 1: Can White play d4 immediately? *Hint 2:* After d4, how should White recapture? *Hint 3:* Where should White's pieces go after the center opens?

Solution: White plays **d3-d4.** After **...exd4 Nxd4**, White has a strong knight on d4 and open lines. Next moves: **Bg5** (pinning the knight on f6), **Qf3** or **Qd3** (adding pressure to the center and kingside), and **Rad1** (controlling the d-file). The key is that d4 must be timed when White can recapture with the knight (not the pawn), keeping the center fluid and the pieces active. After

Nxd4, the bishop on c4 eyes f7, the knight controls key squares, and the e-file is available for the rook.

Exercise 20.32

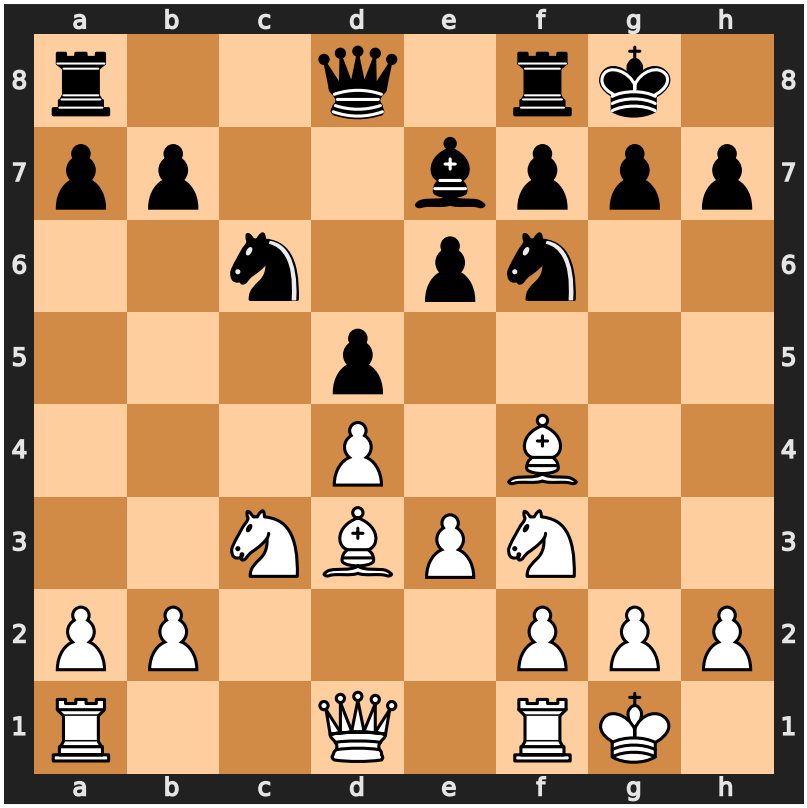

Figure 61.38: Chess Position

White's plan: Exploit the bishop pair by opening the position. Find the move order.

Hint 1: What pawn break opens the position? *Hint 2:* Should White play e4 directly or prepare it? *Hint 3:* After e4, what changes about the diagonals?

Solution: White prepares with **Qe2** (supporting e4 from behind), then plays **e3-e4.** After **...dxe4, Nxe4, Nxe4, Bxe4**, both bishops are active, the one on e4 controls the long diagonal, and the one on f4 controls the dark squares. The e-file opens for the rooks. Next: **Rad1** (centralizing the rook) and **Bc2** (aiming the bishop toward the kingside). The position has transformed from semi-closed to open, and the bishop pair dominates.

Exercise 20.33

White's plan: Kingside pawn storm. Find the move order.

Hint 1: White has castled queenside. What is the first pawn to push? *Hint 2:* g4 gains space and prepares g5. *Hint 3:* After g5, what happens to Black's knight on f6?

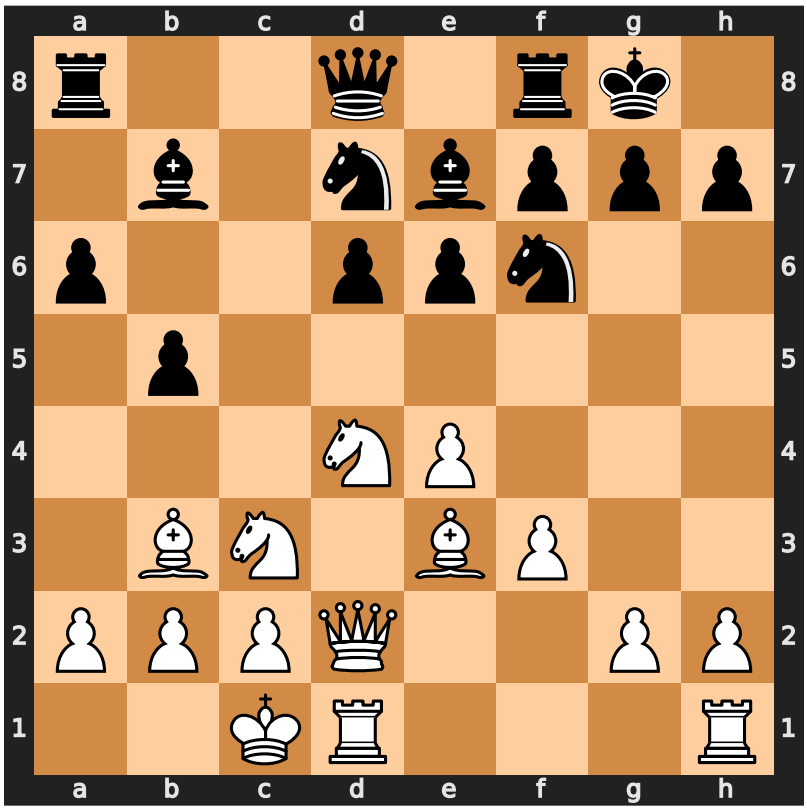

Figure 61.39: Chess Position

Solution: White plays **g2-g4**, then **h2-h4**, then **g4-g5.** The knight on f6 must retreat (to e8, d7, or h5). After g5, the h-file or g-file opens, and White's rooks enter the attack (Rdg1, Rh1-h5). The queen on d2 shifts to h6 or g5. The key is the order: g4 first (gaining space safely), then h4 (supporting g5), then g5 (the breakthrough). Rushing g5 without h4 support can be premature.

Exercise 20.34

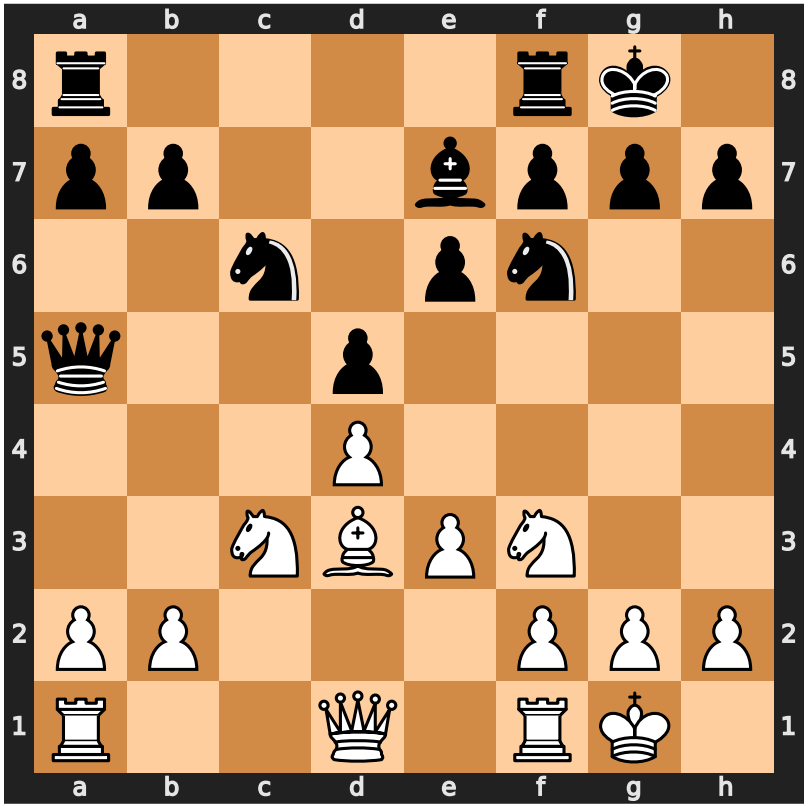

Figure 61.40: Chess Position

White's plan: Minority attack on the queenside with a2-a4, b2-b4, b4-b5. Find the move order.

Hint 1: Should White push a4 or b4 first? *Hint 2:* After a4, what prepares b4? *Hint 3:* Does White need to protect anything before advancing?

Solution: White plays **a2-a4** (gaining space and preparing b4), then **Rb1** (supporting the b-pawn advance), then **b2-b4.** After b4-b5, the b5 pawn hits c6 and forces a structural concession. If …cxb5, axb5 opens the a-file and creates a weak pawn for Black. If …Bxb5, Nxb5 wins a pawn. The queen on d1 can shift to b3 to add pressure on b7 and d5. The key is a4 first (a4 without b4 is safe; b4 without a4 loses the a-pawn to …Qa2).

Exercise 20.35

White's plan: Exploit the space advantage by improving pieces and preparing f4. Find the move order.

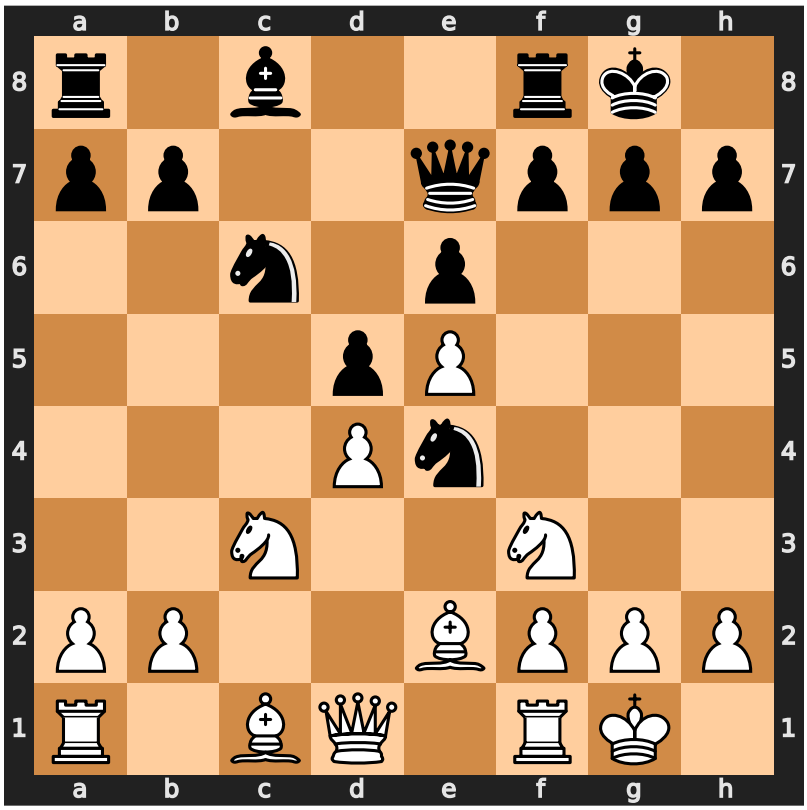

Figure 61.41: Chess Position

Hint 1: The knight on e4 is strong for Black. Should White trade it? *Hint 2:* After Nxe4 dxe4, is that good for White? *Hint 3:* Consider Bd3 to challenge the knight, or Nd2 to offer a trade on White's terms.

Solution: White plays **Nd2** (offering to trade the centralized knight on White's terms), then after **...Nxd2, Bxd2**, White continues with **f2-f4** (supporting e5 and gaining kingside space), **Bf3** (centralizing the bishop), and **Qe2** (connecting rooks and supporting e5). The trade Nxd2/Bxd2 is favorable because it activates White's bishop. Do NOT play Nxe4 dxe4, which gives Black a passed pawn on e4 and open lines for the bishop.

Exercise 20.36

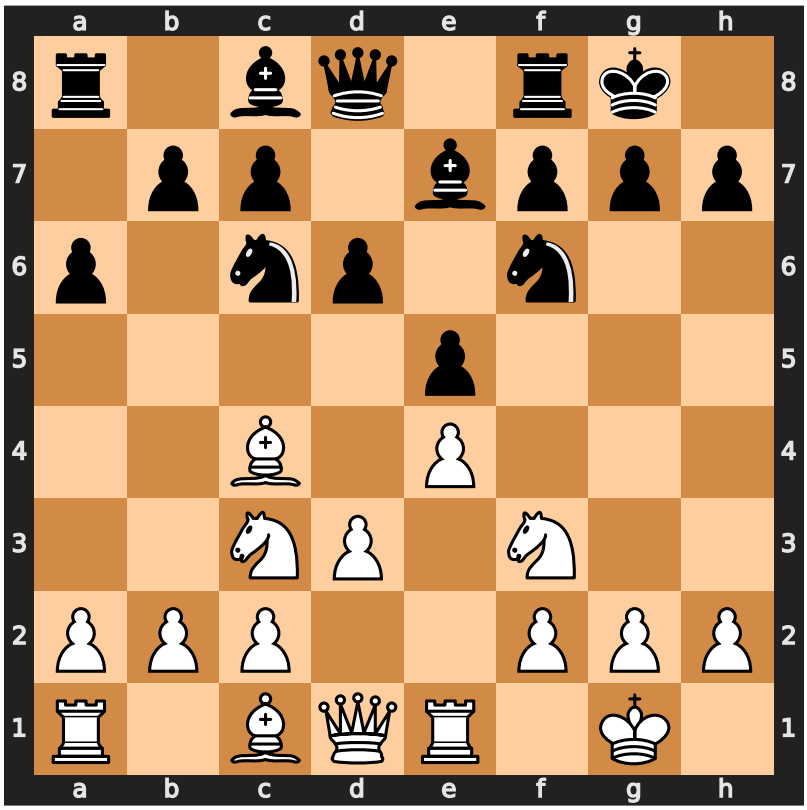

Figure 61.42: Chess Position

White's plan: Build a kingside attack with Nd5, f4, and piece coordination. Find the move order.

Hint 1: Should White play Nd5 immediately? *Hint 2:* After Nd5, how should Black respond? *Hint 3:* Consider a4 first to prevent …b5 hitting the bishop.

Solution: White plays **a4** (preventing …b5 and securing the bishop on c4), then **Nd5** (the knight occupies the ideal central outpost). If **...Nxd5, exd5, Ne7**, the knight is pushed to a passive square and White's bishop pair plus the d5 pawn give a lasting advantage. If Black does not take on d5, the knight stays as a monster. After Nd5, White plays **c3** (supporting d4 later), **Bg5** (pinning the f6 knight), and builds toward f4 for a kingside attack.

Exercise 20.37

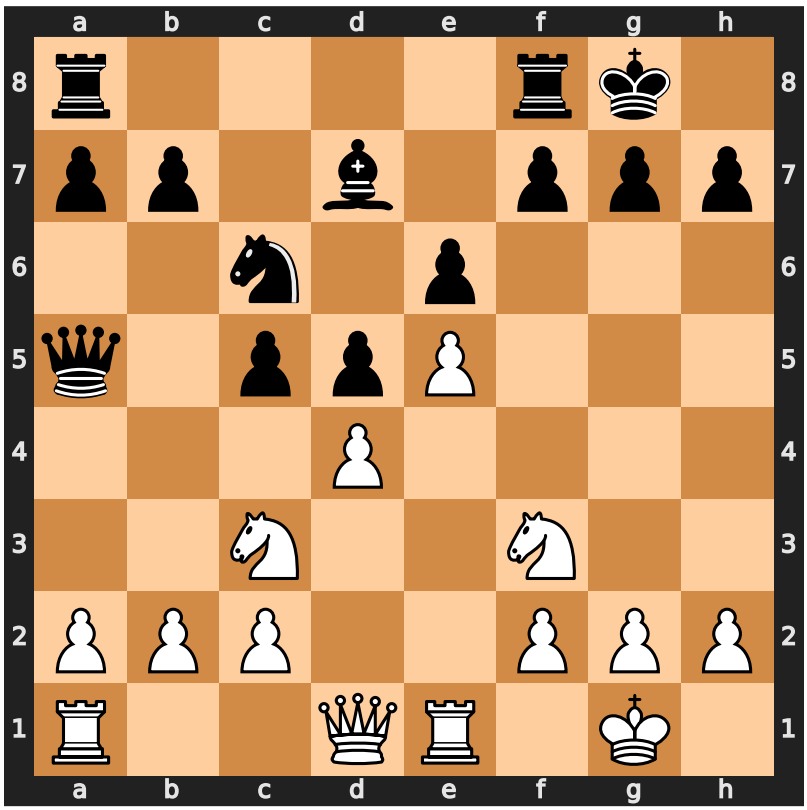

Figure 61.43: Chess Position

White's plan: Attack the d5 pawn by blockading it and doubling rooks on the d-file. Find the move order.

Hint 1: What piece blockades d5 most effectively? *Hint 2:* Can a knight reach d4 to blockade? *Hint 3:* After Nd4, where do the rooks go?

Solution: White plays **Nd4** (blockading the d5 pawn and establishing a powerful outpost, no Black pawn can attack d4 since the c5 and e5 pawns are gone or controlled). Then **Qd3** (supporting the knight on d4 and eyeing the kingside), **Rad1** (adding to the d-file pressure), and **f4** (supporting e5 and adding kingside threats). The plan is complete: the knight blockades d5, the rooks control the d-file, and the d5 pawn becomes a permanent weakness.

Exercise 20.38

White's plan: Trade down into a favorable endgame where the bishop on b3 is better than the bishop on d7. Find the move order.

Hint 1: Which pieces should White trade, and which should White keep? *Hint 2:* White wants to keep the bishop on b3 (it is more active than Black's bishop on d7). *Hint 3:* Trading queens and one pair of rooks simplifies toward the right endgame.

Solution: White plays **Qd3** (centralizing and creating tactical motifs like Qb5), then **Rac1** (contesting the c-file), then seeks to trade one pair of rooks with **Rxc8 Rxc8, Rc1** (or simply allow

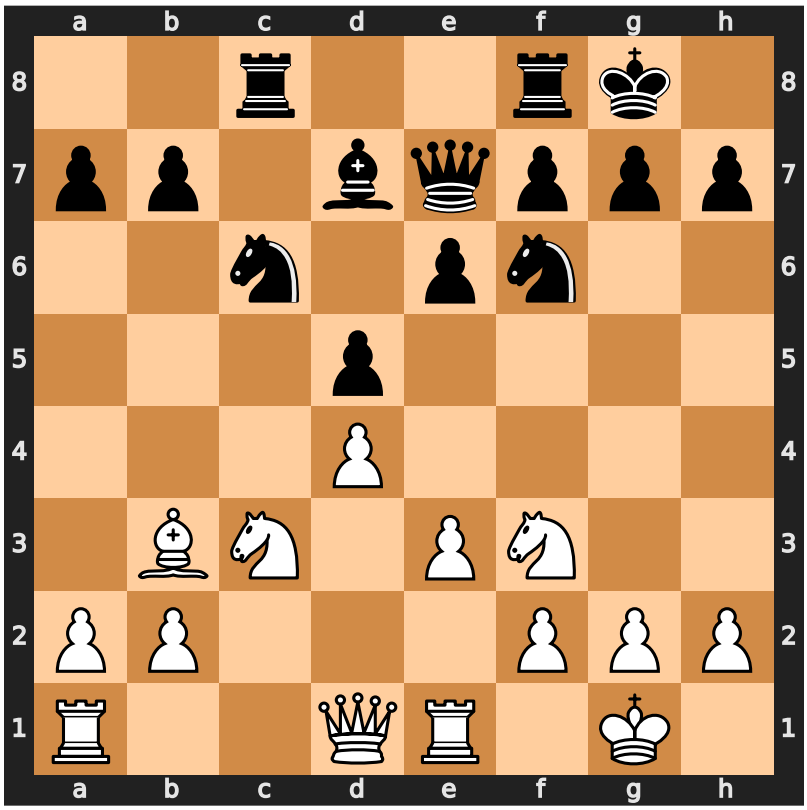

Figure 61.44: Chess Position

the exchange on c1). After further simplification, White enters an endgame where the bishop on b3 dominates the bishop on d7. The b3 bishop has an open diagonal targeting d5, e6, and f7. The d7 bishop is passive, blocked by its own pawns. Patient endgame play wins.

Exercise 20.39

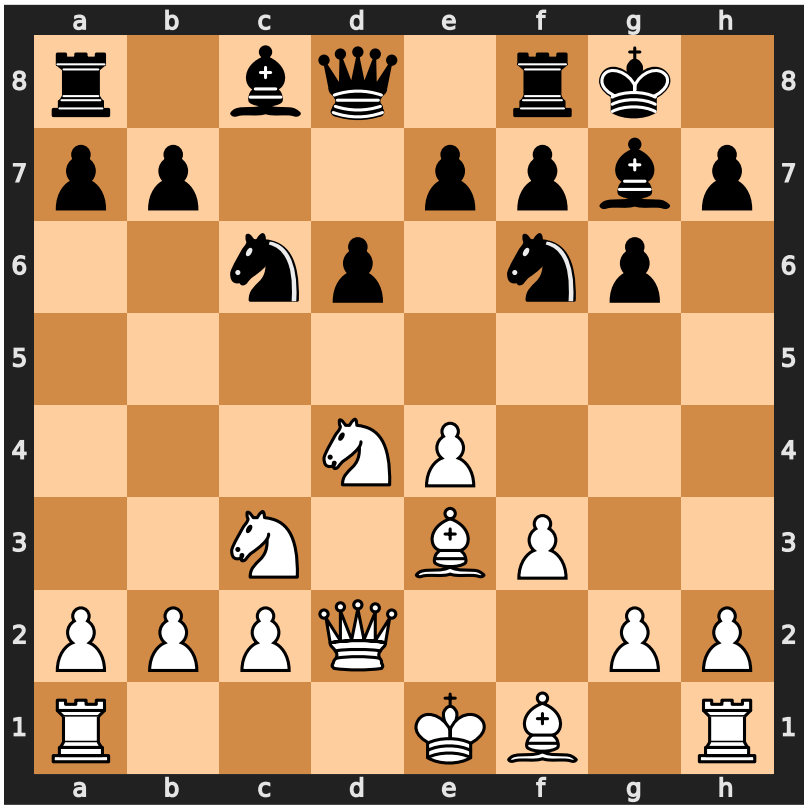

Figure 61.45: Chess Position

White's plan: Castle queenside and launch a kingside pawn storm. Find the complete setup (next 5 moves).

Hint 1: Castle queenside first for king safety. *Hint 2:* Then develop the bishop. Where does it go? *Hint 3:* The pawn storm is g4-h4-g5. But preparation matters.

Solution: White plays **(1) O-O-O** (king safety + connecting rooks), **(2) Bc4** or **Be2** (developing the last minor piece (Bc4 is aggressive, targeting f7; Be2 is solid), **(3) h4** (beginning the storm) h4 is often played before g4 because it prevents …Nh5 ideas), **(4) g4** (gaining space on the kingside), **(5) h5 or g5** depending on Black's response. If Black plays …h5, White plays g5. If Black plays …Nh5, White plays g4xh5. The storm aims to open the g-file or h-file for the rooks. The queen on d2 will join via h6 when the time is right.

Exercise 20.40

White's plan: Execute a complete attack. White wants to improve the worst piece, storm the kingside, and coordinate for a decisive blow. Find the sequence.

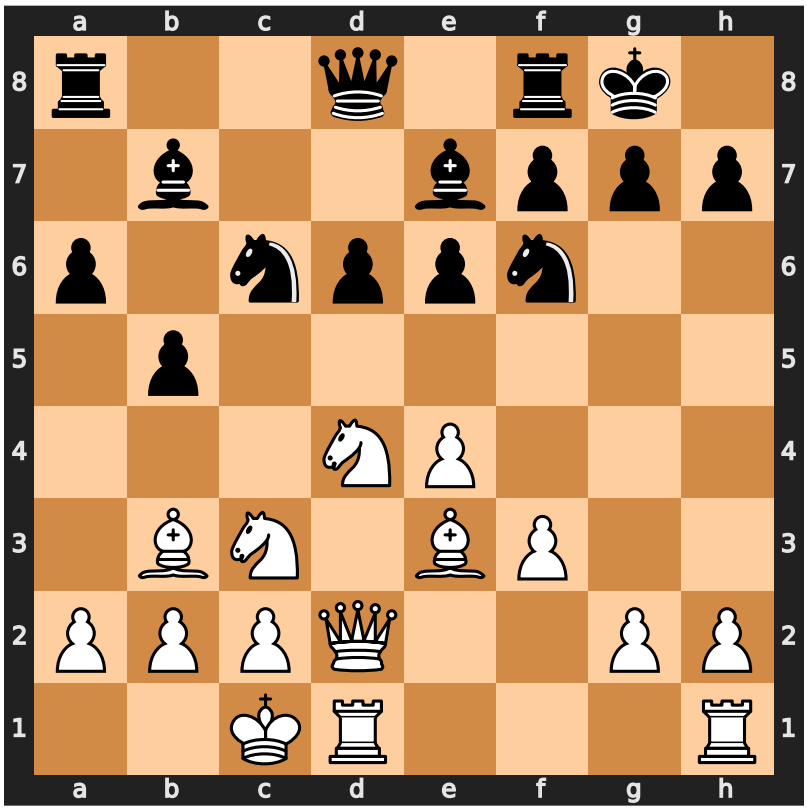

Figure 61.46: Chess Position

Hint 1: White's worst piece is the rook on h1. How can it join the attack? *Hint 2:* g4 opens the possibility of Rdg1 or Rh1-h4-g4. *Hint 3:* The knight on d4 is the anchor. Keep it.

Solution: White's five-move plan: **(1) g4** (the storm begins (gaining space, threatening g5, and opening the possibility of Rdg1), **(2) Rh1-g1** (the worst piece activates) the rook now supports g5 and eyes the g-file), **(3) g5** (the breakthrough (the f6 knight must move, weakening Black's kingside), **(4) Nd5** (the knight leaps to the ideal square, attacking e7 and f6, now that the f6 knight has moved), **(5) Qh6** (the queen enters the attack, threatening mate on g7). This is coordinated aggression: every piece has a role, the storm opens lines, and the knight sacrifice (or occupation) on d5 crowns the attack. This is planning at its finest) every move builds on the last, every piece supports the others, and the opponent faces problems on every square.

61.11 Key Takeaways

1. **A plan is a series of moves aimed at a specific goal.** If you cannot state your plan in one sentence, it is not clear enough.
2. **Evaluate before you plan.** Run through the checklist: material, king safety, piece activity, pawn structure, space, development. Then decide.
3. **Base your plan on the imbalances.** Exploit your advantages. Neutralize your opponent's. Every position has imbalances, find them.
4. **The position tells you what to do.** Look at your pawn breaks, your piece placement, your opponent's weaknesses. The right plan emerges from the position itself.
5. **When in doubt, improve your worst piece.** This is the universal plan that is almost never wrong.
6. **A bad plan is better than no plan.** Coordinated pieces beat scattered pieces, even if the plan is imperfect.
7. **Do not marry your plan.** When the position changes, your plan must change with it. Flexibility wins games.
8. **Tactics override strategy.** Follow your plan, but never miss a tactic. A free piece is always more important than a long-term plan.

61.12 Practice Assignment

This week, do the following:

1. **Play three games** (online or over the board). Before each middlegame move, state your plan to yourself in one sentence. Write it down if possible. After the game, review: did you follow your plans? Did they work? When did you change plans, and was it the right decision?
2. **Pick one of the five annotated games in this chapter** and replay it on a physical board. At each critical moment, cover the moves and try to find the plan yourself before reading the explanation.

3. **Practice the evaluation checklist.** Take any position from a book, a game database, or a paused online game. Run through all six evaluation points (material, king safety, piece activity, pawn structure, space, development) and write down your assessment. Then check with an engine. Repeat this five times.
